## Punchout Integrations

### Setup Considerations: Supplier Punchout Integration

You can use this topic to help make decisions when planning your configuration and use of the supplier punchout integration. It explains:

- Why to set it up.

- How it fits into the rest of Workday.
- Downstream impacts and cross-product interactions.
- Security requirements and business process configurations.
- Questions and limitations to consider before implementation.

Refer to detailed task instructions for full configuration details.

## What It Is

Workday Punchout uses standardized commerce eXtensible Markup Language (cXML) to support real-time, synchronous cXML communications between supplier eCommerce websites and Workday Procurement.

## Business Benefits

This integration enables your buying organization to:

- Easily access numerous external supplier catalogs on supplier marketplace sites for your eCommerce integration needs.
- Reduce administration over-head of maintaining hosted catalogs.
- Expand access to a wider range of suppliers.
- Minimize noncompliant and maverick spend.
- Eliminate the need to key in data for purchase orders (PO), PO acknowledgments, advance shipment notices, and supplier invoices.

## Use Cases

- You enable workers to search the catalogs on external supplier websites and add items to a shopping cart. Then, they can return to Workday to check out and complete the requisition creation process.
- For requisitions with web items, you can set up automatic sourcing and issuing of cXML purchase orders. You can also receive cXML invoices from the supplier for fulfilled orders.
- Automatically associate web items to purchase items based on commodity codes and spend categories to improve your reports on item procurement.

## Question to Consider

Questions	Considerations
How should my supplier and I prepare for the integration?	<p>Confirm that the supplier or marketplace supports cXML. Then, ensure that you have these values on-hand:</p> <ul style="list-style-type: none"> <li>• (Required for invoicing) Punchout URLs, also known as the HTTP endpoint value.</li> <li>• A list of the values from your supplier for these elements:           <ul style="list-style-type: none"> <li>• Header.From.Credential@domain</li> <li>• Header.From.Credential.Identity</li> <li>• Header.Sender.Credential.Identity</li> <li>• Header.To.Credential@domain</li> <li>• Header.To.Credential.Identity</li> <li>• Signature.KeyInfo.X509Data.X509Certificate</li> <li>• Header.Sender.Credential.SharedSecret</li> </ul> </li> <li>• (Optional) Associate UN/CEFACT to units of measure.</li> </ul>

Questions	Considerations
	<ul style="list-style-type: none"> <li>(Optional) Associate UN/SPSC supplier product codes to spend categories.</li> </ul>
Does your supplier require additional punchout element values for identification?	<p>You can configure these values as cXML extrinsic elements on the Maintain Launch Parameters task to fulfill the supplier's requirement:</p> <ul style="list-style-type: none"> <li>Email Address for Current Worker</li> <li>Location ID for Current Worker</li> <li>Location Name for Current Worker</li> <li>Cost Center ID for Current Worker</li> <li>Cost Center Name for Current Worker</li> </ul> <p>Work with the supplier on the details needed, such as the name of the extrinsic element.</p>
<p>Do your Ship To or Workspace (Deliver To) locations include address components beyond the following?:</p> <ul style="list-style-type: none"> <li>Address Line 1</li> <li>Address Line 2</li> <li>City</li> <li>Region</li> <li>Postal Code</li> <li>Country</li> </ul>	<p>If yes, the cXML purchase order file won't automatically include these additional address components.</p> <p>If your addresses require additional components for Address Line 3 and Address Line 4, ensure that you have configured the <i>Allow Multiple Address Lines With Max Number</i> integration attribute in your integration to allow up to 4 address lines. See <a href="#">Steps: Set Up Punchout Purchase Order Integration</a> on page 939.</p> <p>If your addresses require other additional components in the cXML purchase order file, a custom Studio post-processor will be necessary to modify the outfit file accordingly.</p>
Do you plan to connect to supplier marketplace?	Workday recommends that you integrate with a supplier marketplace to decrease the number of integrations you must maintain. When you plan to use a marketplace other than SciQuest or Jaggaer, we recommend that you fully test the integration.
Does Workday have an integration template for the supplier?	<p>You can verify all the available supplier punchout templates in Workday on the View Integration Template report in the Cloud Connect for Spend Management section.</p> <p>Workday doesn't update these templates with each release.</p> <p>When these templates don't meet your business needs, Workday recommends that you create supplier-specific templates in Workday instead of using a custom studio integration.</p>
Do you plan to receive cXML supplier invoices?	Before you set up the supplier invoice integration, you must send the punchout URL (HTTP endpoint value) for the integration to your supplier. Example: <a href="https://wd5-enterprise-services1.workday.com/ccx/ProcurementcXMLReceiver">https://wd5-enterprise-services1.workday.com/ccx/ProcurementcXMLReceiver</a>

Questions	Considerations
	<p>To determine the HTTP endpoint value for your production or implementation tenant, review the Workday Community page for your data center. See <a href="https://community.workday.com/articles/29946">https://community.workday.com/articles/29946</a>.</p> <p>When the cXML invoice has taxes at a line level, the integration will aggregate the amounts at the invoice header level.</p> <p>The connector for supplier invoices supports values for these elements:</p> <ul style="list-style-type: none"> <li>• invoice ID (on InvoiceDetailRequestHeader)</li> <li>• operation (on InvoiceDetailRequestHeader)</li> <li>• invoiceDate (on InvoiceDetailRequestHeader)</li> <li>• ShippingAmount (on InvoiceDetailSummary)</li> <li>• OrderID (on InvoiceDetailOrderInfo/OrderReference)</li> <li>• lineNumber (on InvoiceDetailItemReference)</li> <li>• quantity (on InvoiceDetailItem)</li> <li>• Money (on UnitPrice)</li> <li>• Money (on SubtotalAmount)</li> <li>• Money (on Tax/TaxDetail/TaxAmount)</li> <li>• isTaxInLine (on InvoiceDetailLineIndicator)</li> <li>• Comments</li> </ul>

## Recommendations

We recommend that you use these templates for each respective integration:

- *Supplier Network Connector - Procurement Punchout Purchase Order and Invoicing* for the punchout supplier invoice integration.
- *Procurement Supplier Punchout - Custom Supplier* for the supplier punchout integration.
- *Procurement Punchout Purchase Order - Custom Supplier* for the punchout purchase order integration.

Workday recommends that you integrate with a supplier marketplace to decrease the number of integrations to maintain. When you plan to use a marketplace other than SciQuest or Jaggaer, we recommend that you fully test the integration.

## Requirements

- Sign in with an Implementer role.
- Set up the *Integration Process Event* business process. When you don't do this, purchase orders with web items remain in *Approved* status and can't be issued.
- Associate a UN/CEFACT to each unit of measure available on the supplier website or marketplace. When you don't do this, you can't submit the requisitions for web items.
- When you don't source purchase orders from requisitions in Workday, ensure that you use spend categories enabled for UNSPSC codes on purchase orders.

## Limitations

When interacting with vendors, the encryption algorithms can cause issues. To troubleshoot, see [FAQ: Encryption, Certificates, and Ciphers for Integrations](#).

## Tenant Setup

No impact.

## Security

- Set up security permissions for creating supplier links on the *Set Up: Procurement* domain.
- Sign in with an Implementer role to set up integrations in Workday.
- Requesters must have security permissions to these domains to access the Connect to Supplier Website task and link on the Create Requisition task:
  - *Process: Requisition - Create/Edit*
  - *Self-Service: Requisition*
- When you associate supplier contracts to supplier links, users must create requisitions for the companies on the supplier contracts to access the supplier links. (You can associate supplier contracts to supplier links on the Maintain Supplier Links task).

## Business Processes

Business Process	Considerations
<i>Integration Process Event</i>	Configure this business process or approved purchase orders don't issue to suppliers.
<i>Purchase Order XML Issue Event</i>	Add an integration step that identifies the supplier integration for the purchase order. This setup enables the issuing of the cXML purchase order.

## Reporting

No impact.

## Integrations

Integration	Consideration
cXML Purchase Orders	When you plan to accept cXML invoices from the supplier, use the <i>Supplier Network Connector - Procurement Punchout Purchase Order and Invoicing</i> template to create the purchase order integration. When you don't plan to receive cXML invoices from the supplier, use the <i>Procurement Punchout Purchase Order - Custom Supplier</i> template.
cXML Supplier Invoices	Your supplier can use the cXML user guide to understand how their invoice file should look.

## Connections and Touchpoints

Connections and Touchpoints	Considerations
Requisitions	When users create requisitions with only web items, those requisitions automatically source

Connections and Touchpoints	Considerations
	<p>to cXML purchase orders after approval. Users must have security permissions for the Connect to Supplier Website task to request items from external supplier sites.</p> <p>Workday recommends that you instruct users to select the spend category when it doesn't populate for web items on requisitions. This enables you to use the Maintain Web Items to associate web items to purchase items, which ensures accurate reports.</p>
Purchase Orders	<p>You can automatically source purchase orders from approved requisitions with only web items. Add an integration step, which identifies the supplier integration for purchase orders, to the business process that issues cXML purchase orders. Also configure the <i>Integration Process Event</i> business process.</p>
Web Items	<p>Workday automatically generates web items when users return to Workday with items selected on an external supplier website.</p>

Workday offers a Touchpoints Kit with resources to help you understand configuration relationships in your tenant. Learn more about the [Workday Touchpoints Kit](#) on Workday Community.

### Concepts

[Concept: Supplier Punchout](#)

### Tasks

[Steps: Set Up Supplier Punchout](#)

## Steps: Set Up Punchout Catalog Integration

### Prerequisites

You must have punchout authentication values for the supplier.

### Context

Create an integration system that connects Workday to the punchout catalog of a supplier. Workday provides 2 types of integration templates:

Preconfigured Templates for Suppliers in the Workday Catalog

Integration templates for suppliers in the Workday catalog have factory default values for the credentials of the supplier. These values simplify integration configuration. You can configure the buyer credentials for your organization. Preconfigured templates are available for CDW, Dell, Guest Supply, and Staples.

Generic Template for Custom Suppliers

A generic integration template gives you the flexibility to integrate with any supplier that supports punchout catalogs for procurement. You can

configure the integration system to match the punchout specifications of your supplier.

## Steps

- Access the Create Integration System task and enter the applicable integration template at the New using Template prompt:

- Procurement Supplier Punchout - CDW*
- Procurement Supplier Punchout - Custom Supplier*
- Procurement Supplier Punchout - Dell*
- Procurement Supplier Punchout - Guest Supply*
- Procurement Supplier Punchout - Staples*

Note: Workday recommends that you use the *Procurement Supplier Punchout - Custom Supplier* template.

- Accept the default integration services.
- Select Integration System > Configure Integration Attributes as a related action on the integration system and configure integration attributes.

Integration templates for suppliers in the Workday catalog have factory default values for the supplier credentials. If the supplier asks you to change one of these values, remove the row with the default value, then add a row for the new value. If the test and production integrations of a supplier require separate credentials, enter both values. Then, click the Restricted to Environment prompt in the rows with production values and select *Production*.

Attribute	Description	Corresponding <i>cXML</i> Element
Buyer Domain	Represents the credential type of the buyer.	Header.From.Credential@domain and Header.Sender.Credential@domain
Buyer Identity	Represents the credential identifier of the buyer.	Header.From.Credential.Identity and Header.Sender.Credential.Identity
Service URL	Specifies the URL of the punchout website of the supplier.	(Not applicable)
Supplier Domain	Represents the credential type of the supplier.	Header.To.Credential@domain
Supplier Identity	Represents the credential identifier of the supplier.	Header.To.Credential.Identity
Shared Secret	Represents the credential password of the buyer.	Header.Sender.Credential.SharedSecret
Public Key	Represents the credential digital signature public key of the supplier.	Signature.KeyInfo.X509Data.X509Certificate

- (Optional) Configure unique name types when launching parameters:

- From the related actions menu of the integration system, select Integration System > Maintain Launch Parameters.
- Use 1 of these parameters to configure unique user identification:
  - Email
  - Employee ID
  - Worker Full Name
  - Worker WID

5. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Integration Event* security domain.

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

## Next Steps

Create an integration system to issue purchase orders for the items that you select from the punchout catalog of the supplier.

Related Information

### Tasks

[Steps: Set Up Supplier Punchout](#)

## Steps: Set Up Punchout Purchase Order Integration

### Prerequisites

- Set up punchout authentication values for the supplier.
- Security: *Integration Build* domain in the Integration functional area.

### Context

To complete a supplier punchout solution, create an integration system to submit purchase orders to a supplier based on your requisitions. Workday issues purchase orders for the items that you added to your cart from the punchout catalog of the supplier.

Workday provides preconfigured integration templates for suppliers in the Workday catalog. You can also use a generic template to create a purchase order integration with any supplier that supports the punchout standard.

### Steps

1. Access the Create Integration System task and enter the applicable integration template at the New using Template prompt:
  - *Procurement Punchout Purchase Order - CDW*
  - *Procurement Punchout Purchase Order - Custom Supplier*
  - *Procurement Punchout Purchase Order - Dell*
  - *Procurement Punchout Purchase Order - Guest Supply*
  - *Procurement Punchout Purchase Order - Staples*

Note: Workday recommends that you use the *Procurement Punchout Purchase Order - Custom Supplier* template.

2. View the default integration services and for all the templates. Accept the default integration services.
3. Select Integration System > Configure Integration Attributes as a related action on the integration system and configure integration attributes.

Integration templates for suppliers in the Workday catalog have factory default values for the supplier credentials. If the supplier asks you to change one of these values, remove the row with the default value, then add a row for the new value. If the test and production endpoints of a supplier

require separate credentials, enter both values. Then, click the Restricted to Environment prompt in the rows with production values and select *Production*.

Attribute	Description	Corresponding cXML Element
<i>Buyer Domain</i>	Represents the credential type of the buyer.	Header.From.Credential@domain and Header.Sender.Credential@domain
<i>Buyer Identity</i>	Represents the credential identifier of the buyer	Header.From.Credential.Identity and Header.Sender.Credential.Identity
<i>Service URL</i>	Specifies the URL of the punchout website of the supplier.	Not applicable
<i>Supplier Domain</i>	Represents the credential type of the supplier.	Header.To.Credential@domain
<i>Supplier Identity</i>	Represents the credential identifier of the supplier.	Header.To.Credential.Identity
<i>Shared Secret</i>	Represents the credential password of the buyer.	Header.Sender.Credential.SharedSecret
<i>Unique Name Type</i>	Represents the credential unique name to send to the supplier from a non-punchout requisition.  No direct mapping to the cXML. This value is the line level extrinsic attribute used to identify the corresponding user identifier.	ItemOut.ItemDetail.Extrinsic.UniqueName
<i>Allow Multiple Address Lines With Max Number</i>	By default, Workday concatenates Address Line 1 and Address Line 2 into a single element when creating the outbound cXML file. To keep the address lines as separate elements, populate the integration attribute with either the number: <ul style="list-style-type: none"><li>• 1 to only output Address Line 1.</li><li>• 2 to output Address Line 1 and Address Line 2 as separate elements.</li><li>• 3 to output Address Line 1, Address Line 2, and Address Line 3 as separate elements.</li><li>• 4 to output Address Line 1, Address Line 2, Address Line 3,</li></ul>	Not applicable

Attribute	Description	Corresponding cXML Element
	<p>and Address Line 4 as separate elements.</p> <p>If you leave this attribute blank, by default Workday will provide a single concatenated element. The cXML file will only include Address Line 1 and Address Line 2 in the output file.</p> <p>Workday recommends that you:</p> <ul style="list-style-type: none"> <li>• Keep all necessary information required for address communication within Address Lines 1, 2, 3, and 4 to ensure inclusion in your outbound cXML file.</li> <li>• Ensure that the number of address lines aligns with your punchout purchase order integration.</li> </ul>	
<i>Include PO Attachments</i>	<p>Includes purchase order attachments marked as external for the supplier.</p> <p>Workday sends out cXML messages in a multipart format:</p> <ul style="list-style-type: none"> <li>• The first part contains the cXML message content.</li> <li>• Subsequent parts contain 1 or more attachments.</li> </ul>	Not applicable
<i>Include Line Ship-To Information</i>	<p>Includes this shipping information sent to suppliers:</p> <ul style="list-style-type: none"> <li>• Deliver-to location.</li> <li>• Line ship-to address.</li> <li>• Line ship-to contact.</li> </ul>	ItemOut.ShipTo
<i>Include Service Lines</i>	<p>Includes service lines for purchase orders on the Purchase Order cXML sent to suppliers.</p>	<p>ItemOut and lineNumber section</p> <p>Workday populates these cXML elements for service lines by setting:</p> <ul style="list-style-type: none"> <li>• <i>isAdHoc</i> to yes</li> <li>• <i>SupplierPartId</i> to Not Available</li> </ul>

Attribute	Description	Corresponding cXML Element
		<ul style="list-style-type: none"> <li>• <i>Quantity</i> to 1</li> <li>• <i>UnitPrice</i> to <i>PO Line.Amount</i></li> <li>• Extrinsic <i>StartDate</i> to <i>PO Line.Start Date</i></li> <li>• Extrinsic <i>EndDate</i> to <i>PO Line.End Date</i></li> <li>• Extrinsic <i>DueDate</i> to <i>PO Line.Due Date</i></li> </ul>
<i>Sender Identity</i>	Represents a distinct sender value separate from buyer identity.	Header.Sender.Credential.Identity
<i>Sender Domain</i>	Represents a distinct domain sender value separate from buyer domain.	Header.Sender.Credential.Domain
<i>Override Sender Identity</i>	Dynamically sets the company DUNS number as the sender Identity.	Header.Sender.Credential.Identity

4. (Optional) To enable cXML files issued through the *Procurement Punchout Purchase Order - Custom Supplier* integration template to display procurement card details:

- Select the *Enable* check box to include the *Enable Procurement Card in PO cXML* integration service on your integration system.
- Select *Integration System > Configure Integration Attributes* from the related actions menu of an integration system.
- Ensure these attributes have the following values for the *Enable Procurement Card in PO cXML* integration service:

Attribute	Value
<i>PCI Provider Identifier</i>	cXML-PO  Note: You can't change the <i>PCI Provider Identifier</i> attribute value since the value is already set to cXML-PO by default.
<i>Restrict values to template</i>	Yes
<i>File Type</i>	AMEX-GL 1205  Note: If you don't configure the <i>File Type</i> attribute, the value will be set to AMEX-GL 1205 by default.

Workday only displays procurement card information in the cXML purchase orders when a purchase order contains credit card information from a token in the purchase order header.

5. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Integration Event* security domain.

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

##### Tasks

[Steps: Set Up Supplier Punchout](#)

## Steps: Set Up Supplier Invoicing Integration

### Prerequisites

- Set up authentication values for the supplier.
- Security: *Integration Build* domain in the Integration functional area.

### Context

You can process supplier invoicing by creating an integration system using the Supplier Connector Network integration system template using cXML.

### Steps

1. Send the HTTP endpoint value for integration to your supplier.

To determine the HTTP endpoint value for your production or implementation tenant, review the Workday Community page for your data center. See <https://community.workday.com/articles/29946>.

Example: <https://wd5-enterprise-services1.myworkday.com/ccx/ProcurementcXMLReceiver>.

2. Access the Create Integration System task.
3. Select *Supplier Network Connector - Procurement Punchout Purchase Order and Invoicing* as the applicable integration template from the New using Template prompt.
4. View the default integration services. For supplier network connector, select Procurement Punchout Invoicing to process invoices as part of the punchout integration.
5. Select Integration System > Configure Integration Attributes as a related action on the integration system and configure integration attributes so that suppliers can submit invoices using cXML. Implementors must get supplier credentials and configure the integration attributes.
  - a) If the test and production endpoints of a supplier require separate credentials, enter both values.
  - b) Click the Restricted to Environment prompt in the rows with production values and select *Production*.

Attribute	Description	Corresponding <i>cXML</i> Element
Buyer Domain	Represents the credential type of the buyer.	Header.To.Credential@domain and Header.Sender.Credential@domain
Buyer Identity	Represents the credential identifier of the buyer.	Header.To.Credential.Identity and Header.Sender.Credential.Identity
Service URL	Specifies the URL of the punchout website of the supplier.	(Not applicable)
Supplier Domain	Represents the credential type of the supplier.	Header.From.Credential@domain
Supplier Identity	Represents the credential identifier of the supplier.	Header.From.Credential.Identity
Shared Secret	Represents the credential password of the buyer.	Header.Sender.Credential.SharedSecret

6. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Integration Event* domain.

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

# SAF-T Integrations

## Steps: Set Up SAF-T Integration

### Prerequisites

- Review setup considerations for SAF-T.
- Create SAF-T data in Workday.
- Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

### Context

You can create and configure SAF-T integrations to export tax-relevant data from Workday to SAF-T XML files. You can then submit SAF-T to tax authorities.

### Steps

1. [Create Integration System](#).

Select 1 of these templates from the New Using Template prompt:

- *SAF-T Core*
- *SAF-T Norway*

Enable the optional *SAF-T Schema Retrieval* integration service to retrieve a different SAF-T schema on:

- *SAF-T Core* integrations when your country uses a schema based on OECD SAF-T v2.0 with different fields.
- *SAF-T Norway* integrations to use the latest schema.

On *SAF-T Core* integrations, enable these optional integration services to include the *SourceDocuments* element containing approved accounts payable or accounts receivable transactions:

- *SAF-T\_SalesInvoices*
- *SAF-T\_PurchaseInvoices*
- *SAF-T\_SupplierPayments*
- *SAF-T\_CustomerPayments*

See also:

- [Setup Considerations: SAF-T](#)
- [Steps: Set Up SAF-T](#)

2. [Create an Integration System User \(ISU\)](#) and grant the ISU *Get* and *Put* access to these domains:

- *Integration Event*
- *Process: Tax Master*

See also:

- [Steps: Grant Integration or External Endpoint Access to Workday](#)
- [Concept: Tax Master Records](#)

3. [Select Integration System > Configure Integration Attributes](#) as a related action on the integration system and enter integration service attributes.

4. (Optional) [Select Integration System > Configure Integration Field Overrides](#) as a related action on the integration system.

Configure additional fields in valid extension points or override field mappings as required. Workday only supports fields that comply with the schema used on your integration.

- (Optional) Select Integration System > Configure Integration Field Attributes as a related action on the integration system.

Disable fields as required, or set maximum lengths to truncate values when data exceeds the length permitted by your schema. To ignore any maximum lengths specified by Workday, set the maximum length to zero.

Example: Set a maximum length for the *Name* field when your schema permits 70 characters but your records contain names longer than 70 characters.

- (Optional) Set Up Integration Retrieval on page 1957.

Provide a different SAF-T schema for the integration to use.

- (Optional) Create Integration (Step).

When your country uses a schema that doesn't match the structure of OECD SAF-T v2.0, add a custom integration on the business process to:

- Transform the structure of the output file to match your schema.
- Change fields as required.

Only applies to integrations that use the *SAF-T Core* integration template.

- Launch an Integration on page 24

Related Information

**Reference**

[Workday Community: SAF-T OECD Version 2 - Supported Fields](#)

## Concept: SAF-T Integrations

Workday provides 2 integration templates to generate XML output files that comply with Standard Audit File for Tax (SAF-T) requirements:

- SAF-T Core*
- SAF-T Norway*

The *SAF-T Core* integration template generates a SAF-T using the OECD SAF-T v2.0 schema. You can configure your integration to use another schema once it has the same structure as OECD SAF-T v2.0. When your schema has a different structure, you can use the default output file as a data source for a custom integration to:

- Transform the structure to match your schema.
- Change fields as required.

The *SAF-T Norway* integration template generates a SAF-T for Norway using the Norwegian SAF-T Financial v1.10 schema. You can configure your integration to use a newer version of the schema.

### Integration Services

You can enable these optional integration services on SAF-T integrations:

Integration Service	Description
<i>SAF-T_CustomerPayments</i>	Include customer invoice payments when you create SAF-T.
<i>SAF-T_PurchaseInvoices</i>	Include approved accounts payable transactions in the output. Available on the <i>SAF-T Core</i> integration template only.
<i>SAF-T_SalesInvoices</i>	Include approved accounts receivable transactions in the output.

Integration Service	Description
	Available on the <i>SAF-T Core</i> integration template only.
<i>SAF-T_Schema_Retrieval</i>	Configure document retrieval to provide your own SAF-T schema.
<i>SAF-T_SupplierPayments</i>	Include supplier invoice payments when you create SAF-T.

## Output Files

When the integration runs, Workday generates a ZIP file containing the SAF-T XML file. When the output triggers any validation errors, Workday generates a message log HTML file to help you troubleshoot them. The message log includes the first 500 errors only.

You can find these files on the Output Files tab of the integration event.

## Supplier Accounts Integrations

### Set Up Electronic Invoice Inbound Connector for Supplier Accounts

#### Context

You can create an integration to import custom electronic invoices for Supplier Accounts from a vendor or payment portals.

#### Steps

1. Access the Create Integration System task. As you complete the task, consider:

Option	Description
System Name	Give the integration a meaningful System Name. Record this name; you use it when you launch the integration.
Integration Tags	Access the Maintain Integration Tags task (security: Integration Reports domain) and define any tags that you want to apply to an integration system.
Contacts	Select workers that you want to associate with the integration system from the prompt.
New Using Template	Select the <i>Core Connector: Electronic Supplier Invoice template</i> .

2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains: *Accounting Journal Event* (business process) *Integration Event*.
3. In Configure Integration Services, four services are enabled by default, and three services are optional. If you want to enable one of the three optional services, select the check box in the Optional column or select the Enable All Services check box.
4. In View Integration System use Related Actions to select Integration System > View Integration Retrieval to complete the configuration of your connector by creating a business process definition that contains a retrieval step for the Integration Retrieval Service.
5. In View Integration Retrieval, click Create New Business Process Definition to add the retrieval step to the business process definition.
6. In Create, Copy, or Link Business Process Definition, select the business object that contains the business process definition with a retrieval step for the Integration Retrieval Service. Then specify whether you want to copy or link to an existing business process definition.
7. In View Integration System on the Integration Attributes tab, configure the integration attributes to specify values for the input file.

Integration attributes define various processing options for the input file, such as:

- The retention period for audit files.
  - Data validation rules.
  - Whether Workday always includes data or only when changes occur.
8. In View Integration System on the Integration Maps tab, specify how to map Workday data to data in the input file for:
    - The Unit of Measure.
    - The tax/VAT ID of an external company to that of a Workday company instance.
    - The tax/VAT ID of an external supplier to that of a Workday supplier instance.
- Maps reconcile internal Workday values with the external attribute values defined on your integration.
9. In View Integration System on the Security tab, use Related Actions to edit security settings for your integration.
  10. In View Integration System use Related Actions to select Integration > Launch/Schedule to launch the integration now or schedule it to run on a regular basis in the future. See [Launch an Integration](#).

## Third-Party Payments Integration

### Steps: Set Up Third-Party Payments Integration

#### Context

You can create an integration to generate an XML audit file containing details of payments made to third parties. You can set threshold values to exclude payments below a specified value.

#### Steps

1. Access the Create Tax Authority Form Type task.

Set up the payment categories on your tax authority form.

**Security:** *Set Up: Tax* domain in the Common Financial Management functional area.

2. Access the Maintain Third-Party Payments Configuration task.

Map the payment categories to Workday spend categories or spend category hierarchies and specify any required thresholds.

When you select:

- Aggregate Category Mapping, you can group payment categories after mapping and set thresholds for each group.
- Category Mapping, you can set individual thresholds for each payment category.

**Security:** *Set Up: Tax* domain in the Common Financial Management functional area.

3. Create Integration System.

Select *Third-Party Payments* in the New Using Template prompt.

4. Create an Integration System User (ISU) and grant the ISU Get and Put access to the *Integration Event* domain.

See [../../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).

5. (Optional) Select Integration System > Configure Integration Attributes from the related actions menu of the integration system.  
Enter integration service attributes.  
Security: These domains in the Integration functional area:
  - *Integration Build*
  - *Integration Configure*
6. (Optional) [Set Up Integration Field Overrides for DIS on page 1974.](#)  
Configure additional fields or override field mappings as required.
7. (Optional) [Select and Set Up Connector Output Fields on page 1977.](#)  
Select fields to include or exclude from the output.
8. [Launch an Integration on page 24.](#)

## Next Steps

- Create a custom integration to transform the output file into a different format.
- Submit the audit file to a tax authority.

Related Information

### Tasks

[Steps: Set Up DAS2 Integration on page 761](#)

## Concept: Third-Party Payments Integration

Some tax authorities require companies to provide information about payments to third parties. You can create an integration using the *Third-Party Payments* integration template to export these details to an XML file. When the tax authority specifies another format, you can use a custom integration to transform the XML file as required.

The integration exports the total amounts of these payments for a company, using the company base currency:

- Supplier invoice payments, including supplier invoice adjustments.
- Ad hoc payments.
- Miscellaneous payments.

The integration also includes corrections made through accounting adjustments.

While you can exclude payment types, you can't exclude payees. Workday includes all payees of these types that meet the selection criteria:

- Ad hoc payees.
- Contingent workers.
- Miscellaneous payees.
- Suppliers.

## Tax Authority Forms

Before setting up the integration, you can use the Create Tax Authority Form Type task to:

- Set up the payment categories on the tax authority form.
- Exclude payment types that aren't relevant.

You can then use the Maintain Third-Party Payments Configuration task to map the payment categories to Workday spend categories or spend category hierarchies. You can also set payment thresholds to include payments only when they exceed a specified amount.

You can select:

- Aggregate Category Mapping to group payment categories and set thresholds for each group.
- Category Mapping to set individual thresholds for each payment category.

### **Example: Setting Thresholds for Grouped Payment Categories**

The tax authority requires you to declare payments to third parties under 4 payment categories:

- Accommodation
- Fees
- Food
- Other Payments

The form asks you to include the details of payments in:

- Accommodation and Food when the combined value is greater than 2,000.
- Fees and Other Payments when the combined value is greater than 1,800.

On the Maintain Third-Party Payments Configuration task, you select Aggregate Category Mapping and map the payment categories to your Workday spend categories.

After you map the categories, you add 2 rows to the grid to set the thresholds:

Payment Categories	Threshold
Accommodation	2,000
Food	
Fees	1,800
Other Payments	

When you run the integration, Workday calculates the amounts. The payments in:

- Accommodation and Food total 2,225.
- Fees and Other Payments total 1,800.

Since both groups are equal to or greater than the thresholds you specified, Workday includes all payments in the output file.

### **Example: Setting a Threshold for Each Payee**

The tax authority requires details of payments to any payees to whom you've paid more than 1,200 in the reporting period.

On the Maintain Third-Party Payments Configuration task, you select Aggregate Category Mapping and map the payment categories to your Workday spend categories.

After you map the categories, you add all payment categories to 1 row and enter the 1,200 threshold. When you run the integration, Workday includes details about the relevant payees and payments in the output file.

### **Output Files**

When the integration runs, Workday generates a ZIP file containing the output XML file. You can find the file on the Output Files tab of the integration event.

# Travel Booking Inbound Connector

## Steps: Set Up Travel Booking Inbound Connector

### Prerequisites

Set up an external server that your external endpoint and your integration system can access.

### Context

Set up an integration system to import travel booking data from an external endpoint into Workday.

### Steps

1. Access the Create Integration System task and enter *Import Travel Booking Records* at the New Using Template prompt.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
2. Enable one or more of these optional integration services. The Configure Integration Services task displays all integration services, including required services; those integration services aren't editable.

Option	Description
Dynamic Map Service - Airlines	Enables mapping of airline codes to corresponding airline records in Workday.
Dynamic Map Service - Car Rentals	Enables mapping between: <ul style="list-style-type: none"> <li>Agency codes for car rental agencies.</li> <li>Corresponding records for car rental agencies in Workday.</li> </ul>
Dynamic Map Service - Cities	Enables mapping of cities to corresponding records in Workday.
Dynamic Map Service - Hotels	Enables mapping of hotel codes to corresponding hotel records in Workday.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

3. Create an Integration System User (ISU) and grant the ISU access to the *Process: Travel Booking* security domain.

See: [../../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).

4. As a related action on your integration, select **Integration System > Configure Integration Attributes**:

Option	Description
Default Company	Specify Company to use if there's no corresponding Company for the Employee ID.
ISO Currency Code Type	Specify the ISO Currency Code type used in the inbound integration file. If not overridden, Workday uses <i>ISO Alphabetic Currency Code</i> .
ISO Country Code Type	Specify the ISO Country Code type used in the inbound integration file. If not overridden, Workday uses ISO 2-character country code format.

Option	Description
Dynamic Map Service - Airlines	When implementing this integration, accept the Workday-delivered settings for all attributes of this service. You can modify these settings only if instructed to do so by Workday Support.
Dynamic Map Service - Car Rentals	When implementing this integration, accept the Workday-delivered settings for all attributes of this service. You can modify these settings only if instructed to do so by Workday Support.
Dynamic Map Service - Cities	When implementing this integration, accept the Workday-delivered settings for all attributes of this service. You can modify these settings only if instructed to do so by Workday Support.
Dynamic Map Service - Hotels	When implementing this integration, accept the Workday-delivered settings for all attributes of this service. You can modify these settings only if instructed to do so by Workday Support.

5. [Map Travel Booking Inbound Connector Integration Data](#) on page 1012.  
Map values between your travel booking provider and internal values in Workday.
6. [Set Up Integration Sequence Generators](#) on page 1969.  
Define how Workday generates unique filenames for each integration file.
7. [Set Up Integration Retrieval](#) on page 1957.  
Specify how the integration system retrieves travel booking data files from your external endpoint.
8. [Launch an Integration](#) on page 24.  
Schedule how often the integration system runs.
9. Create a Document Transformation integration system to convert the inbound file into the file format required by the Travel Booking Inbound Connector.  
See: [Steps: Set Up Document Transformation Connector](#) on page 594.

## Map Travel Booking Inbound Connector Integration Data

### Prerequisites

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

### Context

Map external values for travel type, booking status, purchase status, and class of service to corresponding values in Workday.

### Steps

1. Access the View Integration System report.
2. At the Integration System prompt, select the *Travel Booking Inbound Connector*.
3. As a related action on the integration system, select **Integration System > Configure Integration Maps**.

4. Edit maps by adding, removing, or changing entries in the Map Values columns:

- To add an entry, insert a row in the grid and specify the Internal Value and External Value.
- To delete an entry, remove the current row from the grid.
- To change an entry, edit the values in the Internal Value and External Value columns.

Note: Use caution when you edit integration maps. If you enter values in an incorrect format, errors can occur when the integration runs. Values are both case sensitive and space sensitive.

## Concept: Travel Booking Inbound Connector

The Travel Booking Inbound Connector integration enables your travel booking providers to load travel booking data into Workday. This integration provides a unified view of corporate travel booking records sourced from your third-party travel provider. It compares the data with your actual expense report data for purposes of supporting accruals, management reporting, and controls. You benefit from reduced data entry as travel booking records populate details against expense report lines.

### Data Imported by Travel Booking Inbound Connector Integration

Travel Booking Inbound Connector imports data about these types of travel bookings:

- Air travel
- Hotel reservations
- Car rentals

Travel Booking Inbound Connector imports data in a defined Workday XML schema format. Unless your travel booking provider can generate files in the XML format, create a Document Transformation integration to transform each file. The Travel Booking Inbound Connector retrieves each file before it loads the file data into Workday.

### Integration Process Flow

When configured, the Travel Booking Inbound Connector launches and runs using this process:

1. The Travel Booking Inbound Connector retrieves a file from an external server managed by the travel booking provider.
2. The associated Document Transformation integration transforms the file into the XML format required by the Travel Booking Inbound Connector.
3. The Travel Booking Inbound Connector reads the transformed XML file and loads the included data into Workday.

## Reference: Travel Booking Inbound Connector File Schema

This table lists the required and optional fields that comprise the Travel Booking Inbound Connector XML file schema.

**Table 1: File Schema**

Element Name	Required/Optional	Datatype	Notes
<i>TravelBookingFile</i>	Required	<i>TravelBookingFileType</i> (Top-level element of file. Contains one or more <i>Travel_Booking_Record</i> elements.)	
<i>Travel_Booking_Record</i>	Required	<i>TravelBookingRecordType</i> (Contains all following elements.)	
<i>Travel_Provider_Booking_Ref_ID</i> <i>Employee_ID</i>	Required Optional	String String	Nillable (can be null).

Element Name	Required/Optional	Datatype	Notes
<i>Accountholder_Name</i>	Optional	String	Nillable (can be null).
<i>Traveler_Name</i>	Optional	String	Nillable (can be null).
<i>Booking_Date</i>	Optional	Date	Nillable (can be null).

minOccurs="0" nillable="true"/>
        <xs:element name="Travel_Policy_Description" type="xs:string"
minOccurs="0" nillable="true"/>
    </xs:sequence>
</xs:complexType>
</xs:schema>

```

# Tax ID Validation Integrations

## Steps: Set Up Tax ID Validation Integration

### Prerequisites

- Ensure that the format of your tax IDs comply with the format requirements of these validation services:
  - European VAT Information Exchange System (VIES)
    - The ID format should include the country code, followed by 2-12 characters. Special characters are only permitted for tax IDs related to the Netherlands.
  - HM Revenue & Customs (HMRC) Check a UK VAT number
    - The ID format must be either 9 or 12 digits long, without spaces or special characters.
- Security:
  - These domains in the Integration functional area:
    - *Integration Build*
    - *Integration Configure*
  - *Set Up: Tax domain* in the Common Financial Management functional area.

### Context

You can check the validity of tax IDs in your tenant by submitting them to an external validation service using a tax ID validation integration.

You can configure the integration as:

- A standalone process.
- A Data Initialization Service (DIS).
- Part of a business process.

When you run this integration, Workday sends the designated tax ID and country to an external validation service for verification. You can use the verification information received for VAT verification but can't retransmit, copy, or reproduce it.

### Steps

1. [Create Integration System](#) on page 1967.

Create an integration system for tax ID validations.

Select the Tax ID Validation integration template to submit the tax IDs you configure in Workday to an external validation service.

2. Configure the integration using 1 of these methods:

- [Set Up Integration Data Initialization Service](#) on page 588.
  - To validate high volumes of tax IDs or filter for specific criteria, use a custom report to populate your integration.
  - When you configure your document builder, you must set up these report fields:

Report Field	Select
Country	Country for Tax ID
ID (case sensitive)	Tax ID

Report Field	Select
Service	External Validation Service

- When you launch the DIS integration, we recommend not entering any values for the launch parameters. Entering launch parameters will send the same tax IDs for validation twice and increase run time.
- [Launch an Integration](#) on page 24.
  - Schedule or manually launch an integration to check the validity of your tax IDs. If you're not scheduling, you can manually enter your tax IDs.
  - You can use Entity Type to filter your preconfigured tax IDs by company, customer, and supplier. You can only use it when you select a value for Tax IDs by Validation Service.

Note: You can specify a value in the Tax IDs prompt only if configuring the integration as a business process step, and in this instance the Tax IDs by Validation Service and Entity Type prompts must remain blank.
- [Edit Business Processes](#).
  - Add the integration as a step on a business process for any event with a report field that will return tax IDs.
  - You can also add a step on the *Supplier Event* business process to configure the Tax ID Numbers for Validation Service report field (on the Supplier Event business object) to return tax IDs associated with a validation service.

3.

## Result

Workday stores:

- Responses for tax IDs with statuses of *Valid* and *Invalid*.
- Date and time of the validity check.
- Name and address of the associated entity, when provided in the government data.

You can view the 5 most recent responses from the Validation Status column in the Tax Information tab on reports.

## Next Steps

Use report fields to display the most recent results from the external validation service on the custom report.

[Related Information](#)

[Reference](#)

[22R1 What's New Post: Integration for Tax ID Validations](#)

## Reference: European VAT Information Exchange System Tax ID Types

Workday provides these preconfigured European VAT Information Exchange System (VIES) tax ID types in your tenant that you can use in your tax ID integrations:

Country	Tax ID Type
Austria	UID
Belgium	No TVA
Bulgaria	DDS
Croatia	PDV-ID

Country	Tax ID Type
Cyprus	FPA
Czechia	DIC
Denmark	<ul style="list-style-type: none"> <li>• Company VAT Registration Number</li> <li>• CVR</li> </ul>
Estonia	KMKR
Finland	VAT Number (ALV)
France	No TVA
Germany	USt-IdNr
Greece	FPA
Hungary	ANUM
Ireland	VAT No
Italy	<ul style="list-style-type: none"> <li>• E-filing VAT Registration Number - VAT Group</li> <li>• Partita IVA</li> </ul>
Latvia	PVN
Lithuania	PVM kodas
Luxembourg	No. TVA
Malta	VAT Identification Number
Netherlands	BTW-nr
Poland	<ul style="list-style-type: none"> <li>• NIP</li> <li>• VAT Number</li> </ul>
Portugal	NIPC
Romania	CIF
Slovakia	IC DPH
Slovenia	ID za DDV
Spain	IVA
Sweden	Momsnr
United Kingdom	Vat Reg No (Northern Ireland)

#### Reference

[22R1 What's New Post: Integration for Tax ID Validations](#)

### Example: Set Up Data Initialization Service for Tax ID Validation

This example illustrates how to create and run a tenanted Data Initialization Service (DIS) to validate Value Added Tax (VAT) registration numbers using a custom report.

## Context

Your company uses suppliers based in Poland. To comply with VAT reporting requirements and reduce the risk of fraudulent payments, you want to validate these Tax IDs before processing supplier payments. A DIS is the most efficient way to validate large volumes of IDs.

## Prerequisites

Security:

- *Custom Report Creation* domain in the System functional area.
- *Integration Build* domain in the Integration functional area.
- *Public Reporting Items* domain in the Tenant Non-Configurable functional area.

## Steps

1. Access the Create Custom Report task.

- a) Enter these values:

Option	Value
Report Name	Enter <i>Polish VAT IDs</i> .
Report Type	Select <i>Advanced</i> .
Data Source	Select <i>Suppliers</i> .

- b) Click OK.
- c) Add 3 rows to the grid on the Columns tab and select these values:

Business Object	Field
<i>Supplier</i>	<i>Supplier Name</i>
<i>Supplier</i>	<i>Default Address for Supplier</i>
<i>Supplier Tax IDs</i>	<i>Tax ID</i>

- d) On the Filter tab, add a row to the Filter conditions for filtering on instances grid and enter these values:

Option	Value
Field	<i>Supplier Tax IDs</i>
Operator	<i>is not empty</i>

- e) On the Subfilter tab, click Add.
- f) In the Sub Level Filter section, select *Supplier Tax IDs* in the Business Object prompt.
- g) Add a row to the grid and enter these values:

Option	Value
Field	<i>Country for Tax ID</i>
Operator	<i>in the selection list</i>
Comparison Type	<i>Value specified in this filter</i>
Comparison Value	<i>Poland</i>

- h) Click OK and Done.

2. Access the Create Integration System task.

- a) Enter *Vat Validation* in the System Name field.
- b) From the New using Template prompt, select *Tax ID Validation*.
- c) Click OK.
- d) From the related actions menu of the *Vat Validation* integration, select Integration System > Configure Integration Services.
- e) Add a row to the Custom Integration Services grid.
- f) From the Integration Service prompt, select Create > Create Integration Data Initialization Service.
- g) Enter these values:

Option	Value
Name	<i>Polish Vat Validation</i>
Document Filename	<i>Polish Vat Validation</i>
Wrapper Element Name	<i>Polish Vat Validation</i>
Population Using	<i>Polish VAT IDs</i>
Web Service Alias	<i>Polish Vat Validation</i>

- h) Add a row to the Fields grid.
- i) In the Field Details column, enter these values:

Field	Value
Name	Enter <i>Supplier Tax IDs</i> .
Sub-Document	Select.

- j) Select *Supplier Tax IDs* from the Loop on instances prompt.
- k) In the Build content using column, select *Create Document Builder* from the Document Builder prompt.
- l) Enter *Tax IDs* in the Document Builder Name field.
- m) Add 3 rows to the Schema and Build grid.
- n) As you complete the grid, consider:

Field Details	Build content using
Enter <i>Country</i> in the Name field.	Select <i>Country for Tax ID</i> from the Value prompt.
Enter <i>ID</i> (case sensitive) in the Name field.	Select <i>Tax ID</i> from the Value prompt.
Enter <i>Service</i> in the Name field.	Select <i>External Validation Service</i> from the Value prompt.

- o) Click OK on each of these pages:
  - Create Document Builder
  - Create Integration Data Initialization Service
  - Configure Integration Services

3. From the related actions menu of the *VAT Validation* integration, select Integration > Launch / Schedule.

- a) Click OK.
- b) Leave the launch parameters blank and click OK.

## Result

You can view the validation results on the:

- Output Files tab of the integration event.
- Tax Information profile group of the supplier profile.

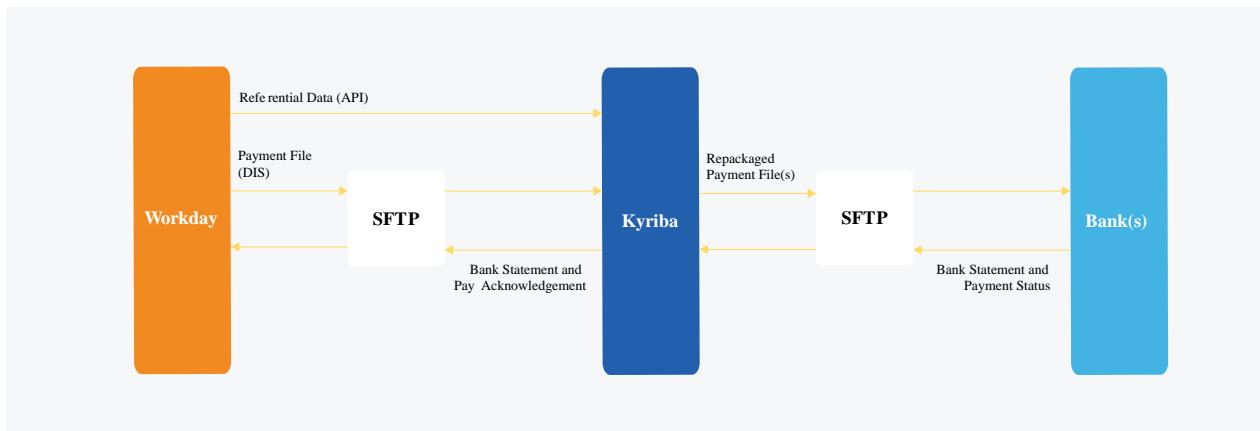

You can also create a custom report that includes the validation results.

## Workday Bank Connectivity

### Concept: Workday Bank Connectivity Integration

Workday Bank Connectivity leverages the Kyriba Bank Connectivity as a Service (BCaaS) system to provide fast and cost-effective implementations for bank integrations. You can access preconfigured payment scenarios in the Kyriba BCaaS that meet country and local regulations for banks across the globe, eliminating the need for further customizations to support local requirements for bank connectivity.

## Workday Bank Connectivity Data Process

You can configure the Workday Bank Connectivity integration system to:

- Generate referential external IDs for Workday data objects that map to the matching referential data in the Kyriba system. Workday sends the referential data to Kyriba using an initial bulk setup and ongoing updates using API calls during payment file generation. Kyriba assigns corresponding IDs to the payments that flow through Kyriba and the banks.
- Send Workday payment files to an SFTP server where Kyriba consumes and processes the payment data. Kyriba transforms the payments into bank-accepted formats based on customer payment scenarios. The payment scenarios define how Kyriba processes combinations of payment category, payment method, and country as well as the format to deliver to the bank. Kyriba then sends the formatted payment files directly to the bank.
- Receive and process payment acknowledgement inbound files from Kyriba by SFTP in the Workday-defined format.
- Receive and process bank statement inbound files from Kyriba by SFTP in the Workday-defined format.

## Steps: Manage Workday Bank Connectivity

### Prerequisites

Note: To use these features, you must purchase the Workday Bank Connectivity SKU. Additionally, you must subscribe to Innovation Services if you're on the MSA-type (see below) subscription service agreement. If you haven't subscribed to Innovation Services, contact your account executive to request the Innovation Services Addendum. For more information, see [Workday Innovation Services](#) on Workday Community.

Note: You might need to take additional steps to enable this feature based on your organization's subscription service agreement. To determine your subscription service agreement:

1. Select your profile avatar on [Workday Community](#).
2. Select Profile.
3. On your profile page, select your organization's name, which is beneath your name and next to your job title.
4. View your Subscription Service Agreement value.

If the value is:

- *UMSA*, you can skip the Innovation Services Opt In step.
- *MSA*, you must enable this feature through Innovation Services using the Innovation Services Opt In step.
- Request these items from Kyriba to use for the implementation:
  - API credentials
  - Referential data workbook
  - SFTP details
- Set up settlement. See [../financial-management/settlement/settlement-configuration/dan1370797015404.dita](#).

### Context

You can configure Workday Bank Connectivity to send electronic payments through the Kyriba Bank Connectivity as a Service (BCaaS) system. Workday Bank Connectivity enables you to process the payments as well as import bank statements and payment acknowledgements in a unified banking solution.

For the initial implementation, you manually generate referential external IDs for data objects within Workday to map to corresponding IDs in Kyriba. Workday sends subsequent updates to referential data using an API during settlement. Kyriba uses the referential data to build out the payments.

### Steps

1. Set up banking.
  - a) Access the Create Financial Institution task or Edit Financial Institution task.

As you complete the task, consider:

Option	Description
Bank Identification Code	Enter the 8 to 11-character BIC code used to identify the bank in payment files for global transactions.
Address	Enter the country and address information for the primary location of the bank.

Option	Description
Email	Enter the email address for the primary location of the bank.

Security: *Set Up: Bank Entity* domain in the Banking and Settlement functional area.

- b) Access the Create Bank Branch task or Edit Bank Branch task.

Define and maintain information about bank or business entity branches. Specify the Branch ID for each bank branch.

All bank accounts attached to a bank branch must share the same bank code or BIC code.

Security: *Set Up: Bank Entity* domain in the Banking and Settlement functional area.

- c) Access the Create Bank Account or Edit Bank Account task.

As you complete the Account Information section, consider:

Option	Description
Bank Account Type	Select <i>Bank Account</i> .
Bank Branch	Select the bank branch where the account is located.
Bank Identification Code	Enter the 8 to 11-character BIC code used to identify the bank in payment files for global transactions.
Bank Statement Format	The bank statement format that the bank uses.  Kyriba supports these file formats: <ul style="list-style-type: none"> <li>• BAI2</li> <li>• CAMT</li> <li>• MT940</li> </ul>

Note that you can't group electronic payments for reconciliation on bank accounts that you're using with Kyriba.

Security: *Set Up: Bank Entity* domain in the Banking and Settlement functional area.

See [../../financial-management/cash/banking-setup/dan1370796812143.dita](#).

2. Access the Innovation Services Opt In task.

Opt in to Innovation Services to use the Workday Bank Connectivity feature, related tasks, and templates in your tenant.

On the Available Services tab, select the Workday Bank Connectivity service in the Financials category.

Security: *Manage: Innovation Services* domain in the Innovation Services functional area.

3. Access the Enable Bank Connectivity Reference Data task.

Enable the mapping functionality within Workday. This generates the referential external IDs for all instances of existing data objects and any new data objects that you create in Workday.

Select Confirm and then click OK to automatically navigate to the next task.

Security: *Set Up: Bank Connectivity* domain.

4. Access the Generate Bank Connectivity Reference Data Files task.

For the initial data load, manually generate the CSV files with the referential external IDs for all instances of these data object types in Workday:

- Bank Account
- Bank Branch
- Company
- Financial Institution

Refresh the task until the output files are available.

You can regenerate output files at any time to include new eligible items within Workday.

**Security:** *Set Up: Bank Connectivity* domain.

5. (Optional) Access the Maintain Bank Connectivity Reference Data Mapping task.

If you're implementing an existing Kyriba BCaaS customer, you can override the generated referential external IDs with the codes that are already populated in their Kyriba tenant.

Enter overridden external IDs that meet these length requirements:

- Bank Account: Between 4 and 12 alphanumeric characters.
- Bank Branch: Between 4 and 10 alphanumeric characters.
- Company: Between 4 and 12 alphanumeric characters.
- Financial Institution: Between 4 and 10 alphanumeric characters.

Note that the external IDs can't contain symbols or special characters.

**Security:** *Set Up: Bank Connectivity* domain.

6. (Optional) Access the View Bank Connectivity Reference Data Mapping report.

View and confirm that external IDs were generated for particular or all existing instances of data objects.

**Security:** *Set Up: Bank Connectivity* domain.

7. Set up an integration system to process and send the outbound payment and referential data to Kyriba using the *Workday Bank Connectivity - Payments Initiation* integration template.

[See Steps: Set Up Bank Connectivity - Payments Initiation Integration.](#)

8. Set up an integration system to receive payment acknowledgements from Kyriba using the *Workday Bank Connectivity - Import Payment Status* integration template.

[See Steps: Set Up Bank Connectivity - Import Payment Status Integration.](#)

9. Set up an integration system to receive bank statements from Kyriba using the *Workday Bank Connectivity - Import Bank Statements* integration template.

[See Steps: Set Up Bank Connectivity - Import Bank Statements Integration.](#)

10. Access the Edit Bank Routing Rule task.

Review the bank routing rules to ensure you're routing payments through a bank account that sends payments to an integration system based on the *Workday Bank Connectivity - Payments Initiation* template.

**Security:** *Set Up: Settlement* domain in the Banking and Settlement functional area.

11. Access the Edit Bank Account task.

For each bank account, select the payments integration system that you configured and payment acknowledgements option for settlement.

As you complete the Settlement Setup tab, consider:

Option	Description
Technical Integration	Select the integration system based on the <i>Workday Bank Connectivity - Payments Initiation</i> integration template for each applicable

Option	Description
	payment type and payment category from the Integration System prompt.
Receives Acknowledgement	Select the check box to receive payment acknowledgements from the bank.

12. Populate the Kyriba-Core Data Workbook spreadsheet with the Workday CSV file data.

For the initial data load, download the CSV files to add the contents into the Kyriba referential data workbook. Send the completed workbook to Kyriba professional services to bulk upload into the Kyriba referential data.

13.(Optional) For banks that use MT940 statements, record the bank ID and BIC details in a separate spreadsheet.

Send the completed spreadsheet to Kyriba professional services to verify the details and load into the Kyriba system.

Example: You can enter the values for all bank accounts in these tabs and columns:

Tab	Columns
1	<ul style="list-style-type: none"> <li>• Bank ID</li> <li>• Bank Account</li> </ul>
2	<ul style="list-style-type: none"> <li>• BIC</li> <li>• IBAN</li> </ul>

14. Create a manual or automatic settlement run to settle your payment category.

You can either:

- [.../financial-management/settlement/payment-settlement/dan1370797016124.dita](#).
- [.../financial-management/settlement/payment-settlement/dan1370797013955.dita](#).

### Result

During settlement processing, Workday generates and sends the payment files to Kyriba. Workday also sends any incremental updates to the referential data objects using API calls. Workday imports the payment acknowledgment files and bank statements based on your scheduled integrations.

### Next Steps

As you create new referential data objects in Workday, work with Kyriba professional services to assess whether existing payment scenarios require configurations to support the new objects. You might need additional payment scenarios created for these Workday dimensions:

- Countries
- Payment categories
- Payment file formats delivered to the bank
- Payment methods

Note: You can access portions of Workday Bank Connectivity for implementation, configuration and troubleshooting through a separate browser-based application console from third-party providers ("TPPs"). You must set up and maintain an account with TPPs to use the features of Workday Bank Connectivity. Upon expiration or termination of your active subscription to Workday Bank Connectivity, you will lose access to the associated TPP account, including any right to retrieve Customer Content from the TPP.

Note: To opt out of Workday Bank Connectivity, you must send a discontinue notification through Workday's CSM or support channels and complete the subsequent offboarding process (the "Offboarding Process"). In the event that you don't send a discontinue notification within 60 days of the expiration or termination of your subscription to Workday Bank Connectivity SKU, Workday may initiate and complete

the Offboarding Process on your behalf. Customers that enabled this feature through Innovation Services must also opt-out of the Workday Bank Connectivity Innovation Service through IS Enablement.

[FAQ: Workday Bank Connectivity Integration](#) on page 1034

## Steps: Set Up Bank Connectivity - Payments Initiation Integration

### Prerequisites

Configure these business processes and security policies in the Banking and Settlement functional area:

- *Payment Release Event*
- *Outsourced Payment Release Event*

### Context

You can create the payment initiation integration to process Workday Bank Connectivity payments. When you settle payments in Workday, the integration generates and delivers the payment files to the Kyriba system by SFTP. The integration calls APIs to update or create the referential data to include in the payment files.

This feature is only available for customers who purchase the Workday Bank Connectivity SKU.

### Steps

1. [Create Integration System](#) on page 1967.

From the New Using Template prompt, select *Workday Bank Connectivity - Payments Initiation*. Also, select the Enable All Services check box.

2. Select Integration System > Configure Integration Attributes from the related actions menu of your payment integration system.

As you complete the task, consider:

Option	Description
File Name Tenant Reference	<p>Enter the File Name Tenant Reference attribute provided to you during implementation. This attribute provides data to the integration system to enable the correct format when building out the payment file name.</p> <p>Example: The tenant reference displays at the beginning of this file name:  <b>WORKDAYTEST.NC4.IMPORT.391116.PY_TRANSFER.WD_FORMAT.NULL.391.XML</b>.</p>
API End Point for Referential Data Updates	Enter the URL location of the API call for referential data updates. Provide the token endpoint URL from Kyriba.
(Optional) Disable Referential Data Updates for Selected Object Types	Workday won't update existing referential data for the selected data object types.
(Optional) Disable the Creation of Referential Data for Selected Object Types	Workday won't create missing referential data for the selected data object types when the data objects don't exist.

Option	Description
(Optional) Ignore Referential Data Failures for Selected Object Types	Workday continues sending the payment file to an external banking partner when there's an error for the selected data objects. The error occurs during the incremental referential data update or creation process.

Security: *Integration Configure* domain in the Integration functional area.

### 3. Create an integration system user (ISU).

Grant the ISU *Get* and *Put* access to these domains:

- *Integration Event* in the Integration functional area.
- *Process: Settlement* in the Banking and Settlement functional area.

See: [.../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#)

### 4. Set Up Integration Sequence Generators on page 1969.

The Workday Bank Connectivity - Payments Initiation template only supports outsourced payment group IDs of:

- A minimum amount of padding and an alphanumeric character.
- Twelve alphanumeric characters.

We recommend that you use the default settings for the payment message ID sequence generator.

### 5. Create Integration Business Process on page 1950.

Create an integration business process to add a document delivery step to your integration system.

Example: *Integration Process Event for Kyriba Payment Outbound* business process definition.

### 6. Set Up Integration Delivery on page 1952.

Specify the SFTP address on the document delivery step of the business process.

### 7. Access the Register External OAuth Client task.

Enable the payment initiation integration system with security access to Kyriba. The API automatically updates Kyriba with changes to the referential data object information and processes any new payments.

Enter values that Kyriba provides you for these fields:

- OAuth 2.0 Client Name
- OAuth 2.0 Client ID
- OAuth 2.0 Client Secret
- Token Endpoint URL

Security: *Security Administration* domain in the System functional area.

## Result

The integration generates a payment DIS file to upload to the Kyriba SFTP server. Example: *WORKDAYTEST.NC4.IMPORT.391116.PY\_TRANSFER.WD\_FORMAT.NULL.391.XML*.

The API also updates the referential data in Kyriba based on the integration system configurations.

## Next Steps

If there's an API error, the integration automatically stops the processing and marks the payment release event as failed. You can either:

- Edit the integration system and select the Ignore Referential Data Failures for Selected Object Types attribute to override the errors.

- Fix the data issues.

Once you've made the adjustments, relaunch the integration to continue sending the payment file. See [Launch an Integration](#) on page 24.

Related Information

### Concepts

[Concept: Workday Bank Connectivity Integration](#) on page 1022

## Steps: Set Up Bank Connectivity - Import Payment Status Integration

### Context

You can create this integration to import payment statuses for the Workday Bank Connectivity payments that your banks receive through Kyriba. Workday retrieves the payment acknowledgement files that Kyriba generates in the accepted format. The payment acknowledgements include both Kyriba statuses and bank statuses. As payments flow through Workday, the import payment status integration provides updates on the statuses.

### Steps

1. [Create Integration System](#) on page 1967.

From the New Using Template prompt, select *Workday Bank Connectivity - Import Payment Status*. Also, select the Enable All Services check box.

2. (Optional) Select Integration System > Configure Integration Attributes from the related actions menu of your payment status integration system.

Security: *Integration Configure* domain in the Integration functional area.

3. Create an integration system user (ISU).

Grant the ISU *Get* and *Put* access to these domains:

- *Integration Event* in the Integration functional area.
- *Process: Settlement* in the Banking and Settlement functional area.
- *Set Up: Bank Connectivity*.

See: [../../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#)

4. [Create Integration Business Process](#) on page 1950.

Create an integration business process to add a document retrieval step to your integration system.

Example: *Integration Process Event for Kyriba Import Payment Status* business process definition.

5. [Set Up Integration Retrieval](#) on page 1957.

As you configure the document retrieval step on the business process, specify:

- The SFTP address for the payment acknowledgement file retrieval.
- [customer kyriba code].NC4.\*WD\_PY\* on the File Name/Pattern field.

Workday uses this name pattern to search for all the payment acknowledgement files.

6. [Launch an Integration](#) on page 24.

### Result

Workday imports your payment acknowledgement files from the file retrieval SFTP location.

See [Reference: Import Payment Status Files and Statuses](#).

Related Information

### Concepts

[Concept: Workday Bank Connectivity Integration](#) on page 1022

## Tasks

[Steps: Manage Workday Bank Connectivity on page 1024](#)

## Steps: Set Up Bank Connectivity - Import Bank Statements Integration

### Context

You can create this integration to import prior day and intraday bank statement files from your financial institutions.

The integration supports these statement file formats:

- BAI2
- ISO 20022
  - *camt.053* for prior day statements
  - *camt.052* for intraday statements
- MT940 for prior day statements
- MT942 for intraday statements

To import statements in other file formats, contact Kyriba professional services.

### Steps

1. [Create Integration System on page 1967](#).

From the New Using Template prompt, select *Workday Bank Connectivity - Import Bank Statements*. Also, select the Enable All Services check box.

2. Select Integration System > Configure Integration Attributes from the related actions menu of your import bank statements integration system.

As you complete the task, consider:

Option	Description
Disable File Uniqueness Validation	Select to allow bank statement files that contain the same: <ul style="list-style-type: none"> <li>• File creation date.</li> <li>• File identification number.</li> <li>• Sender identification.</li> <li>• Receiver identification.</li> </ul>

Security: *Integration Configure* domain in the Integration functional area.

3. (Optional) Select Integration System > Configure Integration Maps from the related actions menu of your import bank statements integration system.

As you complete the task, consider:

Option	Description
Domestic Bank Code	Configure this map to associate an incoming domestic bank code to the relevant value inside Workday.  Note: The default value on this integration map doesn't have any significance. When you don't specify a mapping value, Workday uses the incoming value in the bank statement file as the default value.

Option	Description
	Example: You can configure this map when the domestic bank code within the Kyriba system doesn't match with Workday. A bank might have modified a bank ID before sending it to Kyriba.
Bank Account Number	<p>Configure this map to associate an incoming bank account number to the relevant value inside Workday.</p> <p>Note: The default value on this integration map doesn't have any significance. When you don't specify a mapping value, Workday uses the incoming value in the bank statement file as the default value.</p> <p>Example: You can configure this map when the bank account number within the Kyriba system doesn't match with Workday. A bank might have modified a bank account number before sending it to Kyriba.</p>

**Security:** *Integration Configure* domain in the Integration functional area.

#### 4. Create an integration system user (ISU).

Grant the ISU *Get* and *Put* access to these domains:

- *Integration Event* in the Integration functional area.
- *Process: Banking* in the Banking and Settlement functional area.
- *Process: Bank Reconciliation* in the Banking and Settlement functional area.

See: [.../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).

#### 5. Create Integration Business Process on page 1950.

Create an integration business process to add a document retrieval step to your integration system.

Example: *Integration Process Event for Kyriba Import Bank Statements* business process definition.

#### 6. Set Up Integration Retrieval on page 1957.

Specify the SFTP address on the document retrieval step of the business process.

#### 7. Launch an Integration on page 24.

## Result

Workday imports your bank statement files from the file retrieval SFTP location.

Example:

- BAI2: *WORKDAYTEST.NC4.EXPORT.2024060414385280734.STAT.WD\_BAI\_CAMT.XML*
- CAMT: *WORKDAYTEST.NC4.EXPORT.2024060414385280734.STAT.WD\_CAMT\_CAMT.XML*
- MT940: *WORKDAYTEST.NC4.EXPORT.2024060414385280734.STAT.WD\_MT940\_CAMT.XML*

## Related Information

[Concept: Workday Bank Connectivity Integration on page 1022](#)

### Tasks

[Steps: Manage Workday Bank Connectivity on page 1024](#)

## Reference

[Reference: Bank Statements Connector XML Schema on page 736](#)

## Reference: Import Payment Status Files and Statuses

This table describes the inbound payment acknowledgement integration files and their payment statuses.

Payment Acknowledgement File	Description
Payments in Draft	<p>The payment acknowledgement file contains payments that are either:</p> <ul style="list-style-type: none"> <li>Missing key data related to the payment profile.</li> <li>Not mapped to a payment profile in Kyriba.</li> </ul> <p>The Acknowledgement Status is <i>Rejected</i>.</p> <p>Example: Kyriba generates the file in this file format:  <i>WORKDAYTEST.NC4.EXPORT.2024011910303716318.TRANSFER.WD_PY_DRAFT.DRAFT.XML</i></p>
Payments in Rejection	<p>The payment acknowledgement file contains payments with critical data issues such as:</p> <ul style="list-style-type: none"> <li>Incorrect FX codes.</li> <li>Wrong or missing amounts.</li> </ul> <p>The Acknowledgement Status is <i>Rejected</i>.</p> <p>Example: Kyriba generates the file in this file format:  <i>WORKDAYTEST.NC4.EXPORT.2024061415482394.TRANSFER.WD_PY_STATUS.REJ.XML</i></p>
Payments with Kyriba External IDs	<p>The payment acknowledgement file contains payments sent to the bank. The file also contains external codes that the bank statement files use to map Kyriba IDs to Workday IDs.</p> <p>This doesn't update the Acknowledgement Status.</p> <p>Example: Kyriba generates the file in this file format:  <i>WORKDAYTEST.NC4.EXPORT.2024061415321407.TRANSFER.WD_PY_STATUS.EXTERNALCD.XML</i></p>
Payment Statuses from the Bank	<p>The payment acknowledgement file contains payments and their statuses sent from the bank.</p> <p>The Acknowledgement Status is either <i>Accepted</i> or <i>Rejected</i>.</p> <p>Example: Kyriba generates the file in this file format:  <i>WORKDAYTEST.NC4.EXPORT.2024061415332062.TRANSFER.WD_PY_STATUS.ACCEPT.XML</i></p>

## FAQ: Workday Bank Connectivity Integration

How does Kyriba ensure data protection for each customer?

Kyriba provisions a separate database on their multi-tenant platform for each customer. Kyriba uses encryption at rest and TLS 1.2 for data in transit.

To support large volume requirements from Workday, the information exchange between Workday and Kyriba uses SFTP. Workday creates the payment files in a mutually agreed (payment connector DIS) format and delivers them to an SFTP location that's specific to the customer. Kyriba also delivers the payment acknowledgement and bank statement files from the bank to a customer-specific SFTP location for Workday to upload.

Does Kyriba support bank accounts that use intermediary bank accounts?

Kyriba has a limit of 2 intermediary bank accounts per bank account.

How do I migrate referential data across multiple Workday tenants?

You can use Object Transporter 2.0 to migrate the Bank Connectivity Reference Data Mapping configuration package between your primary implementation tenant and secondary implementation tenants. The primary tenant is where you generate and store the most up-to-date referential data used for testing Workday Bank Connectivity. You can configure secondary tenants to use only for sending the test data to Kyriba.

For more information on configuring the migration and how to access the configuration package, see [Steps: Migrate Packages with Object Transporter](#).

How does Kyriba process files if an SFTP server is down?

The document delivery fails in Workday and notifies you that the files weren't delivered. Once the SFTP service is restored, you can then resend the files.

Does Workday retry sending files if Kyriba doesn't respond?

Workday doesn't retry sending files to avoid accidentally paying someone twice. You can check for any bank-reported statuses in the payment acknowledgement files.

## Absence Third-Party Calendar Integration

### Steps: Set Up Absence Third-Party Calendar Integration

#### Prerequisites

Set up either a:

- Google account with G Suite Basic, G Suite Enterprise, or G Suite Business.
- Microsoft work account through Azure Active Directory and Microsoft Exchange Online only. Workday doesn't support hybrid deployments of on-premise Microsoft Exchange Server and Microsoft Exchange Online when setting up the Workday Absence Third-Party Calendar integration with Microsoft Outlook.

#### Context

You can use the Absence Third-Party Calendar integration to send approved time off events from Workday to your corporate calendars. When you run the integration, Workday automatically creates, updates, and removes approved time off entries, corrections, and cancellations in Google Calendar and Microsoft Outlook.

Note: Workday only processes time off entries when these business process events have a status of *Successfully Completed*:

- *Correct Time Off*
- *Request Absence*
- *Request Time Off*

#### Steps

1. [Configure the Absence Third-Party Calendar Integration](#) on page 1036.
2. Register your client for Google Calendar, Microsoft Outlook, or both, and configure permissions for the Absence Third-Party Calendar integration web API.

See:

- [Steps: Register Your Client-Side Service Account for Google](#) on page 1039
- [Steps: Register Your Client-Side Application for Microsoft Outlook](#) on page 1040

3. Create a credential store to authorize clients when connecting to third-party calendar applications.

See:

- [Steps: Create an External Client CredStore for Google Calendar](#) on page 1040
- [Create an External Client CredStore for Microsoft Outlook](#) on page 1043

4. Access the Create Integration System task.

Select *Absence Third-Party Calendar* from the New Using Template prompt.

As you configure the integration services, enable either of these integrations, or both:

- *Google Calendar Integration*
- *Microsoft Calendar Integration*

Security: These domains in the Integration functional area:

- *Integration Build*
- *Integration Configure*

5. Select Integration System > Configure Integration Attributes as a related action on the integration system and enter integration service attributes.

The *Enabled* integration attribute is required for launch. You need 2 rows of values: 1 for enabled and 1 for disabled. Examples:

- To enable the integration in all environments except for Production, add 2 rows with this configuration:

Value	Restricted to Environment
Clear the check box.	<i>Production</i>
Select the check box.	Leave this field empty.

- To enable the integration in Production only, add 2 rows with this configuration:

Value	Restricted to Environment
Select the check box.	<i>Production</i>
Clear the check box.	Leave this field empty.

Security: These domains in the Integration functional area:

- *Integration Build*
- *Integration Configure*

6. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access on the *Integration Event* domain in the Integration functional area to enable event creation and status updates.

See [Steps: Grant Integration or External Endpoint Access to Workday](#).

7. Launch or schedule the Absence Third-Party Calendar integration.

You don't need to select an organization as you already selected it in Step 1. If you select an organization on the Launch / Schedule Integration task, Workday ignores the value, and uses the organization that you select on the Configure Absence Third-Party Calendar Integration task.

See [Launch an Integration](#) on page 24.

##### Tasks

[Create Integration System](#) on page 1967

##### Reference

[2021R2 What's New Post: Absence Third-Party Calendar Integration](#)

## Configure the Absence Third-Party Calendar Integration

### Prerequisites

Create time offs and absence tables to include in the integration.

Security: *Set Up: Time Off* domain in the Time Off and Leave functional area.

## Context

You can configure the Absence Third-Party Calendar integration for your organization to enable Workday to send approved time off events to your Google or Microsoft Outlook calendars.

## Steps

1. Access the Configure Absence Third-Party Calendar Integration task.

2. As you complete the task, consider:

Option	Description
Time Offs	Select the time offs or absence tables to include in the integration processing.
Calendar Display	<p>Select an option to display calendar events in external calendars for employees, managers, or both.</p> <p>Employees and managers can turn off the display on their calendars at any time by opting out of Absence Third-Party Calendar Integration events on the Change Preferences task. This option is available regardless of whether you've configured the integration, so employees can opt out before Workday runs the integration for the first time.</p>
Organizations	<p>Select the organizations to include in the integration.</p> <p>Select the Include Subordinate Organizations check box to ensure that both managers and employees receive calendar events.</p> <p>Employees and managers must be members of an organization to both receive calendar events.</p> <p>Example: Org X, Org Y, and Org Z are supervisory organizations in Global Modern Services. Org Y and Org Z are subordinate organizations to Org X. The organizations have these manager role assignments:</p> <ul style="list-style-type: none"> <li>• Ann is the manager for Org X.</li> <li>• Barbara is the manager for Org Y.</li> <li>• Colin is the manager for Org Z.</li> </ul> <p>John is a member of Org Y. He has an approved time off entry for a time off that you want to include in the integration.</p> <p>When you select Org Y and Org Z as the organizations, Workday sends the calendar event to John's third-party calendar, but not to the Barbara's because Barbara is a member of Org X, not Org Y.</p> <p>To send the calendar event to both John and Barbara's third-party calendars, select:</p> <ul style="list-style-type: none"> <li>• <i>Org X</i> from the Organizations prompt.</li> </ul>

Option	Description
	<ul style="list-style-type: none"> <li>The Include Subordinate Organizations check box.</li> </ul>
Calendar Event	<p>You can use the Workday-delivered subject and body for the calendar event by leaving the default text, or select the Override Event Text check box to create custom text. Workday automatically translates the default text but not custom text. You can tag workers using their preferred name in custom text.</p> <p>Although you can copy and paste formatted text into the Subject and Body fields, Workday sends the text to your third-party calendars as plain text.</p>

### 3. Review and click OK to apply your changes.

After you run the integration once, you can return to this task and make additional configuration changes. In the Review and Apply section, you can reset the integration by selecting the Reset Integration Processing by 30 Days check box under Options.

When you select this check box, Workday processes:

- Time off requests within the last 30 days and all future time off entries. Workday skips all time off events stored for retry. When not processed within the 2-hour integration processing limit, Workday stores time off events without errors for retry until processing is complete. For time offs with processing errors, such as an HTTP 500 response from Google or Microsoft, Workday performs up to 3 retries before logging a synchronization failure.
- Any configuration changes. Example: Rachel requests time off in January for February. Workday runs the integration, but you didn't initially select the time off type she requested for processing. If you later select the time off for processing and reset the integration, Workday detects the configuration change on the next integration run.

### 4. (Optional) Select the Advanced Logging Enabled check box to generate an additional advanced logging file called *sync\_detail\_log.csv* for debugging purposes only.

Note: Workday recommends that you only enable this option when:

- You're trying to set up the integration for the first time and aren't able to find the approved time off entries in either Microsoft Outlook or Google.
- Your current integration stops working suddenly.

You can enable advanced logging temporarily to help troubleshoot integration errors. This option:

- Helps your IT department understand core issues and assist in resolving integration errors.
- Doesn't impact the original sync log file or stop the integration from processing.
- Logs the first 50,000 records only, except for the Google integration, which stops processing entries after 10,000 records. Workday adds the remaining records to the retry queue where they're picked up in the next scheduled run. For Google, this means that the advanced logging file (*sync\_detail\_log.csv*) only contains 10,000 processed entries.

## Result

Workday applies your changes to the next integration run.

When users enter time off in Absence without specifying start and end times, calendar events display differently in each third-party calendar application. Examples:

- Google Calendar displays the event as a single time block. The event details indicate that the event is for the entire calendar day from 12:00 AM to 11:59 PM. The rest of the day displays as available.

- Microsoft Outlook displays the event as a single time block but the rest of the day displays as busy.

## Steps: Register Your Client-Side Service Account for Google

### Prerequisites

Set up a Google account with G Suite Basic, G Suite Enterprise, or G Suite Business.

### Context

Workday needs access to a Google service account with specific permissions to enable the Absence Third-Party Calendar integration to make authorized web API calls to Google Calendar endpoints.

### Steps

1. [Sign in to the Google Cloud Platform.](#)
2. Create a service account or use an existing one.

See [Creating and managing service accounts](#).

- a) Enter a project name that you can easily recognize as the client for the Absence Third-Party Calendar integration. Example: *workday-calendar-integration*.

- b) Select an organization and location.

- c) Create a service account for the project.

Use an appropriate first and last name for the account to indicate the origin of the integration events, in the form *firstname.lastname@<your\_company\_domain>.com*. Example: If you enter *Absence Calendar* for the first name and last name, when Workday creates time off events, Google Calendar displays *Created by: Absence Calendar*.

- d) Manage permissions.

- Give the service account editor permissions.
- Ensure that the admin account has permissions to the service account.
- Ensure that the service account for the integration has the *Super Admin* role with domain-wide access to enable the integration to perform read and write actions on users' calendars. The *Super Admin* is the only role that Google provides that can edit all users' calendars without user-level configuration. You can't create a custom role.

Note: After you assign the *Super Admin* role to a user, it can take up to 24 hours for the calendar privileges to be available.

See [Pre-built administrator roles](#).

3. Create a new Google-managed service account key.

See [Creating and managing service account keys](#).

Google generates and automatically downloads a JSON file with the service account key details. Save this file for use later when you create the external client cred store.

4. Enable system-wide delegation for the domain.

See [Delegating domain-wide authority to the service account](#).

- a) Sign in to the [Google Admin console](#) as an administrator.

- b) Add a new API client and enter these details:

Field	Value
Client ID	Copy the client ID value from the JSON file.
OAuth scopes (comma-delimited)	Enter these permission values: <a href="https://www.googleapis.com/auth/calendar.events">https://www.googleapis.com/auth/calendar.events</a> ,

Field	Value
	<a href="https://www.googleapis.com/auth/calendar">https://www.googleapis.com/auth/calendar</a>

5. Enable access to the Google Calendar API.
  - a) Navigate to the API & Services Library in the [Google Cloud Platform](#) console.
  - b) Search for and enable Google Calendar.

## Steps: Register Your Client-Side Application for Microsoft Outlook

### Prerequisites

Set up administrator access to an Azure Active Directory (AD) tenant.

### Context

When you register your client application for the Workday Absence Third-Party Calendar integration with Microsoft Outlook, the Microsoft identity platform can provide authentication and authorization services for the application and its users.

You can configure permissions to enable the Absence Third-Party Calendar integration web API to access Microsoft Graph and:

- Read user profiles for all users in your organization.
- Read and write calendars in all mailboxes.

### Steps

1. Register the application in the Azure portal and add credentials:

- Enter a display name that you can easily recognize as the client for the Absence Third-Party Calendar integration. Example: *Absence TPCI*.
- For Supported account types, select *Accounts in this organizational directory only* and your Azure AD tenant.
- You'll need the Application (client) ID value later when you create the external client cred store.
- Add a client secret. Select an expiration option and record the secret value for later use.

[See Quickstart: Register an application with the Microsoft identity platform.](#)

2. Add permissions for the application.

Enable the Absence Third-Party Calendar integration web API to access Microsoft Graph:

- Expand the Calendars menu and select *Calendars.Read* and *Calendars.ReadWrite*.
- Grant admin consent for your client application.

[See Quickstart: Configure a client application to access a web API.](#)

[Get an Azure AD tenant](#)

## Steps: Create an External Client CredStore for Google Calendar

### Prerequisites

Register a Google service account for the Absence Third-Party Calendar integration.

Security: *Security Administration* domain in the System functional area.

## Context

Workday enables you to store the OAuth2 access credentials from the JSON file that you downloaded when registering your service account for Google. Workday uses these credentials to connect to the external Google Calendar domain.

## Steps

1. Access the Create External Client CredStore task.

As you complete the task, consider:

Option	Description
App ID, External Reference ID	Enter a value to distinguish these credentials for your Google service account. The value is for easy identification only and doesn't need to match an existing identifier for your application. You can use the same value for both fields. Example: <i>Absence-TPCI-Google</i> .
Auth Scheme for External Client	Select <i>OAuth 2.0 Jwt Bearer</i> .
Client ID	Enter the <i>client_id</i> value from the JSON file.
Subject	Enter the email of the user with the <i>Super Admin</i> role with access to the service account.
Issuer	Enter the <i>client_email</i> value from the JSON file.
Audience	Enter the <i>token_uri</i> value from the JSON file.
Jwt Bearer Signature Algorithm	Select <i>RS256</i> .
Jwt Header Kid	Enter the <i>private_key_id</i> value from the JSON file.
Token Endpoint	Enter any URL in this mandatory field. Workday doesn't use this value for the integration, however, to enable Workday to save the credential store, you need to enter a URL.

2. Create an X.509 private key pair.

For x509 Private Key Pair, select either:

- Create 3rd Party X509 Key Pair, to create a Google-generated certificate, and store the key pair values from the JSON file in Workday.  
See [Create a Third-Party X.509 Key Pair for Google Calendar on page 1042](#).
- Create x509 Private Key Pair, to generate a Workday certificate, and upload it to Google.  
See [Create an X.509 Private Key Pair for Google Calendar on page 1042](#).

[Create a Third-Party X.509 Key Pair](#)

## Create a Third-Party X.509 Key Pair for Google Calendar

### Prerequisites

Register a Google service account for the Absence Third-Party Calendar integration.

### Context

Save X.509 key pairs supplied by Google to Workday to enable the Absence Third-Party Calendar integration to connect to the external Google Calendar domain.

### Steps

1. Access the Create 3rd Party X509 Key Pair task.
2. As you complete the task, consider:

Option	Description
Certificate Text	<p>Navigate to the URL specified as the <i>client_x509_cert_url</i> value in the JSON file.</p> <p>Copy the certificate text that corresponds to the <i>private_key_id</i> in your JSON file. The text must start with -----<i>BEGIN CERTIFICATE</i>----- and end with -----<i>END CERTIFICATE</i>-----.</p> <p>Paste the certificate text into a text editor and format to replace every newline (\n) with newline plus carriage return (\r\n).</p> <p>Copy and paste the formatted text into this field.</p>
Private Key	<p>Navigate to the <i>private_key</i> value in the JSON file that corresponds to the <i>private_key_id</i> value.</p> <p>Copy the private key text starting with -----<i>BEGIN PRIVATE KEY</i> and ending with <i>END PRIVATE KEY</i>-----.</p> <p>Paste the private key text into a text editor and format, replacing every newline (\n) with newline plus carriage return (\r\n).</p> <p>Copy and paste the formatted text into this field.</p>

### Tasks

[Create an X.509 Private Key Pair](#)

## Create an External Client CredStore for Microsoft Outlook

### Prerequisites

Register a client for Microsoft Outlook for the Absence Third-Party Calendar integration.

Security: *Security Administration* domain in the System functional area.

### Context

Workday enables you to store OAuth2 access credentials that you recorded when registering your client-side application for Microsoft Outlook.

## Steps

1. Access the Create External Client CredStore task.
2. As you complete the task, consider:

Option	Description
App ID, External Reference ID	Enter a value to distinguish these credentials for the application that you registered in the Microsoft Azure AD portal. This value is for easy identification only and doesn't need to match an existing identifier for your application. You can use the same value for both fields, but the External Reference ID value must be unique. Example: <i>Absence-TPCI-Microsoft-Outlook</i> .
Auth Scheme for External Client	Select <i>OAuth 2.0 Client Credential</i> .
Client ID	Enter the client ID that you recorded.
Client Secret	Enter the client secret.
Token Endpoint	Enter any URL in this mandatory field. Workday doesn't use this value for the integration, however, to enable Workday to save the credential store, you need to enter a URL.

## Reference: Absence Third-Party Calendar Integration Output Files

In addition to processing time off entries in Google Calendar and Microsoft Outlook, the Absence Third-Party Calendar integration generates several informational files associated with the integration events. Workday retains these files for debugging and troubleshooting purposes.

File	Description
Absence Third-Party Calendar Integration Summary	Summarizes time off entry processing results.
Retry Time Off Events Partition Store	Includes time off entries to retry in the next integration run.
Retry Time Off Events Partition Tracker	Tracks time off entry retries for the next integration run.
Synchronization Failures Log	Logs entries that failed to synchronize. Workday doesn't store these entries for retry.

- [If managers opt out, will they also stop getting their direct reports' time off entries?](#) on page 1046
- [If workers opt out of Absence Third-Party Calendar Integration events, does that opt them out of all calendar events such as scheduled interviews?](#) on page 1046
- [Can you rescind a time off from the third-party calendar?](#) on page 1046
- [If I change organizations in the integration configuration, what happens to events for workers in the removed organizations?](#) on page 1047
- [What is the recommended schedule frequency for the Absence Third-Party Calendar integration?](#) on page 1047
- [How far back and forward does the integration process time offs?](#) on page 1047
- [Does the Absence Third-Party Calendar integration support leave of absence?](#) on page 1047

Does the Absence Third-Party Calendar integration support Microsoft national cloud services?

No, the integration supports the Microsoft Graph global service but not national cloud service endpoints such as Microsoft Cloud for US Government.

Do I need to specify a redirect URI when registering my app for Microsoft Azure?

No, this is an optional setting for apps that require individual users to authenticate. Our integration

Can you configure multiple email domains?

uses an admin account to update the user's calendars using the Microsoft Graph API.

Do I need a Google service account user with the Super Admin role to run the integration with Google Calendar?

If your organization has more than 1 corporate email domain, you can enter multiple domains as a comma-separated list for the *Email Domains* value when you configure integration attributes for the integration system.

The integration supports multiple domains as long as all the domains are managed in the same Google or Microsoft tenant.

Do I need a Google service account user with the Super Admin role to run the integration with Google Calendar?

Yes, you need a service account user with the *Super Admin* role with domain-wide access to enable the integration to perform read and write actions on users' calendars. The *Super Admin* is the only role that Google provides that can edit all users' calendars without user-level configuration. You can't create a custom role.

Workday uses the values that you enter in these fields on the Create External Client CredStore task:

- Subject: The email of the user with the *Super Admin* role with access to the service account.
- Issuer: The *client\_email* value from the JSON file that you downloaded for the service account.

Although the Absence Third-Party Calendar integration uses the service account user with the *Super Admin* role, Workday doesn't store the credentials. The integration only has authorization to perform read and write actions using the Calendar API.

What determines the Created by value on Google Calendar events?

The *Created by* value is based on the email that you enter in the Subject field on the Create External Client CredStore task. Example: If you would like *Created by* to display *Absence Calendar*, you could create an Administrator account in the Google Admin console with this name, and set the email address as the subject in your credStore. Example: *absence.calendar@mycompany.com*.

What determines the time zone for the calendar events?

When workers request time off, the effective date of the entries is in their time zone as set in Workday. If they don't have a preferred time zone set, Workday uses the tenant time zone. If you haven't configured a time zone for your tenant, Workday uses Pacific Standard Time (PST).

If a worker's manager has a different preferred time zone set, Workday converts the date and time of the calendar entry to the manager's time zone for the manager view.

Why is the time zone Coordinated Universal Time (UTC) or Pacific Time - Los Angeles when I edit an automatically generated event?

If users want their third-party calendar application to match the Workday time zone, they need to set the time zone in their calendar application accordingly.

How do multiple partial days off display for time offs that don't use time off start and end times?

The Absence Third-Party Calendar integration standardizes all time off entries to Pacific Standard Time (PST) before passing them to Microsoft Outlook or Google Calendar. When you hover over an event for a time off entry in Outlook or Google Calendar, the application displays the times correctly in your time zone, depending on its time zone setting. When you edit an event, the application displays the start and end times in UTC or Pacific Time - Los Angeles. These are the correct times for the event in the time zone as it's stored on the Microsoft or Google server. Editing the event without changing the times or time zone maintains the time off at the correct time in your calendar.

What happens to a worker's events in their manager's calendar after a job change?

When workers don't enter start and end times on time off requests, a half day displays as a full day in third-party calendar applications. If there are multiple partial day requests on the same day, the third-party calendar application displays multiple full day events for the same day. We recommend that you use start and end times to enable the application accurately reflect the worker's time off and avoid multiple full day events.

If workers opt out of Absence Third-Party Calendar Integration events, will it stop both their own and their managers' calendars from updating?

Approved time offs that Workday processed before the worker's job change remain in their former manager's calendar even if their effective date is after their job change.

If managers opt out, will they also stop getting their direct reports' time off entries?

If workers opt out, it will only stop their calendars from updating. Their managers will still see their direct reports' time off requests in their calendars, provided Enable managers to see their direct reports' time off events is selected on the Configure Absence Third-Party Calendar Integration task.

If workers opt out of Absence Third-Party Calendar Integration events, does that opt them out of all calendar events such as scheduled interviews?

If they opt out, they won't see their direct reports' or their own time off events in their calendars.

Can you rescind a time off from the third-party calendar?

The Opt Out of Absence Third-Party Calendar Integration Events preference only prevents Workday adding Absence time off requests to their external calendars. Other Workday calendar integrations are unaffected by this preference.

Workday doesn't enable you to rescind time off entries that you inadvertently uploaded but supports corrections. Workday removes time off entries corrected to zero from third-party calendars. You can use the *Adjust Time Off* Enterprise Interface Builder (EIB) to correct entries unless the entries are in-progress. In that case, you can use the *Mass Cancel* business process.

If I change organizations in the integration configuration, what happens to events for workers in the removed organizations?

If you remove an organization on the Configure Absence Third-Party Calendar Integration task, the integration no longer processes the time offs for workers in the organization. Workday doesn't remove previously processed time offs from the third-party calendar even when you select the Reset Integration Processing by 30 Days check box. Worker's will need to manually remove these events from their calendars.

What is the recommended schedule frequency for the Absence Third-Party Calendar integration?

During implementation, Workday recommends starting with a small pilot organization to test and confirm that events display as expected in workers' and managers' calendars. For multinational organizations, you should also test translations before rolling out to a wider organization.

How far back and forward does the integration process time offs?

We recommend that you schedule the Absence Third-Party Calendar integration to run every 3 hours to avoid conflicts and keep third-party calendars current with time off requests in Workday. Only 1 instance of the integration can run at any time. If the integration takes more than 2 hours to process and is still running when Workday attempts a subsequent run, the integration will fail. Workday will attempt to run the integration again in a further 3 hours.

Running the integration too frequently might cause several runs to fail, resulting in it taking noticeably longer for events to display in the third-party calendar.

Does the Absence Third-Party Calendar integration support leave of absence?

The integration processes all approved time offs entered or corrected since the last run date, with an effective date either:

- Within the previous 30 days.
- In the future.

Period schedules on time off plans limit how far in the future workers can enter time off.

We recommend that you build out your period schedules 2 years in the future.

The integration doesn't currently support leave of absence calendar-event processing.

## Related Information

### Tasks

[Steps: Register Your Client-Side Service Account for Google](#) on page 1039

[Steps: Create an External Client CredStore for Google Canlendar](#) on page 1040

### Reference

[Pre-built administrator roles](#)

## Troubleshooting: Absence Third-Party Calendar Integration

This topic provides strategies for diagnosing and resolving these Absence Third-Party Calendar integration issues:

- [Integration displays errors when launched or fails to launch.](#) on page 1048
- [Approved time offs in Workday in the last 30 days don't display in workers' third-party calendars.](#) on page 1049
- [Microsoft Azure Service exceeded the maximum retry attempts to retrieve the refresh token.](#) on page 1049
- [Managers can't identify which calendar events correspond to specific workers.](#) on page 1050
- [Time off for a manager's direct reports doesn't display in their third-party calendar.](#) on page 1050

### **Integration displays errors when launched or fails to launch.**

Cause: Synchronization failures occurred with the Google Calendar integration service.

Solution:

#### **Steps**

Security: These domains in the Integration functional area:

- [Integration Build](#)
  - [Integration Configure](#)
1. Access the Process Monitor report, and select the *Integration* process type.
  2. As a related action on the Absence Third-Party Calendar integration request, select Background Process > View Details to view detailed information about the integration.  
An integration status of *Completed* indicates that Workday was able to access the refresh token and send the request.
  3. Select the Output Files tab and download and review synchronization failures in these files:
    - Absence Third-Party Calendar Integration Summary: Check whether there are any entries stored for retry.
    - Retry Time Off Events Partition Store: You might find HTTP responses with a 403 error code.
    - Synchronization Failures Log: You might find HTTP responses with a 400 or 401 error codes.

To identify the reason for the errors, see the [Google Calendar API](#).

4. On the Integration Details tab, click Retrieve Log Files.
5. Select the Confirm check box.
6. Download the server log file.

Check for error responses from Google such as 403 error codes in HTTP retry exceptions. Example: You might need to use the Google Developers Console to activate the API for your project.

See [Authorizing Requests to the Google Calendar API](#).

If you fix the issues, Workday reprocesses the time off entries stored for retry on the next integration run.

If you don't fix the issues, the integration will fail. After 3 retries, Workday stores those entries in the Synchronization Failure log and won't attempt to retry processing the entries.

Cause: The integration service for Google Calendar failed to authenticate. It can't retrieve the refresh token for the client because the certificate has expired.

Solution:

#### **Steps**

1. [Sign in to the Google Cloud Platform](#)

2. Check the expiry date on the key for the integration client. If the key has expired, add a new key with an expiry date later than today.

See [Creating and managing service account keys](#).

3. Access the Edit External Client CredStore task.

Replace the expired x509 Private Key Pair with the service-account key details from the latest JSON file.

Security: *Security Administration* domain in the System functional area.

Cause: The integration service for Microsoft Outlook failed to authenticate. It can't retrieve the refresh token for the client because the client secret has expired.

Solution:

### Steps

1. Sign in to the Azure portal.

Check the expiry date on the client secret for the integration client. If the secret has expired, add a new one.

See [Quickstart: Register an application with the Microsoft identity platform](#).

2. Access the Edit External Client CredStore.

Replace the expired client secret with the new one.

Security: *Security Administration* domain in the System functional area.

## Approved time offs in Workday in the last 30 days don't display in workers' third-party calendars.

Cause: You configured the email domain incorrectly for the Google Calendar or Microsoft Outlook integration service.

Solution:

### Steps

1. If you need to correct the email domain, access the View Integration System report.

Select the Absence Third-Party Calendar integration system. As a related action, select Integration System > Configure Integration Attributes and enter the *Email Domains* integration attribute value.

Security: These domains in the Integration functional area:

- *Integration Build*
- *Integration Configure*

2. Rerun the Absence Third-Party Calendar integration.

Before resetting the integration, to avoid leaving entries that were corrected to zero in a worker's calendar, make sure that Workday processes corrected entries since the last run. Example: A worker requested a time off and then corrected it to zero since the last run. After resetting the last run date, Workday won't reprocess the request, which results in the original entry remaining in the calendar.

See [Launch an Integration](#) on page 24.

3. Access the Configure Absence Third-Party Calendar Integration task.

Reset the integration to reprocess previously processed time offs and all previously skipped time offs. Otherwise, Workday will only process new events using the correct configuration.

Security: *Set Up: Time Off* domain in the Time Off and Leave functional area.

4. In the Review and Apply section, select the Reset Integration Processing by 30 Days check box and click OK.

## Microsoft Azure Service exceeded the maximum retry attempts to retrieve the refresh token.

Cause: Workday received a 401 error, which might be because:

- The token has expired or is invalid.
- You're using a delegated access token granted to a personal Microsoft account. If this is the case, the integration is able to get a new token but the token is invalid when the integration tries to make a request.

Solution: For more information, see [Resolve Microsoft Graph authorization errors](#).

Solution: Workday recommends that you use a service account rather than a personal Microsoft account for the integration.

### **Managers can't identify which calendar events correspond to specific workers.**

Cause: The calendar event message doesn't display the worker's name.

Solution:

#### **Steps**

Security: *Set Up: Time Off* domain in the Time Off and Leave functional area.

1. Access the Configure Absence Third-Party Calendar Integration task.
2. Select the Calendar Event tab.

Tag the worker using the Worker's Preferred Name report field in the subject or body of the calendar event to enable managers to identify which time off belongs to each of their direct reports.

### **Time off for a manager's direct reports doesn't display in their third-party calendar.**

Cause: The manager has a manager role for the configured organization but isn't a member.

Solution:

#### **Steps**

Security: *Set Up: Time Off* domain in the Time Off and Leave functional area.

1. Access the Configure Absence Third-Party Calendar Integration task.
2. Select the Calendar Display tab.

Ensure that you select the Enable managers to see their direct reports' time off events check box.

3. Select the Organizations tab.

The integration only processes managers and workers that are members of the organizations that you configure for the integration. Ensure that you select both the manager's and worker's organizations. When a manager and worker are members of different organizations but you only select the worker's organization, the manager won't receive their time off events for the worker, even when you also select the Enable managers to see their direct reports' time off events check box.

# Account Provisioning

## Steps: Set Up Account Provisioning Integration

### Prerequisites

Before implementing this integration, determine how you want to launch the integration. Configuration requirements vary depending on which method you select.

### Context

You can create an integration based on the *Account Provisioning* template that sends worker profiles and provisioning group membership data to an external endpoint.

### Steps

1. [Create Integration System](#) on page 1967

Enter *Account Provisioning* at the New using Template prompt.

2. (Optional) In the Configure Integration Services task, enable the Transaction Log Service.

This service enables your integration system to subscribe to events that take place in Workday. Your integration reports only changed fields for workers, rather than reporting all fields.

If disabled, your integration first extracts all data for eligible records, then evaluates the data for changes. Using this option can adversely affect performance.

Security: *Integration Build* in the Integration functional area.

3. (Transaction Log Service) Select Integration System > Configure Integration Transaction Log as a related action on your integration and select the Workday transactions for monitoring.

Workday recommends that you subscribe only to those business processes that can drive changes to your provisioning groups:

- *Add Additional Job*
- *Contract Contingent Worker*
- *Hire*
- *Start International Assignment*
- *End Additional Job*
- *End Contingent Worker*
- *End International Assignment*
- *Termination*

Security: *Integration Build* in the Integration functional area.

4. [Set Up Account Provisioning Integration Fields](#) on page 1052.

5. (Optional) [Set Up Integration Delivery](#) on page 1952.

If you're not launching the integration by web service, specify how the integration system delivers integration output files to your external endpoint.

6. (Optional) [Launch an Integration](#) on page 24.

If you want to launch the integration by schedule within Workday, schedule how often you want Workday to launch the integration.

7. Create an Integration System User (ISU) and grant the ISU access to these domains:

- *External Account Provisioning*
- *Worker Data: All Positions*
- *Worker Data: Business Title on Worker Profile*
- *Worker Data: Current Staffing Information*
- *Worker Data: Public Contact Information*
- *Worker Data: Public Worker Reports*

See: [.../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](https://.../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita).

8. (Optional) [Create Integration Notifications](#) on page 31.

## Set Up Account Provisioning Integration Fields

### Prerequisites

Security: *Integration Build* domain in the Integration functional area.

### Context

Map internal Workday values to external values used by your account provisioning service.

This procedure uses the Configure Integration Field Overrides task. However, in this procedure you provide automatically populated values; you don't override existing values. If you don't select the corresponding report field for each external value, your Account Provisioning integration can't run successfully.

### Steps

1. As a related action on your Account Provisioning integration, select *Integration System > Configure Integration Field Overrides*.
2. In the *Define Eligibility* document section, select *Has Provisioning Group Assignments* from the *Override External Field* prompt.
3. In the *External Account Provisioning Fields* document section, select (or create) the specified report field from the *Override External Field* prompt for each external field value.

Option	Description
Worker ID	Employee ID
Legal First Name	Legal Name - First Name
Legal Middle Name	Legal Name - Middle Name
Legal Last Name	Legal Name - Last Name
Primary Work Email Address	Email - Primary Work
Primary Work Phone Number	Phone - Primary Work
Primary Work Messenger ID	Work IM
Primary Work Messenger Type	Create a calculated field based on the Work IM <i>business object</i> that returns the Messenger Type.  There's no corresponding report field in Workday that returns this value.
Employee ID	Employee ID

Option	Description
Position	Position
Position ID	Position ID
Business Title	Business Title
Location	Location
Manager ID	Manager ID
Hire Date	Hire Date
First Day of Work	First Day of Work
Termination Date	Termination Date
Active Status	Active Status

## Concept: Account Provisioning Integration

Workday supports integration with external account provisioning applications and services using the Simple Cloud Identity Management (SCIM) format. The *Account Provisioning* integration template enables you automatically to add and remove hired and terminated workers from applications and services such as Active Directory and Salesforce Chatter.

The Account Provisioning integration template enables you to create an integration with any account provisioning endpoint. The account provisioning endpoint opens and closes accounts for workers on downstream services, such as Active Directory or Google Apps. The account provisioning endpoint relies on Workday to define which workers have access to a given downstream service. When triggered, the Account Provisioning integration generates an integration output document in the form of a SCIM file. SCIM is an industry-standard format for defining membership in provisioning groups.

### Integration Launch Options

You can use any of these methods to launch the Account Provisioning integration:

- Scheduled in Workday. You schedule the integration to launch at a preset interval.
- Trigger by event. Configure the *Transaction Log Service* to subscribe to Workday events that cause reportable changes to your Provisioning Groups.
- Scheduled in external account provisioning endpoint. You configure a schedule in your external endpoint. You then configure your external endpoint to launch the Account Provisioning integration using the *Launch Integration Event* web service operation. After launch, your external endpoint must check the integration event status using the *Get Integration Events* web service operation. When *Get Integration Events* returns a status of Complete, it includes a reference to the integration output document. You can then retrieve the integration output document from My Reports.

Related Information

#### Concepts

[Concept: Workday Connectors](#) on page 524

#### Tasks

[Steps: Set Up Account Provisioning Groups](#)

## Account Provisioning Connector

### Steps: Set Up Account Provisioning Connector Integration

#### Context

You can create an account provisioning integration that sends these types of data to an external account provisioning endpoint:

- Worker profiles.
- Provisioning group membership.

#### Steps

1. [Create Integration System](#) on page 1967.

Enter the applicable template at the New using Template prompt:

- *Account Provisioning Connector: Worker*
- *(Optional) Account Provisioning Connector: Group*. Use this template only if you already use Account Provisioning Groups and have worker accounts that are part of those groups.

2. (Optional) In the Configure Integration Services task, enable integration services:

Integration Service	Template	Description
Filename Sequence Generator	Both	Enable if you want Workday to apply a custom-formatted, unique filename to each integration file.
Define Eligibility	Account Provisioning Connector: Worker	Enables you to configure an Integration Field Override to define which workers Workday includes in the integration output.

Security: *Integration Build* in the Integration functional area.

3. As a related action on your Connector, select Integration System > Configure Integration Attributes and enter attributes required by the integration template:

Option	Description
Output Document Tags	Applies selected document tags to integration output documents generated by the integration.
Document Retention Policy	Enter the number of days that Workday should preserve output files.

4. [Set Up Integration Sequence Generators](#) on page 1969.
5. [Set Up Integration Delivery](#) on page 1952.
6. [Steps: Set Up Document Transformation Connector](#) on page 594.
7. [Launch an Integration](#) on page 24.

8. Create an Integration System User (ISU) and grant the ISU access to these domains:

- *External Account Provisioning* (required for Account Provisioning Connector: Group only)
- *Worker Data: Current Staffing Information* (required for Account Provisioning Connector: Worker only)
- *Worker Data: Public Worker Reports* (required for Account Provisioning Connector: Worker only)

See: <.../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita>.

9. (Optional) Grant the ISU access to the *View: Account Provisioning Integration Document* security domain to enable the ISU to view documents generated by the connector.

10.(Optional) [Create Integration Notifications](#) on page 31.

## Concept: Account Provisioning Connector

With the Account Provisioning Connector, you can extract worker account related definitions and send it to an endpoint. Using the Workday Web Services API, the Account Provisioning Connector captures changes to account data. The integration then configures an output file for delivery to an external endpoint.

The Account Provisioning Connector generates account data integration output files that you can transform for multiple downstream endpoints.

Depending on your external endpoint, you might need to transform the file into the required format using 1 of these options:

- Transformation step on the business process. You configure the business process definition for the integration to transform the Connector output file into the format required.
- Workday Studio integration. You configure the business process definition of the integration to launch a Workday Studio integration. The Studio integration transforms the Connector output file into the required format.
- Other third-party tool. You configure a third-party tool to transform the Connector output file.

The Account Provisioning Connector is an integration template. When launched, the integration collects a snapshot of the data and creates an output file in XML format. The Account Provisioning Connector integration creates the output files in a Workday-defined XML format. You can configure this output for delivery or further transformation.

## Launch/Schedule Options for Account Provisioning Connector

Workday provides these launch schedule options for the Account Provisioning Connector integration:

- Organization: If you intend to run the integration immediately, select the organization for which you want to run the integration. The prompt varies depending on the Integration Process Event and on your security access:
  - *Owning Organization* displays if the Integration Process Event for this integration is associated with a specific organization. You can select the organization or any of its subordinate organizations of which you're a member or have an organization role.
  - *All Organizations by Type* displays if the Integration Process Event for this integration has no associated organization. You can select any organization and subordinate organization of which you're a member or have an organization role.
- Run Frequency. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration collects all qualifying changes based on the launch parameters. You can specify Run Now to launch the integration manually. Workday prompts you to enter the launch parameters.

For the launch/schedule option for the Account Provisioning Connector: Group, enter these launch parameters:

Parameter	Description
Provisioning Groups	Extracts records for the specified Provisioning Groups.
As Of Entry Moment	Extracts records that are current as of the specified As Of Entry Moment.

For the launch/schedule option for the Account Provisioning Connector: Worker, you enter these launch parameters:

Parameter	Description
Workers	Extracts records for the specified Workers.
As Of Entry Moment, Effective Date	Extracts records that are current as of the specified As Of Entry Moment and Effective Date parameters.

## Integration Audit Files

Every time the integration runs, Workday generates these files:

- *Data Changes Audit* file, which is a readable version of the integration output file.
- *Diagnostic Audit* file, which helps you troubleshoot integration errors.
- *Schema XSD* file, which defines the content and structure of the output file. It includes only those fields that you've enabled for your integration endpoint. Workday generates this file every time the integration runs; the file uses your integration configuration at the time the integration ran. You can only generate this file by running the integration.

You can find these files in the Reports and Other Output Files section of the Integration Event for each integration run.

If you don't want to generate audit files, you can use these integration attributes:

- Suppress Messages Audit
- Suppress Audit Reports

Note: Because actual data is included in the *Data Change Audit* file, you might need to secure this file separately. Example: if administrators can't have access to the data.

## Affordable Care Act (ACA) Connector

### Steps: Set Up ACA Information Returns Connector

#### Prerequisites

- Ensure you created all correct 1095-C and 1094-C data.
- Security: *Integration Build* domain in the Integration functional area.

#### Context

You can create and configure an ACA Information Returns (AIR) Connector integration that uses the IRS AIR system to:

- Send Form 1094-C and Form 1095-C data to the IRS.
- Receive status messages from the IRS.

## Steps

1. Access the Create Integration System task and enter the applicable template for the tax year at the New using Template prompt.

- *ACA Information Returns 2024.*
- *ACA Information Returns 2023.*
- *ACA Information Returns 2022.*
- *ACA Information Returns 2021.*

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

- *Affordable Care Act (ACA) Administration*
- *Integration Event*

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

3. Select Integration > Accept ACA Electronic Reporting Notice as a related action on the integration system.
4. [Steps: Set Up ACA Forms 1094-C and 1095-C](#).
5. Manually launch the integration.

See [Launch an Integration](#) on page 24.

## Steps: Set Up ACA Mailing Connector

### Prerequisites

Security: *Integration Build* domain in the Integration functional area.

### Context

You can create and configure an integration that sends Affordable Care Act (ACA) 1094-C and 1095-C data from Workday Benefits to an external mailing service provider. The mailing service provider can print and mail 1095-C forms. Mailing service provider support is an optional service that is available through the vendor CIC Plus.

## Steps

1. [Create Integration System](#) on page 1967.

Enter *ACA Mailing Connector* at the New using Template prompt.

2. Select Integration System > Configure Integration Attributes as a related action on the integration system and enter integration service attributes.
3. [Set Up Integration Delivery](#) on page 1952.
4. [Launch an Integration](#) on page 24.
5. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

- *Affordable Care Act (ACA) Administration*
- *Integration Event*

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

6. (Optional) [Create Integration Notifications](#) on page 31.

## Concept: Affordable Care Act (ACA) Connectors

Send IRS Form 1094-C and 1095-C data to the Internal Revenue Service (IRS) and external mailing service providers using ACA Connectors. These integrations enable you to:

- Submit ACA tax data under the Affordable Care Act Information Returns (AIR) Program.

- Retrieve status update messages from the IRS endpoint.
- Send 1094-C and 1095-C data from Workday Benefits to an external mailing service provider. The mailing service provider can print and mail the 1095-C forms.

Workday provides these ACA integration templates:

- ACA Information Returns (AIR) Connector:
  - *ACA Information Returns 2024.*
  - *ACA Information Returns 2023.*
  - *ACA Information Returns 2022.*
  - *ACA Information Returns 2021.*
- *ACA Mailing Connector.*

## Launch/Schedule Option

To launch the ACA AIR Connector integrations manually, select the *Run Now* frequency from the Related Action > Integration > Launch Schedule menu. Workday prompts you for the launch parameters. Because IRS processing times can be variable, launching manually is the most flexible option.

You can enter these launch parameters for the AIR Connector for each year:

Parameter	Description
Company	Specifies the company for which you're sending 1094-C and 1095-C data.
Run Mode	Select these options to validate, send, and check the status of your data: <ol style="list-style-type: none"> <li>1. <i>Validate without Sending</i> runs validation checks on the data without transmitting data to the IRS. Use this mode to check the data and make updates to ensure it's correct before transmitting to the IRS.</li> <li>2. <i>Send Data</i> sends 1094-C and 1095-C forms to the IRS endpoint.</li> <li>3. <i>Check Status</i> requests that the IRS sends the status of your submission.</li> </ol>

## Integration Audit Files

Every time the integration runs, Workday generates these files:

- The *Data Changes Audit* is a readable version of the integration output file.
- The *Diagnostic Audit* is designed to help you troubleshoot integration errors.

You can find these files in the Reports and Other Output Files section of the Integration Event. These files display for each integration run.

Note: Because Workday includes actual data in the Data Change Audit file, you can secure this file separately. Example: if you don't want administrators to have access to the data.

## Integration Completion Status

After running the integration in *Check Status* mode, you can get a variety of messages and errors depending on your data. Examine each message carefully and understand the difference between each status.

Status	Description
Rejected	The IRS file rejected your file and your file needs changes.

Status	Description
	<p>Note: A change is different from a correction. You submit a correction for a previously accepted file.</p> <p>The IRS considers the file a replacement file with a transmission type code of R.</p>
Accepted with Errors	<p>The IRS accepted the file, but has discrepancies.</p> <p>You can make 1094-C and 1095-C corrections with the Create ACA 1095-C/1094-C Data (Corrections) task.</p> <p>Use the task for correcting the data only after you transmit data to the IRS. This task updates both 1095-C and 1094-C data. If you don't want to update 1095-C form data, select the Prevent 1095-C corrections for previously transmitted items check box.</p> <p>Note: If you need to make 1095-C corrections with an EIB, run the corrections task before making any updates with EIB. If you run the Create ACA 1095-C/1094-C Data (Corrections) task after importing changes with the EIB, Workday overrides any changes that you loaded using EIB.</p> <p>Corrections to either 1095-C or 1094-C data have a transmission type code of C for corrections file.</p>
Accepted	<p>The IRS accepted your file without issues or errors.</p>

## Troubleshoot: Affordable Care Act (ACA) Connectors

Issue	Resolution
You want to find the record in error.	<p>Run the integration and set the launch parameter to <i>Send Data</i> and save all of the generated files for review. Review the errors in the <i>Transmission_MessageAudit_1.zip</i> file. Fix the errors in an EIB and try the upload again in validate only mode.</p>
You want to find the record in error from the transmission summary.	<p>Workday provides a file called <i>Transmission_MessageAudit_1.zip</i>. If you open that file, you'll see the details about any errors. Review any error files that say &lt;UniqueRecordID&gt;. Fix the errors and submit in validate only mode.</p> <p>Example: You find a record ID with 1095C-17-00115226 1 50. The number 50 refers to the 50th 1095-c form from the submission.</p>
The address or name field is too long.	<p>Use Address Field 2 to avoid the 35 character limit for Primary Address.</p>
You want to exclude 1094-C employee to exclude workers with tuning rules.	<p>Access the Calculate 1094-C Total and Full Time Employee Counts by Month task to get a list of</p>

Issue	Resolution
	workers included using tuning rules and set a filter.  Run the View 1094-C FTE and Total Count Details report and copy the report. Filter the copied report using the same criteria you used in your tuning rules and identify those employees to exclude.
You have a blank 1094-C Part 3b full-time employee count.	If you use the 98% offer method, leave the <i>4980H full-time employee count</i> blank.
You have duplicate dependencies.	Access the Delete 1095-C Form Data task. You can delete an individual 1095 record without deleting the entire company. Review individual records and reupload the record using an EIB.  Delete the covered individual reference ID on the EIB and Workday will generate a new one, otherwise you'll get a duplicate error. Publish the 1095 for that Company so it will display on the record of the worker.

## AngelPoints

### Steps: Set Up AngelPoints Integration

#### Context

Create an integration system that establishes accounts in AngelPoints and updates the accounts when changes occur. The integration reports changes to worker status so that AngelPoints can activate or deactivate accounts as needed.

After the initial full file worker synchronization, Workday sends AngelPoints a changes-only file, when scheduled. The changes-only file contains complete records for workers who are new or whose information has changed since the last integration run.

#### Steps

1. Access the Create Integration System task and enter *AngelPoints - Worker Sync* at the New using Template prompt.  
  
Security: *Integration Build* in the Integration functional area.
2. In the Configure Integration Services task, enable integration services:

Option	Description
Define Eligibility	Enable this service to define rules for whether Workday includes a worker in the integration. If you want to include all workers automatically in the integration, you don't need to select this option.
Account Provisioning - Worker Sync	Enables you to configure the ISO Country Code, Region Organization Type, and Rehire Date usage.

Option	Description
Account Provisioning - Common Configuration	Enables you to configure Employee ID Name and Workday ID (WID) usage.
Account Provisioning - Delivery Service	Enables you to configure delivery of integration output documents to the AngelPoints SFTP server. If you don't enable this service, configure another integration system to retrieve the integration output documents and send them to AngelPoints.
AngelPoints Additional Fields Service	Enables you to map up to 9 Organizations in Workday to the corresponding values in AngelPoints.
Transaction Log Service	Enables the integration to monitor events in Workday and launch when events occur that change worker data.

Security: *Integration Build* in the Integration functional area.

3. (Optional) To send up to 20 additional fields to AngelPoints, access the Configure Integration Services task. Add a *Custom Fields* integration service to the Custom Integration Services grid.
4. Create an Integration System User (ISU) and grant the ISU access to these domains:
  - *Integration Event*
  - *Person Data: Gender*
  - *Person Data: Home Contact Information*
  - *Worker Data: Current Staffing Information*
  - *Worker Data: Public Worker Reports*
  - *Worker Data: Work Contact Information*

See: [.../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).

5. As a related action on your Connector, select Integration System > Configure Integration Attributes and enter attributes required by the integration template:

Option	Description
Include Inactive Workers in Full File	Includes inactive workers in the output when you enable the Full File launch parameter. If you don't select this option, Workday excludes inactive workers from Full File results.
Required Field Validation	Applies additional validation rules that identify errors that can occur when exporting data, and specifies error handling: <ul style="list-style-type: none"> <li>• <i>Omit - Report Error</i>: Workday doesn't include records with errors in the output file. If you don't select a value, Workday uses this option.</li> <li>• <i>Include - Report Warning</i>: Workday includes records with errors in the output file; warning displays in the Integration Event for the integration run.</li> </ul>
ISO Country Code	Select the type of ISO Country Codes (options are two- or three-character codes) that you

Option	Description
	want to include in the integration output document.
Region Organization Type	Specify the organization type for regions that you want to include in the integration output document. If not specified, Workday doesn't include region data in the integration output document.
Send Rehire Date	Specifies that Workday includes the rehire date in the integration output document. Workday doesn't include the original hire date for rehired workers. If not selected, Workday always sends the original hire date.
Employee ID Name	Specify the ID type used to identify workers on the integration output document.
Use WID	To force use of Workday ID (WID) values to identify workers on the integration output document, select this option. Use this option if any type-specific IDs (such as Organization Type) exceed 90 bytes of UTF-8 characters.
Document Retention Policy	To specify the number of days that Workday retains integration output files, enter the Document Retention Policy attribute value.

6. [Set Up Integration Field Overrides for a Connector](#) on page 1973.

Workday requires this step only if you enabled any of these integration services:

Option	Description
AngelPoints Additional Fields Service	You can select up to 9 organization fields to include in your output file. The integration uses these organization fields as membership groupings in AngelPoints.
Define Eligibility	Select a Boolean report field or calculated field for workers that you want to include in the integration output file.
Custom Fields	Map additional worker data fields to the corresponding values in AngelPoints. AngelPoints accepts up to 20 custom field values.

7. As a related action on the integration system, select **Integration System > Configure Integration Maps**.

Map tenant values for employee data in Workday to AngelPoints.

8. [Set Up Integration Sequence Generators](#) on page 1969.

9. [Set Up Integration Delivery](#) on page 1952.

10. As a related action on the integration system, select **Integration System > Configure Integration Transaction Log**.

Configure the integration to subscribe to Workday events that can trigger the need to send an update to AngelPoints. This step is required only if you enabled the Transaction Log Service.

11. [Launch an Integration](#) on page 24.

12.(Optional) Configure Worklets for SSO-Based Access to AngelPoints.

## Steps: Set Up Worklets for SSO-Based Access to AngelPoints

### Prerequisites

Know your AngelPoints tenant name.

### Context

Create worklets that enable your workers to provide access credentials to AngelPoints from worklets in Workday.

### Steps

1. Create an X.509 Private Key Pair.

Create an X.509 *private key pair*, save the *public key* as a *cert* file, and send the public certificate to AngelPoints.

2. Access the Edit Tenant Setup - Security task and select the x509 Private Key Pair from the prompt.

See: Reference: Edit Tenant Setup - Security

3. Create or Edit SAML SSO Links.

4. Access the Create SAML SSO Link task and create an SSO link named Dashboard with these attributes:

Option	Description
SAML Version	1.1
Assertion Consumer Service URL	<code>https://&lt;angelpoints_customer_name&gt;.angelpointsevs.com/login.sso</code>
Name Identifier	User Name
Recipient	<code>https://&lt;angelpoints_customer_name&gt;.angelpointsevs.com/login.sso</code>
Audience	<code>https://sp.angelpoints.com/SAML1</code>
Deeplink	<code>https://&lt;angelpoints_customer_name&gt;.angelpointsevs.com/handlers/dashboard.aph</code>
Issuer ID	<code>https://myworkday.com/&lt;workday_tenant&gt;/login.htmld</code>
Signature Method	SHA256

5. Access the Create SAML SSO Link task and create an SSO link named Event Calendar with these attributes:

Option	Description
SAML Version	1.1
Assertion Consumer Service URL	<code>https://&lt;angelpoints_customer_name&gt;.angelpointsevs.com/login.sso</code>
Name Identifier	User Name

Option	Description
Recipient	<code>https://&lt;angelpoints_customer_name&gt;.angelpointsevs.com/login.sso</code>
Audience	<code>https://sp.angelpoints.com/SAML1</code>
Deeplink	<code>https://&lt;angelpoints_customer_name&gt;.angelpointsevs.com/handlers/event/calendar.aph</code>
Issuer ID	<code>https://myworkday.com/&lt;workday_tenant&gt;/login.htmld</code>
Signature Method	SHA256

6. Access the Create SAML SSO Link task and create an SSO link named Log Independent Volunteer Activity (IVA) with these attributes:

Option	Description
SAML Version	1.1
Assertion Consumer Service URL	<code>https://&lt;angelpoints_customer_name&gt;.angelpointsevs.com/login.sso</code>
Name Identifier	User Name
Recipient	<code>https://&lt;angelpoints_customer_name&gt;.angelpointsevs.com/login.sso</code>
Audience	<code>https://sp.angelpoints.com/SAML1</code>
Deeplink	<code>https://&lt;angelpoints_customer_name&gt;.angelpointsevs.com/handlers/event/ive-create-non-manager.aph</code>
Issuer ID	<code>https://myworkday.com/&lt;workday_tenant&gt;/login.htmld</code>
Signature Method	SHA256

7. Access the Create SAML SSO Link task and create an SSO link named Search for Volunteer Events with these attributes:

Option	Description
SAML Version	1.1
Assertion Consumer Service URL	<code>https://&lt;angelpoints_customer_name&gt;.angelpointsevs.com/login.sso</code>
Name Identifier	User Name
Recipient	<code>https://&lt;angelpoints_customer_name&gt;.angelpointsevs.com/login.sso</code>
Audience	<code>https://sp.angelpoints.com/SAML1</code>

Option	Description
Deeplink	<code>https://&lt;angelpoints_customer_name&gt;.angelpointsevs.com/handlers/event/search.aph</code>
Issuer ID	<code>https://myworkday.com/&lt;workday_tenant&gt;/login.htmld</code>
Signature Method	SHA256

8. Access the Create SAML SSO Link task and create an SSO link named Submit My Hours with these attributes:

Option	Description
SAML Version	1.1
Assertion Consumer Service URL	<code>https://&lt;angelpoints_customer_name&gt;.angelpointsevs.com/login.sso</code>
Name Identifier	User Name
Recipient	<code>https://&lt;angelpoints_customer_name&gt;.angelpointsevs.com/login.sso</code>
Audience	<code>https://sp.angelpoints.com/SAML1</code>
Deeplink	<code>https://&lt;angelpoints_customer_name&gt;.angelpointsevs.com/handlers/event/submit-hours.aph</code>
Issuer ID	<code>https://myworkday.com/&lt;workday_tenant&gt;/login.htmld</code>
Signature Method	SHA256

9. Access the Create Quicklink Group task.

Create a Volunteering group, and add the 5 links you created in the preceding steps to the group.

10. [Create a Quicklinks Worklet](#).

Create a Quicklinks Custom Report that includes the Quicklink Group. Set the output as a worklet, then share the report with any user groups.

11. Add the worklet to the landing pages of your choice.

See: [Steps: Set Up Dashboards and Landing Pages](#).

## Concept: AngelPoints Integration

Support employee volunteering, giving, and sustainability needs for your organization using the *AngelPoints* integration. *AngelPoints* offers a web-based service designed to increase participation in your employee volunteering, giving, and sustainability programs. *AngelPoints* enables you to track and report on the collective impact of your company. Workday synchronizes information about workers and organizations with *AngelPoints* so that you can automate management of accounts in *AngelPoints*.

Workday synchronizes HCM data with *AngelPoints* using a single integration system, which delivers files to an external SFTP server.

Workday manages all HCM data, including:

- Workers
- Organizations

**Related Information****Concepts**

[Concept: Workday Connectors](#) on page 524

## Assign Organizations Inbound Connector

### Steps: Set Up Assign Organizations Inbound Connector Integration

**Prerequisites**

Set up an external endpoint that your Workday integration can access. Your external endpoint must be able to generate change data for organization assignments in the defined XML format.

**Context**

You can create an integration that:

- Accesses an external server.
- Retrieves a data file containing organization assignment changes.
- Imports change data into Workday.

**Steps**

1. Configure your external endpoint so that it can generate data for organization assignment changes. The data must be in one of the formats supported by the Assign Organizations Inbound Connector.
2. Access the Create Integration System task and enter *Core Connector: Assign Organization Inbound* at the New using Template prompt.  
Security: *Integration Build* in the Integration functional area.
3. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:
  - *Integration Build*
  - *Integration Event*
  - *Manage: Organization Integration*
  - *Manage: Organization Update Integration*
  - *Worker Data: Organization Information*
  - *Worker Data: Public Worker Reports*
 See: [..../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).
4. [Set Up Assign Organizations Inbound Connector Attributes](#) on page 1066.  
Create integration attributes for the Connector.
5. [Set Up Integration Retrieval](#) on page 1957.  
Specify how the integration system retrieves data files with organization changes from your external endpoint.
6. [Launch an Integration](#) on page 24.  
Schedule how often the integration system runs.

## Set Up Assign Organizations Inbound Connector Attributes

**Prerequisites**

Security: *Integration Configure* domain in the Integration functional area.

## Context

Configure integration attributes for an integration based on the *Core Connector: Assign Organization Inbound* template.

## Steps

1. As a related action on your Assign Organizations Inbound Connector integration, select Integration System > Configure Integration Attributes.
2. Add a row for each attribute and specify a value:

Option	Description
Business Process Auto Complete	Completes the business process for the organization assignment action automatically. If not selected, business process runs normally.
Input File Tag	Select one or more document tags that identify the file containing the organization inbound updates. Use this attribute in scenarios where you want to attach multiple files of different types to the business process. If you define multiple tags for the attribute, configure the Document Retrieval service to apply all listed tags in order for this integration to find the file. If you leave this field empty, the integration processes input files with a <i>Retrieved</i> tag.
Validation Process	Specifies how the integration processes an organization record that fails validation: <ul style="list-style-type: none"> <li>• Skip: the integration system skips the invalid record and processes any subsequent records.</li> <li>• Abort: the integration system stops all processing.</li> </ul> Note: Records that you loaded previously in the same integration run don't roll back.
Input File Format	Indicates that the incoming file is in XML format.
Document Retention Policy	Specify how many days Workday keeps the imported files. If you don't override this value, Workday sets the retention period to 30 days.

## View Assign Organizations Inbound Connector Integration Audits

### Prerequisites

Security: *Background Process Management* domain in the Tenant Non-Configurable functional area.

## Context

For each integration event, you can use the Assign Organizations Inbound Connector integration audits to determine:

- What operation performs (DataChangesAudit.html)

- Details about the file (DiagnosticAudit.html)

## Steps

1. As a related action on the integration event, select Background Process > View Output Files.
2. Select an audit file:

Option	Description
DataChangesAudit.html	For each worker, displays the operation (Add, Update, Inactivate); for Update operations, also displays each changed field.
DiagnosticAudit.html	For each worker, displays the document name, the name and Reference ID of the worker, and if the file contained errors. Also displays any validation messages received while processing the organization.

Related Information

### Tasks

[Launch an Integration](#) on page 24

[View Integration Events](#) on page 27

## Concept: Assign Organizations Inbound Connector

To import organization assignments from an external endpoint that manages organization assignments into Workday, use the Assign Organizations Inbound Connector integration. The Assign Organizations Inbound Connector updates worker assignments to organizations such as a Company, Cost Center, Region, or Business Unit. With the Assign Organizations Inbound Connector, you can use a non-Workday application as your source of record for chart of account assignments, then synchronize that data with Workday.

Note: The Assign Organizations Inbound Connector integration works with organizations in Workday. Familiarize yourself with the organization feature in Workday.

### Features and Limitations

The Assign Organizations Inbound Connector can assign workers to these types of organizations:

- Companies
- Cost Centers
- Regions
- Business Units

The Assign Organizations Inbound Connector has these limitations:

- Workers and organizations must exist in Workday.
- The integration doesn't support assignment to Supervisory organizations.
- The integration doesn't support custom Organizations.

### File Format for Assign Organizations Inbound Connector Data

The Assign Organizations Inbound Connector integration imports data in a Workday-defined XML format.

### Integration Process Flow

The Assign Organizations Inbound Connector integration can import organization data using this process:

1. Your external endpoint generates a file (in the Workday-supported format) and sends it to a file server known to the integration.

2. You launch the integration, either by schedule or manually.
3. The integration retrieves the file according to the Document Retrieval configuration on the Integration Process Event and applies document tags.
4. The integration processes the file, then imports the data into Workday:

### Assign Organizations Inbound Connector Audits

The Assign Organizations Inbound Connector integration generates audit files each time it runs.

Related Information

**Concepts**

[Concept: Workday Connectors](#) on page 524

## Reference: Assign Organizations Inbound Connector File Schema

### CSV File Description

The CSV format consists of 17 fields. For a complete description of each field, see the XML Elements section:

- Worker\_ID
- Worker\_Type
- Position\_Reference\_ID
- Effective\_Date
- Company\_Organization\_Reference\_ID
- Cost\_Center\_Organization\_Reference\_ID
- Region\_Organization\_Reference\_ID
- Business\_Unit\_Organization\_Reference\_ID
- Custom\_Organization\_Reference\_ID\_1 (Don't use this field.)
- Custom\_Organization\_Reference\_ID\_2 (Don't use this field.)
- Custom\_Organization\_Reference\_ID\_3 (Don't use this field.)
- Custom\_Organization\_Reference\_ID\_4 (Don't use this field.)
- Custom\_Organization\_Reference\_ID\_5 (Don't use this field.)
- Custom\_Organization\_Reference\_ID\_6 (Don't use this field.)
- Custom\_Organization\_Reference\_ID\_7 (Don't use this field.)
- Custom\_Organization\_Reference\_ID\_8 (Don't use this field.)
- Custom\_Organization\_Reference\_ID\_9 (Don't use this field.)

Note: The Date format used for CSV is M/d/yyyy, which follows the date and time pattern defined for a `java.text.SimpleDateFormat`.

### XML Elements

The XML schema for inbound organization update data includes these elements:

Element	Description
Import_Assign_Organization_Request	Contains all other elements. Workday enables only 1 element per file.
Worker_Assign_Organization	Contains 1 instance of all subsequent elements, except as noted. Workday enables unlimited number of elements per file.
Worker_ID	Reference ID value for the worker. Worker must exist in Workday. Must be in XSD <i>string</i> format.  If you entered a value for <i>Position_Reference_ID</i> , leave this field empty.

Element	Description
Worker_Type	Valid values are <i>Employee</i> or <i>Contingent Worker</i> ; value must be in XSD <i>string</i> format.
Position_Reference_ID	If you entered a value for <i>Position_Reference_ID</i> , leave this field empty. Reference ID for the position of the worker. Must be in XSD <i>string</i> format.
Effective_Date	If you entered values for <i>Worker_ID</i> and <i>Worker_Type</i> , leave this element empty. Date that the organization assignment for the worker becomes effective in Workday. Must be in XSD <i>date</i> format.
Company_Organization_Reference_ID	Reference ID for the Company to which you're assigning the worker. Must be in XSD <i>string</i> format.
Cost_Center_Organization_Reference_ID	Reference ID for the Cost Center to which you're assigning the worker. Must be in XSD <i>string</i> format.
Region_Organization_Reference_ID	Reference ID for the Region to which you're assigning the worker. Must be in XSD <i>string</i> format.
Business_Unit_Organization_Reference_ID	Reference ID for the Business Unit to which you're assigning the worker. Must be in XSD <i>string</i> format.
Custom_Organization_Reference_ID	Don't use this element.

## Core Connector: Background Check Order

### Steps: Set Up Core Connector: Background Check Order Integrations

#### Prerequisites

You must:

- Understand Workday integrations.
- Understand Workday integration business processes.
- Set up the background check packages and statuses.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

#### Context

Connect Workday to the external background check endpoint through 2 integration systems:

- An outbound integration that sends background check requests to the external endpoint.
- An inbound integration that receives background check information from the external endpoint.

#### Steps

1. Configure the *Core Connector: Background Check Order Outbound* integration.
  - a) Access the Create Integration System task.
  - b) Enter *Core Connector: Background Check Order Outbound* at the New using Template prompt.
2. (Optional) Enable these integration services. The Configure Integration Services task displays all integration services, including required services; the required integration services aren't editable.

Option	Description
Core Connector: Background Check Outbound Delivery	Enable if you want Workday to deliver output files to background check vendors.

Option	Description
	Note: If you disable this service, deliver the files using an alternative method.
Core Connector: Background Check File Sequence Generator	Enable if you want Workday to apply a custom-formatted, unique filename to each integration file.
Integration Document Retention	Enable if you want Workday to preserve output files.

3. (Optional) Add Evergreen Requisitions for background checks.
  - a) From the related action menu of the integration system, select Integration System > Configure Integration Services.  
Select Create Integration Field Override Service as an Integration Service in the Custom Integration Service grid.
  - b) Configure the Create Integration Field Override Service task. As you complete the task, add these values:
    - On the Name field at the header, add *Evergreen Requisition*.
    - On the Business Object field at the header, add *Background Check*.
    - On the Fields grid, enter *Evergreen Requisition* in the Name column.
  - c) As a related action on the integration system, select Integration System > Configure Integration Field Overrides.  
Select Evergreen Requisition as the Override External Field for Evergreen Requisition background check.
4. As a related action on the integration system, select Integration System > Configure Integration Attributes.  
Enter attributes required by the integration template.
5. As a related action on the integration system, select Integration System > Configure Integration Maps.  
Map values between Workday and the external file format.
6. [Set Up Integration Delivery](#) on page 1952.
7. [Set Up Integration Sequence Generators](#) on page 1969.
8. (Optional) Configure the *Document Transformation* integration.  
See [Steps: Set Up Document Transformation Connector](#) on page 594.
9. [Add Integration Steps to Background Check Business Process](#) on page 1073.  
To launch the outbound integration automatically, configure the *Background Check* business process definition.

10. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

Functional Area	Domains
Integration	<i>Integration Event</i>
Personal Data	<i>Worker Data: Background Check Status</i>
Pre-Hire Process	<ul style="list-style-type: none"> <li>• <i>Job Requisition Data</i></li> <li>• <i>Manage Pre-Hire Process: Manage Pre-Hires</i></li> <li>• <i>Pre-Hire Data: Background Check Status</i></li> </ul>
Recruiting	<ul style="list-style-type: none"> <li>• <i>Candidate Data: Background Check History</i></li> <li>• <i>Candidate Data: Job Application</i></li> </ul>

Functional Area	Domains
	<ul style="list-style-type: none"> <li>• <i>Manage: Evergreen Requisitions</i></li> </ul>
Staffing	<i>Worker Data: Public Worker Reports</i>
Worker Profile and Skills	<ul style="list-style-type: none"> <li>• <i>Pre-Hire: Skills and Experience</i></li> <li>• <i>Worker Data: Skills and Experience</i></li> </ul>

See Steps: Grant Integration or External Endpoint Access to Workday.

11. Configure the *Core Connector: Background Check Inbound* integration.

- Access the Create Integration System task.
- Enter *Core Connector: Background Check Inbound* at the New using Template prompt.

12. As a related action on the integration, select Integration System > Configure Integration Attributes.

Enter attributes required by the integration template.

13. Set Up Integration Retrieval on page 1957.

14. Create an Integration System User (ISU) and grant the ISU access to these domains:

Functional Area	Domain
Personal Data	<i>Worker Data: Background Check Status</i>
Pre-Hire Process	<i>Pre-Hire Data: Background Check Status</i>
Recruiting	<ul style="list-style-type: none"> <li>• <i>Candidate Data: Background Check History</i></li> <li>• <i>Manage: Evergreen Requisitions</i></li> </ul>

See Steps: Grant Integration or External Endpoint Access to Workday.

15. Launch an Integration on page 24.

## Add Integration Steps to Background Check Business Process

### Prerequisites

- Identify the *Background Check* business process or processes that you use to call the outbound integration. Your tenant can use more than 1 *Background Check* business process; you need to modify them all.
- Security: *Business Process Administration* and *Manage: Business Process Definitions* domains in the System functional area.

### Context

To call the outbound integration and perform other operations or processes, add steps to the *Background Check* business process.

### Steps

- Open the business process.
- Select Business Process > Edit Definition as a related action.
- Set up the business process steps:

Order	Type	Specify	Optional	Additional Notes
a	Initiation	No		

OrderIf	Type	Specify	Options Group	Additional Notes
b	Integration	No		<p>This step runs your integration for Core Connector: Background Check Order Outbound.</p> <ul style="list-style-type: none"> <li>Set the Background Check ID field to Determine Value at Runtime and <i>Background Check Business Process</i>.</li> <li>For the As of Entry Moment, set the Value Type to <i>Determine Value at Runtime</i>. Specify a value of <i>Current Moment (DateTime)</i>.</li> </ul>
c	Service Document Delivery	No		Sends the XML file containing the background check requests to the external endpoint.
d	Background Check Event has Package? (Workday Owned)	Action Select Background Check Overall Status	No	<ul style="list-style-type: none"> <li>HR Administrator</li> <li>Manager</li> <li>Manager (Unconstrained)</li> <li>Recruiter</li> <li>Recruiter (Unconstrained)</li> </ul>
e	Event is subevent of Recruiting Event? (Workday Owned)	Action Make Background Check Decision	No	<ul style="list-style-type: none"> <li>HR Administrator</li> <li>Manager</li> <li>Manager (Unconstrained)</li> <li>Recruiter</li> <li>Recruiter (Unconstrained)</li> </ul>

## Concept: Core Connector: Background Check Order

With the Core Connector: Background Check Order Outbound integration, you can send background check requests for workers, pre-hires, and candidates to an external endpoint. The external endpoint performs the checks and sends information back. The Core Connector: Background Check Order Inbound integration receives the information and updates the Workday data. The integration sends requests in an output XML file, and retrieves information in an input XML file.

Depending on the external endpoint, you might need to transform the output file into the format that the external endpoint supports using 1 of these options:

- Transformation step on the business process. You configure the *business process definition* of the outbound integration to transform the output file.
- Workday Studio integration. You configure the business process definition of the outbound integration to launch a Workday Studio integration that transforms the output file.
- Other third-party tool. You configure a third-party tool to transform the output file.

## Reference: File Schema for Core Connector: Background Check Order Outbound

### XML Schema

```

<xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema"
  xmlns:bgo="urn:com.workday/coreconnector/outbound/backgroundcheckout"
  elementFormDefault="qualified" attributeFormDefault="qualified"
  targetNamespace="urn:com.workday/coreconnector/outbound/backgroundcheckout">

## Reference: File Schema for Core Connector: Background Check Inbound

### XML Elements

To import background check data from an external background check application into Workday, the data must be in the XML format described in this section.

The XML schema includes these elements:

Element	Level Description	
Background_Check_Connector_Inbound	Contains all other elements. Only 1 element permitted per file.	
Background_Check_Data	2	Unlimited number of elements permitted per file.
Business_Process_Data	3	Contains business process configurations.
Auto_Complete	4	Specifies if business process automatically completes workflow steps and bypasses To Do tasks, Notifications, and approvals for a process or subprocess. Must be in XSD <i>boolean</i> format.
Run_Now	4	Triggers immediate start of the business process or subprocess.
Comment_Data	4	Contains comment elements.
Comment	5	Free-form text field. Must be in XSD <i>string</i> format.
Worker_ID	5	Worker ID associated with the comment. Must be in XSD <i>string</i> format.
Dynamic_Business_Process_Data	8	Contains configuration elements specific to the Recruiting Job Application dynamic business process.
Next_Step_ID	4	ID value for next step in the job application business process. Must be in XSD <i>string</i> format. If a Decline next step provided, Disposition_Step_ID must have a value.
Disposition_Step_ID	3	ID value for disposition reason where a Decline next step provided on job application business process. Must be in XSD <i>string</i> format.
Comment_Data	4	Contains comment elements.
Comment	5	Free-form text field. Must be in XSD <i>string</i> format.
Worker_ID	5	Worker ID associated with the comment. Must be in XSD <i>string</i> format.
Package_Comment	4	Comment for the package. Must be in XSD <i>string</i> format.
Results_URL	4	URL that points to background check results on the external background check server. Must be in XSD <i>string</i> format.
Background_Check_ID	3	Reference ID value for the background check request. Must be in XSD <i>string</i> format. If empty, Requires Recipient element and subelements.
Recipient	3	Contains recipient identification. Required only if there's no Background_Check_ID. Includes only 1 of these subelements: <ul style="list-style-type: none"> <li>• Employee_ID</li> <li>• Applicant_ID</li> <li>• Candidate_ID</li> <li>• Contingent_Worker_ID</li> </ul>
Employee_ID	4	Identifies the recipient. Must be in XSD <i>string</i> format.
Applicant_ID	4	Identifies the recipient. Must be in XSD <i>string</i> format.
Candidate_ID	4	Identifies the recipient. Must be in XSD <i>string</i> format.
Contingent_Worker_ID	4	Identifies the recipient. Must be in XSD <i>string</i> format.
Background_Check_Status_Data	3	Contains status data elements for the background check.
Status_Date	4	Date of the status entry for the background check. Must be in XSD <i>dateTime</i> format.
Status_ID	4	ID of the status entry. Must be in XSD <i>string</i> format.
Status_Comment	4	Free-form text field. Must be in XSD <i>string</i> format.
Package_Data	3	Contains the package data elements.
Package_ID	4	Reference ID value for the package. Must be in XSD <i>string</i> format.
Package_Status	4	Status for the background check request contained in the package. Must be in XSD <i>string</i> format.
Package_Comment	4	Comment for the package. Must be in XSD <i>string</i> format.
Results_URL	4	URL that points to background check results on the external background check server. Must be in XSD <i>string</i> format.
Package_Test_Data	3	Contains package test data. An example test ensures that the supplied Social Security Number (SSN) is valid.

Element	Level Description
Test_ID	4 Reference ID value for the background check test. Must be in XSD <i>string</i> format.
Test_Status	4 Result of the background check test from the external server. Must be in XSD <i>string</i> format.

## XML Schema

</xs:schema>

```

## Core Connector: Candidate Outbound

### Steps: Set Up Core Connector: Candidate Outbound Integration

#### Prerequisites

Security: These domains in the Integration functional area:

- *Integration Build*
- *Integration Configure*

#### Context

You can create a *Core Connector: Candidate Outbound* integration system to export candidate and job application data from Workday to external applications.

The integration detects changes to candidate data from changes in:

- Job applications
- Job requisitions
- Prospect profiles
- Recruiting business processes

The integration doesn't track delegated or reassigned tasks, as well as these types of business process steps:

- Approval
- Review Documents
- To Do

## Steps

### 1. Create Integration System.

Enter *Core Connector: Candidate Outbound* in the New Using Template prompt.

2. Enable one or more of these optional integration services. The Configure Integration Services task displays all integration services, including required services; those integration services aren't editable.

Option	Description
DIS - Performance Log	Provides logs to keep track of DIS in integration events.
Effective Stack - Performance Log	Provides logs to track the performance of effective changes calculations.
Integration Document Retention	Preserves integration file output for later viewing.
Core Connector: Candidate Outbound - Integration Maps	Enables you to define mappings for select attributes.

3. As a related action on your *Core Connector: Candidate Outbound* integration, select Integration System > Configure Integration Field Attributes.

Select which candidate fields to include in the output file.

4. Select Integration System > Configure Integration Attributes as a related action on the integration system and enter attributes for integration services that you enabled in Step 2, as well as required attributes.
5. Select Integration System > Configure Integration Maps as a related action on the integration system and map the values between Workday and the external file format.
6. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Integration Build* domain.

If you add custom fields to the integration, grant the ISU access to the domains for the custom fields.

See [Steps: Grant Integration or External Endpoint Access to Workday](#).

7. [Launch an Integration](#) on page 24.

Specify these launch criteria to determine how you want the integration to export data:

- To export all data, select the Full File check box and clear the Candidate Change Detection check box.
- To export only updated data with prior values, clear the Full File check box and select the Candidate Change Detection check box.
- To export only updated data without prior values, select the Full File check box and the Candidate Change Detection check box.

## Core Connector: Competency Model

### Steps: Set Up Core Connector: Competency Model Integration

#### Prerequisites

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

#### Context

Create a *Core Connector: Competency Model* integration to export changes to competency model definitions to an external endpoint.

#### Steps

1. Access the Create Integration System task and enter *Core Connector: Competencies Outbound* in the New Using Template prompt.
  2. (Optional) [Set Up Integration Sequence Generators](#) on page 1969.
  3. As a related action on your *Core Connector: Competency Model* integration, select Integration System > Configure Integration Attributes and enter attributes required by the integration template.
  4. Select Integration System > Configure Integration Maps as a related action on the integration system. Map values between Workday and the external file format.
  5. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:
    - *Integration Event*
    - *Set Up: Skills and Experience*
- See: [..../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).
6. [Select and Set Up Connector Output Fields](#) on page 1977.
  7. [Create Integration Business Process](#) on page 1950.
  8. (Optional) [Steps: Set Up Document Transformation Connector](#) on page 594.
  9. [Launch an Integration](#) on page 24.

### Concept: Core Connector: Competency Model

The Core Connector: Competency Model integration exports competency model data from Workday in simple XML format. As you create, update, or delete competency model data, the integration generates an output file containing the changes.

The integration includes a configurable set of competency model data. You can select which fields to include or exclude, which ones to require, and which ones to truncate.

#### Launch/Schedule Options

Workday provides these launch schedule options for the Core Connector: Competency Model integration:

- Scheduled Run Frequency. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration collects all qualifying changes based on the launch parameters. You can schedule a Core Connector: Competency Model integration to run several times per day; launching the integration frequently doesn't affect performance.
- Run Now. You can launch the integration manually. Workday prompts you for launch parameters.

For each launch schedule option, you can enter these launch parameters:

Parameter	Description
As Of Entry Moment	Extracts records that are current as of the specified parameter.
Effective Date	Extracts records that are current as of the specified parameter.

## Integration Audit Files

Every time the integration runs, Workday generates these files:

- The *Data Changes Audit* is a readable version of the integration output file.
- The *Diagnostic Audit* is designed to help you troubleshoot integration errors.
- The *Schema XSD* file defines the content and the structure of the output file. It includes only those fields that you've enabled for your integration system. Workday generates this file every time the integration runs. The file reflects your integration configuration as of the moment that the integration ran. You can only generate this file by running the integration.

You can find these files in the Reports and Other Output Files section of the Integration Event for each integration run.

Note: Because Workday includes actual data in the Data Change Audit file, you can secure this file separately. Example: if administrators can't have access to the data.

## Reference: Core Connector: Competency Model Integration Data Sections

Before you build an integration with the Core Connector: Competency Model template, familiarize yourself with the data section to understand which fields are available for output and how the configuration options affect integration behavior.

Section	Description	Fields
Competency Data	<ul style="list-style-type: none"> <li>This section can have one or more records.</li> <li>The <i>Competency Level</i> attribute doesn't send data, but enables the attributes with the same attribute prefix. Example: enable <i>Competency Level</i> in order to use the <i>Competency Level</i>, <i>Competency Rating</i>, and <i>Competency Behavior</i> field attributes.</li> </ul>	<ul style="list-style-type: none"> <li>Competency ID</li> <li>Competency Name</li> <li>Competency Description</li> <li>Competency Category</li> <li>Competency Level</li> <li>Competency Level / Competency Level ID</li> <li>Competency Level / Competency Level Name</li> <li>Competency Level / Competency Level Behavior</li> <li>Competency Level / Competency Level Value</li> <li>Competency Level / Competency Level Range Begin</li> <li>Competency Level / Competency Level Range End</li> <li>Competency Level / Competency Level Exclude from Calculations</li> <li>Inactive</li> </ul>

## Core Connector: Global Worker

### Steps: Set Up Core Connector: Global Worker

#### Prerequisites

- Create a *True/False Condition* calculated field that returns true for any worker that you want to include in integration output. The calculated field must be based on the *Worker* primary business object.
- Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

#### Context

To export changes to worker data that account for local time zones, create a Core Connector: Global Worker integration.

#### Steps

1. [Create Integration System](#) on page 1967.  
Enter *Core Connector: Global Worker* at the New Using Template prompt.
2. Enable one or more of these optional integration services. The Configure Integration Services task displays all integration services, including required services; those integration services aren't editable.

Option	Description
Core Connector: Global Worker Transaction Log Service	Enables your integration to subscribe to events that take place in Workday. This option

Option	Description
	enables your integration to report only changed fields for workers, rather than report all fields. If disabled, your integration first extracts all data for eligible records, then evaluates the data for changes. Using this option can adversely affect performance.
Core Connector: Global Worker Sequence Generator Service	Applies a custom-formatted, unique filename to each integration file.

3. As a related action on your *Core Connector: Global Worker integration* select Integration System > Configure Integration Transaction Log.

Select the Workday transactions that you want monitored for changes.

Note: Workday recommends that you select Subscribe to all Transaction Types except, then filter out only transaction types that you know have no relevance to your needs. If in doubt, don't filter out a transaction type.

4. Set Up Integration Sequence Generators on page 1969.
5. Select and Set Up Connector Output Fields on page 1977.
6. As a related action on your *Core Connector: Global Worker integration*, select Integration System > Configure Integration Attributes. Enter attributes for integration services that you enabled in Step 2, as well as required attributes.
7. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Integration Event* domain.  
See: [.../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).
8. (Optional) Grant the ISU access to the *View: Core Connector Integration Document* domain so that the ISU has access to files generated by the integration.
9. As a related action on your integration, select Integration System > Configure Integration Population Eligibility and select a *True/False Condition* calculated field that defines which workers the integration should poll for changes.
10. Set Up Integration Delivery on page 1952.
11. (Optional) Steps: Set Up Document Transformation Connector on page 594.  
If you skip this step, create an external application that transforms Workday XML into a format that your external endpoint supports.
12. Launch an Integration on page 24.

## Concept: Core Connector: Global Worker

The Core Connector: Global Worker integration exports worker data changes from Workday in simple XML format. Workday applies effective dates based on local time zones. As you hire, promote, transfer, terminate, or update worker data, the integration generates an XML file containing the changes.

Using configurable data sections, you can remove fields, truncate them, or make them required.

### Change Detection

Core Connector: Global Worker detects changes to worker data by monitoring a transaction log. When you configure the integration system, you select which business process and transaction types that the integration system subscribes to. If your integration system doesn't subscribe to a transaction type that affects the profile of your worker, Workday doesn't include changes triggered by that transaction type. By including all business process and transaction types, you benefit automatically when Workday adds new

types. However, including all is also a potential risk, as the integration might include more information than is necessary.

Core Connector: Global Worker integration uses a three-step process to detect and report changes:

1. The integration checks the transaction log. It determines which workers have changes that result in the generation of one of the configured transaction events.
2. For each worker with a matching transactional change, the integration compares their report fields for:
  - The time at which the integration ran.
  - The time at which the integration last successfully ran

The integration identifies which, if any, of the values of interest have changed.

3. If the worker has any changes in field values or eligibility, Workday generates an appropriate creation, change, or deletion message.

### **Change Detection Limitations**

Changes to the Classification of a Job don't trigger change detection for this integration. The context of the change is on the Job Profile (template), and not directly related to any associated job (instance) for a worker. However, full extraction on worker records includes the job classification element.

### **Worker Eligibility**

For each integration system, you define a group of workers that belongs to the integration system. A single *True/False Condition* report field or calculated field defines membership. If the field value is true for a worker, that worker is a member of the group, and Workday includes changes for that worker in the output file. If the field value is false, the integration system ignores that worker.

You can use report fields on the Worker business object to define eligibility. If you can't define your group membership criteria using a report field, you can create and use a calculated field. If multiple Boolean values are true, the calculated field can evaluate the worker business object and its related business objects to return true. Example: use a calculated field to return true if:

- The worker is a contingent employee.
- The primary location of the worker is in the United States.
- The supervisor of the worker is John Doe.

### **Output Configuration and Formats**

The Core Connector: Global Worker integration supports output configuration using data sections. The integration template includes these data sections:

- Personal Data.
- Status Data.
- Position Data.
- Leave of Absence Data.

You can select which fields to include or exclude, which ones to require, and which ones to truncate. Workday exports data in a Workday-defined XML format. Each field element in the XML file includes separate elements containing the current value and the prior value.

### **Launch/Schedule Options**

Workday provides these launch schedule options for the Core Connector: Worker integration:

- Organization: If you intend to run the integration immediately, select the organization for which you want to run the integration. The prompt varies depending on the Integration Process Event and on your security access:
  - Owning Organization* displays if the Integration Process Event for this integration is associated with a specific organization. You can select the organization or any of its subordinate organizations of which you're a member or have an organization role.
  - Organization By Type* displays if the Integration Process Event for this integration has no associated organization. You can select any organization and subordinate organization of which you're a member or have an organization role.
- Scheduled Run Frequency. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration collects all qualifying changes based on the launch parameters. You can schedule a Core Connector: Worker integration to run several times per day; launching the integration frequently doesn't affect performance.
- Run Now. You can launch the integration manually for specific workers, or for all eligible workers. Workday prompts you to enter launch parameters.

For each launch schedule option, you can enter these launch parameters:

Parameter	Description
As Of Entry Moment, Effective Date, Last Successful Extracts records that are current as of the specified As Of Entry Moment, Last Successful Effective Date	As Of Entry Moment and Effective Date parameters. If Full File isn't selected, then the extract includes only those records that have changed in one or more output fields. Workday compares to what was current as of the Last Successful As Of Entry Moment and Last Successful Effective Date parameters.
Full File	Extracts Workers as of the As Of Entry Moment and Effective Date, regardless of whether they've changed.
Restrict Results By Orgs	Extracts Workers for only the specified Organizations and all subordinates.
Workers	Extracts only the specified Workers.
	If you configure no values, then the integration considers all workers when looking for transactional and data changes. Specifying workers in this list doesn't force their inclusion in the output file. Information for a worker displays in the output file only if there are changes in the data fields evaluated by the integration system.
	If there was an error involving data for one or more workers during a prior integration run, specify workers in this parameter at launch time. Correct the worker data and then run the integration again only for those workers. In this case, set the Last Successful As Of Entry Moment to the moment used for that parameter on the prior run that had problems.

## Integration Audit Files

Every time the integration runs, Workday generates these files:

- The *Data Changes Audit* is a readable version of the integration output file (only when data changes are detected).

- The *Diagnostic Audit* is designed to help you troubleshoot integration events.
- The *Schema XSD* file defines the content and the structure of the output file. It includes only those fields that you've enabled for your integration system. Workday generates this file every time the integration runs. The file reflects your integration configuration as of the moment that the integration ran. You can only generate this file by running the integration.

You can find these files in the Reports and Other Output Files section of the Integration Event for each integration run.

Note: Because Workday includes actual data in the Data Change Audit file, you can secure this file separately. Example, if administrators can't have access to the data.

## Core Connector: Job Postings

### Steps: Set Up Core Connector: Job Postings

#### Prerequisites

Security: *Integration Build* domain in the Integration functional area.

#### Context

To send job posting data to an external job posting service or web site, create and configure a Core Connector: Job Postings integration system.

#### Steps

1. Access the Create Integration System task and enter *Core Connector: Job Postings* at the New using Template prompt.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
2. Enable 1 or more of the optional integration services.  
The Configure Integration Services task displays all integration services, including required services. Required integration services aren't editable.
3. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:
  - *Integration Event*
  - *Job Postings: External*
  - *Job Postings: Internal*

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

4. Select Integration System > Configure Integration Maps from the related actions menu and enter integration service attributes.

All Internal Values need to be mapped to an External Value. If you don't have every Internal Value mapped, then you can also create a Default Value. The integration can fail if you don't select a Default Value.

5. Select Integration System > Configure Integration Attributes as a related action on the integration system and enter integration service attributes.  
Workday displays attributes for each enabled integration service; if you enable additional integration services, more attributes display in the Configure Integration Attributes task.
6. [Set Up Integration Sequence Generators](#) on page 1969.  
This step is required only if you enabled the *Filename Sequence Generator* integration service.
7. [Set Up Integration Delivery](#) on page 1952.  
Specify how Workday delivers integration output documents. Configure a *Document Delivery* step on the business process definition for the integration.

8. (Optional) [Create Integration \(Step\)](#).

Add the integration to the *Post Job* business process.

9. (Optional) [Launch an Integration](#) on page 24.

This step is required if you didn't add the integration to the *Post Job* business process.

10. [Steps: Set Up Document Transformation Connector](#) on page 594.

Create a transformation that converts integration output files into the format required by the external endpoint.

## Concept: Core Connector: Job Postings

Core Connector: Job Postings exports all active job postings from Workday to one or more external job posting websites. As you post, update job postings, or unpost jobs, the integration generates an output file in Workday XML format containing all active postings.

### Integration Services

The Core Connector: Job Postings template includes these integration services:

**Table 2: Core Connector: Job Postings Integration Services**

Integration Service	Required/ Optional	Description
<i>Core Connector: Job Postings Init Svc</i>	Required	Extracts job posting data from your tenant and generates an output file in Workday XML format. Optionally, the Connector can include inactive as well as active job postings.
<i>Filename Sequence Generator</i>	Optional	Enables the Connector to generate a unique, sequenced filename each time it runs.
<i>Transaction Log Service</i> <i>Document Delivery Service</i>	N/A Optional	Don't enable this service. Enables the Connector to send output files to an external endpoint over a range of different transports such as AS2, FTP, FTPS, and SFTP. You can have the documents delivered as part of a larger business process. Example: an explicit approval step before the delivery step.
<i>Integration Document Retention</i>	Optional	Enables the Connector to store output files for auditing purposes.

### Launch/Schedule Options

Workday provides these launch schedule options for the Core Connector: Job Postings integration:

- Launch using an Integration step on the *Post Job* business process.
- Launch by schedule. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration collects all active job postings to send to the external endpoint. Workday recommends that if you schedule Core Connector: Job Postings, you schedule the integration to run daily.
- Launch immediately. You can launch the integration manually. Workday prompts you for the launch parameters.

For launch by schedule and launch immediately, you can enter these launch parameters:

Parameter	Description
<i>Job Requisition(s)</i>	Extracts only the specified Job Requisitions.
<i>Job Posting(s)</i>	Extracts only the specified job postings.

Parameter	Description
Job Posting Site Name(s)	Extracts job postings for only the specified job posting site.
Job Posting Start Date	Extracts job postings with a start date on or after the specified date.
Job Posting End Date	Extracts job postings with an end date on or before the specified date.

## Integration Audit Files

Every time the integration runs, Workday generates these files:

- The *Data Changes Audit* is a readable version of the integration output file.
- The *Diagnostic Audit* is designed to help you troubleshoot integration errors.
- The *Schema XSD* file defines the content and the structure of the output file. Workday generates this file every time the integration runs. You can only generate this file by running the integration.

You can find these files in the Reports and Other Output Files section of the Integration Event for each integration run.

Note: Because Workday includes actual data in the Data Change Audit file, you can secure this file separately. Example: if administrators can't have access to the data.

## Core Connector: Job Profile and Job Family

### Steps: Set Up Core Connector: Job Profile and Job Family Integration

#### Prerequisites

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

#### Context

To export core job family and job profile definitions to an external endpoint, you can create a *Core Connector: Job Profile and Job Family* integration system.

#### Steps

1. Access the Create Integration System task and enter *Core Connector: Job Profile and Job Family* in the New Using Template prompt.
2. Enable 1 or both of these integration services.

Option	Description
Core Connector: Job Family Data Section Fields	Includes job family data in the integration output document.
Core Connector: Job Profile Data Section Fields	Includes job profile data in the integration output document.

3. As a related action on your *Core Connector: Job Profile and Job Family* integration, select Integration System > Configure Integration Attributes and enter attributes required by the integration template.
4. Select Integration System > Configure Integration Maps as a related action on the integration system and map values between Workday and the external file format.
5. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:
  - *Integration Event*
  - *Job Information*

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

6. [Select and Set Up Connector Output Fields](#) on page 1977.
7. [Set Up Integration Delivery](#) on page 1952.
8. [Set Up Integration Sequence Generators](#) on page 1969.
9. (Optional) [Steps: Set Up Document Transformation Connector](#) on page 594.
10. [Launch an Integration](#) on page 24.

## Concept: Core Connector: Job Profile and Job Family

With Core Connector: Job Profile and Job Family, you can extract job-related definitions, transform the data, and send it to an endpoint of your choice. The integration provides tools to capture changes to job profile and job family data and configure an output file to deliver to an external endpoint.

The Core Connector: Job Profile and Job Family integration provides a single source-of-truth for core data. It generates integration output files that you can transform as required to serve the needs of multiple downstream endpoints. Because your needs vary based on organization size, privacy requirements, and external endpoint requirements, the Core Connector: Job Profile and Job Family integration offers a choice of implementation options.

Depending on the requirements of your external endpoint, you might need to transform the file into the format that it supports using one of these options:

- Transformation step on the business process. You configure the business process definition for the integration to transform the output file into the format required.
- Workday Studio integration. You configure the business process definition for the integration to launch a Workday Studio integration. The Studio integration then transforms the output file into the format required.
- Other third-party tool. You configure a third-party tool to transform the output file.

Core Connector: Job Profile and Job Family is an integration template with a configurable set of data across a range of categories. It enables you to specify which data elements to include in integration output files. When launched, the integration collects a snapshot of all data and creates an output file in XML format based on your specifications.

The Core Connector: Job Profile and Job Family integration creates integration output files in a Workday-defined XML format. You can configure this output for delivery, or further transformation.

Using Core Connector: Job Profile and Job Family in combination with Core Connector: Worker, you can create a single source-of-truth for all external endpoints that need Workday data. By creating a single set of Connectors, you can provide a rapid, flexible, and repeatable method for integrating with Workday. Using this Connector you can ensure that all external endpoints receive only the data that you want to expose.

## Launch/Schedule Options

Workday provides these launch schedule options for Core Connector: Job Profile and Job Family:

- Organization: If you intend to run the integration immediately, select the organization for which you want to run the integration. The prompt varies depending on the Integration Process Event and on your security access:
  - *Owning Organization* displays if the Integration Process Event for this integration is associated with a specific organization. You can select the organization or any of its subordinate organizations of which you're a member or have an organization role.
  - *Organization By Type* displays if the Integration Process Event for this integration has no associated organization. You can select any organization and subordinate organization of which you're a member or have an organization role.
- Scheduled Run Frequency. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration collects all qualifying changes based on the launch parameters. You can schedule a Core Connector: Worker integration to run several times per day; launching the integration frequently doesn't affect performance.
- Run Now. You can launch the integration manually for specific workers, or for all eligible workers. Workday prompts you for launch parameters.

For each launch schedule option, you enter these launch parameters:

Parameter	Description
As Of Entry Moment, Effective Date, Last Successful Extracts	records that are current as of the specified As Of Entry Moment and Effective Date parameters.
As Of Entry Moment, Last Successful Effective Date	As Of Entry Moment and Effective Date parameters. If Full Extract isn't selected, then the extract includes only records that changed in one or more output fields. Workday compares current records with what was current as of the Last Successful As Of Entry Moment and Last Successful Effective Date parameters.
Full Extract	Extracts Job Profiles and Job Families as of the As Of Entry Moment and Effective Date, regardless of whether they've changed.
Job Families	Extracts only the specified Job Families.
Job Profiles	Extracts only the specified Job Profiles.

## Integration Audit Files

Every time the integration runs, Workday generates these files:

- The *Data Changes Audit* is a readable version of the integration output file.
- The *Diagnostic Audit* is designed to help you troubleshoot integration errors.
- The *Schema XSD* file defines the content and the structure of the output file. It includes only those fields that you've enabled for your integration. Workday generates this file every time the integration runs. The file reflects your integration configuration as of the moment that the integration ran. You can only generate this file by running the integration.

You can find these files in the Reports and Other Output Files section of the Integration Event for each integration run.

Note: Because Workday includes actual data in the Data Change Audit file, you can secure this file separately. Example: if administrators can't have access to the data.

## Reference: Core Connector: Job Profile and Job Family Data Sections

Before you build an integration with the Core Connector: Job Profile and Job Family template, familiarize yourself with each data section to understand which fields are available for output and how the configuration options affect integration behavior.

During integration configuration, you enable integration services for each data section that you want to include in integration output documents.

Section	Description	Fields
Job Family Data	This section can have multiple records.	<ul style="list-style-type: none"> <li>• Job Family ID</li> <li>• Inactive</li> <li>• Job Family Name</li> <li>• Job Family Summary</li> <li>• Job Profile</li> <li>• Job Profile ID</li> <li>• Inactive</li> <li>• Job Title</li> <li>• Job Profile Summary</li> <li>• Public Job</li> <li>• Work Shift Required</li> <li>• Management Level</li> <li>• Job Category</li> <li>• Job Level</li> <li>• Job Family</li> <li>• Job Classifications</li> <li>• Job Exempt Location Context</li> <li>• Job Exempt</li> <li>• Compensation Grade</li> <li>• Company Insider Type</li> <li>• Critical Job</li> <li>• Difficulty to Fill</li> <li>• Pay Rate Country</li> <li>• Pay Rate Type</li> <li>• Workers Compensation Code</li> <li>• Responsibility Description</li> <li>• Responsibility Required</li> <li>• Work Experience</li> <li>• Work Experience Rating</li> <li>• Work Experience Required</li> <li>• Education Degree</li> <li>• Education Field of Study</li> <li>• Education Required</li> <li>• Language</li> <li>• Language Ability Type</li> <li>• Language Proficiency Type</li> <li>• Language Required</li> <li>• Competency</li> <li>• Certification</li> <li>• Certification Country</li> <li>• Certification Name</li> <li>• Certification Issuer</li> <li>• Proficiency Rating</li> <li>• Training Name</li> <li>• Training Description</li> <li>• Training Type</li> <li>• Training Required</li> </ul>
Job Profile Data	This section can have multiple records.	

## Core Connector: Job Requisitions

### Steps: Set Up Core Connector: Job Requisitions Integration

#### Context

To export changes to job requisition data, create a Core Connector: Job Requisitions integration.

#### Steps

1. Access the Create Integration System task and enter *Core Connector: Job Requisitions* at the New Using Template prompt.  
Security: *Integration Build* in the Integration functional area.
2. Enable one or more of these optional integration services. The Configure Integration Services task displays all integration services, including services that are required; those integration services aren't editable.

Option	Description
<i>HiredScore Effective Data Fields</i>	Provides Role Assignment data for the Job Requisition. (For HiredScore users only)
<i>Job Qualification Data Section Fields</i>	Provides job qualifications data for each job requisition.
<i>Position Data Section Fields</i>	Provides position data for the job requisition.
<i>Transaction Log Service</i>	Enables your integration system to subscribe to events that take place in Workday. Reports only changed fields for job requisitions, rather than all fields.  If disabled, your integration first extracts all data for eligible records, then evaluates the data for changes. Using this option can adversely affect performance.
<i>Job Requisition Init Svc</i>	Specifies these attributes on the integration system: <ul style="list-style-type: none"> <li>• Integration attributes</li> <li>• The integrations maps</li> <li>• The launch parameters (non-date launch parameters)</li> <li>• The toggleable routing strategy</li> </ul>
<i>Date Launch Parameters</i>	Specifies the: <ul style="list-style-type: none"> <li>• As-of-entry moment from which to begin processing entries into Workday.</li> <li>• Effective date when entries became effective in Workday.</li> <li>• Date of the last successful integration event since the as-of-entry moment.</li> <li>• Date of the last successful integration since the effective date.</li> </ul>

Option	Description
<i>Job Requisition Data Section Fields</i>	Provides job requisition data for each job requisition.
<i>Job Qualification Data Section Fields</i>	Provides job qualification data for each job requisition.
<i>Job Requisitions Delivery Service</i>	Enables the delivery of integration documents to an endpoint. Example: An SFTP endpoint.
<i>Filename Sequence Generator</i>	Outputs filenames in sequence to prevent overriding existing files. Example: Filename1, Filename2.
<i>Integration Document Retention</i>	Retains all of the integration documents.

3. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:
- *Integration Event*
  - *Job Requisition Data*

See: [..../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).

4. (Optional) As a related action on the integration system, select Integration System > Configure Integration Transaction Log.

Configure the integration to subscribe to Workday events that might trigger the need to send an update to the external endpoint. This step is required only if you enabled the Transaction Log Service.

5. [Set Up Integration Sequence Generators](#) on page 1969.

Specify how Workday applies a unique name to each integration output document.

6. [Set Up Core Connector: Job Requisitions Integration Attributes and Maps](#) on page 1097.

7. [Select and Set Up Connector Output Fields](#) on page 1977.

Select fields for the output file and enable data validations.

8. (Optional) [Add Custom Fields to Connector Output](#) on page 1978.

Configure custom fields for the output file.

9. [Set Up Integration Delivery](#) on page 1952.

Specify how and where to deliver the integration output files.

10. Define how Workday transforms integration output documents using XSLT.

See: [Steps: Set Up Document Transformation Connector](#) on page 594.

11. [Launch an Integration](#) on page 24.

Schedule how often you want Workday to launch the integration.

## Set Up Core Connector: Job Requisitions Integration Attributes and Maps

### Prerequisites

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

### Steps

1. As a related action on your *Core Connector: Job Requisitions* integration, select Integration System > Configure Integration Attributes.

2. Enter attribute values for enabled integration services:

Option	Description
Country Code Type	Specifies which Country Code type ( <i>ISO-3166-1-Alpha-2</i> , <i>ISO-3166-1-Alpha-3</i> ) to include in the output file.
Output Document Tags	Select one or more Document Tags to apply to each integration output document.
Required Field Validation	Applies additional validation rules that identify errors that can occur when exporting data, and specifies error handling: <ul style="list-style-type: none"> <li><i>Omit</i>: the integration doesn't include records with errors in the output file.</li> <li><i>Include</i>: the integration includes records with errors in the output file; warning displays in the Integration Event for the integration run.</li> </ul>
Include Prior Values	Includes prior values with the current value of each field.
Format Line Breaks For HTML - Job Description Summary	Replaces any line breaks in the Job Description Summary field with an HTML   line break tag.
Include Non-Recruitable Job Requisitions	Includes Job Requisitions that Workday doesn't consider available for recruiting.
Document Retention Policy	Enter the number of days that Workday preserves output files.

## Concept: Core Connector: Job Requisitions

The Core Connector: Job Requisitions integration can export job requisition changes from Workday in simple XML format. As you create, update, or delete job requisition data, the integration generates an output file containing the changes.

The integration includes a configurable set of job requisition data across a range of categories. You can specify which data sections to include in the output file. Each section provides a set of fields. You can select which fields to include or exclude, which fields you want to require, and which fields you want to truncate.

Use this Connector to send data on open, closed, and future positions. Don't use this Connector to track changes to a worker in a position. This Connector doesn't support evergreen job requisitions.

### Change Detection

The Core Connector: Job Requisitions detects changes to job requisitions by monitoring a transaction log. When you configure the integration system, you select which business process and transaction types that the integration system subscribes to. Excluding business process and transaction types that are irrelevant to your needs improves performance. However, if your integration system doesn't subscribe to a transaction type that affects your job requisition records, Workday wouldn't include changes triggered by that transaction type. Workday recommends that if you aren't sure if the integration system must subscribe to a given transaction or business process type, don't exclude it.

The Core Connector: Job Requisitions integration uses a three-step process to detect and report changes:

1. The integration checks the transaction log. It determines which job requisitions have changes that resulted in the generation of at least one of the configured transaction events.
2. For each job requisition with a matching transactional change, the integration compares values:
  - For the time at which the integration was run
  - Time at which it was last successfully run

It identifies which, if any, of the values of interest have changed.

3. If the job requisition has any changes in field values, Workday generates an appropriate creation, change, or deletion message.

### Full-Diff Extract

You can configure your Core Connector: Job Requisitions integration to select all job requisitions, then determine changes for the returned data. To enable this option, disable the Transaction Log service. When you run the integration, Workday extracts all applicable data for all job requisitions. The integration extracts all data regardless of whether the job requisition had any changes since the last successful integration system run. Using this option can adversely affect Workday performance. Core Connector: Job Requisition integration first selects all positions, and only then, determines changes for the returned data.

### Launch/Schedule Options

Workday provides these launch schedule options for the Core Connector: Job Requisitions integration:

- Scheduled Run Frequency. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration collects all qualifying changes based on the launch parameters. You can schedule a Core Connector: Job Requisitions integration to run several times per day; launching the integration frequently doesn't affect performance.
- Run Now. You can launch the integration manually. Workday prompts you to enter launch parameters.

For each launch schedule option, you can enter these launch parameters:

Parameter	Description
As Of Entry Moment, Effective Date, Last Successful As Of Entry Moment, Last Successful Effective Date	Extracts records that are current as of the specified As Of Entry Moment and Effective Date parameters. If Full Extract isn't selected, then the extract includes only those records that have changed in one or more output fields. Workday compares current values as of the Last Successful As Of Entry Moment and Last Successful Effective Date parameters.
Full Extract	Extracts Job Requisitions as of the As Of Entry Moment and Effective Date, regardless of whether they've changed.
Job Requisition(s) Location(s)	Extracts only the specified Job Requisitions. Extracts Job Requisitions for only the specified Locations. Filtering is based on both Primary and/or Additional values tagged on the Job Requisition.
Supervisory Organization(s)	Extracts Job Requisitions for only the specified Supervisory Organizations.

### Integration Audit Files

Every time the integration runs, Workday generates these files:

- The *Data Changes Audit* is a readable version of the integration output file.
- The *Diagnostic Audit* is designed to help you troubleshoot integration errors.

- The *Schema XSD* file defines the content and the structure of the output file. It includes only those fields that you've enabled for your integration system. Workday generates this file every time the integration runs. The file reflects your integration configuration as of the moment that the integration ran. You can only generate this file by running the integration.

You can find these files in the Reports and Other Output Files section of the Integration Event for each integration run.

Note: Because Workday includes actual data in the Data Change Audit file, you can secure this file separately. Example: if administrators can't have access to the data.

## Reference: Core Connector: Job Requisitions Integration Data Sections

Before you build an integration with the Core Connector: Job Requisitions template, familiarize yourself with each data section to understand which fields are available for output and how the configuration options affect integration behavior.

During integration configuration, you enable integration services for each data section that you want to include in the output file.

Section	Description	Fields
Job Requisition Data	This section can have one or more records.	<ul style="list-style-type: none"> <li>• Job Requisition ID</li> <li>• Job Requisition Status</li> <li>• Supervisory Organization</li> <li>• Job Posting Title</li> <li>• Positions Allocated</li> <li>• Positions Available</li> <li>• Available for Recruiting</li> <li>• Replacement for Worker</li> <li>• Job Description</li> <li>• Job Description Summary</li> <li>• Justification</li> <li>• Recruiting Instruction</li> <li>• Do Not Send To Recruiting System</li> <li>• Recruiting Start Date</li> <li>• Target Hire Date</li> <li>• Target End Date</li> <li>• Job Profile</li> <li>• Worker Type</li> <li>• Worker Subtype</li> <li>• Primary Location</li> <li>• Additional Location</li> <li>• Time Type</li> <li>• Scheduled Weekly Hours</li> <li>• Work Shift</li> </ul>

Section	Description	Fields
Job Qualification Data	<p>These attributes do not send data directly but activate the attributes with the same prefix:</p> <ul style="list-style-type: none"> <li>• <i>Competency Qualification</i></li> <li>• <i>Certification Qualification</i></li> <li>• <i>Education Qualification</i></li> <li>• <i>Language Qualification</i></li> <li>• <i>Responsibility Qualification</i></li> <li>• <i>Training Qualification</i></li> <li>• <i>Work Experience Qualification</i></li> </ul> <p>Example: Enabling <i>Language Qualification</i> allows the use of these related field attributes:</p> <ul style="list-style-type: none"> <li>• <i>Language</i></li> <li>• <i>Language Ability Type</i></li> <li>• <i>Language Proficiency Type</i></li> <li>• <i>Language Required</i></li> </ul>	<ul style="list-style-type: none"> <li>• Competency Qualification</li> <li>• Competency Qualification / Competency</li> <li>• Competency Qualification / Competency Level</li> <li>• Competency Qualification / Competency Required</li> <li>• Certification Qualification</li> <li>• Certification Qualification / Certification</li> <li>• Certification Qualification / Certification Country</li> <li>• Certification Qualification / Certification Name</li> <li>• Certification Qualification / Certification Issuer</li> <li>• Certification Qualification / Certification Required</li> <li>• Education Qualification</li> <li>• Education Qualification / Education Degree</li> <li>• Education Qualification / Education Field of Study</li> <li>• Education Qualification / Education Required</li> <li>• Language Qualification</li> <li>• Language Qualification / Language</li> <li>• Language Qualification / Language Ability Type</li> <li>• Language Qualification / Language Proficiency Type</li> <li>• Language Qualification / Language Required</li> <li>• Responsibility Qualification</li> <li>• Responsibility Qualification / Responsibility Description</li> <li>• Responsibility Qualification / Responsibility Required</li> <li>• Training Qualification</li> <li>• Training Qualification / Training Name</li> <li>• Training Qualification / Training Description</li> <li>• Training Qualification / Training Type</li> <li>• Training Qualification / Training Required</li> <li>• Work Experience Qualification</li> <li>• Work Experience Qualification / Work Experience</li> <li>• Work Experience Qualification / Work Experience Rating</li> <li>• Work Experience</li> </ul>

Section	Description	Fields
Position Data	This section has a single record, with primary position only.	<ul style="list-style-type: none"> <li>• Position ID</li> <li>• Is Closed</li> <li>• Role Assignment Reference</li> <li>• Effective Date</li> <li>• Role</li> <li>• Role Reference</li> <li>• Role Assignee</li> <li>• Role Assignee Reference</li> <li>• Worker</li> <li>• Worker Reference</li> </ul>
HiredScore Data	This section can have one or more records.	

## Core Connector: LMS Outbound

### Steps: Set Up Core Connector: Worker for LMS Outbound Integration

#### Prerequisites

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

#### Context

To export changes to worker data, create a *Core Connector: Worker for LMS Outbound* integration.

#### Steps

1. Access the Create Integration System task and enter *Core Connector: LMS Outbound* in the New using Template prompt.
2. Enable one or more of these optional integration services. The Configure Integration Services task displays all integration services, including required services; those integration services aren't editable.

Option	Description
Core Connector: Organization Outbound Integration Configuration	Enables the integration system to deliver organization data to an external LMS.
Core Connector: Organization Data Section Fields	Provides organization data fields.  The <i>Core Connector: Organization Outbound Integration Configuration</i> service must be enabled to enable this service.
Core Connector: Organization Filename Sequence Generator	Applies a custom-formatted, unique filename to each integration file.  The <i>Core Connector: Organization Outbound Integration Configuration</i> service must be enabled to enable this service.
Core Connector: Organization Transaction Log Service	Enables your integration system to subscribe to events that take place in Workday. This action enables your integration to report changed fields for workers, rather than report all fields.  If disabled, your integration first extracts all data for eligible records, then evaluates

Option	Description
	<p>the data for changes. Using this option can adversely affect performance.</p> <p>The <i>Core Connector: Organization Outbound Integration Configuration</i> service must be enabled to enable this service.</p>
Define Organization Eligibility	<p>Enables you to configure an Integration Field Override to define which organizations to include in the integration output.</p> <p>The <i>Core Connector: Organization Outbound Integration Configuration</i> service must be enabled to enable this service.</p>
Core Connector: Location Integration Configuration	<p>Enables the integration system to deliver location data to an external LMS.</p>
Core Connector: Location Data Section Fields	<p>Provides location data fields.</p> <p>The <i>Core Connector: Location Integration Configuration</i> service must be enabled to enable this service.</p>
Core Connector: Location Filename Sequence Generator	<p>Enable if you want Workday to apply a custom-formatted, unique filename to each integration file.</p> <p>The <i>Core Connector: Location Integration Configuration</i> service must be enabled to enable this service.</p>
Core Connector: Competencies Outbound Integration Configuration	<p>Enables the integration system to deliver competency data to an external LMS.</p>
Core Connector: Competency Data Section Fields	<p>Provides competency data fields.</p> <p>The <i>Core Connector: Competencies Outbound Integration Configuration</i> service must be enabled to enable this service.</p>
Core Connector: Competencies Outbound Filename Sequence Generator	<p>Enable if you want Workday to apply a custom-formatted, unique filename to each integration file.</p> <p>The <i>Core Connector: Competencies Outbound Integration Configuration</i> service must be enabled to enable this service.</p>
Core Connector: Job Profile and Job Family Integration Configuration	<p>Enables the integration system to deliver job profile and job family data to an external LMS.</p>
Core Connector: Job Profile Data Section Fields	<p>Provides Job Profile data fields.</p> <p>The <i>Core Connector: Job Profile and Job Family Integration Configuration</i> service must be enabled to enable this service.</p>
Core Connector: Job Family Data Section Fields	<p>Provides Job Family data fields.</p>

Option	Description
	<p>The <i>Core Connector: Job Profile and Job Family Integration Configuration</i> service must be enabled to enable this service.</p>
Core Connector: Job Profile and Job Family Filename Sequence Generator	<p>Enable if you want Workday to apply a custom-formatted, unique filename to each integration file.</p> <p>The <i>Core Connector: Job Profile and Job Family Integration Configuration</i> service must be enabled to enable this service.</p>
Core Connector: Worker Integration Configuration	Enables the integration system to deliver worker data to an external LMS.
Worker Personal Data Section Fields	<p>Provides employee personal data and contact information.</p> <p>The <i>Core Connector: Worker Integration Configuration</i> service must be enabled to enable this service.</p>
Worker Status Data Section Fields	<p>Provides employment status and service dates.</p> <p>The <i>Core Connector: Worker Integration Configuration</i> service must be enabled to enable this service.</p>
Worker Position Data Section Fields	<p>Provides:</p> <ul style="list-style-type: none"> <li>• Job profile data.</li> <li>• Organization membership data.</li> <li>• Salary and base compensation elements.</li> </ul> <p>The <i>Core Connector: Worker Integration Configuration</i> service must be enabled to enable this service.</p>
Worker Contract Data Section Fields	<p>Provides employment contract data.</p> <p>The <i>Core Connector: Worker Integration Configuration</i> service must be enabled to enable this service.</p>
Worker Leave of Absence Data Section Fields	<p>Provides leave of absence data.</p> <p>The <i>Core Connector: Worker Integration Configuration</i> service must be enabled to enable this service.</p>
Worker Qualification Data Section Fields	<p>Provides qualifications data for each worker.</p> <p>The <i>Core Connector: Worker Integration Configuration</i> service must be enabled to enable this service.</p>
Core Connector: Worker Transaction Log Service	Subscribes to events that take place in Workday enabling your integration to report only worker fields that changed.

Option	Description
	<p>If disabled, your integration first extracts all data for eligible records, then evaluates the data for changes. Using this option can adversely affect performance.</p> <p>The <i>Core Connector: Worker Integration Configuration</i> service must be enabled to enable this service.</p>
<a href="#">Define Eligibility</a>	<p>Enables you to configure an Integration Field Override to define which workers to include in the integration output.</p> <p>The <i>Core Connector: Worker Integration Configuration</i> service must be enabled to enable this service.</p>
<a href="#">Core Connector: Integration Maps - Foundation</a>	<p>Enables you to define integration maps that translate foundational data values between Workday and your LMS.</p> <p>To enable this service, enable one of the integration configuration services.</p>
<a href="#">Core Connector: Integration Maps - Job</a>	<p>Enables you to define integration maps that translate job profile and Job Family data values between Workday and your LMS.</p> <p>To enable this service, enable one of the integration configuration services.</p>
<a href="#">Core Connector: Integration Maps - Talent</a>	<p>Enables you to define integration maps that translate talent data values between Workday and your LMS.</p> <p>To enable this service, enable one of the integration configuration services.</p>
<a href="#">Core Connector: Integration Maps - Worker</a>	<p>Enables you to define integration maps that translate worker data values between Workday and your LMS.</p> <p>To enable this service, enable one of the integration configuration services.</p>

- As a related action on your integration, select **Integration System > Configure Integration Transaction Log**.

Note: We recommend that you select **Subscribe to all Transaction Types** except. Then, filter out only transaction types that you know have no relevance to your needs. If in doubt, don't filter out a transaction type.

- [Set Up Integration Sequence Generators](#) on page 1969.
- As a related action on your **Core Connector: Worker integration**, select **Integration System > Configure Integration Attributes** and enter attributes for integration services that you enabled in Step 4, as well as required attributes.
- Select **Integration System > Configure Integration Maps** as a related action on the integration system. Map values between Workday and the external file format.
- [Create Core Connector: Worker for LMS Outbound Worker Selection Criteria](#) on page 1106.
- [Select and Set Up Connector Output Fields](#) on page 1977.

9. [Create Integration Business Process](#) on page 1950.
10. [Steps: Set Up Document Transformation Connector](#) on page 594.
11. [Launch an Integration](#) on page 24.
12. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

- *Integration Event*
- *Job Information*
- *Manage: Location*
- *Manage: Organization Integration*
- *Person Data: Birth Place*
- *Person Data: Citizenship Status*
- *Person Data: Date of Birth*
- *Person Data: Disabilities*
- *Person Data: Emergency Contacts*
- *Person Data: Ethnicity*
- *Person Data: Gender*
- *Person Data: Home Contact Information*
- *Person Data: Hukou (China)*
- *Person Data: ID Information*
- *Person Data: Marital Status*
- *Person Data: Military Status*
- *Person Data: Name*
- *Person Data: Nationalities*
- *Person Data: Personal Data*
- *Person Data: Personal Information*
- *Person Data: Preferred Name*
- *Person Data: Religion*
- *Set Up: Skills and Experience*
- *Worker Data: Beneficiaries and Dependents*
- *Worker Data: Benefit Elections*
- *Worker Data: Compensation*
- *Worker Data: Compensation by Organization*
- *Worker Data: Leave of Absence*
- *Worker Data: Organization Information*
- *Worker Data: Public Worker Reports*
- *Worker Data: Staffing*
- *Worker Data: Total Compensation*
- *Worker Data: Work Contact Information*

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

## Create Core Connector: Worker for LMS Outbound Worker Selection Criteria

### Prerequisites

Security: *Custom Field Management* domain in the System functional area.

### Context

Select a report field or create a calculated field that defines the eligibility criteria for sending workers. Configure the field as an override in the *Core Connector: LMS Outbound* integration so that workers who meet the specified criteria are included in the integration.

## Steps

1. If an existing report field doesn't provide the criteria you want, create a calculated field for worker selection:

- a) Access the Create Calculated Field task.
- b) Specify a meaningful Field Name. Example: LMS Outbound Worker Eligibility.
- c) At the Business Object prompt, select *Worker*.
- d) At the Function prompt, select *True/False Condition*.
- e) On the Calculation tab, specify one or more conditions for worker selection.

To select workers from specific supervisory organizations, but not all organizations, your selection criteria can look like:

And/Or	(	Field	Operator	Comparison Type	Comparison Value	)
And		Supervisory Organization	<i>in the selection list</i>	Value specified in this filter	Human Resources Information Technology Payroll	

- f) (Optional) Click the Additional Info tab, click the Category prompt, and select *Integration*. Categorizing a calculated field makes it easier to find.
2. Configure the field override in the integration:
  - a) Access the View Integration System report.
  - b) As a related action on the integration system, select Integration System > Configure Integration Field Overrides.
  - c) For the Define Eligibility document, click the Override External Field prompt and select the report field or calculated field that determines eligibility.
3. To create overrides for worker domains, roles, statuses, status descriptions, or custom fields, repeat these steps.

## Concept: Core Connector: Worker for LMS Outbound Integration

The Core Connector: Worker for LMS Outbound integration exports worker, job, talent, location, and organization data changes from Workday in simple XML format. As you update Workday data, the integration generates an XML file containing the changes and exports it to your Learning Management System (LMS).

Using configurable data sections or Workday-delivered report fields and calculated fields that you create, you can customize the output to meet the needs of your LMS.

### Change Detection

The Core Connector: Worker for LMS Outbound detects changes to Workday data by monitoring a transaction log. When you configure the integration system, you select which business process and transaction types that the integration system subscribes to. Excluding business process and transaction types that are irrelevant to your needs improves performance. However, if your integration system doesn't subscribe to a transaction type that affects data in your LMS, Workday wouldn't include changes triggered by that transaction type. Workday recommends that if you aren't sure if the integration system must subscribe to a given transaction or business process type, don't exclude it.

The Core Connector: Worker for LMS Outbound integration uses a three-step process to detect and report changes:

1. When the integration checks the transaction log, the integration determines which workers have changes that generated a configured transaction event.

2. For each worker with a matching transactional change, the integration compares their report fields:
  - For the time at which the integration was run
  - For the time at which the integration was last successfully run
 The integration identifies which, if any, of the values of interest have changed.
3. If the worker has any changes in field values or eligibility, Workday generates an appropriate creation, change, or deletion message.

### **Change Detection Limitations**

Changes to the Classification of a Job don't trigger change detection for this integration. The context of the change is on the Job Profile (template), and isn't directly related to any associated job (instance) for a worker. However, full extraction includes the job classification element.

### **Full-Diff Extract**

You can configure your Core Connector: Worker for LMS Outbound integration to all workers who meet the eligibility criteria. To enable this option, disable the Transaction Log service. When you run the integration, Workday extracts all applicable data for the defined population of employees. Workday extracts data regardless of whether the worker had any changes since the last successful integration system run. Using this option can adversely affect Workday performance.

### **Worker Eligibility**

For each integration system, you define a group of workers that belongs to the integration system. You define membership by a single Boolean report field or calculated field. If the field value is true for a worker, that worker is a member of the group, and Workday includes changes for that worker in the output file. If the field value is false, the integration system ignores that worker.

You can use report fields on the Worker business object to define eligibility. If you can't define your group membership criteria using a report field, you can create and use a calculated field. If multiple Boolean values are true, the calculated field can evaluate the worker business object and its related business objects to return true. Example: use a calculated field to return true if the:

- Worker is a contingent employee
- Primary location for the worker is in the United States
- Supervisor of the worker is John Doe

### **Launch/Schedule Options**

Workday provides these launch schedule options for the Core Connector: Worker for LMS Outbound integration:

- Organization: If you intend to run the integration immediately, select the organization for which you want to run the integration. The prompt varies depending on the Integration Process Event and on your security access:
  - *Owning Organization* displays if the Integration Process Event for this integration is associated with a specific organization. You can select the organization or any of its subordinate organizations of which you're a member or have an organization role.
  - *Organization By Type* displays if the Integration Process Event for this integration has no associated organization. You can select any organization and subordinate organization of which you're a member or have an organization role.
- Scheduled Run Frequency. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration collects all qualifying changes based on the launch parameters. You can schedule a Core Connector: Worker for LMS Outbound integration to run several times per day; launching the integration frequently doesn't affect performance.

- Run Now. You can launch the integration manually for specific workers, or for all eligible workers. Workday prompts you to enter launch parameters.

For each launch schedule option, you can enter these launch parameters:

Parameter	Description
As Of Entry Moment, Effective Date, Last Successful As Of Entry Moment, Last Successful Effective Date	Extracts records that are current as of the specified As Of Entry Moment and Effective Date parameters. If Full File isn't selected, then the extract includes only those records that changed in one or more output fields. Workday compares values current as of the Last Successful As Of Entry Moment and Last Successful Effective Date parameters.
Full Extract for Job Profiles/Job Families, Locations, and Organizations	Extracts selected items as of the As Of Entry Moment and Effective Date, regardless of whether they've changed.
Full File	Extracts Workers as of the As Of Entry Moment and Effective Date, regardless of whether they've changed.
Job Families	Extracts only the specified Job Families.
Job Profiles	Extracts only the specified Job Profiles.
Location(s)	Extracts only the specified Locations.
Organization Type	Extracts Organizations for only the specified Organization Types.
Organization(s)	Extracts only the specified Organizations.
Restrict Results By Orgs	Extracts Workers for only the specified Organizations and all subordinates.
Workers	Extracts only the specified Workers.
	If you configure no values, then the integration considers all workers when looking for transactional and data changes. Specifying workers in this list doesn't force their inclusion in the output file. Information for a worker displays in the output file only if there are changes in the data fields evaluated by the integration.
	If there was an error involving data for one or more workers during a prior integration run, you can specify workers in this parameter at launch time. Correct the worker data and then run the integration system again only for those workers. In this case, set the Last Successful As Of Entry Moment to the moment used for that parameter on the prior run that had problems.

## Integration Output Files

The Core Connector: Worker for LMS Outbound integration can generate and deliver up to 5 configurable outputs, depending on which integration services you enable. Workday includes each configurable output in a separate integration output file that Workday generates each time the integration runs. To enable you to identify which output files include a specific configurable output, Workday applies one of the corresponding document tags to each output file:

- Core Connector: Organization Outbound
- Core Connector: Locations
- Core Connector: Competencies Outbound
- Core Connector: Job Profile and Job Family

- Core Connector: Worker

Workday applies these document tags automatically. You can't disable or edit the names of these document tags. You can apply additional document tags to the output files.

### Integration Audit Files

Every time the integration runs, Workday generates these files:

- The *Data Changes Audit* is a readable version of the integration output file.
- The *Diagnostic Audit* is designed to help you troubleshoot integration errors.
- The *Schema XSD* file defines the content and the structure of the output file. It includes only those fields that you've enabled for your integration system. Workday generates this file every time the integration runs. The file reflects your integration configuration as of the moment that the integration ran. You can only generate this file by running the integration.

You can find these files in the Reports and Other Output Files section of the Integration Event for each integration run.

Note: Because Workday includes actual data in the Data Change Audit file, you can secure this file separately. Example: if administrators can't have access to the data.

### Reference: Core Connector: Worker for LMS Outbound Integration Data Sections

Before you build an integration with the Core Connector: Worker for LMS Outbound template, familiarize yourself with each data section to understand which fields are available for output and how the configuration options affect integration behavior.

During integration configuration, you enable integration services for each data section that you want to include in the output file.

Some sections also have an *Operation* field that indicates whether a row of data is new, changed, or deleted. *Operation* codes are: ADD, REMOVE, MODIFY, or NONE.

Section	Description	Fields
Core Connector: Organization Data	This section can have multiple records.	<ul style="list-style-type: none"> <li>• Organization ID</li> <li>• Organization Code</li> <li>• Organization Type</li> <li>• Organization Name</li> <li>• Organization Description</li> <li>• Organization Subtype</li> <li>• Inactive</li> <li>• Manager</li> <li>• Organization Owner</li> <li>• Superior Organization</li> <li>• Primary Business Site Reference</li> </ul>

Section	Description	Fields
Core Connector: Location Data	This section can have multiple records.	<ul style="list-style-type: none"> <li>• Location</li> <li>• Location Name</li> <li>• Location Usage</li> <li>• Location Type</li> <li>• Inactive</li> <li>• Time zone</li> <li>• Default Currency</li> <li>• Default Currency Code</li> <li>• Country</li> <li>• Address Line Data</li> <li>• Municipality</li> <li>• Country Region</li> <li>• Country Region Description</li> <li>• Postal Code</li> <li>• Is Primary Address</li> <li>• Address Usage</li> <li>• International Phone Code</li> <li>• Area Code</li> <li>• Phone Number</li> <li>• Phone Device Type</li> <li>• Phone Usage</li> <li>• Email Address</li> <li>• Email Usage</li> </ul>
Core Connector: Competency Data	<ul style="list-style-type: none"> <li>• This section can have one or more records.</li> <li>• The <i>Competency Level</i> attribute doesn't send data, but enables the attributes with the same attribute prefix. Example: enable <i>Competency Level</i> in order to use the <i>Competency Level</i>, <i>Competency Rating</i>, and <i>Competency Behavior</i> field attributes.</li> </ul>	<ul style="list-style-type: none"> <li>• Competency ID</li> <li>• Competency Name</li> <li>• Competency Description</li> <li>• Competency Category</li> <li>• Competency Level</li> <li>• Competency Level / Competency Level ID</li> <li>• Competency Level / Competency Level Name</li> <li>• Competency Level / Competency Level Behavior</li> <li>• Competency Level / Competency Level Value</li> <li>• Competency Level / Competency Level Range Begin</li> <li>• Competency Level / Competency Level Range End</li> <li>• Competency Level / Competency Level Exclude from Calculations</li> <li>• Inactive</li> </ul>

Section	Description	Fields
Core Connector: Job Profile Data	This section can have multiple records.	<ul style="list-style-type: none"> <li>• Job Profile ID</li> <li>• Inactive</li> <li>• Job Title</li> <li>• Job Profile Summary</li> <li>• Public Job</li> <li>• Work Shift Required</li> <li>• Management Level</li> <li>• Job Category</li> <li>• Job Level</li> <li>• Job Family</li> <li>• Job Classifications</li> <li>• Job Exempt Location Context</li> <li>• Job Exempt</li> <li>• Compensation Grade</li> <li>• Company Insider Type</li> <li>• Critical Job</li> <li>• Difficulty to Fill</li> <li>• Pay Rate Country</li> <li>• Pay Rate Type</li> <li>• Workers Compensation Code</li> <li>• Responsibility Description</li> <li>• Responsibility Required</li> <li>• Work Experience</li> <li>• Work Experience Rating</li> <li>• Work Experience Required</li> <li>• Education Degree</li> <li>• Education Field of Study</li> <li>• Education Required</li> <li>• Language</li> <li>• Language Ability Type</li> <li>• Language Proficiency Type</li> <li>• Language Required</li> <li>• Competency</li> <li>• Competency Level</li> <li>• Competency Required</li> <li>• Certification</li> <li>• Certification Country</li> <li>• Certification Name</li> <li>• Certification Issuer</li> <li>• Certification Required</li> <li>• Training Name</li> <li>• Training Description</li> <li>• Training Type</li> <li>• Training Required</li> <li>• Job Family ID</li> <li>• Inactive</li> <li>• Job Family Name</li> <li>• Job Family Summary</li> <li>• Job Profile</li> </ul>
Core Connector: Job Family Data	This section can have multiple records.	

Section	Description	Fields
Worker Personal Data	<ul style="list-style-type: none"> <li>This section has a single record.</li> <li>If not overridden, name fields are based on Legal Name.</li> <li>The <i>Name Data, Address Data, Phone Data, and Email Data</i> attributes don't send data. They enable the attributes with the same attribute prefix. Example: enable <i>Email</i> in order to use the <i>Email Usage, Email is Public, and Email Address</i> field attributes.</li> <li><i>Name Data / Title</i> is the Prefix of the name and <i>Name Data / Social Suffix</i> is the Suffix of the name.</li> <li><i>Country of Birth</i> is a two-digit country code based on ISO 3166-1 alpha-2.</li> </ul>	<ul style="list-style-type: none"> <li>Name Data</li> <li>Name Data / Name Type</li> <li>Name Data / First Name</li> <li>Name Data / Middle Name</li> <li>Name Data / Last Name</li> <li>Name Data / Secondary Last Name</li> <li>Name Data / Title</li> <li>Name Data / Social Suffix</li> <li>Name Data / Formatted Name</li> <li>Name Data / Reporting Name</li> <li>Name Data / First Name in Local Script</li> <li>Name Data / Middle Name in Local Script</li> <li>Name Data / Last Name in Local Script</li> <li>Name Data / Secondary Last Name in Local Script</li> <li>Name Data / Name in Local Script</li> <li>Name Data / First Name in Local Script 2</li> <li>Name Data / Middle Name in Local Script 2</li> <li>Name Data / Last Name in Local Script 2</li> <li>Name Data / Secondary Last Name in Local Script 2</li> <li>Name Data / Full Legal Name</li> <li>Gender</li> <li>Disability</li> <li>Address Data</li> <li>Address Data / Address Type</li> <li>Address Data / Address Usage</li> <li>Address Data / Address Is Public</li> <li>Address Data / Is Primary</li> <li>Address Data / Address Line Data</li> <li>Address Data / Municipality</li> <li>Address Data / Submunicipality</li> <li>Address Data / Region</li> <li>Address Data / Subregion</li> <li>Address Data / Postal Code</li> <li>Address Data / Country</li> <li>Address Data / Address Line Data Local</li> <li>Address Data / Municipality Local</li> <li>Address Data / Submunicipality Local</li> <li>Address Data / Subregion</li> </ul>

Section	Description	Fields
Worker Status Data	<ul style="list-style-type: none"> <li>• <i>Staffing Event</i> codes are:           <ul style="list-style-type: none"> <li>• <i>HIR</i> (hire).</li> <li>• <i>TRM</i> (termination).</li> <li>• <i>LOA</i> (leave of absence).</li> <li>• <i>RFL</i> (return from leave).</li> <li>• <i>TFR</i> (change of the supervisory organization of the worker).</li> </ul> </li>   <p>Note: <i>TFR</i> staffing events don't populate the Staffing Event Date field.</p> <li>• <i>Employee Status</i> codes are: <i>Active</i>, <i>OnLeave</i>, <i>Terminated</i>, and <i>NotYetHired</i>.</li> </ul>	<ul style="list-style-type: none"> <li>• Staffing Event</li> <li>• Staffing Event Date</li> <li>• Employee Status</li> <li>• Active</li> <li>• Active Status Date</li> <li>• Hire Date</li> <li>• Original Hire Date</li> <li>• End Employment Date</li> <li>• Continuous Service Date</li> <li>• First Day of Work</li> <li>• Terminated</li> <li>• Termination Date</li> <li>• Pay Through Date</li> <li>• Termination Last Day of Work</li> <li>• Probation Start Date</li> <li>• Probation End Date</li> <li>• Has International Assignment</li> <li>• Home Country</li> <li>• Host Country</li> <li>• Rehire</li> </ul>

Section	Description	Fields
Worker Position Data	<ul style="list-style-type: none"> <li>This section has a single record, with primary position only.</li> <li><i>Effective Date</i> represents the effective date for the most recent change to position data.</li> <li>A position can have a number of job classifications that you arrange according to job classification groups.</li> </ul>	<ul style="list-style-type: none"> <li>Operation</li> <li>Position ID</li> <li>Effective Date</li> <li>Primary Position</li> <li>Position Title</li> <li>Business Title</li> <li>Worker Type</li> <li>Position Time Type</li> <li>Job Exempt</li> <li>Pay Rate Type</li> <li>Job Classification Data</li> <li>Job Classification Data/ Operation</li> <li>Job Classification Data / Job Classification</li> <li>Job Classification Data / Job Classification Group</li> <li>Organization Data</li> <li>Organization Data/Operation</li> <li>Organization Data / Organization</li> <li>Organization Data / Organization Type</li> <li>Company Insider Type</li> <li>Work Shift</li> <li>Job Profile</li> <li>Management Level</li> <li>Job Category</li> <li>Job Family</li> <li>Business Site</li> <li>Business Site Name</li> <li>Business Site Address Type</li> <li>Business Site Address Line Data</li> <li>Business Site Municipality</li> <li>Business Site Submunicipality</li> <li>Business Site Region</li> <li>Business Site Subregion</li> <li>Business Site Postal Code</li> <li>Business Site Country</li> <li>Business Site Address Line Data Local</li> <li>Business Site Municipality Local</li> <li>Business Site Submunicipality Local</li> <li>Business Site Subregion Local</li> <li>Supervisor ID</li> <li>Supervisor Name</li> </ul>

Section	Description	Fields
Worker Contract Data	<ul style="list-style-type: none"> <li>This section can have multiple records.</li> <li>Although an employee has only 1 contract in effect at a time, this section can include:           <ul style="list-style-type: none"> <li>Contracts from the past.</li> <li>Contracts that become effective in the future.</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>Operation</li> <li>Position ID</li> <li>Contract ID</li> <li>Contract Type</li> <li>Start Date</li> <li>End Date</li> <li>Contract Status</li> <li>Description</li> <li>Operation</li> <li>Position ID</li> <li>On Leave</li> <li>Leave Start Date</li> <li>Leave End Date</li> <li>Leave of Absence Type</li> </ul>
Worker Leave of Absence Data	<p>This section contains position-specific data.</p> <ul style="list-style-type: none"> <li>This section can have multiple records.</li> <li>An employee can be on multiple different types of leave at the same time.</li> <li>These fields in the Status Data section indicate if an employee is on leave:           <ul style="list-style-type: none"> <li><i>Employee Status</i></li> <li><i>Staffing Event</i></li> <li><i>Staffing Event Date</i></li> </ul> </li> </ul> <p>Enable the Leave of Absence section if you need additional information about leave.</p>	

Section	Description	Fields
Worker Qualification Data	<ul style="list-style-type: none"> <li>This section has a single record.</li> <li>The <i>Competency Achievement, Certification Achievement, Training, Education, and External Job</i> attributes don't send data. They enable the attributes with the same attribute prefix. Example: enable <i>Education</i> in order to use the <i>Last Year Attended</i> or <i>Field of Study</i> field attributes.</li> </ul>	<ul style="list-style-type: none"> <li>Competency Achievement</li> <li>Competency Achievement / Operation</li> <li>Competency Achievement / Competency Achievement ID</li> <li>Competency Achievement / Competency</li> <li>Competency Achievement / Competency Level</li> <li>Competency Achievement / Assessment Date</li> <li>Competency Achievement / Assessed by Worker</li> <li>Certification Achievement</li> <li>Certification Achievement / Operation</li> <li>Certification Achievement / Certification Achievement ID</li> <li>Certification Achievement / Certification</li> <li>Certification Achievement / Certification Country</li> <li>Certification Achievement / Certification Name</li> <li>Certification Achievement / Certification Issuer</li> <li>Certification Achievement / Issued Date</li> <li>Certification Achievement / Expiration Date</li> <li>Certification Achievement / Exam Date</li> <li>Certification Achievement / Exam Score</li> <li>Training</li> <li>Training / Operation</li> <li>Training / Training Achievement ID</li> <li>Training / Training Name</li> <li>Training / Training Description</li> <li>Training / Training Type</li> <li>Training / Training Duration</li> <li>Training / Completion Date</li> <li>Education</li> <li>Education / Operation</li> <li>Education / Education Achievement ID</li> <li>Education / Institution</li> <li>Education / Institution Name</li> <li>Education / Institution Type</li> <li>Education / Institution Location</li> <li>Education / Institution Country</li> <li>Education / Degree</li> <li>Workday Proprietary and Confidential</li> <li>Education / Field of Study</li> </ul>

## Core Connector: Location

### Steps: Set Up Core Connector: Location Integration

#### Prerequisites

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

#### Context

To extract and export core location definitions to an external endpoint, you can create a *Core Connector: Location* integration system.

#### Steps

1. Access the Create Integration System task and enter *Core Connector: Locations* in the New Using Template prompt.
2. As a related action on your *Core Connector: Locations* integration, select Integration System > Configure Integration Attributes and enter attributes required by the integration template.
3. Select Integration System > Configure Integration Maps as a related action on the integration system and map values between Workday and the external file format.
4. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:
  - *Integration Event*
  - *Manage: Location*

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

5. [Select and Set Up Connector Output Fields](#) on page 1977.
6. (Optional) [Add Custom Fields to Core Connector: Location Integration](#) on page 1118.
7. [Set Up Integration Delivery](#) on page 1952.
8. [Set Up Integration Sequence Generators](#) on page 1969.
9. (Optional) [Steps: Set Up Document Transformation Connector](#) on page 594.
10. [Launch an Integration](#) on page 24.

### Add Custom Fields to Core Connector: Location Integration

#### Prerequisites

Security: *Integration Configure*, *Integration Build Custom Services*, and *Integration Build* domains in the Integration functional area.

#### Context

Add an unlimited number of custom fields to a *Core Connector: Location* integration. You can use calculated fields or report fields to incorporate additional data elements into your output files. You can use any report field as long as it's available for:

- The Location *business object*.
- A business object that is directly related to the Location object.

The first step is to create an integration field override service and specify the names of the custom fields. Then, enable the field override service in the integration and configure the override values. If necessary, you can also create custom integration maps to define relationships between the custom fields and values in the external endpoint.

## Steps

1. Create an integration field override service and define custom fields:
  - a) Access the Create Integration Field Override Service task.
  - b) Give the integration service a meaningful Name.
  - c) To select the data source for the custom fields, select the Business Object prompt.
  - d) For each custom field that you want to create, add a row to the Fields grid, enter the field Name, and optionally provide a Description.
  - e) To reorder the fields as desired in the output file, use the Order arrows.
2. Access the View Integration System report.
3. Enable the custom integration service:
  - a) As a related action on the integration system, select Integration System > Configure Integration Services.
  - b) In the Custom Integration Services grid, add a row.
  - c) Select the Integration Service prompt, select *Integration Field Override Service (Audited)*, and then select the custom integration service that you created in step 1.
4. Configure the custom fields:
  - a) As a related action on the integration system, select Integration System > Configure Integration Field Overrides.
  - b) For each field in the grid, select the Override External Field prompt. Then select the report field or calculated field that provides the value you want.

The Override External Field prompt lists fields that are relevant to the Business Object you selected in step 1.

## Result

Workday groups your custom fields into a record called ADD that displays on a separate line in the output file. By default, Workday includes custom fields in output files only when field values change.

## Next Steps

To add or change fields in an integration field override service, use one of these methods:

- Access the View Integration System report. Select Integration Field Override Service > Edit as a related action on the integration service in the Custom Integration Services grid.
- Access the Edit Integration Field Override Service task.

## Concept: Core Connector: Location

With Workday Core Connector: Location, you can extract location-related definitions, transform the data, and send it to an endpoint of your choice. Using Workday business objects and *Get Locations* public API as its foundation, Core Connector: Location provides the tools to capture changes to location data and configure an output file to extract to deliver to an external endpoint.

Core Connector: Location provides a single source-of-truth for core data, and generates integration output files that you can transform as required to serve the needs of multiple downstream endpoints. Because your needs vary based on organization size, privacy requirements, and external endpoint requirements, Core Connector: Location offer a choice of implementation options.

Depending on your external endpoint requirements, transform the file into the format that it supports using one of these options:

- Transformation step on the business process. You configure the business process definition of the integration to transform the Core Connector output file into the format required.

- Workday Studio integration. You configure the business process definition of the integration to launch a Workday Studio integration. The Studio integration then transforms the Core Connector output file into the format required.
- Other third-party tool. You configure a third-party tool to transform the Core Connector output file.

**Core Connector: Location**: Location is an integration template with a configurable set of data across a range of categories. It enables you to specify which data elements to include in integration output files. When launched, the integration collects a snapshot of all data and creates an output file in XML format based on your specifications.

**Core Connector: Location**: Location creates integration output files in a Workday-defined XML format. You can configure this output for delivery, or further transformation.

**Using Core Connector: Location**: Location in combination with Core Connector: Worker, you can create a single source-of-truth for all external endpoints that need Workday data. By creating a single set of Connectors, you can:

- Provide a rapid, flexible, and repeatable method for integrating with Workday.
- Ensure that all external endpoints receive only the data that you want to expose.

## Launch/Schedule Options

Workday provides these launch schedule options for Core Connector: Location:

- **Organization**: If you intend to run the integration immediately, select the organization for which you want to run the integration. The prompt varies depending on the Integration Process Event and on your security access:
  - *Owning Organization* displays if the Integration Process Event for this integration is associated with a specific organization. You can select the organization or any of its subordinate organizations of which you're a member or have an organization role.
  - *Organization By Type* displays if the Integration Process Event for this integration has no associated organization. You can select any organization and subordinate organization of which you're a member or have an organization role.
- **Scheduled Run Frequency**. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration collects all qualifying changes based on the launch parameters. You can schedule a Core Connector: Worker integration to run several times per day; launching the integration frequently doesn't affect performance.
- **Run Now**. You can launch the integration manually for specific workers, or for all eligible workers. You're prompted to enter launch parameters.

For each launch schedule option, you enter these launch parameters:

Parameter	Description
As Of Entry Moment, Effective Date, Last Successful Extracts	Records that are current as of the specified As Of Entry Moment and Effective Date parameters.
As Of Entry Moment, Last Successful Effective Date	If Full Extract isn't selected, then the extract includes only those records that the integration detects to have changed in one or more output fields. Workday compares values to what was current as of the Last Successful As Of Entry Moment and Last Successful Effective Date parameters.
Full Extract	Extracts Locations as of the As Of Entry Moment and Effective Date, regardless of whether they've changed.
Location(s)	Extracts only the specified Locations.

## Integration Audit Files

Every time the integration runs, Workday generates these files:

- The *Data Changes Audit* is a readable version of the integration output file.
- The *Diagnostic Audit* is designed to help you troubleshoot integration errors.
- The *Schema XSD* file defines the content and the structure of the output file. It includes only those fields that you've enabled for your integration. Workday generates this file every time the integration runs. The file reflects your integration configuration as of the moment that the integration ran. You can only generate this file by running the integration.

You can find these files in the Reports and Other Output Files section of the Integration Event for each integration run.

Note: Because Workday includes actual data in the Data Change Audit file, you can secure this file separately. Example: if administrators can't have access to the data.

## Reference: Core Connector: Location Data Sections

Before you build an integration with the Core Connector: Location integration template, familiarize yourself with each data section to understand which fields are available for output and how the configuration options affect integration behavior.

Section	Description	Fields
Location Data	This section can have multiple records.	<ul style="list-style-type: none"> <li>• Location</li> <li>• Location Name</li> <li>• Location Usage</li> <li>• Location Type</li> <li>• Inactive</li> <li>• Time zone</li> <li>• Default Currency</li> <li>• Default Currency Code</li> <li>• Country</li> <li>• Address Line Data</li> <li>• Municipality</li> <li>• Country Region</li> <li>• Country Region Description</li> <li>• Postal Code</li> <li>• Is Primary Address</li> <li>• Address Usage</li> <li>• International Phone Code</li> <li>• Area Code</li> <li>• Phone Number</li> <li>• Phone Device Type</li> <li>• Phone Usage</li> <li>• Email Address</li> <li>• Email Usage</li> </ul>

## Core Connector: Organization

### Steps: Set Up Core Connector: Organization Integration

#### Prerequisites

Security: These domains in the Integration functional area:

- *Integration Build*
- *Integration Configure*

#### Context

To export core organization definitions to an external endpoint, create a *Core Connector: Organization* integration.

#### Steps

1. Access the Create Integration System task and enter *Core Connector: Organization Outbound* in the New Using Template prompt.
2. Enable one or more of these optional integration services. The Configure Integration Services task displays all integration services, including required services; those integration services aren't editable.

Option	Description
Filename Sequence Generator	Enable if you want Workday to apply a custom-formatted, unique filename to each integration file.
Transaction Log Service	<p>Enables your integration system to subscribe to events by only organizations that meet the configured criteria (Example: organization type) and had a transaction event. The subscription to your integration system will be within the date parameters range and will be extracted as of the Effective Date and As Of Entry Moment parameters. Your integration compares data in the fields configured in your output file with the data as of the Last Successful date parameters. If the service detects any changes or it's a new organization, the integration output will include the organization.</p> <p>The <i>Transaction Log</i> service doesn't save changes to organization data such as organization name and code. Disable the <i>Transaction Log</i> service when you want your integration to detect these types of changes.</p> <p>Also, to improve performance and avoid undetected changes, Workday recommends that you disable the <i>Transaction Log</i> service for the <i>Get Organizations</i> web service. The <i>Transaction Log</i> service doesn't detect some changes because event logs don't capture all organization changes.</p>

Option	Description
Define Organization Eligibility	Enables you to configure an Integration Field Override to define organizations included in the integration output.

3. As a related action on your *Core Connector: Organization* integration, select **Integration System > Configure Integration Attributes** and enter attributes required by the integration template.
  4. Select **Integration System > Configure Integration Maps** as a related action on the integration system and map values between Workday and the external file format.
  5. (Required if you enable Define Organization Eligibility service.) As a related action on your *Core Connector: Organization* integration, select **Integration System > Configure Integration Field Overrides**. Designate a report field or calculated field that identifies if an organization is or isn't eligible for the integration.  
Base the report field or calculated field on the organization *business object*, and it must return a Boolean true or false. A Boolean true includes the organization in the integration while a Boolean false excludes the organization.
  6. Create an **Integration System User (ISU)** and grant the ISU *Get* and *Put* access to these domains:
    - *Integration Event*
    - *Manage: Organization Integration*
- See: [.../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).
7. [Select and Set Up Connector Output Fields](#) on page 1977.
  8. [Set Up Integration Delivery](#) on page 1952.
  9. [Set Up Integration Sequence Generators](#) on page 1969.
  10. [\(Optional\) Steps: Set Up Document Transformation Connector](#) on page 594.
  11. [Launch an Integration](#) on page 24.

#### Concepts

[SOAP API Troubleshooting and Guides](#)

## Concept: Core Connector: Organization

With Core Connector: Organization, you can extract organization-related definitions, transform the data, and send it to an endpoint of your choice. Using Workday business objects and *Get Organizations* public API as its foundation, Core Connector: Organization provides the tools to capture changes to organization data and configure an output file to extract to deliver to an external endpoint.

Core Connector: Organization provides a single source-of-truth for core data, and generates integration output files that you can transform as required to serve the needs of multiple downstream endpoints. Because your needs vary based on organization size, privacy requirements, and external endpoint requirements, Core Connector: Organization offer a choice of implementation options.

Depending on the requirements of your external endpoint, transform the file into the format that it supports using one of these options:

- Transformation step on the business process. You configure the business process definition of the integration to transform the Core Connector output file into the format required.
- Workday Studio integration. You configure the business process definition of the integration to launch a Workday Studio integration. The Studio integration transforms the Core Connector output file into the format required.
- Other third-party tool. You configure a third-party tool to transform the Core Connector output file.

Core Connector: Organization is an integration template with a configurable set of data across a range of categories. Core Connector: Organization enables you to specify which data elements to include in

integration output files. When launched, the integration collects a snapshot of all data and creates an output file in XML format based on your specifications.

Core Connector: Organization integration creates integration output files in a Workday-defined XML format. You can configure this output for delivery, or further transformation.

Using Core Connector: Organization in combination with the Core Connector: Worker, you can create a single source-of-truth for all external endpoints that need Workday data. By creating a single set of Connectors, you can:

- Provide a rapid, flexible, and repeatable method for integrating with Workday.
- Ensure that all external endpoints receive only the data that you want to expose.

## Launch/Schedule Options

Workday provides these launch schedule options for the Core Connector integrations:

- Organization: If you intend to run the integration immediately, select the organization for which you want to run the integration. The prompt varies depending on the Integration Process Event and on your security access:
  - *Owning Organization* displays if the Integration Process Event for this integration is associated with a specific organization. You can select the organization or any of its subordinate organizations of which you're a member or have an organization role.
  - *Organization By Type* displays if the Integration Process Event for this integration has no associated organization. You can select any organization and subordinate organization of which you're a member or have an organization role.
- Scheduled Run Frequency. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration collects all qualifying changes based on the launch parameters. You can schedule a Core Connector: Worker integration to run several times per day; launching the integration frequently doesn't affect performance.
- Run Now. You can launch the integration manually for specific workers, or for all eligible workers. Workday prompts you to enter launch parameters.

For each launch schedule option, you enter these launch parameters:

Parameter	Description
As Of Entry Moment, Effective Date, Last Successful As Of Entry Moment, Last Successful Effective Date	Extracts records that are current as of the specified As Of Entry Moment and Effective Date parameters. Compares values of fields configured in your output file to what was current as of the Last Successful As Of Entry Moment and Last Successful Effective Date parameters. When you disable the Transaction Log Service, Workday does this compare for all organizations meeting the configured criteria. Example: organization type.
Full Extract	When True, the integration ignores the Transaction Log Service and all organizations meeting the configured criteria (Example: organization type) are extracted as of the As Of Entry Moment and Effective Date, regardless of whether they've changed. This option is useful when you want to do a full data sync to an external endpoint.
Organization Type	Extracts Organizations for only the specified Organization Types.
Organization(s)	Extracts only the specified Organizations.

## Integration Audit Files

Every time the integration runs, Workday generates these files:

- The *Data Changes Audit* is a readable version of the integration output file.
- The *Diagnostic Audit* is designed to help you troubleshoot integration errors.
- The *Schema XSD* file defines the content and the structure of the output file. It includes only those fields that you've enabled for your integration. Workday generates this file every time the integration runs. The file reflects your integration configuration as of the moment that the integration ran. You can only generate this file by running the integration.

You can find these files in the Reports and Other Output Files section of the Integration Event for each integration run.

Note: Because Workday includes actual data in the Data Change Audit file, you can need to secure this file separately. Example: if administrators can't have access to the data).

## Reference: Core Connector: Organization Data Sections

Before you build an integration with the Core Connector: Organization integration template, familiarize yourself with each data section to understand which fields are available for output and how the configuration options affect integration behavior.

Section	Description	Fields
Organization Data (Core Connector: Organization)	This section can have multiple records.	<ul style="list-style-type: none"> <li>• Organization ID</li> <li>• Organization Code</li> <li>• Organization Type</li> <li>• Organization Name</li> <li>• Organization Description</li> <li>• Organization Subtype</li> <li>• Inactive</li> <li>• Manager</li> <li>• Leadership Role Assignee</li> <li>• Organization Owner</li> <li>• Superior Organization</li> <li>• Primary Business Site Reference</li> </ul>

## Core Connector: Positions

### Steps: Set Up Core Connector: Positions Integration

#### Prerequisites

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

#### Context

To export changes to position data, create a *Core Connector: Positions* integration.

## Steps

1. Access the Create Integration System task and enter Core Connector: Positions from the New Using Template prompt.
2. Enable one or more of these optional integration services. The Configure Integration Services task displays all integration services, including required services; those integration services aren't editable.

Option	Description
Job Qualification Data Section Fields	Provides job qualifications data for each position.
Job Requisition Data Section Fields	Provides job requisition data for the position.
Filename Sequence Generator	Applies a custom-formatted, unique filename to each integration file.
Transaction Log Service	<p>Enables your integration system to subscribe to events that take place in Workday. This action enables your integration to report only changed fields for positions, rather than report all fields.</p> <p>If disabled, your integration first extracts all data for eligible records, then evaluates the data for changes. Using this option can adversely affect performance.</p>

3. As a related action on your *Core Connector: Positions* integration, select Integration System > Configure Integration Transaction Log.

Select the Workday transactions that you want monitored for changes.

Note: Workday recommends that you select Subscribe to all Transaction Types except. Then, filter out only transaction types that you know have no relevance to your needs. If in doubt, don't filter out a transaction type.

4. As a related action on your *Core Connector: Positions* integration, select Integration System > Configure Integration Attributes and enter attributes for integration services that you enabled in Step 2, as well as required attributes.
5. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

- *Integration Event*
- *Job Information*
- *Worker Data: All Positions*

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

6. [Select and Set Up Connector Output Fields](#) on page 1977.
7. [\(Optional\) Add Custom Fields to Core Connector: Positions Integration](#) on page 1126.
8. [Create Integration Business Process](#) on page 1950.
9. [\(Optional\) Set Up Integration Sequence Generators](#) on page 1969.
10. [\(Optional\) Steps: Set Up Document Transformation Connector](#) on page 594.
11. [Launch an Integration](#) on page 24.

## Add Custom Fields to Core Connector: Positions Integration

### Prerequisites

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

## Context

Add an unlimited number of custom fields to a *Core Connector: Positions* integration. You can use calculated fields or report fields to incorporate additional data elements into your output files. You can use any report field as long as it's available for:

- The Position *business object*.
- A business object that is directly related to the Position object.

The first step is to create an integration field override service and specify the names of the custom fields. Then, enable the field override service in the integration and configure the override values. If necessary, you can also create custom integration maps to define relationships between the custom fields and values in the external endpoint.

## Steps

1. Create an integration field override service and define custom fields:
  - a) Access the Create Integration Field Override Service task.
  - b) Give the integration service a meaningful Name.
  - c) To select the data source for the custom fields, select the Business Object prompt.
  - d) For each custom field that you want to create, add a row to the Fields grid, enter the field Name, and optionally provide a Description.
  - e) To reorder the fields as desired in the output file, use the Order arrows.
2. Access the View Integration System report.
3. Enable the custom integration service:
  - a) As a related action on the integration system, select Integration System > Configure Integration Services.
  - b) In the Custom Integration Services grid, add a row.
  - c) Select the Integration Service prompt, select *Integration Field Override Service (Audited)*, and then select the custom integration service that you created in step 1.
4. Configure the custom fields:
  - a) As a related action on the integration system, select Integration System > Configure Integration Field Overrides.
  - b) For each field in the grid, select the Override External Field prompt and select the report field or calculated field that provides the value you want.

The Override External Field prompt lists fields that are relevant to the Business Object you selected in step 1.
5. To map the custom field values to external values, create and configure one or more integration maps:
  - a) As a related action on the integration system, select Integration System > Maintain Integration Maps.
  - b) For each field that requires a map, specify a map Name in the format: ADD-<FieldName>. The ADD prefix indicates that the map pertains to the Additional Data section, and the <FieldName> identifies the fields mapped in the future.
  - c) Specify the Internal Value Type and External Value Type for each map. You can create an Enumeration with a list of valid values or select a report field at the Data Type prompt.
  - d) Save the maps when you finish.
  - e) As a related action on the integration system, select Integration System > Configure Integration Maps. To find the custom maps, then scroll to the bottom of the grid.
  - f) Add a row for each tenanted value, select the Internal Value, and enter the External Value for the output file.

## Result

Workday groups custom fields into a record called ADD that displays on a separate line in the output file. By default, Workday includes custom fields in output files only when field values change.

## Next Steps

To add or change fields in an integration field override service, use one of these methods:

- In the View Integration System report, select Integration Field Override Service > Edit as a related action on the integration service in the Custom Integration Services grid.
- Access the Edit Integration Field Override Service task.

## Concept: Core Connector: Positions

The Core Connector: Positions integration exports position changes from Workday in simple XML format. As you create, update, or delete position data, the integration generates an output file containing the changes.

The integration includes a configurable set of position data across a range of categories. You can specify which data sections to include in the output file. Each section provides a set of fields. You can select which fields to include or exclude, which ones to require, and which ones to truncate.

Use this Connector to send data on open, closed, and future positions. Don't use this Connector to track changes to a worker in a position.

## Change Detection

The Core Connector: Positions integration detects changes to positions by monitoring a transaction log. When you configure the integration system, you select which business process and transaction types that the integration system subscribes to. Excluding business process and transaction types that are irrelevant to your needs improves performance. However, if your integration doesn't subscribe to a transaction type that affects your position records, Workday doesn't include changes for that transaction type. Workday recommends that you include all transactions and business types. Exclude transactions and business types only if you're sure that the integration doesn't need to subscribe to them.

The Core Connector: Positions integration uses a three-step process to detect and report changes:

1. When the integration checks the transaction log, the integration determines which positions changed and generated one of the configured transaction events.
2. For each position with a matching transactional change, the integration compares values for:
  - The time at which the integration ran.
  - The time at which the integration was last successfully run.

The integration identifies which, if any, of the values of interest have changed.

3. If the position has any changes in field values, Workday generates an appropriate creation, change, or deletion message.

## Full-Diff Extract

Full-Diff Extract provides data on all positions, which had changes, between the effective dates provided. To enable this option, disable the Transaction Log service. When you run the integration, Workday extracts all applicable data for all positions, regardless of whether the position had any changes since the last successful integration system run. Using this option can adversely affect Workday performance. The Core Connector: Positions integration first selects all positions, and only then, determines changes for the returned data.

## Results Filtering

Core Connector: Positions can filter results by:

- Open positions only (including frozen positions).
- Closed positions only.
- Open and closed positions.

The integration template includes attributes that enable you to restrict results to:

- Positions available for recruiting.
- Positions available for hire.

## Integration Launch and Scheduling

Workday provides these launch schedule options for the Core Connector: Positions integration:

- Scheduled Run Frequency. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration collects all qualifying changes based on the launch parameters. You can schedule a Core Connector: Positions integration to run several times per day; launching the integration frequently doesn't affect performance.
- Run Now. You can launch the integration manually. Workday prompts you to enter launch parameters.

To bypass entering a from date Effective Date as a launch parameter, enable the Restrict to Positions in the Entry Range integration attribute. The integration only returns positions that are entered between the Last Successful as of Entry Moment and the As of Entry Moment launch parameter values. Workday then uses the Effective Date parameter as the As of Effective Date filter and doesn't use the Last Successful Effective Date filter.

Note: If you don't enable the Restrict to Positions in the Entry Range integration attribute, the integration doesn't return positions with effective dates prior to 1/1/1970.

For each launch schedule option, you can enter these launch parameters:

Parameter	Description
As Of Entry Moment, Effective Date, Last Successful Extracts	Records that are current as of the specified As Of Entry Moment and Effective Date parameters.
As Of Entry Moment, Last Successful Effective Date	If Full Extract isn't selected, then the extract includes only those records that have changed in one or more output fields. Workday compares what was current as of the Last Successful As Of Entry Moment and Last Successful Effective Date parameters.
Full Extract	Extracts Positions as of the As Of Entry Moment and Effective Date, regardless of whether they've changed.
Location(s)	Extracts Positions for only the specified Locations.
Position(s)	Extracts only the specified Positions.
Supervisory Organization(s)	Extracts Positions for only the specified Supervisory Organizations.

## Integration Audit Files

Every time the integration runs, Workday generates these files:

- The *Data Changes Audit* is a readable version of the integration output file.
- The *Diagnostic Audit* is designed to help you troubleshoot integration errors.
- The *Schema XSD* file defines the content and the structure of the output file. It includes only those fields that you've enabled for your integration system. Workday generates this file every time the integration runs. The file reflects your integration configuration as of the moment that the integration ran. You can only generate this file by running the integration.

You can find these files in the Integration Event for each integration run. For each integration run, view the Reports and Other Output Files section.

Note: Because Workday includes actual data in the Data Change Audit file, you can secure this file separately. Example: if administrators can't have access to the data.

## Reference: Core Connector: Positions Integration Data Sections

Before you build an integration with the Core Connector: Positions template, familiarize yourself with each data section to understand which fields are available for output and how the configuration options affect integration behavior.

During integration configuration, you enable integration services for each data section that you want to include in the output file.

Section	Description	Fields
Position Data	This section can have one or more records.	<ul style="list-style-type: none"> <li>• Position ID</li> <li>• Supervisory Organization</li> <li>• Job Posting Title</li> <li>• Job Description</li> <li>• Academic Tenure Eligible</li> <li>• Available for Hire</li> <li>• Available for Recruiting</li> <li>• Hiring Freeze</li> <li>• Availability Date</li> <li>• Earliest Hire Date</li> <li>• Job Family</li> <li>• Job Profile</li> <li>• Location</li> <li>• Worker Type</li> <li>• Time Type</li> <li>• Worker Subtype</li> <li>• Filled By Worker</li> </ul>

Section	Description	Fields
Job Qualification Data	<p>The <i>Competency Qualification, Certification Qualification, Education Qualification, Language Qualification, Responsibility Qualification, Training Qualification, and Work Experience Qualification</i> attributes don't send data. These attributes enable the attributes with the same attribute prefix. Example: enable <i>Language Qualification</i> in order to use the <i>Language, Language Ability Type, Language Proficiency Type, and Language Required</i> field attributes.</p>	<ul style="list-style-type: none"> <li>• Competency Qualification</li> <li>• Competency Qualification / Competency</li> <li>• Competency Qualification / Proficiency Rating</li> <li>• Competency Qualification / Competency Required</li> <li>• Certification Qualification</li> <li>• Certification Qualification / Certification</li> <li>• Certification Qualification / Certification Country</li> <li>• Certification Qualification / Certification Name</li> <li>• Certification Qualification / Certification Issuer</li> <li>• Certification Qualification / Certification Required</li> <li>• Education Qualification</li> <li>• Education Qualification / Education Degree</li> <li>• Education Qualification / Education Field of Study</li> <li>• Education Qualification / Education Required</li> <li>• Language Qualification</li> <li>• Language Qualification / Language</li> <li>• Language Qualification / Language Ability Type</li> <li>• Language Qualification / Language Proficiency Type</li> <li>• Language Qualification / Language Required</li> <li>• Responsibility Qualification</li> <li>• Responsibility Qualification / Responsibility Description</li> <li>• Responsibility Qualification / Responsibility Required</li> <li>• Training Qualification</li> <li>• Training Qualification / Training Name</li> <li>• Training Qualification / Training Description</li> <li>• Training Qualification / Training Type</li> <li>• Training Qualification / Training Required</li> <li>• Work Experience Qualification</li> <li>• Work Experience Qualification / Work Experience</li> <li>• Work Experience Qualification / Work Experience Rating</li> <li>• Work Experience</li> </ul>

Section	Description	Fields
Job Requisition Data		<ul style="list-style-type: none"> <li>• Job Requisition ID</li> <li>• Positions Available</li> <li>• Replacement for Worker</li> <li>• Justification</li> <li>• Recruiting Instruction</li> <li>• Do Not Send To Recruiting System</li> <li>• Recruiting Start Date</li> <li>• Target Hire Date</li> <li>• Target End Date</li> <li>• Primary Location</li> <li>• Additional Location</li> <li>• Scheduled Weekly Hours</li> <li>• Work Shift</li> <li>• Job Profile ID</li> <li>• Job Title</li> <li>• Job Profile Summary</li> <li>• Management Level</li> <li>• Job Family</li> <li>• Job Classifications</li> <li>• Job Exempt Location Context</li> <li>• Job Exempt</li> <li>• Company Insider Type</li> </ul>
Job Profile Data		

## Core Connector: Worker

### Setup Considerations: Core Connector: Worker

You can use this topic to help make decisions when planning your configuration and use of the Core Connector: Worker integration. It explains:

- Why to set it up.
- How it fits into the rest of Workday.
- Downstream impacts and cross-product interactions.
- Security requirements and business process configurations.
- Questions and limitations to consider before implementation.

Refer to detailed task instructions for full configuration details.

### What It Is

The Core Connector: Worker integration enables you to extract changes to worker data from Workday and send them to external applications for:

- Identity management.
- Talent management.
- Time tracking.

Core Connector: Worker with the Worker Data Initialization Service enabled can extract worker data more efficiently using updated frameworks and capabilities. We strongly recommend that you use this service for all new Core Connector: Worker integrations.

## Business Benefits

Core Connector: Worker enables you to use Workday to maintain a single source of truth for your entire population of workers. You can then send updates to worker data to other applications that need that information. Using Core Connector: Worker, you can easily keep worker data in sync across many different applications.

Additionally, Core Connector: Worker with Data Initialization Service provides a more performant, resilient, and scalable way to extract worker data. It doesn't make API calls, helping it withstand network fluctuations. It can extract data more efficiently; and it can get more data than Core Connector: Worker without the service enabled.

## Use Cases

- Select groups of output fields to include in the integration output file.
- Within each group of fields, include, exclude, or require specific fields.
- Add additional custom report fields.
- Monitor specific business processes for activity.
- Limit output to specific workers or groups of workers.
- Generate an output file that contains only changed fields for each affected worker.
- Send the output file to an external endpoint using FTP, SFTP, email, or other transports.

You can use Core Connector: Worker to send updates on worker data to several types of external application. Examples:

- Add and remove workers from an identity management application.
- Populate an external time-tracking application.

## Questions to Consider

Question	Considerations
Does a vendor-specific integration template support your use case?	If a vendor-specific integration supports your use case, use that integration instead of Core Connector: Worker. A vendor-specific integration, with a vendor-specific file output format, is easier to plan, implement, and test. For more information about our vendor integrations, see the <a href="#">Workday Marketplace</a> site.
Is the data that you need to send to an external endpoint specific to workers?	Core Connector: Worker includes many fields related specifically to workers. If you need data specific to other types of HCM data (Examples: Organizations, Job Profiles), use the applicable Core Connector instead. To see available Core Connector templates, access the View Integration Template report, then enter <i>Core Connector</i> at the prompt.
Do you need to extract multiple job data for a worker?	If you take advantage of multiple job capabilities for workers, you should use Core Connector: Worker with Data Initialization Service enabled. Core Connector: Worker without Data Initialization Service doesn't support extracting multiple job data.
Do you need to extract local time zone effective data?	If you have workers located in different time zones and want to send effective data to downstream

Question	Considerations
	applications, taking into account the difference in time zone, use <a href="#">Core Connector: Global Worker</a> .

## Recommendations

- Consider engaging with professional services when implementing this integration.
- Workday recommends that you enable the Worker Data Initialization Service. Enabling this service provides greater resiliency, performance improvements, and an improved configuration experience.
- If you're planning to enable an existing Core Connector: Worker integration with the Data Initialization Service, use the Migrate Integration Configuration for Data Initialization Service task to ensure proper conversion.
  - Note: When using the Migrate Integration Configuration for Data Initialization Service task, to avoid impact to Field Override results, the Integration System User (ISU) and related Integration System Security Group (ISSG) must be secured to the following domains:
    - Report / Task Permissions = View
    - Integration Permissions = Get
- If you change your Core Connector: Worker integration to use the Worker Data Initialization Service, note that output can vary when you enable this service. Output can vary due to differences in integration behavior with the Data Initialization Service enabled. You can perform these steps to confirm results in your Sandbox/Implementation tenant before committing the change to your Production tenant:
  1. Clone the integration.
  2. Run the Migrate Integration Configuration for Data Initialization Service task against the cloned integration.
  3. Use the original integration to generate an output file.
  4. Use the cloned integration to generate an output file with the same launch parameters.
  5. Thoroughly compare the results.
  6. If you find no differences or exceptions, you can migrate the integration in your Production tenant.
- To improve integration performance and relevance (with either option):
  - Don't make integration field attributes required.
  - Don't configure a maximum field length for field attributes.
  - Set the Version integration attribute to 25 or higher.
  - Use XML as the output format (not CSV).
  - Don't group additional information fields.
  - Use the Transaction Log Service.
  - Avoid using more than 20 field overrides.
  - Avoid using the Worker History business object.
  - Avoid using these report fields:
    - *Staffing History – All*.
    - *Staffing History – Approved*.
    - *Worker Events Completed*.
    - *Worker History*.

## Requirements

No impact.

## Limitations

You can't use Core Connector: Worker to send time-worked data. However, you can send updates to an external time tracking application when you hire, change, and terminate workers.

These limitations apply when you use Core Connector: Worker with the Worker Data Initialization Service enabled:

- The *Worker Photo* data section doesn't include an image field.
- Core Connector: Worker doesn't apply contextual security. You can control what fields to include in the output through fields and attributes in the integration.
- Any field overrides and external parameter assignments must use the *Worker* business object. These field overrides can't have restricted usage.

## Tenant Setup

No impact.

## Security

Enable security for these domains in order to configure Core Connector: Worker:

- *Integration Build*
- *Integration Configure*

Enable security for these domains for the integration to access Workday data:

- *Manage: Organization Integration*
- *Person Data: Birth Place*
- *Person Data: Citizenship Status*
- *Person Data: Date of Birth*
- *Person Data: Disabilities*
- *Person Data: Emergency Contacts*
- *Person Data: Ethnicity*
- *Person Data: Gender*
- *Person Data: Home Contact Information*
- *Person Data: Hukou (China)*
- *Person Data: ID Information*
- *Person Data: Institutional Contact Information*
- *Person Data: Marital Status*
- *Person Data: Military Status*
- *Person Data: Name*
- *Person Data: Nationalities*
- *Person Data: Personal Data*
- *Person Data: Personal Information*
- *Person Data: Preferred Name*
- *Person Data: Religion*
- *Worker Data: Beneficiaries and Dependents*
- *Worker Data: Benefit Elections*
- *Worker Data: Compensation*
- *Worker Data: Compensation by Organization*
- *Worker Data: Leave of Absence*
- *Worker Data: Organization Information*
- *Worker Data: Public Worker Reports*
- *Worker Data: Staffing*
- *Worker Data: Workers*

## Business Processes

No impact.

## Reporting

Report	Description
View Integration System	View all integrations that you've created. You can then edit a specific integration that you locate with this report.
Integration Events	Displays: <ul style="list-style-type: none"> <li>A summary of integration events that are in process or completed.</li> <li>Details about the status for each integration event.</li> </ul>

## Connections and Touchpoints

Features	Considerations
Compensation	Core Connector: Worker sends base pay amounts, currency, and compensation change reasons for included workers.
HCM Core	Core Connector: Worker sends HCM core data for included workers.
Talent	Core Connector: Worker sends qualification data for included workers.

Workday offers a Touchpoints Kit with resources to help you understand configuration relationships in your tenant. Learn more about the [Workday Touchpoints Kit](#) on Workday Community.

## Steps: Set Up Core Connector: Worker Integration

### Prerequisites

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

### Context

To export changes to worker data, create a *Core Connector: Worker* integration.

### Steps

1. [Create Integration System](#) on page 1967.  
Enter *Core Connector: Worker* in the New Using Template prompt.

2. Enable one or more of these optional integration services. The Configure Integration Services task displays all integration services, including required services; those integration services aren't editable.

For all Data Section Fields services, disable the service if you don't enable at least 1 field within the data section.

Option	Description
Worker Data Initialization Service	<p>Provides field attributes under a new CCW – Workers for DIS folder. If selected:</p> <ul style="list-style-type: none"> <li>Configure population eligibility in the Configure Integration Population Eligibility task.</li> <li>Workday doesn't apply web service contextual security, but you can ensure data security based on eligibility configuration.</li> </ul> <p>Workday recommends that you use this service if you:</p> <ul style="list-style-type: none"> <li>Extract data for large numbers of workers.</li> <li>Experience performance issues with existing Core Connector: Worker integrations.</li> </ul> <p>Workday recommends that you test this service to determine any downstream impacts.</p>
Data Initialization Service - Exception Log	Provides error logs for calculated fields exceptions. Automatically enabled when you enable the Worker Data Initialization Service.
DIS - Performance Log	Provides logs to track performance of DIS in integration events. Automatically enabled when you enable the Worker Data Initialization Service.
Effective Stack - Performance Log	Provides logs to track the performance of effective changes calculations. Automatically enabled when you enable the Worker Data Initialization Service.
Directory Service - Delivery Service	Enables the integration system to deliver output files to an external endpoint.
Core Connector: Worker Transaction Log Service	<p>Enables your integration system to subscribe to any event that takes place in Workday. This option enables your integration to report only changed fields for workers, rather than report all fields.</p> <p>If disabled, your integration first extracts all data for eligible records, then evaluates the data for changes. Using this option can adversely affect performance.</p>
Core Connector: Worker Filename Sequence Generator	Applies a custom-formatted, unique filename to each integration file.

Option	Description
CSV Options	Applies quotation formatting and column headers to the integration file.
Integration Document Retention	Preserves integration file output for later viewing.
Worker Profile Photo	Provides worker photo data (in base64 binary format). If enabled, set the Version integration attribute to <i>17</i> or later. You can disable this service if you enable the Worker Data Initialization Service.
Worker Personal Data Section Fields	Provides employee personal data and contact information. If enabled, set the Version integration attribute to <i>17</i> or later. You can disable this service if you enable the Worker Data Initialization Service.
Worker Status Data Section Fields	Provides employment status and service dates. If enabled, set the Version integration attribute to <i>17</i> or later. You can disable this service if you enable the Worker Data Initialization Service.
Worker Position Data Section Fields	<p>Provides:</p> <ul style="list-style-type: none"> <li>• Job profile data</li> <li>• Salary and base compensation elements</li> <li>• Organization membership data</li> </ul> <p>If enabled, set the Version integration attribute to <i>17</i> or later. You can disable this service if you enable the Worker Data Initialization Service.</p>
Worker Contract Data Section Fields	Provides employment contract data. If enabled, set the Version integration attribute to <i>17</i> or later. You can disable this service if you enable the Worker Data Initialization Service.
Worker Leave of Absence Data Section Fields	Provides leave of absence data. If enabled, set the Version integration attribute to <i>17</i> or later. You can disable this service if you enable the Worker Data Initialization Service.
Worker Compensation Data Section Fields	Provides compensation data for each worker. If enabled, set the Version integration attribute to <i>17</i> or later. You can disable this service if you enable the Worker Data Initialization Service.
Worker Identification Data Section Fields	Provides identification data for each worker. If enabled, set the Version integration attribute to <i>17</i> or later. You can disable this service if you enable the Worker Data Initialization Service.
Worker Related Person Data Section Fields	Provides related person data for each worker. If enabled, set the Version integration attribute to <i>17</i> or later. You can disable this service

Option	Description
	if you enable the Worker Data Initialization Service.
Worker Qualification Data Section Fields	Provides qualifications data for each worker. If enabled, set the Version integration attribute to 17 or later. You can disable this service if you enable the Worker Data Initialization Service.
Worker Transaction Log Data Section Fields	Provides transaction log data for each worker. If enabled, set the Version integration attribute to 17 or later. You can disable this service if you enable the Worker Data Initialization Service.

3. As a related action on your *Core Connector: Worker integration* select Integration System > Configure Integration Transaction Log.

Select the Workday transactions that you want monitored for changes.

Note: Workday recommends that you select Subscribe to all Transaction Types except. Then, filter out only transaction types that you know have no relevance to your needs. If in doubt, don't filter out a transaction type.

4. (Optional) Add custom fields to connector out put, or integration field overrides for DIS.

Add an unlimited number of custom fields to a *Core Connector: Worker integration*. You can use calculated fields or report fields to incorporate additional data elements into your output files. You can use any report field as long as it's available for:

- The Worker business object.
- A business object that is directly related to the Worker object.

See [Add Custom Fields to Connector Output](#). If you enable the *Worker Data Initialization Service* see [Set Up Integration Field Overrides for DIS](#)

5. [Set Up Integration Sequence Generators](#) on page 1969.

6. [Configure Core Connector: Worker Integration Attributes](#) on page 1140.

7. From the related actions menu on the integration, select Integration System > Configure Integration Maps.

On the Integration Maps grid, add a row for each tenant value. Select the Internal Value and enter the External Value for the output file.

(Optional) Provide a Default Value for data elements with values that don't have a corresponding map value.

8. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

- *Manage: Organization Integration*
- *Person Data: Birth Place*
- *Person Data: Citizenship Status*
- *Person Data: Date of Birth*
- *Person Data: Disabilities*
- *Person Data: Emergency Contacts*
- *Person Data: Ethnicity*
- *Person Data: Gender*
- *Person Data: Home Contact Information*
- *Person Data: Hukou (China)*
- *Person Data: ID Information*
- *Person Data: Institutional Contact Information*
- *Person Data: Marital Status*
- *Person Data: Military Status*
- *Person Data: Name*
- *Person Data: Nationalities*
- *Person Data: Personal Data*
- *Person Data: Personal Information*
- *Person Data: Preferred Name*
- *Person Data: Religion*
- *Worker Data: Beneficiaries and Dependents*
- *Worker Data: Benefit Elections*
- *Worker Data: Compensation*
- *Worker Data: Compensation by Organization*
- *Worker Data: Leave of Absence*
- *Worker Data: Organization Information*
- *Worker Data: Public Worker Reports*
- *Worker Data: Staffing*
- *Worker Data: Workers*

[See: Steps: Grant Integration or External Endpoint Access to Workday.](#)

Note: If you enabled the Worker Data Initialization Service, grant the ISU access to *Integration Event* only.

9. (Optional) Grant the ISU access to the *View: Core Connector Integration Document* domain so that the ISU has access to files generated by the integration.
10. [Select Workers to Include in a Core Connector: Worker Integration](#) on page 1145.
11. (For Version 17 and higher integrations only) [Select and Set Up Connector Output Fields](#) on page 1977.
12. (For Version 15 and 16 integrations only) [Map Core Connector: Worker Integration Data](#) on page 1145.  
Map Workday data to the integration.
13. [Create Integration Business Process](#) on page 1950.
14. (Optional) [Steps: Set Up Document Transformation Connector](#) on page 594.
15. [Launch an Integration](#) on page 24.

## Configure Core Connector: Worker Integration Attributes

### Prerequisites

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

## Context

Configure the Core Connector: Worker integration by entering attributes for enabled integration services, as well as required attributes.

## Steps

- From the related actions menu on your integration, select Integration System > Configure Integration Attributes.
- Enable and disable integration attributes. As you complete the task, consider:

Option	Description
Output Filename	Assigns the name to the output file. If you enabled the filename sequence generator, leave this value empty. Otherwise, enter a valid filename.
Output Document Tags	The integration applies these tags to integration output files.
Version	Sets the version of the output file.
Output Format	Specifies the format of the file that the integration generates.
Include Inactive Workers in Full File	Includes inactive workers in the output when you enable the Full File launch parameter option. If not specified, the integration excludes inactive workers from Full File results.
Name Type	Includes selected Name Types in the output file. (Applicable for Version 17 and above).
Country ISO Code Type	Includes the selected type of country code for addresses in the output file. If not specified, the integration uses ISO 3166-1 Alpha 2 code. (Applicable for Version 17 and above).
Country Code Type	Includes the selected type of country code for addresses in the output file. If not specified, the integration uses ISO 3166-1 Alpha 2 code. (Applicable for Version 17 and above).
Address Type	Includes the primary address for the selected Address Types in the output file. (Applicable for Version 17 and above).
Address Usage	Includes any additional nonprimary addresses in the output file: <ul style="list-style-type: none"> <li>Of the selected Address Usages</li> <li>For the selected Address Types</li> </ul> (Applicable for Version 17 and above).
Include Private Addresses	Includes private addresses in the output file. (Applicable for Version 17 and above).
Include Non-Primary Addresses	Includes nonprimary addresses in the output file. (Applicable for Version 17 and above). Workday applies this value only if you enable the Worker Data Initialization Service.

Option	Description
Phone Number Format	Specifies which output format that the integration uses for Formatted Phone Number.
Phone Type	Includes the primary phone number for the selected Phone Types in the output file. (Applicable for Version 17 and above).
Include Private Phone Numbers	Includes private phone numbers in the output file. (Applicable for Version 17 and above).
Include Non-Primary Phone Numbers	Includes nonprimary phone numbers in the output file. (Applicable for Version 17 and above). Workday applies this value only if you enable the Worker Data Initialization Service.
Email Type	Includes the primary email address for the selected Email Types in the output file. (Applicable for Version 17 and above).
Include Private Email Addresses	Includes private email addresses in the output file. (Applicable for Version 17 and above).
Include Non-Primary Email Addresses	Includes nonprimary email addresses in the output file. (Applicable for Version 17 and above). Workday applies this value only if you enable the Worker Data Initialization Service.
Include Prior Values	Includes a Prior Value attribute containing the previous value for a field. (Applicable for Version 17 and above).
Job Classification Group for Job Classification	Specifies the type of Job Classification Group that the integration uses to select the Job Classification fields in the output. Also enable this field in the Position Data field service. (Applicable for Version 17 and above).
Organization Type for Organization	Specifies the type of Organization that the integration uses to select the Organization field in the output. Also enable this field in the Position Data field service. (Applicable for Version 17 and above).
Identification Type for Identification	Specifies the type of Identification that the integration uses to select the Identification field in the output. Also enable this field in the Identification Data field service. (Applicable for Version 17 and above).
Related Person Type for Related Person	Specifies the type of Related Person (Example: Beneficiary, Dependent, Emergency Contact) that the integration uses to select the Related Person data in the output. Also enable this field in the Related Person data field service. (Applicable for Version 17 and above).
Required Field Validation	To identify errors that might occur when the integration exports data, the integration applies validation rules to the worker data. This

Option	Description
	<p>attribute controls what happens when these validation rules detect an issue. If not specified, the integration uses <i>Omit - Report Error</i>:</p> <ul style="list-style-type: none"> <li>• <i>Omit - Report Error</i>: integration omits worker record, reports error, continues processing.</li> <li>• <i>Omit - Report Warning</i>: integration omits worker record, displays a warning message, continues processing.</li> <li>• <i>Include - Report Warning</i>: integration includes worker record, adds a warning message to the integration event, continues processing.</li> </ul> <p>(Applicable for Version 17 and above).</p>
Include Terminated and Transferred Workers from Restrict Results By Orgs	<p>Overrides the standard integration behavior. Includes in delta extracts those Workers who you have terminated or transferred out of the organizations specified in the Restrict Results by Org launch parameter.</p>
Include Address Field Descriptive Attributes	<p>Includes or excludes the Type and Label attributes for certain Address fields in the output file. If you set the Version to 21.0 or higher, then the integration includes the additional attributes. If you set the Version to 20 or lower, the integration doesn't include the additional attributes. You can set this integration attribute to override either value.</p> <p>(Applicable for Version 17 and above).</p>
Suppress Worker Messages Audit	<p>Disables generation of Get_Workers web service responses for each worker in the Messages Audit file.</p>
Suppress Audit Reports	<p>Disables generation of the Data Changes Audit and Diagnostic Audit files.</p>
Include Multiple Supervisors	<p>If selected, the output includes multiple supervisors (if applicable) for the position of the worker. (Applicable for Version 25.0 and above).</p>
Use Transaction Log with Full File	<p>If selected, the integration uses the Transaction Log (if enabled) for Full File extracts. (Applicable for Version 17 and above).</p>
Group Additional Information Fields By Service	<p>If selected, the output file includes the Additional Information Fields grouped under the Field Override Service Name. You enter the Field Override Service Name in the Configure Integration Field Overrides related action on the integration system.</p> <p>To group under a custom group name, place a period between the group name and the field</p>

Option	Description
	<p>name. Don't include a period in any other part of the name. Example: <i>Group_Name.Field_Name_3_I</i></p> <p>Workday applies this value only if you enable the Worker Data Initialization Service.</p>
Include Multiple Positions	<p>If selected, the Position Data Section returns additional jobs and international assignments. (Applicable for Version 25 and above).</p> <p>Workday applies this value only if you enable the Worker Data Initialization Service.</p>
Job Type	<p>Select the job types that you want Workday to return (applicable for Version 25.0 and above). The <i>Primary Position</i> and <i>International Assignment</i> fields in the Position Data Section reflect the types of positions returned. Workday applies this value only if you enable the Worker Data Initialization Service.</p>
Always Include Workers with Manager Change in Output	<p>The integration checks each worker for associated manager change events. If manager change events exist for a worker, the integration includes the worker in the integration output regardless of field output changes. Workday applies this value only if you enable the Worker Data Initialization Service.</p>
Generate Multiple Output Files	<p>If selected, the integration creates multiple output files containing 1000 Workers each. (Applicable for Version 34 and above).</p> <p>Workday applies this value only if you enable the Worker Data Initialization Service.</p>
Suppress Warning Messages on Calculated Field Exceptions	<p>Disables the warning messages related to exceptions that the integration returns from calculated fields used as Field Overrides or Eligibility Criteria. Workday applies this value only if you enable the Worker Data Initialization Service.</p>
Show headers	<p>Determines if the integration includes column headers. If not specified, the integration displays the headers.</p>
Always quote values	<p>Determines if the integration applies quotation marks to output file values. If not specified, the integration applies quotation marks only to any value that requires quotation marks.</p>
Document Retention Policy	<p>Specify the duration (in days) that the integration retains output files for viewing.</p>

## Select Workers to Include in a Core Connector: Worker Integration

### Prerequisites

You must have a Core Connector: Worker integration system to perform this task.

If you intend to use a calculated field for the eligibility criterion, create it before performing this task.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

### Context

Designate a report field or calculated field that identifies if a worker is or isn't eligible for the integration. You have to create the report field or calculated field on the Worker *business object*, and it must return a Boolean true or false. A Boolean true includes the worker in the integration, while a Boolean false excludes the worker.

### Steps

1. As a related action on the Core Connector: Worker integration system, select Integration System > Configure Integration Field Overrides.
2. Select a report field or calculated field from the Override External Field prompt in the Field Configuration grid for *Define Eligibility / Eligibility criterion*.

### Example

If your integration system monitors changes for all of your staff employees, you select the *Worker is Employee* field. This field would return true for all your employees, and return false for all of your contingent workers.

If your integration system monitors changes for your sales staff in your Chicago office, you create a calculated field that returns true if the:

- Worker was an employee.
- The worker belonged to a sales organization.
- The worker belonged to the Chicago location.

[Create Calculated Fields](#)

## Map Core Connector: Worker Integration Data

### Prerequisites

You must have selected 15 or 16 as the Version when configuring the integration attributes to perform this task.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

### Context

In this task, you add (and if necessary, create) an Integration Field Override Service to the Core Connector: Worker integration. The Integration Field Override Service defines the fields that Workday includes on integration output files. Then, you configure integration field overrides for all integration services. These overrides define which report fields Workday uses to add data for each field.

## Steps

1. As a related action on the Core Connector: Worker integration, select Integration System > Configure Integration Services.
2. Add a row to the Custom Integration Services grid and select an Integration Field Override Service from the Integration Service prompt. If you haven't already created one, do so now:
  - a) Access the Create Integration Field Override Service task.
  - b) Name your new Integration Field Override Services. Then, select the *business object* (Contingent Worker, Employee, or Worker) that includes the report fields that you want to map to the integration file for each worker.
  - c) Add 1 row for each field and provide a name for each field. You can reorder the fields using the up and down arrows.
3. As a related action on the Core Connector: Worker integration, select Integration System > Configure Integration Field Overrides.
4. Scroll down to the Field Configuration grid for the Integration Field Override Service.
5. For each field, select a corresponding report field from the Override External Field prompt.

## View Core Connector: Worker Integration Audits

### Prerequisites

Security: *Background Process Management* domain in the Tenant Non-Configurable functional area.

### Context

For each integration event, you can use the Core Connector: Worker integration audits to determine:

- What data sends (*DataChangesAudit.html*)
- Why Workday includes the worker in the integration event (*DiagnosticAudit.html*)
- How the data groups on the integration file (*Event Name.csv*)

## Steps

1. As a related action on the integration event, select Background Process > View Output Files.
2. Select an audit file:

Option	Description
<i>DataChangesAudit.html</i>	For each worker, displays the Integration Field Override Service name, field name, current and prior field values, and worker transactions for each field included on the integration file.  If you enabled the <i>Suppress Audit Files</i> integration attribute, Workday doesn't generate this audit file. For this reason, suppression isn't the automatically populated configuration.
<i>DiagnosticAudit.html</i>	For each worker, displays each worker transaction that the integration detected during the date range covered by the integration event.  If you enabled the <i>Suppress Audit Files</i> integration attribute, Workday doesn't generate this audit file. For this reason, suppression isn't the automatically populated configuration.

Option	Description
<i>Event Name.csv</i>	Displays the raw output of the integration in a Comma Separated Value (CSV) format.

## Concept: Core Connector: Worker

The Core Connector: Worker integration exports worker data changes from Workday in simple XML format. Workday also supports output in CSV (Comma-Separated Value) format, with certain limitations. As you hire, promote, transfer, terminate, or update worker data, the integration generates a text file containing the changes.

Using configurable data sections or Workday-delivered report fields and calculated fields that you create, you can export any worker data, in any combination.

Use this Connector to send data for workers and attributes of those workers.

### Change Detection

The Core Connector: Worker detects changes to worker data by monitoring a transaction log. When you configure the integration system, you select which business process and transaction types that the integration system subscribes to. Workday ignores changes caused by business processes and transaction types that the integration doesn't subscribe to. By including all business process and transaction types, you benefit automatically when Workday adds new types. However, including all is also a potential risk, as the integration might include more information than is necessary.

The Core Connector: Worker integration uses a three-step process to detect and report changes:

1. The integration checks the transaction log. It determines which workers have changes that result in the generation of one of the configured transaction events.
2. For each worker with a matching transactional change, the integration compares their report fields for:
  - The time at which the integration ran.
  - The time at which the integration last successfully ran.

The integration identifies which, if any, of the values of interest have changed.

3. If the worker has any changes in field values or eligibility, Workday generates an appropriate creation, change, or deletion message.

### Change Detection Limitations

Changes to the Classification of a Job don't trigger change detection for this integration. The context of the change is on the Job Profile (template), and not directly related to any associated job (instance) for a worker. However, full extraction on worker records includes the job classification element.

### Full-Diff Extract

You can configure your Core Connector: Worker integration to select all workers who meet the eligibility criteria, then determine changes for the returned data. To enable this option, disable the Transaction Log service or enable the *Use Transaction Log with Full File* integration attribute. When you run the integration, Workday extracts all applicable data for the defined population of employees. If any data for an employee changed during the defined date range, Workday includes all data for that employee. The integration doesn't include prior values when performing a full extract using the Transaction Log option. Using this option can adversely affect Workday performance.

### Worker Eligibility

For each integration system, you define a group of workers that belongs to the integration system. A single boolean report field or calculated field defines membership. If the field value is true for a worker, that

worker is a member of the group, and Workday includes changes for that worker in the output file. If the field value is false, the integration system ignores that worker.

You can use report fields on the Worker business object to define eligibility. If you can't define your group membership criteria using a report field, you can create and use a calculated field. If multiple boolean values are true, the calculated field can evaluate the worker business object and its related business objects to return true. Example: use a calculated field to return true if:

- The worker is a contingent employee.
- The primary location of the worker is in the United States.
- The supervisor of the worker is John Doe.

## Worker Data Initialization Service

Core Connector: Worker includes a Worker Data Initialization Service as an alternate method for accessing data from Workday. This integration service can provide significant performance improvements. We highly recommend that you use this service if:

- You're extracting data for large numbers of workers.
- You're experiencing performance issues with existing integrations.

You can use the Migrate Integration Configuration for Data Initialization Service task to make setting up new integrations with this service easier.

The Worker Data Initialization Service provides field attributes under a separate *CCW – Workers for DIS* folder in the Configure Integration Field Attributes task. Core Connector: Worker integrations require access to the *Integration Event* security domain only.

Core Connector: Worker doesn't support returning multiple values when a Field Override uses a multi-instance field.

## Output Configuration and Formats

The Core Connector: Worker integration supports output configuration using either data sections or report fields. The integration template includes a *Version* attribute. Versions 17 and later supports configurable data sections. Versions 16 and earlier support report field overrides and provides backward compatibility for any HCM Worker: Connector integrations that you built before Workday 17, using HCM Worker Sync:

### Data Sections

The template includes a configurable set of HCM data across a range of categories. You can specify which data sections to include in the output file. Each section provides a set of fields. You can select which fields to include or exclude, which ones to require, and which ones to truncate.

### Report fields

You can include any report fields from the Worker-related business objects (Contingent Worker, Employee, and Worker) on the integration file. You can add a unique label for each field. When Workday generates an integration file, it combines the field name and the report field into a single formatted entry.

Workday creates Core Connector: Worker integration files in one of these formats, depending on which *Version* attribute you select:

- Version 15 and 16: Workday can generate an output file in Comma-Separated Value (CSV) format; values and separators are all in ASCII text. The file includes current values for each field included in the file.

- Version 16 and later: Workday can generate an output file in XML format. Each field element in the file includes separate elements containing the current value and the prior value.

## Launch/Schedule Options

Workday provides these launch schedule options for the Core Connector: Worker integration:

- Organization: If you intend to run the integration immediately, select the organization for which you want to run the integration. The prompt varies depending on the Integration Process Event and on your security access:
  - *Owning Organization* displays if the Integration Process Event for this integration is associated with a specific organization. You can select the organization or any of its subordinate organizations of which you're a member. You can also select any organization or subordinate organization if you have an organization role.
  - *Organization By Type* displays if the Integration Process Event for this integration has no associated organization. You can select any organization and subordinate organization of which you're a member or have an organization role.
- Scheduled Run Frequency. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration collects all qualifying changes based on the launch parameters. You can schedule a Core Connector: Worker integration to run several times per day; launching the integration frequently doesn't affect performance.
- Run Now. You can launch the integration manually for specific workers, or for all eligible workers. Workday prompts you to enter launch parameters.

For each launch schedule option, you can enter these launch parameters:

Parameter	Description
As Of Entry Moment, Effective Date, Last Successful As Of Entry Moment, Last Successful Effective Date	Extracts records that are current as of the specified As Of Entry Moment and Effective Date parameters. If Full File isn't selected, then the extract includes only those records that have changed in one or more output fields. Workday compares to what was current as of the Last Successful As Of Entry Moment and Last Successful Effective Date parameters.
Full File	Extracts Workers as of the As Of Entry Moment and Effective Date, regardless of whether they've changed.
Restrict Results By Orgs	Extracts Workers for only the specified Organizations and all subordinates.
Workers	Extracts only the specified Workers.
	If you configure no values, then the integration considers all workers when looking for transactional and data changes. Specifying workers in this list doesn't force their inclusion in the output file. Information for a worker displays in the output file only if there are changes in the data fields evaluated by the integration system.
	If there was an error involving data for one or more workers during a prior integration run, specify workers in this parameter at launch time. Correct the worker data and then run the integration again only for those workers. Set the <i>Last Successful As Of Entry Moment</i> to the moment used for that parameter on the prior run.

## Integration Audit Files

Every time the integration runs, Workday generates these files:

- The *Data Changes Audit* is a readable version of the integration output file.
- The *Diagnostic Audit* is designed to help you troubleshoot integration errors.
- The *Schema XSD* file defines the content and the structure of the output file. It includes only those fields that you've enabled for your integration system. Workday generates this file every time the integration runs. The file reflects your integration configuration as of the moment that the integration ran. You can only generate this file by running the integration.

The Reports and Other Output Files section of the Integration Event for each integration run displays these files.

Note: Because Workday includes actual data in the Data Change Audit file, you can secure this file separately. Example: If administrators can't have access to the data.

### Tasks

[Add Custom Fields to Connector Output](#) on page 1978

## Concept: Core Connector: Worker Integration Data Mapping

You must have selected 15 or 16 as the Version when configuring the integration attributes to perform this task.

This data mapping example displays how you would map worker data to a Version 15 or 16 Core Connector: Worker integration:

1. Create an Integration Field Override Service named *Worker Data*, with these field names:
  - Full Name
  - First Name
  - Last Name
  - Email Address
  - Secondary Email Address
  - Employee Type
2. Add the Worker Data integration service to your Core Connector: Worker integration system.
3. In the Integration Field Overrides for your integration system, you map Workday report fields to the fields you defined:

Fields	Override External Field
Worker Data / Full Name	Legal Name
Worker Data / First Name	Legal Name - First Name
Worker Data / Last name	Legal Name - Last Name
Worker Data / Email Address	Email - Primary Work
Worker Data / Employee Type	Worker Type - Text

When you hire employee John Doe into your company (Acme, Inc. in this example), Workday includes this entry for John Doe on the integration file:

Full Name: John Doe

First Name: John

Last Name: Doe

Email Address: john.doe@acmeinc.com

Employee Type: Employee

## Concept: Core Connector: Worker Integration Launch Parameters

### Scheduled Integration Launch Parameter Examples

Example 1: Full File, Run Weekly.

To schedule a full file integration, specify these values for the Effective Date, As Of Entry Moment, and Full File launch parameters:

Field	Value Type	Value
Effective Date	<i>Determine Value at Runtime</i>	Current Effective Date
As Of Entry Moment	<i>Determine Value at Runtime</i>	Current Moment ( <i>DateTime</i> )
Full File	<i>Determine Value at Runtime</i>	Select check box as <i>True</i> .

When the integration runs, it sends a file that contains all workers who are in the specific date range. The integration includes all workers regardless if there are any changes for a worker.

Example 2: Full File, Compare Current, Run Now.

To schedule an integration that compares:

- Current worker records.
- What was current as of the Last Successful Effective Date and Last Successful As Of Entry Moment.

Specify these values:

Field	Value Type	Value
Effective Date	<i>Determine Value at Runtime</i>	Current Effective Date
As Of Entry Moment	<i>Determine Value at Runtime</i>	Current Moment ( <i>DateTime</i> )
Last Successful Effective Date	<i>Determine Value at Runtime</i>	As Of Effective Date of Last Completed Integration Event
Last Successful As Of Entry Moment	<i>Determine Value at Runtime</i>	As Of Entry <i>DateTime</i> of Last Completed

Field	Value Type	Value
		Integration Event

Each time the integration runs, it sends a file that contains:

- Changes that occurred between the last integration run (From Last Successful As Of Entry Moment) and the current date and time (As of Entry Moment ).
- Changes that are effective between the Last Successful Effective Date and the Effective Date.

#### Example 3: Restrict Results by Orgs.

To schedule an integration that extracts workers from specific orgs and their subordinates, specify values for these launch parameters:

- Effective Date
- As Of Entry Moment
- Restrict Results by Orgs

Field	Value Type	Value
Effective Date	Determine Value at Runtime	Current Effective Date
As Of Entry Moment	Determine Value at Runtime	Current Moment (DateTime)
Restrict Results By Orgs	Determine Value at Runtime	Organizations

#### Example 4: Full File, Workers

To schedule an integration that extracts specified workers, specify these values for the Effective Date, As Of Entry Moment, and Workers launch parameters:

Field	Value Type	Value
Effective Date	Determine Value at Runtime	Current Effective Date
As Of Entry Moment	Determine Value at Runtime	Current Moment (DateTime)
Workers	Determine Value at Runtime	Workers

## Reference: Core Connector: Worker Integration Data Sections

Before you build an integration with the Core Connector: Worker template, familiarize yourself with each data section to understand which fields are available for output and how the configuration options affect integration behavior.

During integration configuration, you enable integration services for each data section that you want to include in the output file.

Some sections also have an *Operation* field that indicates whether a row of data is new, changed, or deleted. *Operation* codes are: ADD, REMOVE, MODIFY, or NONE.

Section	Description	Fields
Worker Profile Photo	<ul style="list-style-type: none"> <li>This section has a single record.</li> <li>Workday populates this section only if the worker has a profile photo.</li> <li>Workday includes Profile photo data in the <i>Image</i> field in base64 binary format. Use a base64 converter to translate the binary data into a graphic file.</li> <li>Workday ignores any Maximum Length value for the <i>Image</i> field attribute.</li> <li>If the <i>Image</i> field value is changed, Workday includes only a truncated prior value, not the full prior image. A truncated prior value indicates that the image changed. Truncation doesn't require sending a large (redundant) prior value base64 string in the output file.</li> </ul>	<ul style="list-style-type: none"> <li>• <i>Filename</i></li> <li>• <i>Image</i></li> </ul>

Section	Description	Fields
Worker Personal Data	<ul style="list-style-type: none"> <li>This section has a single record.</li> <li>If not overridden, name fields are based on Legal Name.</li> <li>The <i>Name Data</i>, <i>Address Data</i>, <i>Phone Data</i>, and <i>Email Data</i> attributes don't send data. They enable the attributes with the same attribute prefix. Example: Enable <i>Email</i> in order to use the <i>Email Usage</i>, <i>Email is Public</i>, and <i>Email Address</i> field attributes.</li> <li><i>Name Data / Title</i> is the Prefix of the name and <i>Name Data / Social Suffix</i> is the Suffix of the name.</li> <li><i>Country of Birth</i> is a two-digit country code based on ISO 3166-1 alpha-2.</li> <li>If a worker has more than 1 <i>Ethnicity</i>, Workday includes only 1 ethnicity value unless: <ul style="list-style-type: none"> <li>The Version integration attribute is set to 21 or higher.</li> <li>The integration generates output files in XML format.</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>Name Data</li> <li>Name Data / Name Type</li> <li>Name Data / First Name</li> <li>Name Data / Middle Name</li> <li>Name Data / Last Name</li> <li>Name Data / Secondary Last Name</li> <li>Name Data / Title</li> <li>Name Data / Social Suffix</li> <li>Name Data / Formatted Name</li> <li>Name Data / Reporting Name</li> <li>Name Data / First Name in Local Script</li> <li>Name Data / Middle Name in Local Script</li> <li>Name Data / Last Name in Local Script</li> <li>Name Data / Secondary Last Name in Local Script</li> <li>Name Data / Name in Local Script</li> <li>Name Data / First Name in Local Script 2</li> <li>Name Data / Middle Name in Local Script 2</li> <li>Name Data / Last Name in Local Script 2</li> <li>Name Data / Secondary Last Name in Local Script 2</li> <li>Name Data / Full Legal Name</li> <li>Gender</li> <li>Birth Date</li> <li>Country of Birth</li> <li>Region of Birth</li> <li>City of Birth</li> <li>Marital Status</li> <li>Religion</li> <li>Disability</li> <li>Ethnicity</li> <li>Hispanic or Latino</li> <li>Citizenship Status</li> <li>Nationality</li> <li>Military Status</li> <li>Military Discharge Date</li> <li>Address Data</li> <li>Address Data / Address Type</li> <li>Address Data / Address Usage</li> <li>Address Data / Address Is Public</li> <li>Address Data / Is Primary</li> <li>Address Data / Address Line Data</li> <li>Address Data / Address Privacy and Confidentiality</li> <li>Address Data /</li> </ul>

Section	Description	Fields
Worker Status Data	<ul style="list-style-type: none"> <li>Staffing Event codes are: HIR (hire), TRM (termination), LOA (leave of absence), RFL (return from leave), and TFR (supervisory organization change). Workday returns the:           <ul style="list-style-type: none"> <li>HIR staffing event for a worker with a Employee Status value of <i>Is Added</i>.</li> <li>HIR staffing event for a worker with a Prior Employee Status of <i>Terminated</i> and a current Employee Status of <i>Active</i>.</li> <li>LOA code for a worker with a Prior Employee Status of <i>Is Not on Leave</i> and a current Employee Status of <i>On Leave</i>.</li> <li>RFL code for a worker with a Prior Employee Status of <i>On Leave</i> and a current Employee Status of <i>Active</i>.</li> <li>TFR code for a worker with a Prior Supervisory Organization value.</li> <li>TRM code for a worker with a Prior Employee Status of <i>Is Not Terminated</i> and a current Employee Status of <i>Terminated</i>.</li> <li><i>Employee Status</i> codes are: <i>Active</i>, <i>OnLeave</i>, <i>Terminated</i>, and <i>NotYetHired</i>.</li> <li>These fields support Record of Employment (ROE) reporting for Canada:           <ul style="list-style-type: none"> <li><i>Last Date for Which Paid</i></li> <li><i>Expected Return Date</i></li> <li><i>Not Returning</i></li> <li><i>Return Unknown</i></li> </ul> </li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>Staffing Event</li> <li>Staffing Event Date</li> <li>Employee Status</li> <li>Active</li> <li>Active Status Date</li> <li>Hire Date</li> <li>Original Hire Date</li> <li>Hire Reason</li> <li>End Employment Date</li> <li>Continuous Service Date</li> <li>First Day of Work</li> <li>Expected Retirement Date</li> <li>Retirement Eligibility Date</li> <li>Retired</li> <li>Retirement Date</li> <li>Seniority Date</li> <li>Severance Date</li> <li>Benefits Service Date</li> <li>Company Service Date</li> <li>Time Off Service Date</li> <li>Vesting Date</li> <li>Terminated</li> <li>Termination Date</li> <li>Pay Through Date</li> <li>Primary Termination Reason</li> <li>Primary Termination Category</li> <li>Termination Involuntary</li> <li>Secondary Termination Reason</li> <li>Local Termination Reason</li> <li>Not Eligible for Hire</li> <li>Regrettable Termination</li> <li>Termination Last Day of Work</li> <li>Resignation Date</li> <li>Last Date for Which Paid</li> <li>Expected Date of Return</li> <li>Not Returning</li> <li>Return Unknown</li> <li>Probation Start Date</li> <li>Probation End Date</li> <li>Academic Tenure Date</li> <li>Has International Assignment</li> <li>Home Country</li> <li>Host Country</li> <li>Rehire</li> </ul>

Section	Description	Fields
Worker Position Data	<ul style="list-style-type: none"> <li>This section has a single record, with primary position only.</li> <li><i>Effective Date</i> represents the effective date for the most recent change to position data. Workday doesn't report prior values for this field.</li> <li>A position can have a number of job classifications that you arrange according to job classification groups.</li> </ul>	<ul style="list-style-type: none"> <li>Operation</li> <li>Position ID</li> <li>Effective Date</li> <li>Primary Position</li> <li>Position Title</li> <li>Business Title</li> <li>Worker Type</li> <li>Position Time Type</li> <li>Job Exempt</li> <li>Scheduled Weekly Hours</li> <li>Default Weekly Hours</li> <li>Full Time Equivalent Percentage</li> <li>Exclude from Headcount</li> <li>Pay Rate Type</li> <li>Job Classification Data</li> <li>Job Classification Data/Operation</li> <li>Job Classifications</li> <li>Job Classification Group</li> <li>Company Insider Type</li> <li>Organization Data</li> <li>Organization Data/Operation</li> <li>Organization</li> <li>Organization Type</li> <li>Work Shift</li> <li>Work Hours Profile</li> <li>Workers Compensation Code</li> <li>Job Profile</li> <li>Management Level</li> <li>Job Category</li> <li>Job Family</li> <li>Business Site</li> <li>Business Site Name</li> <li>Business Site Address Type</li> <li>Business Site Address Line Data</li> <li>Business Site Municipality</li> <li>Business Site Submunicipality</li> <li>Business Site Region</li> <li>Business Site Subregion</li> <li>Business Site Postal Code</li> <li>Business Site Country</li> <li>Business Site Address Line Data Local</li> <li>Business Site Municipality Local</li> <li>Business Site Submunicipality Local</li> <li>Business Site Subregion Local</li> <li>Regular Paid Equivalent Hours</li> <li>Workday Proprietary and Confidential</li> <li>Worker Hours Profile</li> </ul>

Section	Description	Fields
Worker Contract Data	<ul style="list-style-type: none"> <li>This section can have multiple records.</li> <li>Although an employee can have only 1 contract in effect at a time, this section can include contracts from the past. This section also can include contracts that become effective in the future.</li> </ul>	<ul style="list-style-type: none"> <li>Operation</li> <li>Position ID</li> <li>Contract ID</li> <li>Contract Type</li> <li>Start Date</li> <li>End Date</li> <li>Contract Status</li> <li>Description</li> </ul>
Worker Leave of Absence Data	<ul style="list-style-type: none"> <li>This section contains position-specific data.</li> <li>This section can have multiple records.</li> <li>An employee can be on multiple different types of leave at the same time.</li> <li>These fields in the Status Data section indicate whether an employee is on leave:             <ul style="list-style-type: none"> <li><i>Employee Status</i></li> <li><i>Staffing Event</i></li> <li><i>Staffing Event Date</i></li> </ul> </li> </ul> <p>Enable the Leave of Absence section if you need additional information about leave.</p>	<ul style="list-style-type: none"> <li>Operation</li> <li>Position ID</li> <li>On Leave</li> <li>Leave Start Date</li> <li>Estimated Leave End Date</li> <li>Leave End Date</li> <li>First Day of Work</li> <li>Leave Last Day of Work</li> <li>Leave of Absence Type</li> <li>Benefits Effect</li> <li>Payroll Effect</li> <li>Paid Time Off Accrual Effect</li> <li>Continuous Service Accrual Effect</li> <li>Stock Vesting Effect</li> <li>Operation</li> <li>Position ID</li> <li>Effective Date</li> <li>Compensation Change Reason</li> <li>Total Annual Base Pay</li> <li>Total Base Pay</li> <li>Base Pay Currency</li> <li>Base Pay Frequency</li> <li>Operation</li> <li>Identification</li> <li>ID</li> <li>ID Type</li> <li>Issued Date</li> <li>Expiration Date</li> <li>Verification Date</li> <li>Issuing Agency</li> <li>Series</li> <li>Country</li> <li>Region</li> <li>Authority</li> <li>License Class</li> <li>Organization</li> <li>Description</li> </ul>
Worker Compensation Data	<ul style="list-style-type: none"> <li>This section contains position-specific data.</li> <li><i>Effective Date</i> represents the effective date for the most recent change to compensation data. Workday doesn't report prior values for this field.</li> </ul>	
Worker Identification Data	<p>This section contains worker identification data.</p> <p>Workday performs Required field validation for this section only when a worker has at least one of the ID Types that you've configured for reporting.</p>	

Section	Description	Fields
Worker Related Person Data	<ul style="list-style-type: none"> <li>This section can have multiple records. It contains related-person details to a worker that can include emergency contacts, beneficiaries, and dependent details related to a worker.</li> <li>If not overridden, name fields are based on Legal Name.</li> <li>The <i>Name Data</i>, <i>Address Data</i>, <i>Phone Data</i>, and <i>Email Data</i> attributes don't send data. They enable the attributes with the same attribute prefix. Example: Enable <i>Email</i> in order to use the <i>Email Usage</i>, <i>Email is Public</i>, and <i>Email Address</i> field attributes.</li> <li><i>Name Data / Title</i> is the Prefix of the name and <i>Name Data / Social Suffix</i> is the Suffix of the name.</li> </ul>	<ul style="list-style-type: none"> <li>Operation</li> <li>Related Person ID</li> <li>Related Person Type</li> <li>Relationship</li> <li>Name Data</li> <li>Name Data / Name Type</li> <li>Name Data / First Name</li> <li>Name Data / Middle Name</li> <li>Name Data / Last Name</li> <li>Name Data / Secondary Last Name</li> <li>Name Data / Title</li> <li>Name Data / Social Suffix</li> <li>Name Data / Formatted Name</li> <li>Name Data / Reporting Name</li> <li>Name Data / First Name in Local Script</li> <li>Name Data / Middle Name in Local Script</li> <li>Name Data / Last Name in Local Script</li> <li>Name Data / Secondary Last Name in Local Script</li> <li>Name Data / Name in Local Script</li> <li>Name Data / First Name in Local Script 2</li> <li>Name Data / Middle Name in Local Script 2</li> <li>Name Data / Last Name in Local Script 2</li> <li>Name Data / Secondary Last Name in Local Script 2</li> <li>Name Data / Full Legal Name</li> <li>Gender</li> <li>Birth Date</li> <li>Marital Status</li> <li>Disability</li> <li>Ethnicity</li> <li>Address Data</li> <li>Address Data / Address Type</li> <li>Address Data / Address Usage</li> <li>Address Data / Address Is Public</li> <li>Address Data / Is Primary</li> <li>Address Data / Address Line Data</li> <li>Address Data / Municipality</li> <li>Address Data / Submunicipality</li> <li>Address Data / Region</li> <li>Address Data / Subregion</li> <li>Workday Data Protection Confidential</li> <li>Address Data / Country</li> </ul>

Section	Description	Fields
Worker Qualification Data	<ul style="list-style-type: none"> <li>This section has a single record.</li> <li>The <i>Competency Achievement, Certification Achievement, Training, Education, and External Job</i> attributes don't send data. They enable the attributes with the same attribute prefix. Example: Enable <i>Education</i> in order to use the <i>Last Year Attended</i> or <i>Field of Study</i> field attributes.</li> </ul>	<ul style="list-style-type: none"> <li>Competency Achievement</li> <li>Competency Achievement / Operation</li> <li>Competency Achievement / Competency Achievement ID</li> <li>Competency Achievement / Competency</li> <li>Competency Achievement / Proficiency Rating</li> <li>Competency Achievement / Assessment Comments</li> <li>Competency Achievement / Assessment Date</li> <li>Competency Achievement / Assessed by Worker</li> <li>Certification Achievement</li> <li>Certification Achievement / Operation</li> <li>Certification Achievement / Certification Achievement ID</li> <li>Certification Achievement / Certification</li> <li>Certification Achievement / Certification Country</li> <li>Certification Achievement / Certification Name</li> <li>Certification Achievement / Certification Issuer</li> <li>Certification Achievement / Certification Number</li> <li>Certification Achievement / Issued Date</li> <li>Certification Achievement / Expiration Date</li> <li>Certification Achievement / Exam Date</li> <li>Certification Achievement / Exam Score</li> <li>Training</li> <li>Training / Operation</li> <li>Training / Training Achievement ID</li> <li>Training / Training Name</li> <li>Training / Training Description</li> <li>Training / Training Type</li> <li>Training / Training Duration</li> <li>Training / Completion Date</li> <li>Education</li> <li>Education / Operation</li> <li>Education / Education Achievement ID</li> <li>Education / Institution</li> <li>Education / Institution Name</li> <li>Education / Institution Type</li> <li>Workday Proprietary and Confidential</li> <li>Education / Institution Location</li> </ul>

Section	Description	Fields
Worker Transaction Log Data	<ul style="list-style-type: none"> <li>This data section applies only if you enable the <i>Core Connector: Worker Transaction Log Service</i> integration service.</li> <li>This data section applies only to non-Full File integration runs. Exception: if you set the <i>Use Transaction Log with Full File</i> integration attribute to True. In that case, Workday still includes this data section in the integration output.</li> <li>The data fields in this data section don't represent field-level change detection. Therefore, there are no <i>priorValue</i> annotations in this data section.</li> <li>Workday includes transaction log entries only for worker transactions that match: <ul style="list-style-type: none"> <li>The type of transaction log subscription that you configured for the integration.</li> <li>The launch parameter dates.</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>Transaction Log Description</li> <li>Transaction Effective Moment</li> <li>Transaction Entry Moment</li> <li>Transaction Log Type</li> <li>Is Rescind Or Rescinded</li> <li>Is Correction Or Corrected</li> </ul>

## Directory Service

### Steps: Set Up Directory Service Integration

#### Prerequisites

- Be familiar with the organization structure of your Directory Service server.
- Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

#### Context

To synchronize account profiles between Workday and a directory server, create a *Directory Service* integration. The integration can send an LDIF file to an FTP server for use by your directory server.

#### Steps

- Access the Create Integration System task and enter *Directory Service* in the New using Template prompt.
- Enable one or more of these optional integration services. The Configure Integration Services task displays all integration services, including required services; those integration services aren't editable.

Option	Description
Active Directory	Enable only if your target directory server runs Microsoft Active Directory.
Simple DN	Enable only if you use a simple Distinguished Name format on your target directory server.
Simple DN User ID	Enable only if you use a simple Distinguished Name format on your target directory server.

Option	Description
Directory Service Distinguished Name	Enable only if you use a complex Distinguished Name format on your target directory server.
Transaction Log Service	Enables your integration system to subscribe to events that take place in Workday. This service enables your integration to report only changed fields for workers, rather than report all fields.  If disabled, your integration first extracts all data for eligible records, then evaluates the data for changes. Using this option can adversely affect performance.
Integration Document Retention	Enable if you want to retain copies of exported files for a set period.
Filename Sequence Generator	Enable if you want Workday to apply a custom-formatted, unique filename to each integration file.
CSV Options	Enable if you want to apply quotation formatting and column headers to the integration file.

3. As a related action on your *Directory Service* integration, select Integration System > Configure Integration Transaction Log

Note: We recommend that you select *Subscribe* to all Transaction Types except, then filter out only transaction types that you know have no relevance to your needs. If in doubt, don't filter out a transaction type.

4. Set Up Integration Sequence Generators on page 1969.
  5. As a related action on your *Directory Service* integration, select Integration System > Configure Integration Attributes. Enter attributes for integration services that you enabled in Step 2, as well as required attributes.
  6. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:
    - *Integration Event*
    - *Worker Data: Public Worker Reports*
- See: [../../../../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#)
7. Map Directory Service Integration Data on page 1161.
  8. Select Workers to Include in a Directory Service Integration on page 1162.
  9. Create Integration Business Process on page 1950.
  10. Launch an Integration on page 24.

## Map Directory Service Integration Data

### Prerequisites

You must have a Directory Service integration system to perform this task.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

## Context

You can add an Integration Field Override Service to the Directory Service integration. The Integration Field Override Service defines the fields that Workday includes on integration output files. The output files must match the schema on the target directory server. Then you configure integration field overrides for all integration services. These overrides define which report fields Workday uses to add data for each field.

## Steps

1. From the related actions menu of the Directory Service integration, select Integration System > Configure Integration Services.
2. Add a row to the Custom Integration Services grid and select an Integration Field Override Service from the Integration Service prompt. If you haven't already created one, do so now:
  - a) Access the Create Integration Field Override Service task.
  - b) Name your new Integration Field Override Services. Then, select the *business object* (Contingent Worker, Employee, or Worker). The business object includes the report fields that you want to map to the integration file for each worker.
  - c) Add 1 row for each field and provide a name for each field. You can reorder the fields using the up and down arrows. If your integration produces an LDIF file, Workday includes each field name on the integration file.
3. From the related actions menu of the Directory Service integration, select Integration System > Configure Integration Field Overrides.
4. Specify how you want Workday to generate a DN (Distinguished Name) for each worker included in the integration:

Option	Description
Simple DN User / User Identity	Select a report field that returns the name format that you want to use for each worker name.
Directory Service Distinguished Name / DN prefix	Create, then select, a calculated field that constructs a DN in the format used by your directory server.

5. Scroll down to the Field Configuration grid for the Integration Field Override Service.
6. For each field, select a corresponding report field or calculated field from the Override External Field prompt.

## Example

You create an Integration Field Override Service using the Employee business object that includes a field named `lastname`.

- `lastname` mapped to the Legal Name - Last Name report field
- Simple DN User/User Identity mapped to the Legal name in General Display Format report field.

When Workday creates an LDIF file for the employee John Doe, the LDIF file includes an entry of `CN=John Doe,1 Lastname=Doe`.

## Select Workers to Include in a Directory Service Integration

### Prerequisites

- You must have a *Directory Service* integration system to perform this task.
- If you intend to use a calculated field for the eligibility criterion, create it before performing this task.
- Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

## Context

Designate a report field or calculated field that identifies if a worker is or isn't eligible for the integration. The report field or calculated field is based on the Worker *business object*, and it must return a boolean true or false. A boolean true includes the worker in the integration, while a boolean false excludes the worker.

## Steps

1. As a related action on the Directory Service integration system, select Integration System > Configure Integration Field Overrides.
2. In the Field Configuration grid for *Account Provisioning Eligibility / Eligibility criterion*, select a report field or calculated field from the Override External Field prompt.

## Example

If your integration system target is a directory server that manages all of your staff employees, select the *Worker is Employee* field. This field returns true for all your employees, and return false for all of your contingent workers.

Create a calculated field if your target is a directory server that manages sales staff in Chicago. The field returns true if the:

- Worker is an employee.
- Worker belongs to a sales organization.
- The worker belongs to the Chicago location.

Related Information

### Tasks

[Create Calculated Fields](#)

## View Directory Service Integration Audits

### Prerequisites

Security: *Background Process Management* domain in the Tenant Non-Configurable functional area.

## Context

For each integration event, you can use the Directory Service integration audits to determine:

- Data sent (*DataChangesAudit.html*)
- Why Workday included the worker in the integration event (*DiagnosticAudit.html*)
- How the data was grouped on the integration output file (*Event\_Name.csv* or *Event\_Name.ldif*)
- Where *Event\_Name* is the name of the integration event

## Steps

1. As a related action on the integration event, select Background Process > View Output Files.
2. Select an audit file:

Option	Description
<i>DataChangesAudit.html</i>	For each Integration Field Override Service, displays field names for each worker, current and prior field values, and worker transactions. Workday displays these fields for each field included on the integration file.
<i>DiagnosticAudit.html</i>	For each worker, displays each worker transaction that the integration detected during

Option	Description
	the date range covered by the integration event.
<i>Event_Name.csv</i> <i>Event_Name.ldif</i>	Displays the actual output of the integration in the format that you specified in the integration attributes.

## Concept: Directory Service Integration

The Directory Service integration exports worker data changes from Workday in a format that supports both LDAP and Microsoft Active Directory servers. This integration assumes that Workday is the source-of-truth for the HCM data that it exports to your directory servers. As you hire, promote, transfer, terminate, or update worker data, the integration identifies updates that are relevant to your LDAP or Microsoft Active Directory servers.

Using Workday-delivered report fields and calculated fields that you create, you can export any worker data, in any combination.

### Change Detection

The Workday transaction log drives the change detection process by tracking event-based changes to employee data. By configuring integration subscriptions to transaction log events, you can identify employees whose changes Workday reports. The Directory Service integration detects changes to export to the directory server by monitoring a transaction log. When you configure the integration, you select which business process and transaction types that the integration subscribes to. Excluding business process and transaction types that are irrelevant to your directory service server improves performance. However, if your integration doesn't subscribe to a transaction type that affects directory server profiles, Workday doesn't include changes for that transaction type. Workday recommends that if you aren't sure if the integration must subscribe to a given transaction or business process type, don't exclude it.

The Directory Service integration uses a three-step process to detect and report changes:

1. The integration checks the transaction log. The integration then determines which workers have had changes that generated at least one of the configured transaction events.
2. For each worker with a matching transactional change, the integration compares their report fields for:
  - The time at which the integration ran.
  - The time at which it was last successfully run.

The integration identifies which, if any, of the values of interest have changed.

3. If the worker has any changes in field values or eligibility, Workday generates an appropriate creation, change, or deletion message.

### Worker Eligibility

For each integration, you define a group of workers a directory server manages, and thus also to the integration. You define membership with a single Boolean report field or calculated field. If the field value is true for a worker, that worker is a member of the group, and the integration includes changes for that worker. If the field value is false, the integration ignores that worker.

You can use report fields on the Worker business object to define eligibility. If you can't match the membership criteria for your directory server using a report field, you can create and use a calculated field. If multiple Boolean values are true, the calculated field can evaluate the worker business object and its related business objects to return true. Example: use a calculated field to return true if:

- The worker is a contingent employee
- The primary location if the worker is in the United States,

- The supervisor of the worker is John Doe

You can configure the eligibility and the relevant data for a given directory server, which your integration then reflects. If your company uses several directory servers, configure a separate integration for each directory server. For each integration, identify both the group eligibility along with the detailed data definition to support each directory server.

### Distinguished Name (DN) Support

The Directory Service integration supports both simple and complex DNs. For both types, you set the base DN of your directory server in the integration attributes. You then define how Workday builds a simple or complex DN for each worker included on the integration file:

- Include simple DNs. Select a report field (such as Legal Name in Display Format) for the Simple DN / User Identity field configuration override. Set your prefix (such as *CN*) in the integration attributes.
- Include complex DNs. Create a calculated field that retrieves values from other report fields, adds the necessary prefixes, and concatenates them in a text string.

### Synchronization Options

The Directory Service integration enables Workday to be your source-of-truth. However, you can configure your integration to work with existing directory server accounts. The Directory Service integration provides these synchronization options:

- Create. Use this option if:
  - Workday is the primary source of all worker account information on the directory server
  - You add workers to Workday before you add them to the directory server.
- Update. Use this option if you add workers to the directory server manually before you add workers to Workday.

Selecting an option that doesn't match how you intend to synchronize Workday with your directory server can cause errors when importing the LDIF file. The LDIF file can instruct the directory server to create an already-existing account or to modify a nonexistent account.

### Output Configuration and Formats

You can include any report fields from the Worker-related business objects (Contingent Worker, Employee, and Worker) on the integration file. You can add a unique label for each report field that matches the existing schema on your directory server. When Workday generates an integration file, it combines the field name and the report field into a single formatted entry.

Workday creates Directory Service integration files in either of these formats:

- LDIF (LDAP Data Interchange Format). This format supports LDAP servers and Microsoft Active Directory servers.
- CSV (Comma-Separated Value). Workday creates a CSV file that included the values from the report fields but doesn't include the field labels.

### Launch/Schedule Options

Workday provides these launch schedule options for the Directory Service integration:

- Scheduled Run Frequency. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration collects all qualifying changes since the last time that the integration successfully completed. You can set a Directory Service integration to run several times per day; launching the integration frequently doesn't affect performance.
- Run Now. You can launch the integration manually for specific workers, or for all eligible workers. Example: to cancel a directory server account for a worker immediately, launch the integration

manually. Select the worker from the Workers field. The integration prompts you to enter these launch parameters:

- Last Successful Launch Moment defaults to the last moment (date and time) at which the integration was successfully launched. To force the integration to retrieve data changes over a wider period, you can override this date and time.
- Workers enables you to restrict the integration to only considering those workers selected in this list. If you configure no values, the integration considers all workers when looking for transactional and data changes. Specifying workers in this list doesn't force their inclusion in the output file. Information for a worker displays in the output file only if there are changes in the data fields evaluated by the integration.

If there was an error involving data for one or more workers during a prior integration run, specify workers in this parameter at launch time. Correct the worker data and then run the integration again only for those workers. In this case, set the Last Successful Launch Moment to the date and time used for that parameter on the prior run which had problems.

## Concept: Directory Service Integration Data Mapping

This data mapping example displays how you would map worker data to the *inetorgperson* Object Class in the Directory Service integration:

1. Create an Integration Field Override Service named *Worker Data*. The field names must match the names from the *inetorgperson* object class from the *inetorgperson* schema:
  - *displayName*
  - *givenName*
  - *sn*
  - *mail*
  - *Secondary Email Address*
  - *employeeType*
2. Add the *Worker Data* integration service to your Directory Service integration system.
3. In the Integration Field Overrides for your integration system, you map Workday report fields to the fields you defined:

Fields	Override External Field
Worker Data / <i>displayName</i>	Legal Name
Worker Data / <i>givenName</i>	Legal Name - First Name
Worker Data / <i>sn</i>	Legal Name - Last Name
Worker Data / <i>mail</i>	Email - Primary Work
Worker Data / <i>employeeType</i>	Worker Type - Text

When you hire employee John Doe into your company (Acme, Inc. for this example), Workday includes an entry for John Doe with his simple or complex DN:

```
dn: CN=john doe,DC=acmeinc,DC=com
changetype:add
objectclass: inetOrgPerson
displayName: John Doe
givenName: John
sn: Doe
mail: john.doe@acmeinc.com
```

*employeeType: Employee*

## FAQ: Directory Service Integration

What directory servers does the Directory Service integration support?

If you configure the LDIF file option, the Directory Service integration supports both LDAP and Microsoft Active Directory. Additionally, you can create the output in CSV format, and optionally post-process the file to conform to other directory server formats.

Can the Directory Service integration connect directly to my directory server?

The integration writes a file in LDIF (LDAP Directory Interchange Format) or CSV format. The integration posts the file to an FTP or SFTP server that you specify in the integration attributes. From there, you can import the file into your directory server. Workday doesn't have direct access to your directory server.

If I change a record on my directory server, can I export that change to Workday?

The Directory Service integration design is based on the assumption that Workday is the source-of-truth, not your directory servers. The Directory Service integration supports one-way integration from Workday to your directory server, using an FTP server. Workday doesn't detect changes made directly on your directory server.

## E-Verify

### Setup Considerations: E-Verify Integration

You can use this topic to help make decisions when planning your configuration and use of the Workday integration with E-Verify. It explains:

- Why to set it up.
- How it fits into the rest of Workday.
- Downstream impacts and cross-product interactions.
- Security requirements and business process configurations.
- Questions and limitations to consider before implementation.

Refer to detailed task instructions for full configuration details.

#### What It Is

E-Verify is a service provided by the United States Citizenship and Immigration Services (USCIS). You can enable the Workday *E-Verify* integration to submit Form I-9 data to E-Verify. The *E-Verify* integration supports:

- Case creation and closure at E-Verify.
- Data verification.
- Duplicate case closure.
- Photo match requests from government databases.
- Resubmission of Forms I-9 to E-Verify in bulk.
- Sync of case statuses from E-Verify.
- E-Verify web services account password update.

## Business Benefits

You can use the Workday integration with E-Verify to:

- Streamline Form I-9 authorization for your employees.
- Maintain workforce employment eligibility and help your company reach its compliance goals.
- Receive verification results of employment eligibility from the Department of Homeland Security (DHS) and Social Security Administration (SSA) databases promptly.
- Reduce manual administrative work.

## Use Cases

If you're using an E-Verify STAGE environment, you can test certain outcomes for a better understanding of what each response means.

You can use the *E-Verify* integration to receive verification of employment eligibility for your employees. You can:

- Select if you want to create a new case by closing existing duplicate cases at E-Verify if Workday identifies more than 1 case with the same SSN in the past 365 days.
- Configure the integration to sync case statuses from E-Verify automatically.
- View any Section 1 or Section 2 information that might need correcting.
- Select if a photo provided by the DHS or SSA databases matches the document the employee presented. If it doesn't match, you must scan and upload front and back images of the employee's document.

## Questions to Consider

Questions	Considerations
Can you only have an E-Verify STAGE Environment account?	You must have a production E-Verify account to request an E-Verify STAGE Environment account. If you're an implementing customer, enroll in a production Web services account before requesting an E-Verify STAGE Environment account.
What if you have an external production account and you're transitioning to Workday?	You can still have an existing production account. E-Verify won't close the existing account until you instruct them to do so.  Ensure you have the Memorandum of Understanding (MOU) for Web Services Employers account type.
What do you do if you have multiple companies associated with different Federal and State Employer Identification Numbers (FEIN)?	You can still have an existing production account. E-Verify won't close the existing account until you instruct them to do so.  Ensure you have the Memorandum of Understanding (MOU) for Web Services Employers account type or Web Services Employer Agent account type.  If you have multiple companies associated with different FEIN, you can configure either: <ul style="list-style-type: none"> <li>• 1 single <i>Complete Form I-9 and Amend Form I-9</i> business process with condition rules.</li> </ul>

Questions	Considerations
	<ul style="list-style-type: none"> <li>• 1 single <i>Complete Form I-9 and Amend Form I-9</i> business process for each company so it routes appropriately.</li> </ul> <p>If you are an employer agent, you can configure 1 single <i>Complete Form I-9 and Amend Form I-9</i> business process. Then, you can add in each company's E-Verify Client Company and Client Company ID in the Maintain E-Verify Employer Agent Client Company ID task.</p>

## Recommendations

With the *E-Verify* integration, Workday recommends you:

- Set up calendar reminders to change passwords. The integration stops working once your password expires.
- Consider how many companies you have and set up multiple integrations so cases can route correctly.
- Create a validation condition on the *Complete Form I-9* business process to require a Social Security Number (SSN) when an employee completes Section 1. Otherwise, the *E-Verify* integration fails.

If an employee doesn't have an SSN on their start date, leave the *Review Form I-9* item in the Inbox. If you submit the case and it fails, you must handle the case separately.

If an employee enters their Foreign Passport number on Section 1 and presents an I-766 document for Section 2, send back Section 1 so the employee can enter their Alien number. Otherwise, E-Verify won't create a case.

If you're using an *E-Verify* STAGE Environment, don't use real data. Use your own fake data or the test cases on Workday Community. The *E-Verify* STAGE Environment isn't as secure as an *E-Verify* production account. Since more people can access the STAGE Environment, they can view the information you use.

## Limitations

- The Memorandum of Understanding (MOU) for Web Services Employers and the MOU for Web Services Employer Agents are the only MOUs that function with Workday. One of these MOUs is required by *E-Verify* if you use the Workday integration with *E-Verify*. If you are an Employer Agent, in addition to signing the MOU for Web Services Employer Agents, you may need to sign additional MOUs with your client companies per DHS requirements.
- Workday provides the software integration that allows you to exchange data with *E-Verify*. However, pursuant to the Memorandum of Understanding (MOU) your organization signs with *E-Verify*, you have the relationship with *E-Verify*. Workday does not have any control over *E-Verify*'s Web Service. If there is a technical problem with *E-Verify*'s Web Service, we recommend you contact *E-Verify* to resolve the issue.
- *E-Verify* requires you to update your web services account password every 90 days, and you must wait at least 5 days before changing it.
- If you get an error when you initially submit a Form I-9, you can only:
  - Cancel the Form I-9 and reinitiate it.
  - Access the *E-Verify* website and create a case manually.
- If you use the Retry button to submit a case that requires a photo match, duplicate case, or data verification, you can only progress the case on the *E-Verify* website.

## Tenant Setup

If you have multiple companies and select the Collect advanced routing fields when Updating Form I-9 Receipts check box on the Maintain Form I-9 Settings task, advanced routing would be a tenant-wide decision.

When you configure the *E-Verify Employment Verification* integration template, these attributes will be the default name sent to E-Verify as the point of contact for case questions:

- *E-Verify Contact Name*
- *E-Verify Email Address*
- *E-Verify Phone Number*

When you configure the Manage E-Verify Duplicate Case Reasons grid on the Maintain Form I-9 Settings task, these reasons are a tenant-wide decision.

## Security

Domains	Functional Areas	Considerations
<i>Integration Build</i>	Integration	Provides access to setup information related to integration systems.
<i>Integration Event</i>	Integration	Provides access to launching integrations and viewing their status in the process monitor.
<i>Integration Debug</i>	Integration	Provides access to launch and debug an integration.
<i>Process: I-9 Forms</i>	Onboarding	Provides access to overall processing for employees Forms I-9.
<i>Worker Data: I-9 Forms</i>	Onboarding	Provides a user with access to another employee's Form I-9.
<i>Process: Resubmit Form I-9</i>	Onboarding	Provides a person access to resubmit a Form I-9 to E-Verify.

## Business Processes

Business Processes	Considerations
<i>Amend Form I-9</i>	<ul style="list-style-type: none"> <li>• Enables an employer to amend Forms I-9 after the <i>Complete Form I-9</i> business process.</li> <li>• Forms only send to E-Verify through the <i>E-Verify</i> integration using the Update Form I-9 Receipts task.</li> </ul>
<i>Complete Form I-9</i>	(Optional) Employers can configure E-Verify service steps to send electronic Form I-9 information to the E-Verify service.

## Reporting

Reports	Considerations
E-Verify Account Details	Lists IDs and other data for all <i>E-Verify</i> integrations in your tenant.
View E-Verify Account Details	Displays enrollment credentials and point-of-contact information for a single integration system.

Note:

Workday retrieves your E-Verify Account ID and Integration ID when you make a service call through the E-Verify integration. Workday treats this information as confidential data. The E-Verify Account ID retrieved is saved to your tenant and can be viewed in E-Verify Account Details. When E-Verify requires a mandatory web service upgrade, Workday will share your E-Verify Account ID at their request.

## Integrations

If you have multiple companies, you can create a separate integration for each company.

If you are an employer agent, you can create a single employer agent integration.

## Connections and Touchpoints

You must use the electronic Form I-9 in Workday to use the *E-Verify* integration.

Workday offers a Touchpoints Kit with resources to help you understand configuration relationships in your tenant. Learn more about the [Workday Touchpoints Kit](#) on Workday Community.

Related Information

### Reference

[The Next Level: Discover the Capabilities of Workday's E-Verify Integration](#)

[Workday Community: How to Get and Set Up Your E-Verify Staging Account Integration in Workday](#)

## Steps: Set Up E-Verify Integration

### Prerequisites

Complete all prerequisites for the E-Verify service.

### Context

Create an integration system that connects to the E-Verify service provided by the United States Citizenship and Immigration Services (USCIS). The integration:

- Submits Form I-9 data to the E-Verify service for employment eligibility verification.
- Receives results for employment eligibility verification, including photos. Department of Homeland Security (DHS) and Social Security Administration (SSA) databases provide some of these results.

Create 1 E-Verify integration for each separate E-Verify Account ID or Federal Employer Identification Number (FEIN).

### Steps

1. Access the Edit Tenant Setup - System task.

Enable *jpeg*, *pdf*, and *png* file types in the File Type Setup Instructions prompt.

Security: *Set Up: Tenant Setup - System* domain in the System functional area.

- Access the Create Integration System task.

Enter *E-Verify - Employment Verification* at the New using Template prompt.

**Security:** *Integration Build* and *Integration Configure* domains in the Integration functional area.

- From the related actions menu on the integration system, select **Integration System > Configure Integration Attributes**:

Attribute	Value
<i>E-Verify URL</i>	Select the staging or production environment URL you want to use.
<i>E-Verify User Id</i>	Enter the ID for the E-Verify web services account.
<i>E-Verify Password</i>	Enter the password for the E-Verify web services account.  Note: E-Verify requires that you change this password every 90 days. If you don't do so, E-Verify locks out your web services account and the integration will no longer complete successfully.
<i>E-Verify Contact Name</i>	Enter the default name sent to E-Verify as the point of contact for case questions.
<i>E-Verify Email Address</i>	Enter the default email sent to E-Verify as the point of contact for case questions.
<i>E-Verify Phone Number</i>	Enter the default phone number sent to E-Verify as the point of contact for case questions.
<i>E-Verify Company</i>	Enter the company associated with the <i>E-Verify</i> integration to: <ul style="list-style-type: none"> <li>Sync case statuses from E-Verify.</li> <li>Resubmit Forms I-9 to E-Verify to create cases when the integration fails to connect.</li> </ul> Configure this attribute for each <i>E-Verify</i> integration you have.
<i>E-Verify employer agent</i>	Check the E-Verify employer agent box. This identifies that the integration is intended to integrate with E-Verify's employer agent web services.

- Access the Create Integration System User task to create an ISU.

## 5. Create Integration System Security Groups.

Create an Integration System User (ISU) with an unconstrained security group, and grant the ISU *Get* and *Put* access to these domains:

- *Integration Event*
- *Person Data: ID Information*
- *Person Data: Name*
- *Person Data: Personal Data*
- *Person Data: Personal Information*
- *Worker Data: I-9 Forms*
- *Worker Data: Staffing*

See: [.../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).

## 6. From the related actions menu of the E-Verify Integration, access Workday Account > Edit and add the ISU you created.

## 7. Create Integration (Step).

Enable launch of the integration from these business processes:

- *Complete Form I-9*
- *Amend Form I-9*

## Next Steps

For employer agents, access the Maintain E-Verify Employer Agent Client Company ID task. Enter the E-Verify Client Company and its E-Verify Client Company ID for each company.

Access the Maintain E-Verify Account Details task. Record, maintain, and retrieve your E-Verify enrollment credentials and point-of-contact associated with your E-Verify integrations.

Workday provides these reports for E-Verify account detail information:

- View E-Verify Account Details displays enrollment credentials and point-of-contact information for a single integration system.
- E-Verify Account Details lists IDs and other basic data for all E-Verify integrations in your tenant.

Note:

Workday retrieves your E-Verify Account ID and Integration ID when you make a service call through the E-Verify integration. Workday treats this information as confidential data. The E-Verify Account ID retrieved is saved to your tenant and can be viewed in E-Verify Account Details. When E-Verify requires a mandatory web service upgrade, Workday will share your E-Verify Account ID at their request.

## Complete Set Up and Upgrade Prerequisites for E-Verify Integration

### Context

Enroll in E-Verify and send a request email to E-Verify for access to the E-Verify service. Then create your E-Verify integration.

If you're not using the most current version of E-Verify, contact support to request an upgrade.

## Steps

1. Enroll in the E-Verify program from the U.S. Citizenship and Immigration Services:
  - a) Sign up with E-Verify through the [enrollment website](#).
  - b) Define your access methods (Web Services Employer or Web Services Employer Agent).
  - c) Execute the Memorandum of Understanding (MOU) for Web Services Employers or the MOU for Web Services Employer Agents.
  - d) Add Company and Program Administrator details.
  - e) Assign the E-Verify Program Administrator and have the administrator complete the E-Verify Knowledge Session and test.
  - f) Add any other hiring sites or verifiers defined within the service.

Note: For existing E-Verify accounts that need to change their access method, re-enroll and create a new account. Example: You currently have an employer agent account and want to change your access method to web services. Then, re-enroll and create a new web services account.

2. Send an email to E-Verify to request production and staging accounts. For instructions, see: [Request Access to Your E-Verify Staging and E-Verify Production Accounts](#).

You must create E-Verify staging accounts to start testing the E-Verify integration.

E-Verify provides you with your web service credentials for the production E-Verify endpoint.

3. Create an E-Verify integration system in your Workday Production tenant.

When configuring the E-Verify Environment URL integration attribute, set it to the E-Verify production URL.

## Launch E-Verify Integration Manually

### Prerequisites

Security: *Integration Event* domain in the Integration functional area.

### Context

Launch the *E-Verify* integration manually to:

- Change your E-Verify password.
- Close cases.
- Verify the E-Verify service is running and accepting requests from your integration.
- Verify your username and password.
- Select the run frequency to run now, or schedule a recurring sync of:
  - E-Verify case statuses.
  - Resubmitting Forms I-9 in bulk to E-Verify.

If the E-Verify service is down and you don't want to resubmit Forms I-9 in bulk, you can resubmit an employee manually when the *Complete Form I-9* business process launches the *E-Verify* integration.

However, when you manually relaunch the integration, the launch isn't within the context of the *Complete Form I-9* business process. Therefore:

- Once you manually relaunch the integration, you perform all further verification tasks directly in the E-Verify service.

- Workday recommends that you find the instance of the *Complete Form I-9* business process and complete the last step if E-Verify doesn't return an *Employment Authorized* status.

## Steps

1. Access the Launch / Schedule Integration task.
2. Select the Integration at the prompt.
3. Determine the Run Frequency, then select OK.
4. In the Integration Criteria grid, specify the applicable launch parameters:

E-Verify Service Call Values	Usage Description	Launch Parameter
<i>ChangePassword</i>	Sends a password change command to the E-Verify service.	Enter a new password in the New E-Verify Password field.
<i>CloseCase</i>	Enables you to manually close a case.	Enter these parameters: <ul style="list-style-type: none"> <li>• E-Verify Case Number</li> <li>• E-Verify Case Closure Reason</li> <li>• E-Verify Case Closure Reason Details (Optional)</li> <li>• Submit Employee ID</li> </ul>
<i>CloseMultipleCases</i>	Enables the E-Verify integration to assess and close multiple cases. You can't manually run this service call.	Not Applicable
<i>GetCaseClosureReason</i>	Retrieves all case closure reasons for open duplicate cases.	E-Verify Case Number
<i>MassRetry</i>	Resubmits Forms I-9 to E-Verify based on the schedule you determine. This creates cases when the integration fails to connect due to: <ul style="list-style-type: none"> <li>• An integration template error.</li> <li>• Events such as a government shutdown.</li> <li>• E-Verify password expiration.</li> </ul> Note: If your integration events fail due to E-Verify password expiration, Workday recommends that you reset your password before you manually run the integration with the MassRetry service call to reprocess impacted workers.	Default Overdue Reason (Optional) Default Overdue Reason Other (Optional)

E-Verify Service Call Values	Usage Description	Launch Parameter
<i>SyncCaseStatus</i>	<p>Syncs case statuses from E-Verify based on the schedule you determine.</p> <p>Before you select this option, select a valid company for the <i>E-Verify Company</i> attribute on the <i>E-Verify - Employment Verification</i> integration template. Valid companies include any workers with possible new or updated Forms I-9.</p>	Not Applicable
<i>VerifyConnection</i>	<p>Pings the E-Verify service to verify that:</p> <ul style="list-style-type: none"> <li>The E-Verify service is running.</li> <li>The user ID and password are valid.</li> <li>The service is accepting web service requests.</li> </ul>	Not Applicable
<i>VerifyCredentials</i>	Enables you to verify your E-Verify username and password when you run the integration.	Not Applicable
<i>WorkerSubmit</i>	Manually resubmits the worker I-9 data. Use this option if the E-Verify service was down when the <i>Complete Form I-9</i> business process launched the E-Verify integration.	Enter these parameters for the employee who you want to resubmit to E-Verify: <ul style="list-style-type: none"> <li>Submit Employee ID</li> <li>Default Overdue Reason</li> <li>Default Overdue Reason Other</li> </ul>

- Select OK to launch the integration.

## Change E-Verify Account Password

### Prerequisites

Security: *Integration Build*, *Integration Event*, and *Integration Debug* domains in the Integration functional area.

### Context

United States Citizenship and Immigration Services (USCIS) requires that you change your E-Verify account password every 90 days. If you don't change your password within 90 days, E-Verify locks your account. To change your password after the 90-day limit, see [E-Verify - Resetting password and unlocking E-Verify Web Services account](#). You must wait at least 5 days before changing your password again.

Use the Launch / Schedule Integration task for your E-Verify integration, enter a new password, and send the password update request to the E-Verify service. It is your responsibility to adhere to the E-Verify password rules as defined by USCIS.

## Steps

1. Access the Launch / Schedule Integration task.
2. Select the Integration at the prompt.
3. Select *Run Now* as the Run Frequency, then select OK.
4. In the Integration Criteria grid, specify launch parameters:

Option	Description
E-Verify Service Call	Select <i>ChangePassword</i> from the Value prompt.
New E-Verify Password	<p>Enter the new password in the Value field.</p> <p>E-Verify requires that your password contains:</p> <ul style="list-style-type: none"> <li>• At least 1 uppercase or lowercase letter.</li> <li>• At least 1 number.</li> <li>• At least 1 special character.</li> <li>• No more than 2 identical, consecutive characters in any position from the previous password.</li> <li>• A non-numeric in the first and last position.</li> </ul> <p>Workday recommends you follow best practices when creating passwords.</p>

5. Select OK to launch the integration.  
The integration updates the password for the E-Verify web services account on the USCIS / E-Verify server. You still need to update the password on your E-Verify integration.
6. From the related actions menu of the integration system, select Integration System > Configure Integration Attributes and update the E-Verify Password attribute value.

## Concept: E-Verify Integration

Integrate Workday with the E-Verify service provided by the United States Citizenship and Immigration Services (USCIS). Use the *E-Verify* integration to:

- Submit Form I-9 data to the E-Verify service.
  - For an employer using an employer access account.
  - On behalf of employers using an employer agent account.
- Receive verification results of employment eligibility (including photos) from Department of Homeland Security (DHS) and Social Security Administration (SSA) databases promptly.

The integration supports:

- Case creation.
- Duplicate cases.
- Syncing case statuses.
- Data verification.
- Photo match requests.
- Scan and upload requests.
- Closing cases.
- Updating the E-Verify web services account password.

## Preparing to Use E-Verify

The E-Verify integration is available for organizations that are already in the E-Verify program. For details, see the [E-Verify website](#).

Workday strongly recommends that you're familiar with the E-Verify program before creating an *E-Verify* integration, especially:

- For employer agents, enrolling employers in E-Verify as a client company under its E-Verify employer agent account.
- When manually processing verifications.
- In the E-Verify work flow.

Before using E-Verify, you need to:

1. Review the E-Verify Memorandum of Understanding (MOU) and familiarize yourself with your responsibilities when using E-Verify.
1. For employer agents, enroll employers in E-Verify as a client company.
2. Define your E-Verify participation sites, where all new hires take part in E-Verify.
3. Define your E-Verify Program Administrator.
4. Define members who need access to the E-Verify website to run cases manually. This supports management of cases outside of Workday.

When you're ready, you can enroll in E-Verify through the [enrollment website](#). Review the [enrollment checklist](#) and ensure that you've all of the required information before you select *Begin E-Verify Enrollment*.

## Before Starting a Workday to E-Verify Integration

- Establish a Memorandum of Understanding (MOU) between your organization and E-Verify. Ensure that you select the Employer Access Web Services or Employer Agent Web Service type. Workday recommends that you complete this step before any testing and data exchange takes place between your data and the DHS.
- Appoint a program administrator who is provided access to E-Verify directly.
- For employer agents, have the E-Verify client company ID available.

## Integration Process

The E-Verify integration exchanges data with the E-Verify website using this process:

1. The *Complete Form I-9 or Amend Form I-9* (updating receipts only) business process passes Form I-9 information for an employee to the *E-Verify* integration.
2. The *Complete Form I-9 or Amend Form I-9* (updating receipts only) business process launches the *E-Verify* integration.
3. The *E-Verify* integration sends Form I-9 data to the E-Verify service.
4. The E-Verify service checks Form I-9 data against DHS and SSA records.
5. The E-Verify service sends eligibility results back to the *E-Verify* integration.

6. The *E-Verify* integration processes the eligibility results and does one of these actions:

- If the Form I-9 data matches government databases, the case receives an *Employment Authorized* status and the case automatically closes.
- If E-Verify identifies cases for an employee created within 365 days, you can close all their duplicate cases before creating a new case at E-Verify.
- If E-Verify queues a case, you can schedule the integration to sync an updated case status so the case can progress forward.
- If E-Verify has a photo on file, the *Complete Form I-9* or *Amend Form I-9* business process routes a photo match request to the appropriate role.
- If E-Verify returns a *MANUAL REVIEW* status, an individual at the DHS is physically reviewing the case information. You can schedule the integration to sync the updated status.
- If E-Verify didn't find a matching record, the *Complete Form I-9* business process routes a retry request to the appropriate role. The role holder then amends the Form I-9 data and reverifies the data with E-Verify.

Note: If the second attempt fails, DHS returns a *PENDING\_REFERRAL* case status for the employee.

- If the Form I-9 information included the email address for the employee, E-Verify emails updates on the verification process to that email address.

### **E-Verify Integration Limitations**

Only run the *E-Verify* integration with live data from your Production environment. Never send test data to E-Verify from any Workday environment.

If DHS or SSA returns a *PENDING\_REFERRAL* case status for an employee whose credentials don't match DHS or SSA records:

- You can't process the verification request further in Workday.
- You must use the E-Verify website directly to progress the case and bring the final case status back into Workday to complete it.

When you receive the *Form I-9 Data Verification* event, you can only update information E-Verify identifies as incorrect. Otherwise, you must wait until the Form I-9 is completed to initiate the Amend Form I-9 task.

When you're using the Update Form I-9 Receipts task, you can't receive the *Form I-9 Data Verification* or *Photo Match* responses.

If you don't configure the integration to sync case statuses, you must use the E-Verify website directly if the U.S. Employment Verification Status returns as *Authorization Pending*. If you do configure the integration to sync case statuses, you can continue syncing until the case reaches closure. Once receiving closure, Workday closes the case automatically. The integration syncs case statuses that don't require a photo match or data verification.

#### Related Information

##### **Tasks**

[Complete Set Up and Upgrade Prerequisites for E-Verify Integration](#) on page 1173

[Steps: Set Up Electronic Form I-9](#)

### **Concept: Mass Resubmit Forms I-9 to E-Verify**

You can resubmit Forms I-9 to E-Verify in bulk based on the frequency and schedule you determine. If you decide to schedule the resubmission on a recurring basis and use a frequency other than Run Now, Workday recommends selecting a Start Time at nonpeak or off-hours.

The Launch / Schedule Integration task displays the overdue reason configured on the Overdue Reason prompt on the Maintain Form I-9 Settings task. Specifying an overdue reason on the Form I-9 takes precedence over the overdue reason that displays on Launch / Schedule Integration task.

If you resubmit a Form I-9 that later requires any of these responses, you can only progress the case at the E-Verify website:

- Photo match.
- Duplicate case.
- Data verification.

You can't resubmit Forms I-9 in bulk that has a validation error, such as an:

- Invalid document number.
- Incorrect social security number.

The mass resubmission won't include the Forms I-9 for employees that have multiple positions in different companies and self-initiate the Complete Form I-9 task (not part of the *Onboarding* or *Manage Form I-9 Assignment* business processes).

You can resubmit self-initiated Forms I-9 through the:

- Integration using the *WorkerSubmit* option for the *E-Verify Service Call* field.
- Retry button on the *Final U.S. Employment Verification Status* step.

To verify the *U.S. Employment Verification Status* of employees whose Forms I-9 you resubmitted in bulk, you can use the U.S. Electronic Form I-9 Verifications report.

## Image Upload

### Steps: Set Up Integration to Load Worker Photos in Bulk

#### Context

You can create an integration to upload multiple worker photos from an external server.

#### Steps

1. [Create Integration System](#).

Enter the *Image Upload Template* on the New Using Template prompt.

2. Access the Create an Integration System User task.

Security: *Integration Security* domain in the Integration functional area.

3. Grant the ISU *Put* access to these domains:

- *Integration Event*
- *Person Data: Personal Photo*

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

4. Select Integration System > Configure Integration Attributes as a related action on the integration system and enter integration service attributes.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

5. Access the Configure Integration Services task.

Enable the *Document Image Retrieval Service*, and don't enable the FTP client. You can't use both at the same time. We recommend using the *Document Image Retrieval Service* because it supports multiple protocols.

6. (Optional) [Set Up Integration Retrieval](#).

Complete this step if you enabled the *Document Image Retrieval Service*.

7. [Launch an Integration](#).

## Related Information

### Tasks

[Launch an Integration on page 24](#)

[Steps: Grant Integration or External Endpoint Access to Workday](#)

## Concept: Worker Photo Recommendations

Once you upload an image, it can display in many places throughout Workday. Therefore, images are dynamically scaled and cropped so that they display at an appropriate size. Although an image might be scaled and cropped at run time, the aspect ratio of the original image never changes.

For best results and performance, follow these guidelines:

Feature	Description
Size	The maximum image size (in terms of storage) is 10 MB.
Aspect Ratio	Use square images for best results. Because images typically display as circles within Workday, images in any other shape don't fit properly, resulting in white spaces in the circular area. An image about 200 x 200 pixels produces good results for most applications. Example: The worker profile image is 150 x 150 pixels. Elsewhere, the same images might display at 50 x 50 pixels. At run time, users can enlarge the image to its original size.
Background	A transparent background (available with PNG images, but not with the JPG format) is optimal. However, a solid white background also produces good results.
Color Space	Workday doesn't support images in the CMYK color space.
File Format	Workday supports JPG, PNG, and GIF formats for worker images. However, PNG and JPG images produce the best results in terms of size and quality. Worker images in GIF format might produce undesirable results when resized for different uses at run time.
Layout	Use a consistent photographic layout for all workers.

## Related Information

### Tasks

[Load Worker Photos Individually](#)

[Steps: Set Up Integration to Load Worker Photos in Bulk](#)

## Inline Assessments

### Steps: Set Up Inline Assessments Integration

#### Prerequisites

Know the user name, password, and endpoint URL for the external site for the assessment vendor.

#### Context

You can create an integration with third-party assessment vendors for registering candidates that have applied for a job using an external career site.

#### Steps

1. Access the Create Integration System task and enter *Inline Assessment* at the New using Template prompt.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:
  - *Candidate Data: Assessment Results*
  - *Integration Event*

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

3. Select Integration System > Configure Integration Attributes as a related action on the integration system and enter integration service attributes.

### Concept: Inline Assessments Integration

The Inline Assessments integration enables you to integrate with third-party assessment vendors for registering candidates that are applying for a job using an external career site. Workday provides the *Inline Assessment* integration template. The integration exports these fields (in a Workday-defined XML format) to the external assessment vendor:

- Assessment Test Reference (WID, ID)
- Job Application Reference (WID, ID)
- Candidate Reference (WID, ID)
- Candidate First Name
- Candidate Last Name
- Candidate Email

#### Integration Services

The *Inline Assessment* integration template includes these integration services:

Integration Service	Required?	Description
Inline Assessment Registration - ESB Service	Required	Launches the integration.
Integration Document Retention	Required	Retains copy of each integration file

#### Launch/Schedule Options

Workday launches the integration automatically when:

- A candidate advances past the first application page on the external career site.
- The job requires an inline assessment.

## Reference: Inline Assessments Integration XML Schema

### Inline Assessment XML Element Reference

XML Element	Description
Register_Candidate_Request	Parent element for these subelements: <ul style="list-style-type: none"> <li>• Assessment_Test_Reference</li> <li>• Job_Application_Reference</li> <li>• Candidate_Reference</li> <li>• Candidate_First_Name</li> <li>• Candidate_Last_Name</li> <li>• Candidate_Email</li> </ul>
Assessment_Test_Reference	Must be a Reference ID value.
Job_Application_Reference	Must be a Reference ID value.
Candidate_Reference	Must be a Reference ID value.
Candidate_First_Name	Must be in XSD <i>string</i> format.
Candidate_Last_Name	Must be in XSD <i>string</i> format.
Candidate_Email	Must be in XSD <i>string</i> format.

### Inline Assessment Integration Sample XML File

```

<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/" 
  xmlns:wor="http://www.workday.com/WorkdayInlineAssessment/">
  <soapenv:Header/>

      <wor:Assessment_Test_Reference_ID?></
      wor:Assessment_Test_Reference_ID>
      </wor:Register_Candidate_Request>
    </soapenv:Body>
  </soapenv:Envelope>

```

## Kenexa Connectors

### Steps: Set Up Kenexa Foundation Data Integration

#### Prerequisites

- Know the sender ID, client ID, and endpoint URL for your Kenexa account.

- Use the Job Management staffing model for your organization. If you use the Position Management staffing model, you can't use this Connector.
- Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

## Context

To send foundation data to your Kenexa account, create and configure a Kenexa Foundation Connector integration system.

## Steps

1. Access the Create Integration System task and enter *Kenexa Foundation Data* at the New using Template prompt.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
2. Enable one or more of the optional integration services.  
The Configure Integration Services task displays all integration services, including required services. Required integration services aren't editable.
3. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Integration Event* security domain.  
See: [Steps: Grant Integration or External Endpoint Access to Workday](#).
4. Select Integration System > Configure Integration Attributes as a related action on the integration system and enter integration service attributes.  
Workday displays attributes for each enabled integration service; if you enable additional integration services, more attributes display in the Configure Integration Attributes task.
5. As a related action on the integration system, select Integration System > Configure Integration Maps and map data between Workday and Kenexa.

## Steps: Set Up Kenexa User Provisioning Connector

### Prerequisites

- Use the Job Management staffing model for your organization. If you use the Position Management staffing model, you can't use this Connector.
- Create a *True/False Condition* calculated field that returns *true* for any workers that you want to include in the integration output.
- Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

## Context

To send new and changed worker data to your Kenexa account, create and configure an integration based on the *Kenexa User Provisioning* integration template.

## Steps

1. Access the Create Integration System task and enter *Kenexa User Provisioning* at the New using Template prompt.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Integration Event* security domain.  
See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

3. Select Integration System > Configure Integration Attributes as a related action on the integration system and enter integration service attributes.  
For Eligibility Criteria, select a *True/False Condition* calculated field that returns true for any workers that you want to include in the integration output.
4. Select Integration System > Configure Field Overrides for Data Initialization Services as a related action on the integration system.  
Use calculated fields and report fields to define overrides.
5. [Set Up Integration Delivery](#) on page 1952  
Specify how Workday delivers integration output documents. Configuring a *Document Delivery* step on the business process definition for the integration.
6. [Launch an Integration](#) on page 24.  
Launch the integration manually or configure a recurring schedule.

## Steps: Set Up Kenexa Hire Inbound Integration

### Prerequisites

- Set up an external SFTP that Kenexa and your integration can access.
- Use the Job Management staffing model for your organization. If you use the Position Management staffing model, you can't use this Connector.
- Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

### Context

Set up an integration system to import new hire data from Kenexa into Workday.

### Steps

1. Access the Create Integration System task and enter *Kenexa Hire Inbound* at the New using Template prompt.  
Security: *Integration Build* in the Integration functional area.  
(Optional) To import payment elections and tax-related data, enable the *Kenexa Hire Inbound - Pay and Tax Service*.
2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these security domains:
  - *Contract Contingent Worker* (business process)
  - *Hire* (business process)
  - *Manage: Payment Election*
  - *Manage Pre-Hire Process: Manage Pre-Hires*
  - *Personal Information Change* (business process)

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

3. As a related action on your Kenexa Hire Inbound integration, select Integration System > Configure Integration Attributes add a row for each attribute and specify a value.
4. [Set Up Integration Retrieval](#) on page 1957.  
Specify how the integration system retrieves data files from the SFTP server.
5. [Launch an Integration](#) on page 24.  
Schedule how often the integration system runs.

## Concept: Kenexa Connector

Synchronize data between Workday and IBM Kenexa® Talent Acquisition Suite with the Kenexa Connector. These Connectors enable you to establish an integration between your Workday tenant and Kenexa, for workers in the United States only. To support Kenexa, Workday provides 3 Kenexa integration templates:

- *Kenexa Foundation Data*
- *Kenexa User Provisioning*
- *Kenexa Hire Inbound*

To integrate Workday with Kenexa, implement all 3 Kenexa integrations. Kenexa Connectors support the Job Management staffing model only. If you use Position Management in your tenant, you can't use these Connectors.

### Kenexa Foundation Connector

The *Kenexa Foundation Data* template supports export of organization, location, job family, job classification, and job profile data from Workday to Kenexa *BrassRing*. As you add, change, move, and delete these items, the integration sends updates directly to your Kenexa account.

Integration Service	Description
Kenexa Foundation Data - Organizations Data Init Service	Extracts organization structure changes from your tenant. You can select types of organizations that the integration monitors for changes.
Kenexa Foundation Data - Locations Data Init Service	Extracts location changes from your tenant. You can select types of locations that the integration monitors for changes.
Kenexa Foundation Data - Job Families Data Init Service	Extracts job family changes from your tenant.
Kenexa Foundation Data - Job Profiles Data Init Service	Extracts job profile changes from your tenant.
Kenexa Foundation Data - Job Classifications Data Init Service	Extracts job classification changes from your tenant.

### Kenexa Account Provisioning Connector

The *Kenexa User Provisioning* template enables you to create, update, and disable accounts in Kenexa Talent Acquisition Suite. As you hire, transfer, and terminate workers, the integration generates a CSV file with the changes. The integration then delivers the CSV file to an SFTP site. The template enables you to filter output so that the integration sends only data for eligible workers.

### Kenexa Hire Inbound

The *Kenexa Hire Inbound* template enables you to import Kenexa Onboarding XML files containing new hire data from an external SFTP site. Workday provides the XML file format. You can customize element names as part of the field mapping. Contact Kenexa for assistance in formatting and generating the inbound XML file.

To support multiple input files and prevent duplicates, you can configure a uniqueness check in the Connector. You can select either Worker ID or Custom ID as the unique attribute. A uniqueness check ensures that there are no duplicate records in the input file. The uniqueness check also determines if Workday has assigned the Worker ID or Custom ID to an active worker. This verification enables processing of multiple input files. Workday also requires uniqueness checking to rehire workers who you previously terminated but didn't have a Workday account during their previous tenure.

## Integration Launch and Scheduling

Workday provides these launch schedule options for Kenexa Foundation Connector and Kenexa Account Provisioning integrations:

- Launch using a schedule. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration collects all qualifying changes based on the launch parameters.
- Launch immediately. You can launch the integration manually. Workday prompts you for the launch parameters.

For launch using a schedule and launch immediately, you can enter these launch parameters:

Parameter	Description
As Of Entry Moment	Extracts records that you entered into Workday after the specified moment.
Effective Date	Extracts records that became effective in Workday on or after the specified date.
Last Successful As Of Entry Moment	Extracts records that you entered into Workday after this date/time.
Last Successful Effective Date	Extracts records with an effective date after this date.

## Integration Audit Files

Every time a Kenexa Connector integration runs, Workday generates these files:

- (Outbound Connectors only) A copy of the outbound file. The integration retains this document for a length of time that you define.
- The *MessagesAudit.zip* file includes troubleshooting files that confirm data processing steps.
- (Outbound Connectors only) The *Data Changes Audit* is a readable version of the integration output file.
- (Outbound Connectors only) The *Diagnostic Audit* is designed to help you troubleshoot integration errors.

You can find these files in the Reports and Other Output Files section of the Integration Event for each integration run.

Note: Because Workday includes actual data in the Data Change Audit file, you can secure this file separately. Example: if administrators can't have access to the data.

## Reference: Kenexa User Provisioning Attributes

This table lists all available attributes that the Kenexa User Provisioning integration supports. Contact Kenexa for configuration assistance.

Attribute	Required?
<i>First Name</i>	Y
<i>Last Name</i>	Y
<i>Middle Name</i>	N
<i>User Name</i>	Y
<i>Email Address</i>	Y
<i>HRIS Employee Id</i>	Y

Attribute	Required?
<i>Phone Number</i>	N
<i>Phone Extension</i>	N
<i>Job Title</i>	N
<i>Active</i>	Y
<i>Country</i>	Y
<i>Locale</i>	Y
<i>Fax Number</i>	N
<i>Sender Employee Id</i>	Y
<i>Source</i>	N
<i>User SSO Id</i>	N
<i>SSO Enabled</i>	N
<i>Expiration Date</i>	N
<i>Validity Date</i>	N
<i>BR Hiring Access</i>	Y
<i>BR User Type</i>	Y
<i>BR Approval Groups</i>	N
<i>BR Code Access Groups</i>	N
<i>BR Express User</i>	Y
<i>BR KIB User Group</i>	N
<i>BR Manager</i>	Y
<i>BR Organization Group</i>	Y
<i>BR Recruiter</i>	Y
<i>BR User Group</i>	Y
<i>OB Manager Access</i>	Y
<i>OB User Type</i>	Y
<i>OB User Group</i>	Y
<i>TM Performance Access</i>	Y
<i>TM User Type</i>	Y
<i>Department</i>	N
<i>BRTG Job Access</i>	Y
<i>Connections Social Access</i>	Y
<i>TimeZone</i>	Y
<i>TS Admin Access</i>	Y
<i>TS Admin User Type</i>	Y

Attribute	Required?
<i>TI Talent Access Insights</i>	Y

## Reference: Kenexa Hire Inbound Attributes

This table lists all available attributes that the Kenexa Hire Inbound integration supports. Contact Kenexa for configuration assistance.

Field	Description	Required?	Comments
Country	Employee Country – Drives Employee Name Data Logic	Required	Defined by Workday integration mapping. ISO 3166-1 alpha 3.
Worker_ID	Specify the Employee or Contingent Worker ID that identifies the Worker record.	Optional	Workday uses this value to look up existing applicants that were previous employees or contingent workers. Workday also uses this value as the HRIS ID for new workers.
Applicant_ID	Specify the Applicant ID for the pre-hire record.	Optional	Workday generates an ID when no ID exists on the file. Workday doesn't use this value to find pre-hires.
Title_Prefix	Employee Prefix Data	Optional	Defined by Workday integration mapping
Name_Suffix	Employee Suffix Data	Optional	Defined by Workday integration mapping
Salutation_Prefix		Optional	Defined by Workday integration mapping
First_Name		Required	Conditionally Required Based on Country Reference
Middle_Name		Optional	
Last_Name		Required	Conditionally Required Based on Country Reference
Secondary_Last_Name		Optional	Conditionally required based on Country Reference.
Local_First_Name		Optional	Conditionally required based on Country Reference.
Local_Last_Name_2		Optional	Conditionally required based on Country Reference.

Field	Description	Required?	Comments
Local_Middle_Name		Optional	Conditionally required based on Country Reference.
Local_Middle_Name_2		Optional	Conditionally required based on Country Reference.
Local_Last_Name		Optional	Conditionally required based on Country Reference.
Local_Last_Name_2		Optional	Conditionally required based on Country Reference.
Local_Secondary_Last_Name		Optional	Conditionally required based on Country Reference.
Local_Secondary_Last_Name_2		Optional	Conditionally required based on Country Reference.
Email Address		Optional	Text Field
Email_Address_Public		Optional	Text Field
Work_Email_Address		Optional	Text Field
Work_Email_Address_Public		Optional	Boolean True/False value ( <i>I</i> or <i>O</i> ).
Phone Device Type		Required	Defined by Workday integration mapping.
Phone Number		Required	Text Field
Address Data	Can repeat 3 Address records. Example: Address_2_Address_Country		See default mapping in tenant for default field values.
Address_Country		Optional	Conditionally required based on Country Reference. ISO 3166-1 alpha 3.
Address_Effective_Date		Optional	Conditionally required if loading address data
Municipality	City for the Home Address of the worker.	Optional	Conditionally required based on Country Reference.
Region	State for the Home Address of the worker.	Optional	Conditionally required based on Country Reference. ISO 3166-1 alpha 3.

Field	Description	Required?	Comments
Postal Code		Optional	Conditionally required based on Country Reference.
Region_Subdivision_1	Region subdivision	Optional	
Region_Subdivision_2	Region subdivision	Optional	
Region_Subdivision_1_Local	Region subdivision Local	Optional	
Region_Subdivision_2_Local	Region subdivision Local	Optional	
City_Subdivision_1	City subdivision	Optional	
City_Subdivision_1_Local	City subdivision	Optional	
City_Subdivision_2	City subdivision Local	Optional	
City_Subdivision_2_Local	City subdivision Local	Optional	
Municipality - Local	Municipality Local	Optional	
Address_Line_1		Optional	
Address_Line_1_Local		Optional	
Address_Line_2		Optional	
Address_Line_2_Local		Optional	
Address_Line_3		Optional	
Address_Line_3_Local		Optional	
Address_Line_4		Optional	
Address_Line_4_Local		Optional	
Address_Line_5		Optional	
Address_Line_5_Local		Optional	
Address_Line_6		Optional	
Address_Line_6_Local		Optional	
Address_Line_7		Optional	
Address_Line_7_Local		Optional	
Address_Line_8		Optional	
Address_Line_8_Local		Optional	
Address_Line_9		Optional	
Address_Line_9_Local		Optional	
Birth_Date		Optional	Text Field: YYYY-MM-DD. ISO 8601.
Gender		Optional	Defined by Workday integration mapping.

Field	Description	Required?	Comments
Country_of_Birth		Optional	Defined by Workday integration mapping. ISO 3166-1 alpha 3.
Region_of_Birth	State of Birth for the employee.	Optional	Defined by Workday integration mapping. ISO 3166-2
City_of_Birth	City of Birth for the employee.	Optional	
Marital_Status	Marital status date of the person.	Optional	Defined by Workday integration mapping
Marital_Status_Date		Optional	
Citizenship_Status		Optional	
Ethnicity		Optional	Defined by Workday integration mapping
Nationality	Nationality Reference for the employee.	Optional	Defined by Workday integration mapping. ISO 3166-1 alpha 3.
Native_Country_Region		Optional	Defined by Workday integration mapping. ISO 3166-1 alpha 3.
Military_Status		Optional	Defined by Workday integration mapping
Military_Status_Begin_Date	Beginning date for military service status.	Optional	
Military_Service_Type	Service type for military service	Optional	
Military_Rank	Military rank for military service type	Optional	
Military_Notes	Notes for military service	Optional	
Discharge_Date		Optional	Text Field: YYYY-MM-DD. ISO 8601.
Personnel File Agency	Personnel File Agency (China) Indicates where workers have their personnel file stored.	Optional	
Date_of_Death	Date of death for the worker.	Optional	
Tobacco_Use	Tobacco usage for the person.	Optional	

Field	Description	Required?	Comments
Hispanic_or_Latino_for_Visual_Survey	Reference to visual survey ethnicity for the person.	Optional	
Hispanic_or_Latino	Boolean. Reference to visual survey ethnicity for Hispanic or Latino for the person.	Optional	
Religion	Reference for religions for the person.	Optional	
Personnel_File_Agency		Optional	
Hukou_Region	Country Region of the <i>Hukou</i> of the person.	Optional	
Hukou_Subregion	Country Subregion on the <i>Hukou</i> of the person.	Optional	
Hukou_Locality	Locality on the <i>Hukou</i> of the person	Optional	
Hukou_Postal_Code	<i>Hukou</i> Postal Code for the Person	Optional	
Hukou_Type	<i>Hukou</i> Type on the <i>Hukou</i> of the person.	Optional	
Native_Country_Region	Native Region on the <i>Hukou</i> of the person.	Optional	
Political_Affiliation	Political affiliation of the person.	Optional	
Last_Medical_Exam_Date	Date of most recent medical examination for the person.	Optional	
Last_Medical_Exam_Valid_Until	Expiration date of most recent medical examination for the person.	Optional	
Medical_Exam_Notes	Notes for the most recent medical examination for the person.	Optional	
Social_Benefits_Locality	Social Benefits Locality for the person.	Optional	
Relative_Data	Can repeat 3 Relative records. Example: Relative_Type_1		See default mapping in tenant for default field values.
Relative_Type_1	Specifies the relative person relationship.	Optional	

Field	Description	Required?	Comments
Relative_Country_1	The country that the name is for.	Optional	
Relative_Title_1	A reference to the title for a person.	Optional	
Relative_Salutation_1	Reference to the form of address for a person. Valid for Germany only.	Optional	
Relative_First_Name_1	The first name (given name) for a person.	Optional	
Relative_Middle_Name_1	The middle name for a person.	Optional	
Relative_Last_Name_1	The last name (family name) for a person	Optional	
Relative_Social_Suffix_1	A reference to the social suffix for a person.	Optional	
Custom ID Data	Can repeat 10 Custom ID records. Example: Custom_ID_1		See default mapping in tenant for default field values.
Custom_ID_1_Type		Conditionally Required When Custom ID Data is Provided	Defined by Workday integration mapping
Custom_ID_1		Conditionally Required When Custom ID Data is Provided	Text
Passport_ID_Issuing_Country		Optional	Conditionally required when passport data exists on the file. Defined by Workday integration mapping. ISO 3166-1 alpha 3.
Passport_ID_Type		Optional	Conditionally required when passport data exists on the file. Defined by Workday integration mapping
Passport_ID		Optional	Conditionally required when passport data exists on the file.
Passport_ID_Issued_Date		Optional	
Passport_ID_Expiration_Date		Optional	
Passport_ID_Issuing_Country		Optional	
Visa_ID_Issuing_Country		Optional	Conditionally required when visa data exists

Field	Description	Required?	Comments
			on the file. Defined by Workday integration mapping. ISO 3166-1 alpha 3.
Visa_ID_Type		Optional	Conditionally required when visa data exists on the file. Defined by Workday integration mapping
Visa_ID		Optional	Conditionally Required When Visa Data is Provided
Visa_ID_Expiration_Date		Optional	
Visa_ID_Issued_Date		Optional	
Government ID Data	Can repeat 10 Government ID records. Example: Custom_ID_1		See default mapping in tenant for default field values.
Government_ID_1		Optional	
Government_ID_1_Expiration_Date		Optional	
Government_ID_1_Issued_Date		Optional	
Government_ID_1_Issuing_Country		Conditionally Required When Government ID Data is Provided	
Government_ID_1_Type		Conditionally Required When Government ID Data is Provided	
National ID Data	Can repeat 10 National ID records. Example: National_ID_1		See default mapping in tenant for default field values.
National_ID_1_Type		Conditionally Required When National ID Data is Provided	Defined by Workday integration mapping. Add numbers to repeating elements. Example: National_ID_Reference1, National_ID_Reference2.
National_ID_1_Issuing_Country		Conditionally Required When National ID Data is Provided	Defined by Workday integration mapping. Add numbers to repeating elements. Example: Issue_Country_Reference1, Issue_Country_Reference2. ISO 3166-1 alpha 3.
National_ID_1_Issuing_Agency			Text Field

Field	Description	Required?	Comments
National_ID_1_Expiration	Date		Text Field: YYYY-MM-DD. ISO-8601
National_ID_1_Issued_Date			Text Field: YYYY-MM-DD. ISO-8601
National_ID_1_Series			Text Field
National_ID_1	Can repeat 10 National ID values.	Conditionally required when National ID data exists on the file.	Add numbers to repeating elements. Example: National_ID1, National_ID2
User_Name	Workday Account User Name for the employee.	Optional	Text Field
Hire_Date		Required	Text Field: YYYY-MM-DD. ISO-8601
Hire_Reason		Conditionally Required	Defined by Workday integration mapping
Employee_Type		Conditionally Required	Defined by Workday integration mapping
Contingent_Type		Conditionally Required	Defined by Workday integration mapping
Contract_Reason		Conditionally Required	Defined by Workday integration mapping
Job_Profile	You can use a Kenexa Foundation Data integration to load this data.	Required	Job Code from Foundation Data Integration.
Position_Time_Type		Required	Defined by Workday integration mapping
Default_Hours		Optional	Text
Scheduled_Hours		Optional	Text
Work_Shift		Optional	Defined by Workday integration mapping
Work_Hours_Profile		Optional	Defined by Workday integration mapping
Job_Classification	You can use a Kenexa Foundation Data integration to load this data.	Optional	Reference ID from Foundation Data Integration.
Location	You can use a Kenexa Foundation Data integration to load this data.	Required	Reference ID from Foundation Data Integration.
Supervisory_Organization	You can use a Kenexa Foundation Data	Required	Send Kenexa corresponding object

Field	Description	Required?	Comments
	integration to load this data.		ID if the data exists in Kenexa.
Start_Date		Optional	YYYY-MM-DD. ISO 8601
End_Date		Conditionally Required Based on Employee Type.	YYYY-MM-DD. ISO 8601
Continuous_Service_Date		Optional	YYYY-MM-DD. ISO 8601
Probation_Type_Reference		Optional	Defined by Workday integration mapping
Probation_Start_Date		Optional	YYYY-MM-DD. ISO 8601
Probation_End_Date		Optional	YYYY-MM-DD. ISO 8601
Probation_Extended_End_Date		Optional	YYYY-MM-DD. ISO 8601
Probation_Note		Optional	Text
Probation_Period_Reference		Optional	Defined by Workday integration mapping
Probation_Reason_Reference		Optional	Defined by Workday integration mapping
Pay_Rate_Type		Optional	Defined by Workday integration mapping
Work_Space	You can use a Kenexa Foundation Data integration to load this data.	Optional	Location (from Kenexa Foundation Data)
Position_Title		Optional	Text Field
Job_Title		Optional	Text Field
Compensation_Package		Conditionally required if Comp Data exists on file.	Defined by Workday integration mapping
Compensation_Grade_Profile		Optional	Defined by Workday integration mapping
Compensation_Grade		Conditionally required if Comp Data exists on file.	Defined by Workday integration mapping
Amount		Conditionally required if Comp Data exists on file.	Text Field

Field	Description	Required?	Comments
Compensation_Currency		Conditionally required if Comp Data exists on file.	ISO 4217 alpha
Compensation_Frequency		Conditionally required if Comp Data exists on file.	Defined by Workday integration mapping
Compensation_Step		Optional	Defined by Workday integration mapping
Compensation_Plan		Conditionally required if Comp Data exists on file.	Defined by Workday integration mapping
Stock_Plan		Optional	Defined by Workday integration mapping
Stock_Currency		Conditionally required if Stock Data exists on file.	Defined by Workday integration mapping. ISO 4217 alpha
Stock_Individual_Target_Amount		Optional	Include 1 of these elements if stock data exists on the file: <ul style="list-style-type: none"><li>• Target Amount</li><li>• Target Percent</li><li>• Target Shares</li></ul>
Stock_Individual_Target_Percent		Optional	Include 1 of these elements if stock data exists on the file: <ul style="list-style-type: none"><li>• Target Amount</li><li>• Target Percent</li><li>• Target Shares</li></ul>
Stock_Individual_Target_Shares		Optional	Include 1 of these elements if stock data exists on the file: <ul style="list-style-type: none"><li>• Target Amount</li><li>• Target Percent</li><li>• Target Shares</li></ul>
Compensation_Plan		Conditionally required if Commission Data exists on file.	Defined by Workday integration mapping
Commission_Target_Amount		Conditionally required if Commission Data exists on file.	Text Field
Commission_Frequency		Conditionally required if Commission Data exists on file.	Defined by Workday integration mapping
Commission_Draw_Amount		Optional	Text Field

Field	Description	Required?	Comments
Commission_Draw_Frequency		Optional	Defined by Workday integration mapping
Commission_Draw_Duration		Optional	Informational text field to describe how long the draw will be.
Compensation_Currency		Conditionally required if Commission Data exists on file.	Defined by Workday integration mapping. ISO 4217 alpha
Merit_Guaranteed_Minimum		Optional	Boolean True/False value (1 or 0).
Merit_Individual_Target_Percent		Optional	Enter 1 for 100%. Enter 0.5 for 50%.
Merit_Plan		Conditionally required if Merit Data exists on file.	Defined by Workday integration mapping
Bonus_Plan		Conditionally Required if Bonus Data exists on file.	Defined by Workday integration mapping
Bonus_Percent_Assigned		Optional	Enter 1 for 100%. Enter 0.5 for 50%.
Bonus_Guaranteed_Minimum		Optional	Text Field
Bonus_Individual_Target_Percent		Optional	Enter 1 for 100%. Enter 0.5 for 50%.
Bonus_Individual_Target_Amount		Optional	Text Field
Allowance Data	Can repeat 5 Allowance records. Example: Allowance_Plan_2		See default mapping in tenant for default field values.
Allowance_Currency		Optional	Conditionally required when allowance payment data exists on the file. Defined by Workday integration mapping. ISO 3166-1 alpha 3.
Allowance_Plan		Optional	Defined by Workday integration mapping
Allowance_Amount		Optional	Text Field
Allowance_Percent		Optional	Enter 1 for 100%. Enter 0.5 for 50%.
Allowance_End_Date		Optional	YYYY-MM-DD. ISO 8601
Allowance_Frequency		Optional	Defined by Workday integration mapping

Field	Description	Required?	Comments
One-Time Payment Data	Can repeat 5 One-Time Payment records: Example: One-Time_Payment_Plan_2		See default mapping in tenant for default field values.
One-Time_Payment_Currency		Conditionally required if One Time Payment data exists on file.	Conditionally required when one-time payment data exists on the file. Defined by Workday integration mapping. ISO 3166-1 alpha 3.
One-Time_Payment_Plan		Conditionally required if One Time Payment data exists on file.	Defined by Workday integration mapping
One-Time_Payment_Date		Conditionally required if One Time Payment data exists on file.	YYYY-MM-DD. ISO 8601
One-Time_Payment_Amount		Conditionally required if One Time Payment data exists on file.	Text Field
One-Time_Payment_Percent		Optional	Enter 1 for 100%. Enter 0.5 for 50%.
Education Data	Can repeat 5 Education Records: Example: School_Country_1		See default mapping in tenant for default field values.
School_Name_1		Conditionally required if School Data exists on file.	Text Field
Year_of_Degree_1		Conditionally required if School Data exists on file.	YYYY
Subject_of_Stud_1		Conditionally required if School Data exists on file.	Defined by Workday integration mapping
Attainment_Level_1		Conditionally required if School Data exists on file.	Defined by Workday integration mapping
School_Country_1		Conditionally required if School Data exists on file.	Defined by Workday integration mapping. ISO 3166-1 alpha 3
School_Type_1		Conditionally required if School Data exists on file.	Defined by Workday integration mapping
Federal_Tax_Exemption_Effective_Date		Conditionally required if Federal Tax Election Data exists on file.	YYYY-MM-DD. ISO 8601

Field	Description	Required?	Comments
Federal_Tax_Number_of_Allowances	Allowances	Optional	Text Field
Federal_Tax_Additional_Amount		Optional	Text Field
Federal_Tax_Exempt_Indicator		Optional	Boolean True/False value (1 or 0).
Federal_Tax_Exempt_from_NRA_Additional_Amount		Optional	Boolean True/False value (1 or 0).
Federal_Tax_Lock_In_Letter	Lock in Letter indicator on the W-4.	Optional	Boolean True/False value (1 or 0).
Federal_Tax_No_Wage_Not_Worker	Not Worker is nonresident alien, indicate whether the worker is subject to NRA additional amount.	Optional	Boolean True/False value (1 or 0).
Federal_Tax_Nonresident_Alien		Optional	
Federal_Tax_Marital_Status		Optional	
Federal_Tax_Company		Optional	
Payment_Election_Data	Can repeat 3 Payment Elections records. Example: Payment_Election_Account_Type_1		See default mapping in tenant for default field values.
Payment_Election_Bank_Account_Number_1	Actual bank account	Optional	Optional
Payment_Election_Rule_1		Conditionally required if Payment Election data exists on file.	Defined by Workday integration mapping
Payment_Election_Type_1		Conditionally required if Payment Election data exists on file.	Defined by Workday integration mapping
Payment_Election_Bank_Name_1		Conditionally required if Payment Election data exists on file.	
Payment_Election_Bank_Account_Number_1		Optional	
Payment_Election_Bank_ID_1		Optional	
Payment_Election_Currency_1		Conditionally required if Payment Election data exists on file.	Defined by Workday integration mapping. ISO 4217 alpha
Payment_Election_Country_1		Conditionally required if Payment Election data exists on file.	Defined by Workday integration mapping. ISO 3166-1 alpha 3
Payment_Election_Bank_Name_1		Optional	
Payment_Election_Roll_Number_1		Optional	

Field	Description	Required?	Comments
Payment_Election_Account_Type_1		Optional	Text Field. Defined by Workday integration mapping
Payment_Election_BIC_1		Optional	Text Field
Payment_Election_IBAN_1		Optional	Text Field
Payment_Election_Branch_ID_1		Optional	Text Field
Payment_Election_Check_Digit_1		Optional	Text Field
Payment_Election_Amount	Fixed payment amount allocated to this bank account	Optional	
Payment_Election_Percent	Percentage of payment allocated to this bank account	Optional	Enter 1 for 100%. Enter 0.5 for 50%.
Payment_Election_Full_Allocation	When true, allocates the full amount to this bank account	Optional	Boolean True/False value (1 or 0).
Organization_Business_Unit_ID		Optional	
Organization_Company_ID		Optional	
Organization_Cost_Center_ID		Optional	
Organization_Custom_ID		Optional	
Organization_Fund_ID		Optional	
Organization_Gift_ID		Optional	
Organization_Grant_ID		Optional	
Organization_Program_ID		Optional	
Organization_Region_ID		Optional	
Pay_Group		Optional	

## Kronos Workforce Timekeeper Outbound

### Steps: Set Up Integration for Kronos Employee Extract

#### Context

Create an integration that establishes worker records in Kronos and updates the records when changes occur. The integration reports changes to worker status so that Kronos can activate or deactivate records as needed.

After the initial full file worker synchronization, Workday sends Kronos a changes-only file, when scheduled. The changes-only file contains complete records for workers who are new or whose information has changed since the last integration run.

## Steps

1. [Create Integration System](#) on page 1967.  
Enter *Kronos Employee Extract Template* at the New Using Template prompt.
2. Select Integration System > Configure Integration Attributes as a related action on your integration system and configure attributes for your integration.
3. As a related action on the integration, select Integration System > Configure Integration Maps.
4. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these security domains:
  - *Integration Event*
  - *Set Up: Compensation*
  - *Worker Data: Public Worker Reports*

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

5. (Optional) [Set Up Integration Subscriptions](#) on page 1968.
6. [Launch an Integration](#) on page 24.

## Next Steps

Set up absence and payroll input Connectors to import time card data from Kronos into Workday.

## Concept: Kronos Workforce Timekeeper Integration

Track worker time and attendance through the Workday integration with Kronos Workforce Timekeeper. Kronos Workforce Timekeeper automates the error-prone processes related to time and attendance. Workforce Timekeeper enables you to apply complex time and attendance pay policies accurately. Workforce Timekeeper provides your managers with real-time labor data along with the tools to control costs and improve productivity. Workday synchronizes information about workers and organizations with Kronos so that your employees can record time and attendance.

Workday synchronizes HCM data with Kronos using the outbound integration system, which delivers files to an external FTP server. You then use Kronos Connect to import the file into Kronos Workforce Timekeeper.

**Note:** To import Kronos time card data into Workday, create an inbound integration using the Absence and Payroll Input Connectors.

Workday is the source-of-truth for HCM data, including:

- Workers
- Organizations
- Job profiles

Kronos collects time and attendance data from employees. The Kronos integrations do not work directly with Payroll Interface. However, Workday can generate payroll data using time and attendance data uploaded from Kronos Workforce Timekeeper.

## Concept: Kronos Integration Data Mapping

### Employee Extract Maps

When you create integration maps for the Kronos Employee Extract files, you're mapping Workday values to Kronos values. In this case, the Internal Values represent the Workday values and the External Values represent the Kronos values.

## Employee Extract Map Samples

Map	Description	Internal Value (Workday)	External Value (Kronos)
Business Title	Maps Business Title between Workday and Kronos values.	Staff Payroll Specialist	SPYS
Ethnicity	Maps ethnicity values between Workday and Kronos values.	White (Not Hispanic or Latino)	CAUC
Leave Type Name	Maps Leave Type names between Workday and Kronos values.	Workers Compensation	WC

## FAQ: Kronos Outbound Integration

What is the format of the Kronos integration files?

The Kronos integration files are Pipe Delimited files.

Can I select the fields included in the Kronos integration?

No, the Kronos integration employee extract includes 111 fields and you can't change the output. Use Kronos Connect to map the desired Workday fields to the appropriate Kronos fields.

Can I select the records to include in the Kronos Employee Extract integration?

You can't filter the Kronos integration extract records by specific workers or organizations. The dates you specify in the launch parameters of the employee extract determine whether Workday creates a full or change extract. You can also Edit Subscriptions to target specific event records to include.

Can I import Kronos time card data into Workday?

Yes, using the Absence and Payroll Input Connectors.

# LinkedIn Recruiter System Connect

## Steps: Set Up LinkedIn Recruiter System Connect

### Prerequisites

Review LinkedIn documentation for Recruiter System Connect (RSC) feature guidelines.

You must have a LinkedIn Recruiter admin license. See [Access RSC features based on a user's license and permissions in Recruiter](#) for more information.

**Security:** These domains in the Recruiting functional area:

- *Candidate Data: LinkedIn Recruiter System Connect*
- *Set Up: LinkedIn Middleware*

### Context

You can use the LinkedIn RSC integration to synchronize this data between LinkedIn Recruiter and Workday Recruiting:

- Candidate data.
- LinkedIn InMail.
- Job application.
- Prospect data.

Supported browsers include Chrome, Firefox, or Microsoft Edge.

You can enable One-Click Export functionality to quickly export a LinkedIn profile from LinkedIn Recruiter to Workday.

### Steps

1. (Optional) [Maintain Recruiting Sources](#).

To report on data sourced from LinkedIn, create a recruiting source that maps to Recruiter System Connect.

2. Create an integration system user (ISU) and an integration for One-Click Export.

See [Steps: Set Up LinkedIn One-Click Export](#) on page 1206.

3. Access the Edit Tenant Setup - Recruiting task.

Click Configure LinkedIn Integrations.

- a) Select the ISU created for the LinkedIn integration. The ISU is required for LinkedIn RSC One-Click Export.

- b) Review and accept the Terms and Conditions agreement.

The Terms and Conditions apply to both Apply with LinkedIn and LinkedIn RSC. Accepting the agreement doesn't impact previously enabled Apply with LinkedIn functionality.

4. Select the package containing the LinkedIn RSC integration.

For more information, see [Connect your Workday ATS to Recruiter](#). If you encounter an error message, see [Troubleshoot hiring integrations widget](#).

5. Access the Edit Tenant Setup - Recruiting task.

Click Configure LinkedIn Integrations and verify if you enabled the integration under Additional Information for Integration.

6. Configure the *LinkedIn Recruiter System Connect Import* integration.

See [Steps: Set Up Inbound LinkedIn Recruiter System Connect](#).

7. Configure the *LinkedIn Recruiter System Connect Export* integration.  
See Steps: Set Up Outbound LinkedIn Recruiter System Connect.
  8. Access the Configure Profile Group task.
    - a) Add these reports to the LinkedIn Data for Candidate Profile and LinkedIn Data for Prospect Profile profile groups:
      - InMail History
      - LinkedIn Profile
 LinkedIn controls the display language for the reports.
    - b) Add the Candidates Exported for This Job from LinkedIn report to the Candidates for Job Requisition Composite View profile group.
- See Steps: Set Up Profiles and Profile Groups.
9. Set Up Scheduled LinkedIn Recruiter System Connect Integrations.

## Next Steps

When you switch to a new environment, repeat the steps to configure the LinkedIn RSC integration.

If you're testing in a non-production environment and sent data to LinkedIn, contact LinkedIn before moving to Production so they can deactivate the integration and delete the test data. For more information, see Testing Recruiter System Connect (RSC).

Related Information

### Reference

[Reference: Edit Tenant Setup - Recruiting](#)

[2022R2 What's New Post: LinkedIn Recruiter System Connect \(RSC\) One-Click Export](#)

## Steps: Set Up LinkedIn One-Click Export

### Prerequisites

Security: These domains in the Integration and System functional areas:

- *Integration Security*
- *Security Configuration*

### Context

Recruiters can seamlessly export a candidate's LinkedIn profile from LinkedIn Recruiter to Workday and attach it to a specific job requisition. After the recruiter associates the candidate with a job, the inbound and outbound integrations run in the background and transfer data between LinkedIn and Workday. Workday creates or updates the candidate profile using the contact information from LinkedIn Recruiter. You can only export the candidate's LinkedIn profile if their privacy settings allow for their information to be accessed by Workday and they accept the request in LinkedIn InMail.

### Steps

1. Access the Create Integration System User task.  
Create the integration system user (ISU) for your LinkedIn RSC One-Click Export integration.
2. Access the Create Security Group task.  
Create an unconstrained integration system security group.
3. Select the ISU that you created from the Integration System Users prompt.
4. From the related actions of the security group, select Security Group > Maintain Domain Permissions for Security Group.

5. Select the *Candidate Data: Web Service LinkedIn Recruiter System Connect* domain from the Domain Security Policies permitting Put access prompt.
6. Run the Activate Pending Security Policy Changes task.  
Security: *Security Activation* domain in the System functional area.
7. Access the Create Integration System task.  
Create an integration system using the *LinkedIn Recruiter System Connect One Click Export* template. You can only create 1 integration system for the template.  
Security: *Integration Build* domain in the Integration functional area.
8. From the related actions of the integration system, select Workday Account > Edit.  
Add the ISU that you created. You can only assign 1 ISU to the integration system.

## Next Steps

Access your LinkedIn Recruiter Admin account and enable 1-click export in the ATS integrations settings after you enable LinkedIn RSC.

[2022R2 What's New Post: LinkedIn Recruiter System Connect \(RSC\) One-Click Export](#)  
[Export candidates to your Applicant Tracking System \(ATS\) with RSC](#)

## Steps: Set Up Inbound LinkedIn Recruiter System Connect

### Prerequisites

Ensure you've:

- Completed Steps 1–3 of [Steps: Set Up LinkedIn Recruiter System Connect](#) on page 1205.
- Enabled the integration in Workday for 1 or more LinkedIn contracts.

Synchronize historical data to prevent duplicate prospect data in Workday.

### Context

You can create a *LinkedIn Recruiter System Connect Import* integration system to import this data from LinkedIn to Workday:

- LinkedIn InMail.
- LinkedIn Profiles.

You can access this data in the prospect and candidate profiles in Workday. Workday might not display the imported data based on privacy settings that users set in LinkedIn.

You can only configure 1 inbound integration system per LinkedIn contract.

### Steps

1. [Create Integration System](#) on page 1967.  
Select the *LinkedIn Recruiter System Connect Import* option from the New using Template prompt.
2. Select Integration System > Configure Integration Attributes as a related action on the integration system, and configure the LinkedIn Contract ID attribute.
3. Create an integration system user (ISU) and grant the ISU *Get* and *Put* access to these domains:
  - *Candidate Data: Web Service LinkedIn Recruiter System Connect* in the Recruiting functional area.
  - *Integration Event* in the Integration functional area.

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

4. [Launch an Integration](#) on page 24.

- To ensure an optimal experience, sync a minimum of 2 years of historical data between LinkedIn and Workday. To avoid integration failures due to large volumes of data, we recommend launching multiple manual integrations for 1-3 months of data at a time. You might need to test the date range that is successful for your integration events.
- Schedule ongoing integrations after synchronizing historical data. A typical schedule is every 15, 30, 45, or 60 minutes depending on business needs.

5. (Optional) Create a custom report on candidates and filter by the new source value.

## Result

Recruiters can access LinkedIn Profile data and InMails from the Candidate or Prospect profile in Workday. You can view the LinkedIn profile on 1 of the supported web browsers. If a LinkedIn Recruiter browser session isn't active, Workday Recruiting displays the LinkedIn profile as the public profile for the candidate or prospect.

Related Information

### Concepts

[Concept: LinkedIn Recruiter System Connect](#) on page 1211

### Reference

[LinkedIn Recruiter System Connect \(RSC\) Data Security](#)

## Steps: Set Up Outbound LinkedIn Recruiter System Connect

### Prerequisites

Ensure you've:

- Completed Steps 1–3 of [Steps: Set Up LinkedIn Recruiter System Connect](#) on page 1205.
- Enabled the integration in Workday for 1 or more LinkedIn contracts.

### Context

You can create *LinkedIn Recruiter System Connect Export* integration systems for your external career sites to send this data from Workday to LinkedIn:

- External candidates.
- Job applications.
- Job application stages.
- Job postings (marked as private).
- Prospects.

You can have multiple export integration systems, however only 1 per external career site. This integration:

- Enables recruiters to view limited job application information for Workday jobs on the LinkedIn candidate profile.
- Exports job postings as private to LinkedIn Recruiter, and won't override any custom solutions that send job posting data from Workday to LinkedIn.
- Isn't a job posting integration.

LinkedIn verifies each candidate or prospect sent from Workday by matching the data with a corresponding LinkedIn profile. If LinkedIn finds a match, LinkedIn displays the data and sends a LinkedIn profile reference to Workday. Workday associates this reference with the candidate or prospect profile. If LinkedIn can't find a match, the exported Workday data won't display in LinkedIn Recruiter.

## Steps

1. [Create Integration System](#) on page 1967.  
Select the *LinkedIn Recruiter System Connect Export* option from the New using Template prompt.
  2. Select Integration System > Configure Integration Attributes as a related action on the integration system,  
Configure the Included External Job Posting Site attribute for the external career site.  
(Optional) You can enable the Excluded Countries attribute to filter data.
  3. Create an integration system user (ISU) and grant the ISU *Get* and *Put* access to these domains:
    - *Candidate Data: Web Service LinkedIn Recruiter System Connect* in the Recruiting functional area.
    - *Integration Event* in the Integration functional area.
- [See Steps: Grant Integration or External Endpoint Access to Workday.](#)
4. [Launch an Integration](#) on page 24.
    - To ensure an optimal experience, sync a minimum of 2 years of historical data between LinkedIn and Workday. To avoid integration failures due to large volumes of data, we recommend launching multiple manual integrations for 1-3 months of data at a time. You might need to test the date range that is successful for your integration events.
    - Schedule ongoing integrations after synchronizing historical data. A typical schedule is every 15, 30, 45, or 60 minutes depending on business needs.

## Result

In LinkedIn Recruiter, recruiters with security access can view Workday data for Workday candidates that have a LinkedIn profile.

LinkedIn Recruiter One-Click Export uses exported job postings to associate candidates with open job requisitions in Workday.

Concepts

[Concept: LinkedIn Recruiter System Connect](#) on page 1211

## Set Up Scheduled LinkedIn Recruiter System Connect Integrations

### Prerequisites

[Steps: Set Up LinkedIn Recruiter System Connect](#)

Launch inbound and outbound LinkedIn Recruiter System Connect (RSC) integrations to synchronize the last 2 years of candidate data.

Security:

- *Candidate Data: LinkedIn Recruiter System Connect* domain in the Recruiting functional area.
- *Candidate Data: Web Service LinkedIn Recruiter System Connect* domain in the Recruiting functional area.
- *Integration Event* domain in the Integration functional area.
- *Set Up: LinkedIn Middleware* domain in the Recruiting functional area.

### Context

Set up run schedules for both the inbound and outbound integrations between LinkedIn Recruiter and Workday after synchronizing historical data between the 2 applications to ensure that:

- The candidate data remains synced.

- Recruiters spend less time switching between LinkedIn Recruiter and Workday when searching for candidates.

## Steps

- Access the Launch / Schedule Integration task.  
See [Launch an Integration](#).
- Select the inbound or outbound LinkedIn RSC integration from the Integrations prompt.
- In the Run Frequency prompt, select the frequency that best fits your business needs.
- As you complete the Integration Criteria grid, consider:

Provider	Field	Description	Value Type	Value
<i>LinkedIn Recruiter System Connect Launch Parameters</i>	<i>Integration Start Time</i>	<i>The last time this integration was run.</i>	<i>Determine Value at Runtime</i>	Select from these options: <ul style="list-style-type: none"> <li><i>As Of Entry DateTime of Last Completed Integration Event</i></li> <li><i>As Of Entry DateTime of Last Completed or Completed with Warnings Integration Event</i></li> </ul>
	<i>Integration End Time</i>	<i>The integration end time.</i>	<i>Determine Value at Runtime</i>	<i>Current Moment (DateTime)</i>

- Complete the Schedule tab. Select the parameters under the Recurrence Criteria section.  
Your selection on the Catch Up Behavior prompt determines how many times Workday reruns an integration after an error.

When you select *Dependent* on the Run Frequency prompt, consider:

Option	Description
Dependency	Select the Dependency event type that triggers this integration.
Trigger on Status	Select the event statuses that will trigger this integration. You can run this integration when a specified Workday event status completes, fails, or aborts.

- Select the *Start Date* and *End Date* to schedule the integration event in the Range of Recurrence section.

## Result

View details about the scheduled integrations in the Scheduled Future Processes report.

## Example

### Next Steps

Repeat the steps for the other LinkedIn RSC integration.

## Concept: LinkedIn Recruiter System Connect

The LinkedIn Recruiter System Connect (RSC) integration enables data transfer between Workday Recruiting and LinkedIn Recruiter. The integration reduces switching between the 2 applications.

### Integration Templates

Workday supports these LinkedIn RSC Integration Templates:

- *LinkedIn Recruiter System Connect Export*.
- *LinkedIn Recruiter System Connect Import*
- *LinkedIn Recruiter System Connect One Click Export*

### Imported LinkedIn InMails

Existing Workday prospect profiles display LinkedIn InMail data based on the privacy settings that users set in LinkedIn. If the candidate or prospect elects to share contact information, Workday will include their contact information as part of the import.

Workday creates new prospect profiles for LinkedIn InMail recipients who have elected to share their name data, but don't have a Workday profile. To ensure Workday creates prospect profiles, enable the InMail Stub Profile setting in the LinkedIn Recruiter administrator settings. If the recipients didn't elect to share their name data, Workday won't be able to create a new prospect in Workday.

If a recruiter with access to LinkedIn Recruiter is also an internal candidate, the LinkedIn InMail communication for that recruiter doesn't import into Workday.

### Security

Due to the different security model of LinkedIn, Workday excludes confidential candidates and job applications when exporting data to LinkedIn. We can't associate data imported from LinkedIn with confidential data in Workday.

Workday recruiters with security to access LinkedIn Recruiter can view candidates and job applications sent from Workday to LinkedIn. Workday users with security to access candidate or prospect profiles can view LinkedIn Profiles and LinkedIn InMail data.

### Integration Support

Workday supports:

- Displaying the inbound data retrieved from LinkedIn within Workday.
- The inbound LinkedIn RSC integration and retrieving LinkedIn data.
- The outbound LinkedIn RSC integration and exporting Workday data.
- The One-Click Export integration and retrieving the LinkedIn data.

LinkedIn supports:

- All APIs for data transfer to and from LinkedIn Recruiter.
- All RSC features within LinkedIn Recruiter.
- Matching candidates between Workday and LinkedIn.
- Providing LinkedIn message history and consented LinkedIn InMail contact information for Workday retrieval.

- Providing One-Click Export data for Workday retrieval.
- The LinkedIn Onboarding widget inside of Workday.
- The LinkedIn Profile widget on the candidate profile.

## Troubleshooting: LinkedIn Recruiter System Connect Integration

**You couldn't successfully enable the LinkedIn Recruiter System Connect (RSC) integration after several attempts.**

If you're seeing internal server errors or other issues while enabling the LinkedIn RSC integration, you can start over by resetting the LinkedIn Middleware integration.

Note: The Reset LinkedIn Middleware Integrations task removes configuration data in Workday for the LinkedIn RSC and Apply with LinkedIn integrations. Running this task is irreversible for both integrations.

Only use this task in a:

- Non-Production environment.
- Production environment if the LinkedIn RSC and Apply with LinkedIn integrations aren't in use yet.

Solution:

### Steps

Security: *Set Up: LinkedIn Middleware* domain in the Recruiting functional area.

1. Access the Reset LinkedIn Middleware Integrations task.
2. Select the Reset check box.
3. Wait 30 to 60 minutes.
4. Try to enable the LinkedIn RSC integration again.

See [Steps: Set Up LinkedIn Recruiter System Connect](#).

### The LinkedIn RSC export integration completes with errors.

Cause: The integration event completed, but you're missing records in LinkedIn Recruiter due to rejected data. Example: LinkedIn rejected a candidate record because the last name for a candidate is missing in Workday.

Solution:

### Steps

Security: *Integration Event* domain in the Integrations functional area.

1. Access the Integration Events report.  
See [View Integration Events](#).
2. Access the integration that completed with errors.
3. On the Output Files tab, review the *MessagesAudit.zip* file for any errors that occurred during the integration.
4. Correct the data on the candidate profile.
5. [Launch an Integration](#).  
Launch the LinkedIn RSC export integration again.

### The LinkedIn RSC integration failed due to a server error.

The LinkedIn RSC integration has failed with a 500 Internal Server Error or 504 Gateway Timeout response message. If you encounter these failures several times, contact LinkedIn support.

Cause: LinkedIn's server isn't responding.

Solution:

### Steps

Security: *Integration Event* domain in the Integrations functional area.

1. Access the Integration Events report.  
See [View Integration Events](#).
2. Access the integration that failed.
3. On the Messages tab, review the Process Messages grid for any errors that occurred during the integration.
4. Contact LinkedIn support.

[Troubleshoot hiring integrations widget](#)

## Medicare Integrations

### Steps: Set Up Medicare Integrations

#### Prerequisites

Establish an Employer Voluntary Data Sharing Agreement (VDSA) with the Centers for Medicare & Medicaid Services (CMS):

- Sign the [VDSA agreement](#) and obtain a VDSA ID.
- Designate an employer-named contact and know who the CMS EDI contact is.

#### Context

You can create integrations that support Employer Voluntary Data Sharing Agreements (VDSAs) with CMS.

Perform this procedure once for each integration template.

#### Steps

1. Access the Create Integration System task and enter the applicable template name at the New using Template prompt:

Option	Description
Medicare Secondary Payer Input File Outbound	Sends coordination of benefits request files for active employees to CMS.
Medicare Secondary Payer Response File Inbound	Imports coordination of benefits response files for active employees from CMS.
Non-Medicare Secondary Payer Input File Outbound	Sends coordination of benefits request files for retired employees and dependents to CMS.
Non-Medicare Secondary Response File Inbound	Imports coordination of benefits response files for retired employees and dependents from CMS.

Security: *Integration Build* in the Integration functional area.

2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

- *Integration Build*
- *Worker Data: Medicare*

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

3. Select Integration System > Configure Integration Attributes as a related action on the integration system and enter integration service attributes.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

4. Configure delivery and retrieval of integration files using SFTP.

(Inbound integrations) See: [Set Up Integration Retrieval](#) on page 1957.

(Outbound integrations) See: [Set Up Integration Delivery](#) on page 1952.

5. [Launch an Integration](#) on page 24.

Launch each integration manually during the date-of-submission windows defined by CMS. Don't schedule your integrations.

## Concept: Medicare Integrations

Workday enables you to support Employer Voluntary Data Sharing Agreements (VDSAs) with the Centers for Medicare & Medicaid Services (CMS).

Workday provides 4 integrations that enable you to send and receive coordination of benefits request and response files for active and retired employees and their dependents:

- *Medicare Secondary Payer Input File Outbound*
- *Medicare Secondary Payer Response File Inbound*
- *Non-Medicare Secondary Payer Input File Outbound*
- *Non-Medicare Secondary Response File Inbound*

### Medicare Integration Details

When planning to implement Medicare integrations, consider:

- These integrations support Employer VDSA agreement with CMS. These integrations don't support Section 111 compliance reporting for GHP or non-GHP coverage (worker's compensation or legal settlements). Establish your TIN numbers for the VDSA data exchange before you can use our delivered integrations for the coverage data.
- Workday doesn't maintain Medicare Part C data as part of Medicare coverage information.
- The *Non-Medicare Secondary Payer Input File Outbound* integration template doesn't support Drug Subsidy reporting records. Workday supports EGWP drug coverage with the *Import Medicare Part D EGWP* web service operation.
- Workday transmits Medicare Beneficiary Identifier (MBI) information for outbound Medicare integrations. Workday no longer transmits Health Insurance Claim Number (HICN) information for those integrations.

### Integration Files and Reports

Every time a Medicare integration runs, Workday generates these files:

- *Data Changes Audit* file, which is a readable version of the integration output file.
- *Diagnostic Audit* file, which helps you troubleshoot integration errors.

You can find these files in the Reports and Other Output Files section of the Integration Event for each integration run.

Note: Because actual data is included in the *Data Changes Audit* file, you might need to secure this file separately.

## Okta

### Steps: Set Up Okta Integration

#### Prerequisites

- Determine if you want to configure this integration (Workday-driven provisioning) or configure Okta to import data from Workday. See: [Configuring Provisioning for Workday](#).
- Know the location and token for your Okta tenant.
- Review the Workday deployment documentation provided by Okta.
- Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

#### Context

Implement an integration based on the *Okta - Worker* template to monitor Workday events and send a notification to your Okta tenant when worker data changes.

#### Steps

1. Access the Create Integration System task and enter *Okta - Worker* at the New using Template prompt.  
Security: *Integration Build* in the Integration functional area.
  2. (Optional) In the Configure Integration Services task, enable any optional integration services.  
Security: *Integration Build* in the Integration functional area.
  3. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:
    - *Worker Data: Current Staffing Information*
    - *Worker Data: Public Worker Reports*
- See: [Steps: Grant Integration or External Endpoint Access to Workday](#).
4. (Optional) Grant the ISU access to the *View: Account Provisioning Integration Document* domain to enable the ISU to view documents generated by the connector.
  5. Select Integration System > Configure Integration Attributes as a related action on your integration system and configure attributes for your integration.
  6. [Select Workers to Include in Connector Output](#) on page 1977.  
Complete this step only if you enabled the *Define Eligibility* integration service in Step 2.
  7. Configure one of these methods to monitor events in Workday:
    - a) [Create Integration \(Step\)](#).
    - b) [Set Up Integration Subscriptions](#) on page 1968.

Select any business processes and transaction events that directly affect a worker. Examples: hire, transfer, termination.

#### Next Steps

Configure your Okta tenant to extract required data from Workday.

### Concept: Okta Integration

The Okta integration enables you to send notifications of changes to your employees directly to your Okta tenant. The *Okta - Worker* integration template enables you to monitor business processes and events in Workday that impact your workers. As you hire, transfer, and terminate your workers, the Okta integration sends the Workday ID (WID) value for each affected worker directly to your Okta tenant.

The Okta integration sends only the WID value for each affected worker. Configure your Okta tenant to extract additional data from your Workday tenant using the Workday Web Service API.

## Integration Services

The *Okta - Worker* integration template consists of these integration services:

Integration Service	Required/Optional	Description
Account Provisioning Connector: Worker - ESB Service	Required	Extracts worker data from your Workday tenant.
Account Provisioning Connector: Worker - Configuration	Required	Manages configuration of your Okta integration, including attribute values.
Integration Document Retention	Required	Defines how long the integration stores output files for auditing purposes.
Define Eligibility	Optional	Enables you to define which workers the integration monitors for sending notifications to Okta. Create a Document Field Override with a report field or calculated field. The report field or calculated field must return a check box <i>true</i> value for workers that you want to include.
Okta Account Provisioning	Required	Transforms data into JavaScript Object Notation (JSON) format and sends data to your Okta tenant.

## Launch/Schedule Options for Okta Integration

When you configure the Okta integration, you select which business process and event types that trigger the integration. Excluding business process and transaction types that are irrelevant to Okta improves performance. However, Workday doesn't notify your Okta tenant of changes for a transaction type if:

- Your integration system doesn't subscribe to a transaction type that affects your workers.
- Your integration isn't in the business process for a transaction type that affects your workers.

If you aren't sure if the Okta integration should subscribe to a transaction or business process type, exclude the transaction or business process type.

Note: To avoid triggering double integration events, don't configure the same Transaction Type as both a Business Process Integration Step and an Integration Subscription.

Workday provides these options for launching the Okta integration:

Option	Advantages	Disadvantages
Business Process Integration Step	Enables you to adjust integration scheduling for each business process type using condition rules and delay steps.	Requires you to configure an integration step for each business process that you want to monitor.

Option	Advantages	Disadvantages
Integration Subscriptions	Enables you to select, from a single prompt, each business process, and event type that you want to monitor. Workday includes automatically all business process definitions for each business process type that you select.	You can't adjust the integration launch time using condition rules or delay steps. The integration launches when the business process completes.

## Launch Parameters for Okta Integration

The Okta integration includes these launch parameters:

Launch Parameter	Description
Workers	<p>Returns the worker data as of the specified date and time. The integration can only launch for a single worker:</p> <ul style="list-style-type: none"> <li>If you're launching the integration manually, select only 1 worker.</li> <li>If you configure the integration to launch by business process or integration subscription, use the Workday-delivered Transaction Targets as Workers field.</li> </ul> <p>Note: Don't use the Transaction Targets report field. This field can sometimes return multiple workers, which the integration can't process.</p>
As of Entry Moment	<p>Includes any changes to worker data entered as of the specified date and time.</p> <p>Workday suggests using:</p> <ul style="list-style-type: none"> <li>The current moment if launching manually.</li> <li>The Workday-delivered field Current Moment (DateTime) if launching using a business process or integration subscription.</li> <li>The Workday-delivered field Transaction Entry Moment if launching using a business process or integration subscription.</li> </ul> <p>Workday doesn't recommend back-dating the As of Entry Moment parameter because it can cause subsequent data values to be invalid.</p>
Effective Date	<p>Returns the worker data effective as of the specified date. Workday recommends that you use the Transaction Effective Moment field.</p> <p>Note: For termination-related Business Process (BP) initiation or Integration Subscription, Workday recommends that you use a calculated field to take <i>Transaction Effective Moment + 1 Day</i>.</p>

Launch Parameter	Description
	This calculated field reflects the first day that the worker didn't work.

## Integration Files

Every time the integration runs, Workday generates these files:

- Data files: Workday generates 2 files in different formats. Each file includes the same data.
- *Data Changes Audit* file, which is a readable version of the integration output file.
- *Diagnostic Audit* file, which helps you troubleshoot integration errors.

You can find these files in the Integration Event for each integration run.

If you don't want to generate audit files, you can use the Suppress Messages Audit integration attribute.

Note: Since the *Data Changes Audit* file includes actual data, evaluate the need to secure this file separately.

## Reference: Okta Integration Output Fields

The Okta integration generates 2 data files for each event, in XML and JSON format. Each file contains the same data; the Okta integration sends the JSON file to your Okta tenant.

Field	Description
Published	Date and time when Workday generated the output file, in ISO 8601 format.
Generator	Name of the Workday tenant and environment that generated the output file.
Verb	Identifies the business process or event.
Context	Includes the Workday ID (WID) of the worker affected by the business process or event.

## Organization Inbound Connector

### Steps: Set Up Organization Inbound Connector

#### Prerequisites

Set up an external server that an external endpoint and your integration can access.

#### Context

Set up an integration system to import organization changes from an external endpoint into Workday.

#### Steps

1. To generate organization change data, configure your external endpoints.  
To improve Connector performance, Workday recommends that you load organizations in batches for high-volume organization loads.
2. Access the Create Integration System task and enter *Core Connector: Organization Inbound* at the New using Template prompt.  
Security: *Integration Build* in the Integration functional area.

3. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these security domains:
  - *Integration Build*
  - *Manage: Organization Integration*
  - *Manage: Organization Update Integration*
  - *Worker Data: Organization Information*
  - *Worker Data: Public Worker Reports*

See: [.../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).

4. Set Up Assignable Roles.

Add the ISU account to a role that can assign roles for any affected organization at the Assigned by Security Groups prompt.

5. As a related action on your integration, select Integration System > Configure Integration Attributes, add a row for each attribute, and specify a value.
6. Set Up Integration Retrieval on page 1957.
7. Launch an Integration on page 24.

## Concept: Organization Inbound Connector

Use the Organization Inbound Connector to import organization data from an external endpoint that defines organizations and their codes into Workday. The Organization Inbound Connector can add new organizations to Workday, update existing organizations, and deactivate organizations. With the Organization Inbound Connector, you can use a non-Workday application as your source-of-truth for organization data, then synchronize that data with Workday.

The Organization Inbound Connector works with organizations in Workday. Workday recommends that you familiarize yourself with Workday organization features.

### Organization Events

The Organization Inbound Connector enables your external endpoint to:

- Create an organization in Workday. To load the organization into Workday, include an organization in the integration file with a unique Reference ID. Define these items in a hierarchy for an organization:
  - Reference ID.
  - Name.
  - Availability date.
  - Code.
  - Organization type and subtype.
  - Location.
- Edit an existing organization in Workday. To amend the existing organization in Workday, include an organization in the integration file with a pre-existing Reference ID. You can change the superior organization (equivalent to moving the organization) of the organization. You can also edit other information about the organization, including role assignments.

Organization Inbound Connector supports 1 assignment of role to position, whether the position supports multiple assignments or not.

- Inactivate an organization. By using the provided Inactive flag, you can deactivate an organization. When you deactivate an organization:
  - Workday moves all active subordinate and included organizations up to an active superior organization unless you specify a specific organization. Deactivated subordinate and included organizations don't move up.
  - Specify a specific organization if:
    - There's no parent organization.
    - The organization that you're deactivating has active subordinates and included organizations.
  - If you set Keep in Hierarchy to false, Workday dissolves the organization structure and converts deactivated organizations to standalone organizations.

### **File Format for Organization Inbound Connector Data**

The Organization Inbound Connector imports data in a Workday-defined CSV (Comma-Separated Value) or XML format. Send data full file. The Organization Inbound Connector doesn't support change-only files. Instead, the integration determines if an organization is new or changed based on the Reference ID.

To improve Connector performance, Workday recommends that you load organizations in batches for high volume organization loads.

Note: If you include a new organization that doesn't exist in Workday, the Reference ID can't already be in use by another organization. The Organization Inbound Connector performs no additional data validation aside from the Reference ID. Workday overwrites the existing organization if:

- You include a new organization on the file.
- The organization uses the same Reference ID as an existing organization.

### **Integration Process Flow**

The Organization Inbound Connector imports organization data using this process:

1. Your external endpoint generates a file (in the Workday-supported format) and sends it to a file server known to the integration.
2. You launch the integration, either by schedule or manually.
3. The integration retrieves the file according to the Document Retrieval configuration on the Integration Process Event and applies document tags.  
If the file isn't in Workday XML or CSV format, configure a Document Transformation integration to convert the input file.
4. The integration processes the file, then imports the data into Workday:
  - The integration creates new organizations in Workday.
  - The integration updates or deactivates existing organizations.

### **Organization Inbound Connector Audits**

The Organization Inbound Connector generates audit files each time it runs.

## **View Organization Inbound Connector Integration Audits**

### **Prerequisites**

Security: *Background Process Management* domain in the Tenant Non-Configurable functional area.

## Context

For each integration event, you can use the Organization Inbound Connector integration audits to determine:

- What operation performs (DataChangesAudit.html)
- Details about the file (DiagnosticAudit.html)

## Steps

1. As a related action on the integration event, select Background Process > View Output Files.
2. Select an audit file:

Option	Description
DataChangesAudit.html	For each organization, displays the operation (Add, Update, Inactivate); for Update operations, also displays each changed field.
DiagnosticAudit.html	For each organization, displays the document name, the name and Reference ID of the organization, and if the file contained errors. Also displays any validation messages received while processing the organization.

## Reference: Organization Inbound Connector File Schema

### CSV File Description

The CSV format consists of various fields, each occurring once per organization. If you don't include a header on the CSV file, the fields must be in the order listed. For a complete description of each field, see the XML Elements section:

Note: The CSV file input supports a single Container\_Organization\_Reference\_ID field value for each included organization. The XML file input, in contrast, can support multiple Container\_Organization\_Reference\_ID field values for each organization.

- Organization\_Reference\_ID
- Organization\_Name
- Availability\_Date
- Include\_Organization\_Code\_In\_Name
- Organization\_Code
- Organization\_Type\_Name
- Organization\_Subtype\_Name
- Organization\_Visibility\_Name
- Organization\_Inactive
- Inactivation\_Date
- Superior\_Organization\_Reference\_ID. If Container\_Organization\_Reference\_ID has a value, leave this field empty.
- Container\_Organization\_Reference\_ID. If Superior\_Organization\_Reference\_ID has a value, leave this field empty.
- Frozen\_Status
- Staffing\_Model
- Primary\_Business\_Site\_Reference
- Organization\_Role\_ID\_1
- Position\_ID\_1
- Organization\_Role\_ID\_2

- Position\_ID\_2
- Organization\_Role\_ID\_3
- Position\_ID\_3
- Keep\_in\_Hierarchy
- Organization\_for\_Subordinates\_Reference\_ID
- Organization\_for\_Included\_Organizations\_Reference\_ID

## XML Elements

The XML schema for inbound organization update data includes these elements:

Element	Description
External_Organization_Inbound_Records	Contains all other elements. Only 1 element permitted per file.
External_Organization_Inbound_Record	Contains 1 instance of all subsequent elements, except as noted. Unlimited number of elements permitted per file.
Organization_Reference_ID	Reference ID value for the organization. If you're inserting the organization into Workday, ensure that this Reference ID doesn't exist for any other organization in Workday. Must be in XSD <i>string</i> format.
Organization_Name	Organization name in Workday. Must be in XSD <i>string</i> format.
Availability_Date	Availability Date is for informational purposes. This field value communicates when to begin using this organization. Workday doesn't use this field in any Workday validations to control when a staffing transaction can use the Organization, such as Hire Employee or Change Job. Must be in XSD <i>date</i> format.
Include_Organization_Code_In_Name	Indicates if you're concatenating the Organization_Code element value with the Organization_Name value. Must be in XSD <i>Boolean</i> format.
Organization_Code	Organization code value. Must be in XSD <i>string</i> format.
Organization_Type_Name	Organization type for the organization. Must be in XSD <i>string</i> format.
Organization_Subtype_Name	Organization subtype for the organization. Must be in XSD <i>string</i> format.
Organization_Visibility_Name	Determines organization visibility in Workday. Must be in XSD <i>string</i> format.  Valid visibility values are <i>Role Assignees</i> , <i>Role Assignees of Current and Superiors</i> , <i>Role Assignees and Members</i> , and <i>Everyone</i> .
Organization_Inactive	Former visibility values <i>Administrators Only</i> , <i>Administrators Only - All Organizations</i> , and <i>Members Only</i> are also still valid.  If set to Yes, sets the organization to inactive. You can't use this element to reactivate organizations. Must be in XSD <i>Boolean</i> format.
Inactivation_Date	Date that organization becomes inactive. Must be in XSD <i>date</i> format.

Element	Description
Superior_Organization_Reference_ID	Reference ID value for the superior organization of the organization in Workday. This field will be effective as of current date. Must be in XSD <i>string</i> format.
Container_Organization_Reference_ID	If you include a <i>Container_Organization_Reference_ID</i> value, leave this element empty. Only applicable for hierarchical organization types such as supervisory organization and cost center hierarchy.
Frozen_Status	Reference ID value for the organization in Workday that you're including the organization in. This field will be effective as of current date. Must be in XSD <i>string</i> format.
Staffing_Model	If you include a <i>Superior_Organization_Reference_ID</i> value, leave this element empty. You can enter only organizations that can include the organization type for that container organization. Example: This value could only be the Reference ID for a cost center hierarchy when the organization is a cost center.
Primary_Business_Site_Reference	If set to Yes, freezes all positions in the Organization. You can use this field only for supervisory organizations. Must be in XSD <i>Boolean</i> format.
Organization_Role_ID_1	Indicates the type of staffing model used by the organization. You can use this field only for supervisory organizations and for new organizations with no superior. Valid Staffing Model values are: Position Management and Job Management. Must be in XSD <i>string</i> format.
Position_ID_1	Workday ID (WID) for the Organization primary business site location. You can use this field only for supervisory organizations and for new organizations with no superior. Must be in XSD <i>string</i> format.
Organization_Role_ID_2	Name of an organization role. Must be in XSD <i>string</i> format.
Position_ID_2	Position ID that you assign to the Organization_Role_ID_1. Must be in XSD <i>string</i> format.
Organization_Role_ID_3	Name of an organization role. Must be in XSD <i>string</i> format.
Position_ID_3	Position ID that you assign to the Organization_Role_ID_2. Must be in XSD <i>string</i> format.
	Name of an organization role. Must be in XSD <i>string</i> format.
	Position ID that you assign to the Organization_Role_ID_3. Must be in XSD <i>string</i> format.

Element	Description
Keep_in_Hierarchy	Keeps an organization that you're inactivating in its current hierarchy. If not specified, Workday sets the value to False. Use only when you set Organization_Inactive to Yes. You can't use Keep_in_Hierarchy when an organization is already inactive. In that case, use the Inactivate Organizations web service instead. Must be in XSD Boolean format.
Organization_for_Subordinates_Reference_ID	Reference ID value for new superior organization for any subordinate organizations. Only applicable if you're inactivating the organization because an inactive organization can't have active subordinates. If not specified, inactive subordinates remain as is and Workday moves active ones to superior. Must be in XSD string format.
Organization_for_Included_Organizations_Reference_ID	Reference ID value for new superior organization for any included organizations. Only applicable if you're inactivating the organization because an inactive organization can't include active organizations. If not specified, inactive included organizations remain as is and active ones move to superior. Must be in XSD string format.

## XML Schema

## Salesforce.com Chatter

### Steps: Set Up Salesforce.com Chatter Integration

#### Context

To export updates from My Tasks to Chatter, create a Salesforce.com Chatter integration. Chatter then displays the My Tasks items.

#### Steps

1. [Create Custom Report for Salesforce.com Chatter Integration](#) on page 1226.  
To extract data from My Tasks, create a custom report.
2. Access the Create Integration System task and enter *Salesforce - Chatter Workfeed Sync* at the New Using Template prompt.  
*Security: Integration Build and Integration Configure* security domains.
3. Create an Integration System User (ISU) and grant the ISU Get and Put access to the *Integrations: Workfeed* security domain.  
This domain secures the Report Data Source used by the custom report that retrieves Workfeed data.  
See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

4. As a related action on your Salesforce.com Chatter integration, select Integration System > Configure Integration Attributes:

Option	Description
Salesforce Integration User ID	Enter the account ID for the Salesforce user who posts the My Tasks data in Salesforce.
Salesforce User Password	Enter the password for the account ID.
Salesforce Security Token	To authenticate with Salesforce, enter the Salesforce security token.
Workfeed Report Owner	Enter the owner of the custom report that retrieves My Tasks items from Workday.
Workfeed Report Name	Enter the name of the custom report that retrieves My Tasks items from Workday.
Workday Default URL	Enter the Workday tenant URL that Salesforce Chatter displays.
Salesforce Environment	<p>Specify the Salesforce.com sign-in URL, depending on which environment you select in the Restricted to Environment prompt. If not overridden, the integration uses these URLs:</p> <ul style="list-style-type: none"> <li>Production environment: login.salesforce.com</li> <li>All other environments, or no environment specified: test.salesforce.com</li> </ul> <p>You can override these values by editing the attribute.</p>

5. [Launch an Integration](#) on page 24.

Schedule how often you want Workday to launch the integration.

## Create Custom Report for Salesforce.com Chatter Integration

### Prerequisites

Security: *Custom/Standard Report Copy* domain in the Tenant Non-Configurable functional area.

### Context

Copy the Standard Report My Tasks and create a custom report in Workday that returns My Tasks data for use by the *Salesforce.com Chatter* integration.

### Steps

- Access the My Tasks report.
- As a related action on the report, select Standard Report > Copy.
- Give the copied report a new Name.  
You refer to this report when configuring the *Salesforce.com Chatter* integration.
- Change the Data Source to *Business Process Transactions Awaiting Employee ID*.

5. Select the Columns tab and add Column Heading Override values exactly as listed:

Option	Description
Business Process Event	<i>Business Process Event</i>
Subject	<i>Subject</i>
Date and Time Initiated	<i>Date Time Initiated</i>
Due Date	<i>Due Date</i>

6. Select the Sort tab and verify that the Sort Direction for *Date and Time Initiated* is set to *Alphabetical - Descending*.

7. Select the Filter tab and add a filter:

Option	Description
And/Or	<i>And</i>
(	<i>(</i>
Field	<i>Date and Time Initiated</i>
Operator	<i>greater than or equal to</i>
Comparison Type	<i>Prompt the user for the value</i>
Comparison Value	<i>Default prompt</i>

8. Select the Prompts tab and add a prompt for the *ID* report field:

Option	Description
Field	<i>ID</i>
Prompt Qualifier	<i>None.</i>
Label Override	<i>Employee ID</i>
Default Type	<i>No default value</i>
Required	<i>Yes</i>

9. In the Prompts tab, add a second prompt for the *Date and Time Initiated* report field:

Option	Description
Field	<i>Date and Time Initiated</i>
Prompt Qualifier	<i>Default prompt</i>
Label Override	<i>As Of DateTime Initiated</i>
Default Type	<i>No default value</i>
Required	<i>N/A</i>

10. Select the Share tab and select Share with all authorized users.

11. Select the Advanced tab and set the Web Service Options:

Option	Description
Enable as Web Service	<i>Select.</i>
Web Service API Version	<i>v15</i>

## Concept: Salesforce.com Chatter Integration

Synchronize My Tasks data between Workday and Salesforce.com Chatter. Salesforce.com Chatter brings the power of social networks inside your company. Salesforce.com Chatter is a free, private, and secure social network just for your business. With Chatter, your workers can connect with each other to work together and be more productive. The integration pushes updates on the people, projects, and files that you care about most automatically to your workers, so you always know what's going on.

### Salesforce.com Chatter Integration Template

The *Salesforce - Chatter Workfeed Sync* integration template enables you to export data from the Workday My Tasks to Salesforce.com Chatter. When run, the integration extracts all new My Tasks items created in Workday since the last integration run. The integration exports them to Salesforce.com Chatter as a single entry in private messages.

Note: Set up a *Salesforce - Worker Sync* integration to use the *Salesforce - Chatter Workfeed Sync* integration template.

### Salesforce.com Prerequisites

Before setting up the Salesforce.com Chatter integration, verify that you have an *Admin User* account on Salesforce.com that your integration can use.

### Salesforce.com Configuration

We recommend that you configure your Chatter Admin account as follows:

- Set the *User Account Name* to the *Admin User* or *Company User*. This name displays as the sender on the private message.
- Don't set an Alias for the *User Account*.

The Admin account in Chatter can see all messages for all workers.

Salesforce.com Chatter passwords expire every 3 months. Update the password and security token in the integration attributes for the Salesforce.com integrations.

### Configuration Steps

To configure Salesforce.com integrations:

1. [Steps: Set Up Salesforce.com Worker Sync Integration](#) on page 1228.  
To synchronize worker data in Workday with accounts in Salesforce.com, create a *Salesforce - Worker Sync* integration.
2. [Create Custom Report for Salesforce.com Chatter Integration](#) on page 1226  
Create a custom report to return My Tasks items to the integration.
3. [Steps: Set Up Salesforce.com Chatter Integration](#) on page 1225  
To export data returned by the custom report to Salesforce.com, create a *Salesforce - Chatter Workfeed Sync* integration.

## Salesforce.com Worker Sync

### Steps: Set Up Salesforce.com Worker Sync Integration

#### Prerequisites

- Verify that you have an *Admin User* account on your Salesforce.com tenant that the 2 integration templates can use.

- Create any Profiles in Salesforce.com that you want to assign to your workers using the integrations.

## Context

Create an integration system that establishes accounts for workers in Salesforce.com and updates the accounts when changes occur. The integration reports changes to worker status so that Salesforce.com can activate or deactivate accounts as needed.

After the initial full file worker synchronization, Workday sends Salesforce.com a changes-only file, when scheduled. The changes-only file contains complete records for workers who are new or whose information has changed since the last integration run.

You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration collects all qualifying changes based on the launch parameters. You can schedule the integration to run several times per day. Launching the integration frequently doesn't affect performance.

If you want to send additional worker attributes to the Salesforce.com environment, consider using *Core Connector: Worker*.

## Steps

1. Access the Create Integration System task and enter *Salesforce - Worker Sync* at the New Using Template prompt.  
Security: *Integration Build* and *Integration Configure* security domains.
2. Select Integration System > Configure Integration Attributes as a related action on the integration system and enter integration service attributes.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
3. As a related action on the integration system, select Integration System > Configure Integration Field Overrides.

Define which workers are eligible for Workday to include in the integration. Define which Salesforce.com profile, department, and division workers belong to in Salesforce:

Grid	Description
<i>Define Eligibility / Eligibility criterion</i>	Select (or create and select) a Boolean report field or calculated field from the Override External Field prompt. The Boolean must return <i>true</i> for any worker that is included in the integration.
<i>Salesforce Worker Configuration / Salesforce_Profile</i>	Select a report field or calculated field from the Override External Field prompt. The report field or calculated field defines which profile each worker receives in Salesforce.  For information on where to locate the profile ID for a worker in Salesforce, see Salesforce product documentation.

4. (Optional) Select Integration System > Configure Integration Transaction Log and select the Workday transactions that the integration monitors for changes.

Note: Workday recommends that you select Subscribe to all Transaction Types except. Then filter out only transaction types that you know have no relevance to your needs. If in doubt, don't filter out a transaction type.

5. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these security domains:
  - *Worker Data: Current Staffing Information*
  - *Person Data: Gender*
  - *Worker Data: Private Contact Information*
  - *Worker Data: Public Worker Reports*

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

6. [Launch an Integration](#) on page 24.

Schedule how often you want Workday to launch the integration.

## Concept: Salesforce.com Worker Sync Integration

Synchronize accounts between Workday and Salesforce.com using the *Salesforce - Worker Sync* integration template. As you hire workers into Workday, the integration sends worker data to Salesforce.com. You can use the integration to create Chatter accounts, Salesforce.com accounts, or both kinds of accounts. You also define rules in the integration to specify which profile, department (Optional), and division (Optional) the integration assigns a worker to based on defined criteria.

Use this integration template if you want to use the Salesforce.com Chatter integration.

### Launch/Schedule Options

Workday provides these launch schedule options for the *Salesforce - Worker Sync* integration:

- Organization: If you intend to run the integration immediately, select the organization for which you want to run the integration. The prompt varies depending on the Integration Process Event and on your security access:
  - *Owning Organization* displays if the Integration Process Event for this integration is associated with a specific organization. You can select the organization or any of its subordinate organizations of which you're a member or have an organization role.
  - *Organization By Type* displays if the Integration Process Event for this integration has no associated organization. You can select any organization and subordinate organization of which you're a member or have an organization role.
- Scheduled Run Frequency. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration collects all qualifying changes based on the launch parameters. You can schedule a Core Connector: Worker integration to run several times per day; launching the integration frequently doesn't affect performance.
- Run Now. You can launch the integration manually for specific workers, or for all eligible workers. The integration prompts you to enter launch parameters.

For each launch schedule option, you can enter these launch parameters:

- Last Successful Launch Moment automatically populates with the last moment (date and time) at which the integration system was successfully launched. You can force the integration to search for and retrieve data changes over a wider period. Override this date and time in order with the *Specify Value* option.
- As Of Moment enables you to retrieve the later end of the entry time range. Example: If you specify an entry range of 07-01-20:00:00:00 to 07-02-20:01:00:00, the As Of Moment time is 07-02-20:01:00:00. You can enter a specific date in the future (using the *Specify Value* option) when using the Run Now launch schedule option. When scheduling a recurring integration event, use the *Determine Value at Runtime* option. Then select a date field from the Value prompt. Example: *First Day of Next Month*.
- Full File extracts all data, regardless of how recently it was changed.

Note: You can only deactivate Salesforce accounts if you don't select *Full File*.

- Restrict Results By Orgs enables you to select one or more Organizations to include in the integration output file.

### Salesforce.com Prerequisites

Before setting up the Salesforce.com integration, verify that you have an *Admin User* account on Salesforce.com that the 2 integration templates can use. Create any profiles that you want to assign to your workers using the integrations.

### Salesforce.com Chatter Configuration

If you want to provision Chatter accounts, Workday recommends that you configure your Chatter Admin account as follows:

- Set the *User Account Name* to the *Admin User* or *Company User*. This name displays as the sender on the private message.
- Don't set an Alias for the *User Account*.

The Admin account in Chatter can see all messages for all workers.

Salesforce.com Chatter passwords expire every 3 months. Update the password and security token in the integration attributes for the Salesforce.com integrations.

### Reference: Salesforce.com Worker Sync Integration Fields

This table lists Salesforce.com field values in the Connector output document and the source fields or attributes in Workday:

Salesforce.com Field	Workday Source Field
<i>Username</i>	<i>Primary Work Email Address</i>
<i>Alias</i>	<i>Worker ID</i>
<i>Email</i>	<i>Primary Work Email Address</i>
<i>IsActive</i>	<i>Worker is Active &amp; meets Eligibility criteria</i>
<i>LanguageLocaleKey</i>	<i>Language Locale Key integration attribute</i>
<i>TimeZonesSidKey</i>	<i>Time Zone Configuration integration attribute</i>
<i>LocaleSidKey</i>	<i>Locale Sid Key integration attribute</i>
<i>EmailEncodingKey</i>	<i>Email Encoding Key integration attribute</i>
<i>ProfileId</i>	<i>Integration Field Override</i>
<i>Department</i>	<i>Integration Field Override</i>
<i>Division</i>	<i>Integration Field Override</i>
<i>Title</i>	<i>Position Title</i>
<i>FirstName</i>	<i>Preferred First Name</i>
<i>Last Name</i>	<i>Preferred Last Name</i>
<i>Country</i>	<i>Work Address Country</i>
<i>Company Name</i>	<i>Tenant name</i>
<i>EmployeeNumber</i>	<i>Worker ID</i>

# Skillsoft Integration

## Steps: Set Up Skillsoft Integration

### Prerequisites

Know the customer ID, endpoint URL, and password for your Skillsoft account.

### Context

Set up an integration that imports licensed courseware into your learning catalog in Workday as external digital courses.

### Steps

1. Access the Create Integration System task and select *Learning SkillSoft Course Sync* from the New Using Template prompt.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
2. Enable all optional integration services. The Configure Integration Services task displays all integration services, including required services; those integration services aren't editable.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
3. Create an Integration System User (ISU) and grant the ISU access to the *Integration Event* domain in the Integration functional area.  
[See Steps: Grant Integration or External Endpoint Access to Workday.](#)
4. Register an API client for integrations in Workday and manage refresh tokens for the integration system user.

Ensure that you configure these settings:

- For Scope (Functional Areas), select *Backpack Hub Service* from the prompt.
- Leave Non-Expiring Refresh Tokens selected.
- Leave the Include Workday Owned Scope and Locked Out due to Excessive Failed Signon Attempts check boxes unselected.

[See Register API Clients for Integrations.](#)

5. Access the View API Clients report and record these values for the API client that you generated in the previous step:
  - *Client ID*.
  - *Refresh Token*.
  - *Token Endpoint*.

Security: *Security Administration* domain in the System functional area.

6. Select Integration System > Configure Integration Attributes as a related action on the integration system and enter integration service attributes.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
7. Access the Configure External Content task and specify Workday Learning-specific settings that the integration applies to all imported courses.

The Topic Mapping section enables you to map learning topics to your Skillsoft tags or course folders after you launch the integration for the first time. If you access this task before running the integration, there are no tags available to map, but you can create mappings for subsequent runs.

Security: *Set Up: Learning External Content Integrations* domain in the Learning Core functional area.

## 8. Launch an Integration on page 24.

For the Skillsoft Initiation Mode launch parameter, select one of these launch options:

- *ALL*: Gets metadata for all course content. Use this mode the first time you run the integration.
- *DELTA*: Gets new or updated metadata. If you don't select a value, Workday uses *DELTA*.
- *ALL\_NOT\_RESET*: Gets metadata for all course content, but doesn't reset the *ALL* or *DELTA* mode.

Related Information

**Tasks**

[Configure External Content](#)

## Concept: Skillsoft Integration

Import licensed courseware from Skillsoft into your learning catalog in Workday as external digital courses.

Workday Learning only supports Skillsoft courses on mobile that Skillsoft has designed for mobile.

### Skillsoft Integration and Supporting Tasks and Reports

The Skillsoft integration consists of these components and supporting tasks and reports:

Component	Description
Configure External Content	This task enables you to specify Workday Learning-specific settings that the integration applies to all imported courses. You can map learning topics to your Skillsoft tags or course folder.
View External Digital Course	Workday Learning displays this report when you select a Skillsoft external digital course from: <ul style="list-style-type: none"> <li>• A worklet on the Learning Home page.</li> <li>• The Manage Learning Content report.</li> </ul>
<i>Learning SkillSoft Course Sync</i>	This integration template enables you to create an integration system that: <ul style="list-style-type: none"> <li>• Retrieves data files from Skillsoft.</li> <li>• Loads the data into Workday.</li> </ul>

### Launch/Schedule Options

Workday provides these launch schedule options for the Skillsoft integration:

- Launch on schedule. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration retrieves any files from the endpoint.
- Launch immediately. You can launch the integration manually.

### Integration Output Files

The Skillsoft integration creates learning content in Workday based on your Skillsoft catalog. The main output of the integration is new courses in the learning catalog in your tenant. The integration also outputs several informational files associated with the integration events. Workday retains these files for debugging and troubleshooting purposes.

File	Retention	Description
<i>Diagnostic-Audit.html</i>	30 days	A human-readable output file that you can open in a web browser.

File	Retention	Description
		browser. It contains detailed information on the courses that the integration added, updated, or removed from the tenant as well as identifiers that are important for support. The integration generates this file as the final step.
<i>Skillsoft-Asset-Metadata.zip</i>	7 days	A download of AICC packaged content from the Skillsoft portal for debugging purposes. It contains many small text files that enable the media player in Workday to launch out to content on Skillsoft.
<i>Skillsoft-Full-Course-Listing.csv</i>	7 days	A download of the catalog hierarchy from Skillsoft for debugging purposes. The integration uses this data to generate tags that we apply to the courses.
<i>Diag_Course_Sync_Summary.xml</i>	3 days	An intermediate XML file that contains records of tenant modifications. The integration later processes this data and transforms it into the <i>Diagnostic-Audit.html</i> file.
<i>Post-Processing-1.zip</i>	3 days	The integration can output up to 15 similarly named files. Due to polling delays while Skillsoft prepare their catalog for download, the integration terminates and relaunches a number of times. These zip files enable Workday to pass the context or state from one invocation to the next.

## Troubleshooting: Error When Syncing Course Data with Skillsoft Integration

When you're syncing course data in DELTA mode, you receive an error message because the integration timed out while waiting for Skillsoft to generate the ZIP file.

Cause: Workday reached its maximum number of attempts when trying to sync course data because Skillsoft isn't currently available.

Solution: Run the integration in DELTA mode again later.

Solution: Run the integration in ALL mode to sync metadata for all course content.

## Social Security Number Verification Service

### Steps: Set Up Social Security Number Verification Service Integration

#### Context

Set up an integration to generate employee Social Security Number data for uploading to the Social Security Number Verification Service (SSNVS).

#### Steps

1. Enroll your organization in the [Social Security Number Verification Service](#).
2. Access the Create Integration System task and enter *Social Security Number Verification* at the New using Template prompt.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
3. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Integration Event* domain.  
See: [.../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](https://.../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita).
4. (Optional) Grant the ISU access to the *View: Social Security Number Verification Integration Document* domain to enable the ISU to view files generated by the integration.
5. As a related action on your integration, select Integration System > Configure Integration Attributes and enter the number of days that Workday preserves output files.
6. [Set Up Integration Sequence Generators](#) on page 1969.  
In the Sequence ID Format field, add *.txt* to the end of the field value.
7. [Launch an Integration](#) on page 24.  
Verify that the integration generates data as expected. Since the integration doesn't deliver files to the SSNVS, you can test the integration with live data.
8. Upload the SSNVS files to the SSNVS for overnight processing.

### Concept: Social Security Number Verification Service Integration

To verify that your employee names and Social Security numbers (SSN) match Social Security Administration records, use the Social Security Number Verification Service (SSNVS) integration. The Social Security Number Verification Service integration generates one or more flat files in the SSNVS file format for upload to the SSNVS.

#### About the Social Security Number Verification Service (SSNVS)

The SSNVS provides several online verification methods. The Social Security Number Verification Service integration generates files for overnight upload. Files can contain up to 250,000 names and SSN numbers; the SSNVS usually sends results the next government business day. This option is ideal if you want to verify an entire payroll database or if you hire many workers at a time. While the service is available to all employers and third-party submitters, these limits apply:

- You can use the service only for verifying current or former employees.
- You can use the service only for wage reporting (Form W-2) purposes.

## Integration File Generation and Delivery

The integration template doesn't support integration file delivery; integration output files are attached to the integration event. The integration generates a flat text file (.txt) in the SSNVS format. If you run the integration for more than 250,000 employees (past and current), the integration splits the output into 2 files. Download the output files from the integration event and send the files on to the SSNVS. This integration doesn't support direct delivery of integration output files to the SSNVS.

Using a combination of launch parameters you can define which employees to include in the output file:

- Begin Date and End Date: includes any employee with a Hire Date within the date range.
- Calendar Year: includes any employee who you paid at any point during the calendar year.
- Employee: includes employees that you select by name.

## Integration Audit Files

Every time the integration runs, Workday generates a *Messages Audit* that includes response messages from the integration system.

You can find the SSNVS zip and *Messages Audit* files in the Reports and Other Output Files section of the Integration Event for each integration run.

# Talent Profile Inbound Connector

## Steps: Set Up Talent Profile Inbound Connector

### Prerequisites

Set up an external server that your external endpoint and Connector can access.

### Context

Set up an integration that imports worker talent profile updates from an external endpoint into Workday.

### Steps

1. Configure your external endpoints so that they generate data for in 1 of the formats supported by the Connector.  
See: [Reference: Talent Profile Inbound Connector File Schema](#) on page 1237.
2. [Create Integration System](#) on page 1967.  
Enter *Core Connector: Talent Profile Inbound* at the New Using Template prompt.
3. Enable one or more of these optional integration services. The Configure Integration Services task displays all integration services, including required services; those integration services aren't editable.

Option	Description
Talent Profile Inbound: Worker Certification Achievement Data	Enables your integration to import certification achievements into corresponding certification achievement records in Workday.
Talent Profile Inbound: Worker Competency Achievement Data	Enables your integration to import competency achievements into corresponding competency achievement records in Workday.
Talent Profile Inbound: Worker Training Achievement Date	Enables your integration to import training achievements into corresponding training achievement records in Workday.

Option	Description
Talent Profile Inbound: Worker Experience Data	Enables your integration to import experience records into corresponding experience records in Workday.

4. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

- *Manage Certifications* (business process)
- *Manage Competencies* (business process)
- *Manage Training* (business process)
- *Worker Data: Public Worker Reports*
- *Worker Data: Skills and Experience*
- *Worker Data: Workers*

See: [..../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](https://www.dan1370797146076.dita).

5. [Set Up Integration Retrieval](#) on page 1957.

Specify how the integration system retrieves data files containing changes to worker talent profiles from your external server. If your integration imports files in CSV format, configure a separate retrieval step for each worker talent profile file type that applies the appropriate Document tag:

- *Talent Profile Inbound Certification*
- *Talent Profile Inbound Competency*
- *Talent Profile Inbound Training*

6. [Launch an Integration](#) on page 24.

Schedule how often the integration system runs.

## Concept: Talent Profile Inbound Connector

To import talent profile updates for workers into Workday, use the *Talent Profile Inbound Connector*. The Connector can update worker certifications, competencies, and completed training. You can use a non-Workday application as your source-of-truth for talent profile data, then synchronize that data with Workday.

Note: *Talent Profile Inbound Connector* works with worker talent profiles in Workday. Workday recommends that you familiarize yourself with Workday talent features.

### File Format for Talent Profile Inbound Connector Data

The integration imports data in a Workday-defined XML or CSV (Comma-Separated Value) format.

### Integration Process Flow

The integration imports talent data using this process:

1. Your external endpoint generates a file (in one of the Workday-supported formats).
2. Your external endpoint sends the file to a file server known to the integration.
3. You launch the integration, either by schedule or manually.
4. The integration retrieves the file according to the Document Retrieval configuration on the Integration Process Event and applies document tags.
5. The integration processes the file, then imports the data into Workday.

## Reference: Talent Profile Inbound Connector File Schema

### Certification CSV Format

The certification CSV file must contain these fields, in order:

- Worker\_ID
- Worker\_Type
- Certification\_Reference\_ID
- Remove\_Certification
- Certification\_ID
- Certification\_Name
- Issuer
- Country\_Code
- Issued\_Date
- Expiration\_Date
- Examination\_Date
- Examination\_Score
- Certification\_Number

### **Competency CSV Format**

The competency CSV file must contain these fields, in order:

- Worker\_ID
- Worker\_Type
- Competency\_Reference\_ID
- Competency\_Level\_ID
- Note
- Assessed\_On
- Assessed\_By\_Worker\_ID
- Assessed\_By\_Worker\_Type

### **Training CSV Format**

The training CSV file must contain these fields, in order:

- Worker\_ID
- Worker\_Type
- Training\_Reference\_ID
- Remove\_Training
- Training\_Name
- Description
- Training\_Type\_ID
- Completion\_Date
- Training\_Duration

### **Worker Experience CSV Format**

The Worker Experience CSV file must contain these fields, in order:

- Worker\_ID
- Worker\_Type
- Experience\_Reference\_ID
- Remove\_Experience
- Experience\_Rating\_Reference\_ID
- Experience\_Comment

### **XML Elements**

The XML schema for inbound talent profile data includes these elements:

Element	Description
Import_Talent_Profiles_Request	Contains all other elements. Only 1 element per file.
Worker_Talent_Profile	Contains 1 instance of all subsequent elements, except as noted. Unlimited number of elements per file.
Worker_ID	Reference ID value for the worker. Must be in XSD <i>string</i> format.
Worker_Type	Employment type for the worker in Workday. If not specified, Workday sets this value to <i>Employee</i> .
Certification	Contains 1 instance of each certification-related subelement. Unlimited number of elements per file.
Certification_Reference_ID	Reference ID value for the Certification. This value must match the Reference ID for the certification defined in Workday. Must be in XSD <i>string</i> format.
Remove_Certification	If selected, removes the specified certification from the talent profile of the worker. Must be in XSD <i>boolean</i> format.
Certification_ID	External ID value for the certification. Match this value to the corresponding ID value as defined in your external endpoint. If <i>Certification_Name</i> and <i>Issuer</i> have values, don't include this element. Must be in XSD <i>string</i> format.
Certification_Name	External name value for the certification. Match this value to the corresponding name value as defined in your external endpoint. If <i>Certification_ID</i> has a value, don't include this element. Must be in XSD <i>string</i> format.
Issuer	Entity that manages the certification. If <i>Certification_ID</i> has a value, don't include this element. Must be in XSD <i>string</i> format.
Country_Code	Code value for the country where the worker acquired the certification. Must be in XSD <i>string</i> format.
Issued_Date	Date that the worker acquired the certification. Must be in XSD <i>date</i> format.
Expiration_Date	Date that the certification expired. Must be in XSD <i>date</i> format.
Examination_Date	Date that worker completed certification exam. Must be in XSD <i>date</i> format.
Examination_Score	Score that worker earned for examination. Must be in XSD <i>string</i> format.
Certification_Number	The number that the issuer assigned to the certification. Must be in XSD <i>string</i> format.
Competency	Contains 1 instance of each competency-related subelement. Unlimited number of elements per file.
Competency_Reference_ID	Reference ID value for the competency. This value must match the Reference ID for the competency defined in Workday. Must be in XSD <i>string</i> format.
Competency_Level_ID	Reference ID value for the competency level. This value must match the Reference ID for the competency level defined in Workday. Must be in XSD <i>string</i> format.
Note	Free-form note text. Must be in XSD <i>string</i> format.
Assessed_On	Date that the assessor assessed the competency of the worker. Must be in XSD <i>date</i> format.

Element	Description
Assessed_By_Worker_ID	4Reference ID for the worker who assessed the competency. Must be in XSD <i>string</i> format.
Assessed_By_Worker_Type	4Employment type of the assessing worker in Workday. If not specified, Workday sets this value to <i>Employee</i> .
Training	3Contains 1 instance of each training-related subelement. Unlimited number of elements per file.
Training_Reference_ID	4Reference ID value for the training. This value must match the Reference ID for the training defined in Workday. Must be in XSD <i>string</i> format.
Remove_Training	4If selected, removes the specified training from the talent profile of the worker. Must be in XSD <i>boolean</i> format.
Training_Name	4External name value for the training. Match this value to the corresponding name value as defined in your external endpoint. Must be in XSD <i>string</i> format.
Description	4Description of the training. Must be in XSD <i>string</i> format.
Training_Type_ID	4Training type ID value. Must be in XSD <i>string</i> format.
Completion_Date	4Date that worker completed training. Must be in XSD <i>date</i> format.
Training_Duration	4Length of time that the training lasted. Must be in XSD <i>string</i> format.
WorkerExperience	3Contains 1 instance of each worker experience-related subelement. Unlimited number of elements per file.
Experience_Reference_ID	4Reference ID value for the experience element of the worker. This value must match the Reference ID for the experience record of the worker defined in Workday. Must be in XSD <i>string</i> format.
Remove_Experience	4If selected, removes the specified experience record from the talent profile of the worker. Must be in XSD <i>boolean</i> format.
Experience_Rating_Reference_ID	4Reference ID for the experience rating of the worker. This value must match the Reference ID for the experience rating of the worker defined in Workday. Must be in XSD <i>string</i> format.
Experience_Comment	4Comment about the experience of the worker. Must be in XSD <i>string</i> format.

## XML Schema

```

<?xml version="1.0" encoding="UTF-8"?>

## Unistaff Connectors

### Steps: Set Up Unistaff Foundation Connector

#### Context

You can create an integration that sends data to Unistaff.

## Steps

1. Access the Create Integration System task and enter *Unistaff Foundation Data* at the New using Template prompt.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
2. To customize which types of foundation data that the integration sends, enable one or more of the optional integration services.  
The Configure Integration Services task displays all integration services, including required services. Required integration services aren't editable.
3. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Integration Event* security domain.  
See: [Steps: Grant Integration or External Endpoint Access to Workday](#).
4. Select Integration System > Configure Integration Attributes as a related action on the integration system and enter integration service attributes.  
Workday displays attributes for each enabled integration service. If you enable additional integration services, more attributes display in the Configure Integration Attributes task.
5. As a related action on the integration system, select Integration System > Configure Integration Maps and map data between Workday and the external endpoint.
6. Select Integration System > Configure Integration Field Overrides as a related action on the integration system and configure integration output.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
7. [Create Integration Business Process](#) on page 1950.  
Add a *Document Delivery Service* step to the business process definition of the integration.
8. [Set Up Integration Delivery](#) on page 1952.  
Configure the integration so that it sends integration output files to Unistaff using SFTP.
9. [Launch an Integration](#) on page 24.  
Schedule how often the integration system runs. To export all foundation data from Workday to Unistaff, use the Full Extract launch parameter.

## Steps: Set Up Unistaff Hire Inbound Connector

### Prerequisites

Set up an external SFTP that Unistaff and your integration can access.

### Context

Set up an integration system to import new hire data from Unistaff into Workday.

## Steps

1. Access the Create Integration System task and enter *Unistaff Inbound* at the New using Template prompt.  
Security: *Integration Build* in the Integration functional area.  
(Optional) To import specific types of worker data, enable the *Unistaff Inbound - Hire and Contract* or *Unistaff Inbound - Update Worker Information* integration services.

2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:
  - *Contract Contingent Worker* (business process)
  - *Dependent Event* (business process)
  - *Edit Government IDs* (business process)
  - *Edit Licenses* (business process)
  - *Edit Other IDs* (business process)
  - *Hire Employee* (business process)
  - *Integration Event*
  - *Legal Name Change* (business process)
  - *Manage Education* (business process)
  - *Manage Job History* (business process)
  - *Manage Payment Election*
  - *Manage Pre-Hire Process: Manage Pre-Hires*
  - *Passports and Visa Change* (business process)
  - *Preferred Name Change* (business process)
  - *Request Compensation Change* (business process)
  - *Request Leave of Absence* (business process)
  - *Request One Time Payment* (business process)
  - *Workday Accounts*
  - *Person Data: Personal Information*
  - *Worker Data: Public Worker Reports*

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

3. As a related action on your Unistaff Inbound integration, select Integration System > Configure Integration Attributes add a row for each attribute and specify a value.
4. [Set Up Integration Retrieval](#) on page 1957.  
Specify how the integration system retrieves data files from the SFTP server.
5. [Launch an Integration](#) on page 24.  
Schedule how often the integration system runs.

## Concept: Unistaff Connectors

Synchronize data between Workday and Unistaff with Unistaff Connectors. Unistaff Connectors enable you to meet data privacy requirements for employees in the Russian Federation. The Connector transfers personally identifiable information for Russian citizens between Unistaff and Workday. To support Unistaff, Workday provides 2 Unistaff integration templates:

- *Unistaff Foundation Data*
- *Unistaff Inbound*

To integrate Workday with Unistaff, implement both integrations.

### Unistaff Foundation Connector

The *Unistaff Foundation Data* template supports export of organization, location, job family, position, and job profile data from Workday to Unistaff. As you add, change, move, and delete these items, the integration sends incremental updates directly to Unistaff. The integration also provides a Full File launch parameter. You can use the full file launch option to transfer these items from Workday to Unistaff:

- Job families
- Job profiles
- Locations
- Organizations
- Positions

Integration Service	Description
Unistaff Foundation Data - Organizations Data Init Service	Extracts organization changes from your tenant.
Unistaff Foundation Data - Locations Data Init Service	Extracts location changes from your tenant. You can select types of locations that the integration monitors for changes.
Unistaff Foundation Data - Job Families Data Init Service	Extracts job family changes from your tenant.
Unistaff Foundation Data - Job Profiles Data Init Service	Extracts job profile changes from your tenant.
Unistaff Foundation Data - Position Restrictions Data Init Service	Extracts position restriction changes from your tenant.

## Unistaff Inbound

The *Unistaff Inbound* template enables you to import new hires and updates to personally identifiable information only pertaining to Russian citizens. Workday provides the XML file format. Contact Unistaff for assistance in formatting and generating the inbound XML file. The Unistaff Inbound integration supports these actions:

- *Add Dependent*: add, delete, update
- *Address*: add, delete, replace, update
- *Certification*: add, delete, update
- *Compensation change*: add
- *Education*: add, delete, update
- *Government ID*: add, replace
- *Job History*: add, delete, update
- *Legal Name*: add, update
- *License*: add, replace
- *National ID*: add, replace
- *Other IDs (Custom IDs)*: add, replace
- *Passport and Visas*: add, replace
- *Personal Information*: add, update
- *Phone, Email, Instant Messenger and Web*: add
- *Preferred Name*: add, update
- *Request Leave of Absence*: add

## Launch/Schedule Options

Workday provides these launch schedule options for the Unistaff Foundation Connector integration:

- Launch using a schedule. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration collects all qualifying changes based on the launch parameters.
- Launch immediately. You can launch the integration manually. Workday prompts you for the launch parameters.

For launch using a schedule and launch immediately, you can enter these launch parameters:

Parameter	Description
As Of Entry Moment	Extracts records that you entered into Workday after the specified moment.
Effective Date.	Extracts records that became effective in Workday on or after the specified date.
Last Successful As Of Entry Moment	Extracts records that you entered into Workday after this date/time.

Parameter	Description
Last Successful Effective Date	Extracts records with an effective date after this date.
Full Extract	Extracts all records.

### Integration Audit Files

Every time the integration runs, Workday generates these files:

- A copy of the outbound file.
- The *MessagesAudit.zip* file includes troubleshooting files that confirm data processing steps.
- The *Unistaff Inbound* error log displays integration errors. The integration generates this report only if there are errors in the integration.

You can find these files in the Integration Event for each integration run.

Note: Because Workday includes actual data in the Data Change Audit file, you can secure this file separately. Example: if you don't want administrators to access the data.

### Reference: Unistaff Hire Inbound Connector XML File Schema

This table lists available attributes that the integration supports. Some supported attributes might not be available. Contact Unistaff:

- To create custom attributes as needed.
- To import custom field data into Workday.
- For general configuration assistance.

Each file must have a top-level element of *Actions*. All action elements in the file (Example: *Hire*) must be child elements of the *Actions* top-level element.

Action/Sub-Element(s)	Field	Comments
Hire		Required element. You can include many <i>Hire</i> elements.
	Worker_ID	Required element. Specify the Employee or Contingent Worker ID that you want to use for the Worker record. Workday uses this value to look up existing applicants that were previous employees or contingent workers. Workday uses this ID as the HRIS ID for new workers.
	Updated_Worker_ID	Optional element. If Worker_ID specifies an existing worker that you're rehiring, setting this field sets the Worker ID of the new worker. If empty, the Worker ID remains unchanged.
	User_Name	Optional element. Workday account ID.
	Hire_Reason	Conditional element. The reason that you're rehiring the

Action/Sub-Element(s)	Field	Comments
		employee. Defined by Workday integration mapping.
	Contract_Reason	Conditional element. The reason that you're contracting the contingent worker. Defined by Workday integration mapping.
	Hire_Date	Required element. The date of hire for the worker in YYYY-MM-DD format.
	Employee_Type	Conditional element. Defined by Workday integration mapping.
	Contingent_Worker_Type	Conditional element. Defined by Workday integration mapping.
	Start_Date	Optional element. The first day of work of the worker in YYYY-MM-DD format.
	End_Date	Optional element. The last day of work of the worker in YYYY-MM-DD format.
	Job_Profile	Required element. You can pass this value with Workday Unistaff Foundation Data Integration. Job Profile Code from Foundation Data Integration.
	Position_Time_Type	Required element. Defined by Workday integration mapping.
	Location	Required element. You can pass this value with Workday Unistaff Foundation Data Integration. Reference ID from Foundation Data Integration.
	Work_Space	Optional element. You can pass this value with Workday Unistaff Foundation Data Integration. Location (from Unistaff Foundation Data).
	Job_Title	Optional element. Text field.
	Position_Title	Optional element. Text field.
	Pay_Rate_Type	Optional element. Defined by Workday integration mapping.
	Work_Shift	Optional element. Defined by Workday integration mapping.
	Supervisory_Organization	Required element. You can pass this value with Workday

Action/Sub-Element(s)	Field	Comments
		Unistaff Foundation Data Integration.
	Position	Conditional element. Required for Position Management organizations. Defined by Workday integration mapping.
	Pay_Group	Optional element. You can pass this value with Workday Unistaff Foundation Data Integration. Send Unistaff corresponding object ID if the data exists in Unistaff.
	Name_Country	Optional element. Employee Country. Controls Employee Name Data logic. Defined by Workday integration mapping. ISO 3166-1 alpha 3.
	First_Name	Optional element. Employee Legal First Name.
	Middle_Name	Optional element. Employee Legal Middle Name or initial.
	Last_Name	Employee Legal Last Name
	Secondary_Last_Name	Optional element.
	Local_First_Name	Optional element.
	Local_Middle_Name	Optional element.
	Local_Last_Name	Optional element.
	Local_Secondary_Last_Name	Optional element.
	Birth_Date	Optional element. Employee Birth Date in YYYY-MM-DD format.
	City_of_Birth	Optional element. Employee City of Birth.
	Gender	Optional element. Defined by Workday integration mapping.
	Region_of_Birth	Optional element. Employee Region (State/Province/Region) of Birth. Defined by Workday integration mapping. ISO 3166-2.
	Country_of_Birth	Employee country of birth.
	Marital_Status	Optional element. Worker marital status. Defined by Workday integration mapping.

Action/Sub-Element(s)	Field	Comments
	Marital_Status_Date	Optional element. The date that this marital status changed. Workday requires marital status if you specify the date on the file.
	Nationality	Optional element. Employee Nationality Reference. Defined by Workday integration mapping. ISO 3166-1 alpha 3 or alpha 2.
	Citizenship_Status	Optional element. Defined by Workday integration mapping.
	Ethnicity	Optional element. Defined by Workday integration mapping.
	Ethnicity_Visual_Survey	Optional element. Global Race reference by visually surveying the worker
	Religion	Optional element. Defined by Workday integration mapping.
	Political_Affiliation	Optional element. Defined by Workday integration mapping.
	Military_Status	Optional element. Defined by Workday integration mapping.
	Military_Service_Type	Optional element. Defined by Workday integration mapping.
	Military_Discharge_Date	Optional element. Date in YYYY-MM-DD format.
	Military_Notes	Optional element.
	Military_Rank	Optional element. Defined by Workday integration mapping.
	Military_Status_Begin_Date	Optional element. Date in YYYY-MM-DD format.
	Address_Line_1	Optional element.
	Address_Line_2	Optional element.
	Municipality	Optional element. City for the Worker Home Address
	Address_Country	Required element. Address Country. Controls Employee Contact Data Logic. Defined by Workday integration mapping. ISO 3166-1 alpha 3 or alpha 2.
	Region	Optional element. Region for the Worker Home Address. ISO 3166-1 alpha 3.

Action/Sub-Element(s)	Field	Comments
	Sub_Region	Optional element.
	Sub_Region_Type	Optional element.
	Postal_Code	Optional element.
	Address_Usage	Optional element. Workday populates this value with HOME if this element is empty. Defined by Workday integration mapping.
	Address_Usage_Comments	Optional element.
	Is_Primary	Optional values: Y or N.
	Phone_Is_Public	Optional values: Y or N.
	Phone_Country	Required element. Phone Country. Controls Employee Phone Data Logic. Defined by Workday integration mapping. ISO 3166-1 alpha 3.
	Phone_Area_Code	Optional element.
	Phone_Number	Optional element.
	Phone_Extension	Optional element.
	Phone_Device_Type	Optional element. Defined by Workday integration mapping.
	Phone_Usage	Optional element. Workday populates this value with HOME if this element is empty. Defined by Workday integration mapping.
	Phone_Usage_Comments	Optional element.
	Email_Address	Conditionally required for a new worker when you provide a <i>User_Name</i> . Text field.
	Email_Address_Usage	Optional element. Workday populates this value with HOME if this element is empty. Defined by Workday integration mapping.
	Email_Address_Usage_Comments	Optional element.
	Compensation_Grade_Profile	Optional element. Defined by Workday integration mapping.
	Compensation_Grade	Conditionally required if Compensation data exists on the file. Defined by Workday integration mapping.

Action/Sub-Element(s)	Field	Comments
	Compensation_Package	Conditionally required if Compensation data exists on the file. Defined by Workday integration mapping.
	Compensation_Plan	Conditionally required if Compensation data exists on the file. Defined by Workday integration mapping.
	Compensation_Step	Optional element. Defined by Workday integration mapping.
	Compensation_Amount	Conditionally required if Compensation data exists in this section.
	Compensation_Frequency	Conditionally Required if Compensation data exists in this section. Defined by Workday integration mapping.
	Compensation_Currency	Conditionally required if Compensation data exists in this section. Defined by Workday integration mapping. ISO 4217 alpha.
	Stock_Plan	Optional element. Defined by Workday integration mapping.
	Stock_Individual_Target_Shares	Optional element. Include a Target Amount, Target Percent, or Target shares if stock data exists on the file.
	Stock_Individual_Target_Percent	Optional element. Include a Target Amount, Target Percent, or Target shares if stock data exists on the file.
	Stock_Individual_Target_Amount	Optional element. Include a Target Amount, Target Percent, or Target shares if stock data exists on the file.
	Stock_Currency	Conditional element. Defined by Workday integration mapping. ISO 4217 alpha.
	Commission_Plan	Conditionally required if Commission data exists on the file. Defined by Workday integration mapping
	Commission_Amount	Conditionally required if Commission data exists on the file.

Action/Sub-Element(s)	Field	Comments
	Commission_Frequency	Conditionally required if Commission data exists on the file. Defined by Workday integration mapping.
	Commission_Currency	Conditionally required if Commission data exists on the file. Defined by Workday integration mapping. ISO 4217 alpha.
	Commission_Draw_Amount	Optional element.
	Commission_Draw_Frequency	Optional element. Defined by Workday integration mapping.
	Commission_Draw_Duration	Optional element.
	Merit_Plan	Conditionally required if Merit data exists on the file. Defined by Workday integration mapping.
	Merit_Individual_Target_Percent	Optional element.
	Merit_Individual_Target_Amount	Optional element.
	Merit_Guaranteed_Minimum	Optional element.
	Merit_Actual_End_Date	Optional element. Date in YYYY-MM-DD format.
	Bonus_Plan	Conditionally required if Bonus data exists in this section. Defined by Workday integration mapping
	Bonus_Individual_Target_Amount	Optional element. Text field.
	Bonus_Individual_Target_Percent	Optional element. <ul style="list-style-type: none"> <li>• For 100%, enter 1.</li> <li>• For 50%, enter 0.5.</li> </ul>
	Bonus_Percent_Assigned	Optional element. <ul style="list-style-type: none"> <li>• For 100%, enter 1.</li> <li>• For 50%, enter 0.5.</li> </ul>
	Bonus_Guaranteed_Minimum	Optional element.
	Allowance_Plan	Conditionally required if Allowance data exists in this section. Defined by Workday integration mapping.
	Allowance_Amount	Optional element. Alternately, use Allowance_Percent.
	Allowance_Percent	Optional element. Alternately, use Allowance_Amount.

Action/Sub-Element(s)	Field	Comments
	Allowance_Frequency	Conditionally required if One Time Payment data exists on the file. Defined by Workday integration mapping.
	Allowance_Currency	Conditionally required if One Time Payment data exists on the file. Defined by Workday integration mapping. ISO 4217 alpha.
	Allowance_End_Date	Optional element. Date in YYYY-MM-DD format.
	One-Time_Payment_Plan	Conditionally required if One Time Payment data exists on the file. Defined by Workday integration mapping.
	One-Time_Payment_Reason	Optional element. Defined by Workday integration mapping.
	One-Time_Payment_Date	Conditionally required if One Time Payment data exists on the file. Date in YYYY-MM-DD format.
	One-Time_Payment_Begin_Date	Optional element. Date in YYYY-MM-DD format.
	One-Time_Payment_End_Date	Optional element. Date in YYYY-MM-DD format.
	One-Time_Payment_Amount	Conditionally required if One Time Payment data exists on the file.
	One-Time_Payment_Percent	Optional element. Text field. <ul style="list-style-type: none"> <li>• For 100%, enter 1.</li> <li>• For 50%, enter 0.5.</li> </ul>
	One-Time_Payment_Currency	Conditionally required if One Time Payment data exists on the file. Defined by Workday integration mapping. ISO 4217 alpha.
	One-Time_Payment_Comment	Optional element.
Hire > Additional_Nationalities		Required element. You can include many <i>Additional_Nationality</i> elements.
	Additional_Nationality	Optional element. Employee Additional Nationality references. Defined by Workday integration mapping. ISO 3166-1 alpha 3 or alpha 2.

Action/Sub-Element(s)	Field	Comments
Hire > Disabilities		You can include many Disabilities elements.
Hire > Disabilities > Disability		
	Disability_Status	Optional element. Defined by Workday integration mapping.
	Disability_Status_Date	Optional element. Date in YYYY-MM-DD format.
	Disability_Known_Date	Optional element. Date in YYYY-MM-DD format.
	Disability_End_Date	Optional element. Date in YYYY-MM-DD format.
Hire > National_IDs		You can include many National_IDs elements.
Hire > National_IDs > National_ID		
	ID	Required element. Workday uses the Reference ID to create a unique identifier when creating new records and updating existing records
	Type	Required element. Defined by Workday integration mapping. Number any repeating elements. Examples: <ul style="list-style-type: none"><li>• National_ID_Reference1</li><li>• National_ID_Reference2</li></ul>
	Issuing_Country	Required element. Defined by Workday integration mapping. Number any repeating elements. Examples: <ul style="list-style-type: none"><li>• Issue_Country_Reference1</li><li>• Issue_Country_Reference2</li></ul> ISO 3166-1 alpha 3 or alpha 2.
	Issuing_Agency	Optional element. Defined by Workday integration mapping.
	Issued_Date	Optional element. Date in YYYY-MM-DD format.
	Issued_By	Optional element. Defined by Workday integration mapping.

Action/Sub-Element(s)	Field	Comments
	Expiration_Date	Optional element. Date in YYYY-MM-DD format.
	Verification_Date	Optional element. Date in YYYY-MM-DD format.
	Verified_by_Worker	Optional element.
	Series	Optional element. Conditionally required for Russian integrations.
Hire > Government_IDs		You can enter many Government_ID elements.
Hire > Government_IDs > Government_ID		
	ID	Required element. Workday uses the Reference ID to create a unique identifier when creating new records and updating existing records
	Type	Required element. Defined by Workday integration mapping.
	Issuing_Country	Required element. Defined by Workday integration mapping. ISO 3166-1 alpha 3 or alpha 2.
	Issued_Date	Optional element. Date in YYYY-MM-DD format.
	Expiration_Date	Optional element. Date in YYYY-MM-DD format.
	Verification_Date	Optional element. Date in YYYY-MM-DD format.
	Verified_by_Worker	Optional element.
Hire > Passports		You can include many Passport elements.
Hire > Passports > Passport		
	ID	Required element. Workday uses the Reference ID to create a unique identifier when creating new records and updating existing records.
	Type	Required element. Defined by Workday integration mapping.

Action/Sub-Element(s)	Field	Comments
	Issuing_Country	Required element. Defined by Workday integration mapping. ISO 3166-1 alpha 3 or alpha 2.
	Issued_Date	Optional element. Date in YYYY-MM-DD format.
	Expiration_Date	Optional element. Date in YYYY-MM-DD format.
	Verification_Date	Optional element. Date in YYYY-MM-DD format.
	Verified_by_Worker	Optional element.
Hire > Visas		You can include many Visa elements.
Hire > Visas > Visa		
	ID	Required element. Workday uses the Reference ID to create a unique identifier when creating new records and updating existing records.
	Issuing_Country	Required element. Defined by Workday integration mapping. ISO 3166-1 alpha 3 or alpha 2.
	Type	Required element.
	Issued_Date	Optional element. Date in YYYY-MM-DD format.
	Expiration_Date	Optional element. Date in YYYY-MM-DD format.
	Verification_Date	Optional element. Date in YYYY-MM-DD format.
	Verified_by_Worker	Optional element.
Hire > Licenses		You can include many License elements.
Hire > Licenses > License		
	ID	Required element. Workday uses the Reference ID to create a unique identifier when creating new records and updating existing records

Action/Sub-Element(s)	Field	Comments
	Issuing_Country	<p>Conditional element. Country issuing license. You can include only 1 of these elements:</p> <ul style="list-style-type: none"> <li>• Issuing_Authority</li> <li>• Issuing_Country</li> <li>• Issuing_Country_Region</li> </ul> <p>Defined by Workday integration mapping. ISO 3166-1 alpha 3 or alpha 2.</p>
	Issuing_Country_Region	<p>Conditional element. Country Region issuing license. You can include only 1 of these elements:</p> <ul style="list-style-type: none"> <li>• Issuing_Authority</li> <li>• Issuing_Country</li> <li>• Issuing_Country_Region</li> </ul> <p>Defined by Workday integration mapping. ISO 3166-1 alpha 3 or alpha 2.</p>
	Issuing_Authority	<p>Conditional element. Authority issuing license. You can include only 1 of these elements:</p> <ul style="list-style-type: none"> <li>• Issuing_Authority</li> <li>• Issuing_Country</li> <li>• Issuing_Country_Region</li> </ul>
	Type	Required element.
	License_Class	Optional element.
	Issued_Date	Optional element. Date in YYYY-MM-DD format.
	Expiration_Date	Optional element. Date in YYYY-MM-DD format.
	Verification_Date	Optional element. Date in YYYY-MM-DD format.
	Verified_by_Worker	Optional element.
Hire > Custom IDs		You can enter many Custom ID elements.
Hire > Custom IDs > Custom ID		
	ID	Required element. Workday uses ID to create a unique identifier when creating new

Action/Sub-Element(s)	Field	Comments
		records, or updating existing records
	Type	Conditionally required if Custom ID data exists on the file.
	Issued_by_Organization	Optional element.
	Issued_Date	Optional element. Date in YYYY-MM-DD format.
	Expiration_Date	Optional element. Date in YYYY-MM-DD format.
	Description	Optional element.
Hire > Education Achievements		You can enter many Education Achievement elements.
Hire > Education Achievements > Education Achievement		
	Reference_ID	Required element when using this section.
	Action	<p>Optional element. Indicates the action that Workday performs on the record. Add creates a new record. Update changes an existing record in Workday. Delete removes the record from Workday. Valid values:</p> <ul style="list-style-type: none"> <li>• Add: 0. If blank, Workday performs an Add.</li> <li>• Update: 1</li> <li>• Delete: 2</li> </ul>
	School_Type	Required element. Defined by Workday integration mapping.
	School_Country	Required element. Provide either School or School Name. Defined by Workday integration mapping. ISO 3166-1 alpha 3 or alpha 2.
	School	Optional element. Reference to school defined in Workday. Provide either School or School Name. Defined by Workday integration mapping.
	School_Name	Optional element. Name of the school. Provide either School or School Name.

Action/Sub-Element(s)	Field	Comments
	School_Location	Optional element. Text location of the school
	Subject_of_Study	Required element. Defined by Workday integration mapping.
	Attainment_Level	Required element. Defined by Workday integration mapping.
	Year_of_Degree	Required element. Year in YYYY format.
	Grade_Average	Optional element.
Hire > Payment_Elections		You can enter many Payment_Election elements.
Hire > Payment_Elections > Payment_Election		
	Election_Country	Conditionally required if Payment Election data exists on the file. Defined by Workday integration mapping. ISO 3166-1 alpha 3 or alpha 2.
	Election_Rule	Conditionally required if Payment Election data exists on the file. Defined by Workday integration mapping.
	Election_Currency	Conditionally required if Payment Election data exists on the file. Defined by Workday integration mapping.
	Election_Type	Conditionally required if Payment Election data exists on the file. Defined by Workday integration mapping.
	Bank_Name	Required element.
	Bank_ID	Optional element. Text field.
	BIC	Optional element. Text field.
	Bank_Branch_Name	Optional element. Text field.
	Bank_Branch_ID	Optional element. Text field.
	Bank_Account_Nickname	Optional element.
	Bank_Account_Number	Optional element.
	Bank_Account_Roll_Number	Optional element.

Action/Sub-Element(s)	Field	Comments
	Bank_Account_Type	Optional element. Text field. Defined by Workday integration mapping.
	Bank_Account_IBAN	Optional element. Text field.
	Check_Digit	Optional element. Text field.
	Amount	Optional element. Must be one of Amount, Percentage, Remaining Balance. Text field.
	Percentage	Optional element. Must be one of Amount, Percentage, Remaining Balance. Text field.
	Remaining_Balance	Optional Values: Y/N. Must be one of Amount, Percentage, Remaining Balance. Text field.
Change_Personal_Profile		
	Worker_Id	Required element. Identifies the worker to update.
	Country_of_Birth	Optional element. Worker's country of birth. Defined by Workday integration mapping. ISO 3166-1 alpha 3 or alpha 2.
	City_Of_Birth	Optional element.
	Region_of_Birth	Optional element. Defined by Workday integration mapping. ISO 3166-1 alpha 3 or alpha 2.
	Marital_Status	Optional element. Defined by Workday integration mapping.
	Marital_Status_Date	Optional element. Date in YYYY-MM-DD format.
	Birth_Date	Optional element. Date in YYYY-MM-DD format.
	Gender	Optional element. Defined by Workday integration mapping.
	Nationality	Optional element. Primary Nationality for the worker. Defined by Workday integration mapping. ISO 3166-1 alpha 3 or alpha 2.
	Additional_Nationalities	Optional element. List of Additional Nationalities for the worker. Defined by Workday integration mapping. ISO 3166-1 alpha 3 or alpha 2.

Action/Sub-Element(s)	Field	Comments
	Ethnicity	Optional element. Global Race reference that the worker identifies as. Defined by Workday integration mapping.
	Ethnicity_Visual_Survey	Optional element. Global Race reference by visually surveying the worker. Defined by Workday integration mapping.
	Religion	Optional element. Defined by Workday integration mapping.
	Political_Affiliation	Optional element. Defined by Workday integration mapping.
	Citizenship_Status	Optional element. Defined by Workday integration mapping.
	Military_Status	Optional element. Defined by Workday integration mapping.
	Military_Service_Type	Optional element. Defined by Workday integration mapping.
	Military_Discharge_Date	Optional element. Date in YYYY-MM-DD format.
	Military_Notes	Optional element.
	Military_Rank	Optional element. Defined by Workday integration mapping.
	Military_Status_Begin_Date	Optional element. Date in YYYY-MM-DD format.
Change_Personal_Profile > Disabilities		You can enter many Disability elements.
Change_Personal_Profile > Disabilities > Disability		
	Disability_Status	Optional element. Defined by Workday integration mapping.
	Disability_Status_Date	Optional element. Date in YYYY-MM-DD format.
	Disability_Known_Date	Optional element. Date in YYYY-MM-DD format.
	Disability_End_Date	Optional element. Date in YYYY-MM-DD format.
Change_Legal_Name		
	Worker_ID	Required element. Identifies the worker to update.

Action/Sub-Element(s)	Field	Comments
	Effective_Date	Optional element. Effective Date of the legal name change event. If you don't provide a value, Workday uses the processing effective moment (current time).
	Country	Required element. Country used to identify the validations and rules to apply to the name. Defined by Workday integration mapping. ISO 3166-1 alpha 3 or alpha 2.
	First_Name	Required element. The worker's first name.
	Middle_Name	Optional element. The worker's middle name (or middle initial).
	Last_Name	Required element. The worker's last name.
	Secondary_Last_Name	Optional element.
	Local_First_Name	Optional element.
	Local_Middle_Name	Optional element.
	Local_Last_Name	Optional element.
Change_PREFERRED_Name		
	Worker_ID	Required element. Identifies the worker to update.
	Use_Legal_Name	Optional: Y or N.
	Country	Required element. Country used to identify the validations and rules to apply to the name. Defined by Workday integration mapping. ISO 3166-1 alpha 3 or alpha 2.
	First_Name	Required element. The worker first name.
	Middle_Name	Optional element. The worker middle name (or middle initial).
	Last_Name	The worker last name.
	Local_First_Name	Optional element.
	Local_Secondary_Name	Optional element.
	Local_Middle_Name	Optional element.
	Local_Last_Name	Optional element.
Change_Contact_Information		

Action/Sub-Element(s)	Field	Comments
	Worker_ID	Required element. Identifies the worker to update.
	Replace_All	Optional element. Y or N. If value is Y, Workday replaces existing contact information. If value is N, Workday adds contact information.
	Effective_Date	Optional element. The effective date of the change request, in YYYY-MM-DD format.
Change_Contact_Information > Addresses		You can enter many Address elements.
Change_Contact_Information > Addresses > Address		
	Last_Modified_Date	Optional element.
	Address_Line_1	Required element. Line 1 of the address
	Address_Line_2	Optional element. Line 2 of the address
	Address_Line_3	Optional element. Line 3 of the address
	Address_Line_4	Optional element. Line 4 of the address
	Municipality	Required element. The address city or town
	Country	Required element. The address country. Defined by Workday integration mapping. ISO 3166-1 alpha 3 or alpha 2.
	Region	Required element. The address region. Defined by Workday integration mapping. ISO 3 character Country Code followed by a dash and a region code. Example: USA-CA, or RUS-MOS
	Sub_Region	Optional element. Defined by Workday integration mapping. ISO 3166-1 alpha 3 or alpha 2.
	Sub_Region_Type	Optional element. Defined by Workday integration mapping.
	Postal_Code	Optional element.

Action/Sub-Element(s)	Field	Comments
	Usage	Optional element. The usage type for this address, such as HOME, WORK. Defined by Workday integration mapping.
	Usage_Comments	Optional element. Usage comments for this address.
	Is_Public	Optional element. Y or N. If Y, indicates that the address is public.
	Is_Primary	Optional element. Y or N. Indicates that the address is primary.
Change_Contact_Information > Phones		You can enter many Phone elements.
Change_Contact_Information > Phones > Phone		
	Country	Optional element. ISO 3166-1 alpha 3 representation of country code for phone. Limited to only ISO 3166-1 alpha 3 (not 2).
	Phone_Area_Code	Area code of the phone number.
	Phone_Number	Required element. Phone number.
	Phone_Extension	Optional element. Worker phone extension.
	Device_Type	Required element. The phone device type. Defined by Workday integration mapping.
	Usage	Required element. The usage type for this phone, such as HOME, WORK. Defined by Workday integration mapping.
	Usage_Comments	Optional element. Comments about the usage of this phone number.
	Is_Primary	Optional element. Y or N. Indicates that phone number is the primary phone.
	Is_Public	Optional element. Y or N. Indicates that phone is public.
Change_Contact_Information >		You can enter many Email elements.

Action/Sub-Element(s)	Field	Comments
Emails		
Change_Contact_Information > Emails > Email		
	Email_Address	Required if creating new email record.
	Comments	Optional element. General comments about email address.
	Usage	Required if creating new email record. The usage type for this email account, such as HOME, WORK. Defined by Workday integration mapping.
	Usage_Comments	Optional element. Comments about the usage of this email address.
	Is_Primary	Optional: Y or N. Indicates that the email address is the primary email address.
	Is_Public	Optional: Y or N. Indicates that email address is public.
Change_Contact_Information > Instant_Messenger_Accounts		You can enter many Instant_Messenger_Account elements.
Change_Contact_Information > Instant_Messenger_Accounts > Instant_Messenger_Account		
	Address	Required element. The account name or identifier
	Type	Required element. The Type of Instant Messenger account. Defined by Workday integration mapping.
	Comments	Optional element. Comments about the account
	Usage	Required if creating new IM record. The usage type for this IM account, such as HOME, WORK. Defined by Workday integration mapping.
	Usage_Comments	Optional element. Comments about the usage of this IM account.

Action/Sub-Element(s)	Field	Comments
	Is_Primary	Optional: Y or N. Indicates that the IM account is the primary IM account.
	Is_Public	Optional: Y or N. Indicates that IM account is public.
Change_Contact_Information > URLs		You can enter many URL elements.
Change_Contact_Information > URLs > URL		
	Web_Address	Optional element. A URL to a home or work website for the worker.
	Web_Comments	Optional element. Comments about the URL.
	Usage	Required if creating new IM record. The usage type for this IM account, such as HOME, WORK. Defined by Workday integration mapping
	Usage_Comments	Optional element. Comments about the usage of this URL.
	Is_Primary	Optional: Y or N. Indicates that web address is primary web site for the worker.
	Is_Public	Optional: Y or N. Indicates that web address is public.
Change_National_Government_IDs		
	Worker_ID	Required element. Identifies the worker to update.
	Replace_All	Y or N. If value is Y, Workday replaces all National/Government IDs. If N, Workday adds the National/Government IDs to the existing IDs.
Change_National_Government_IDs > National_IDs		
Change_National_Government_IDs > National_IDs > National_ID		

Action/Sub-Element(s)	Field	Comments
	ID	Required element. ID is the number for the ID provided by the issuing agency.
	Reference_ID	Optional element. Used to reference an existing ID for update or Delete. Note: Underlying web service doesn't support specifying the ID during create.
	Action	Optional element. Indicates the action that Workday performs on the record. Add creates a new record. Update changes an existing record in Workday. Delete removes the record from Workday. Valid values: <ul style="list-style-type: none"> <li>• Add: 0. If blank, Workday performs an <i>Add</i>.</li> <li>• Update: 1</li> <li>• Delete: 2</li> </ul>
	Type	Required element. Defined by Workday integration mapping.
	Issuing_Country	Required element. Defined by Workday integration mapping. ISO 3166-1 alpha 3 or alpha 2.
	Issuing_Agency	Optional element. Defined by Workday integration mapping.
	Issued_Date	Optional element. Date in YYYY-MM-DD format.
	Issued_By	Optional element. Defined by Workday integration mapping.
	Expiration_Date	Optional element. Date in YYYY-MM-DD format.
	Verification_Date	Optional element. Date in YYYY-MM-DD format.
	Verified_by_Worker	Optional element.
	Series	Conditionally required for Russian integrations.
Change_National_Government_IDs > Government_IDs

Add_Dependent > National_IDs		You can enter many National_IDs elements.
Add_Dependent > National_IDs > National_ID	ID	Optional element. Workday uses the Reference ID to create a unique identifier when creating new records, or updating existing records
	Type	Required element. Defined by Workday integration mapping. Number each repeating element. Examples: <ul style="list-style-type: none"><li>• National_ID_Reference1</li><li>• National_ID_Reference2</li></ul>
	Issuing_Country	Required element. Defined by Workday integration mapping.
	Issuing_Agency	Defined by Workday integration mapping.
	Issued_Date	Optional element. YYYY-MM-DD.

Action/Sub-Element(s)	Field	Comments
	Issued_By	Optional element. Defined by Workday integration mapping.
	Expiration_Date	Optional element. YYYY-MM-DD format.
	Verification_Date	Optional element. YYYY-MM-DD format.
	Verified_by_Worker	Optional element.
	Series	Conditionally required for Russian integrations.
Add_Dependent > Government_IDs		You can enter many Government_ID elements.
Add_Dependent > Government_IDs > Government_ID	ID	Required element. Workday uses the Reference ID to create a unique identifier when creating new records, or updating existing records.
	Type	Required element. Defined by Workday integration mapping.
	Issuing_Country	Required element. Defined by Workday integration mapping.
	Issued_Date	Optional element. YYYY-MM-DD format.
	Expiration_Date	Optional element. YYYY-MM-DD format.
	Verification_Date	Optional element. YYYY-MM-DD format.
	Verified_by_Worker	Optional element.
Add_Dependent > Passports		You can enter many Passport elements.
Add_Dependent > Passports > Passport	ID	Required element. Workday uses the Reference ID to create a unique identifier when creating new records and updating existing records.
	Type	Required element. Defined by Workday integration mapping.
	Issuing_Country	Required element. Defined by Workday integration mapping.
	Issued_Date	Optional element. YYYY-MM-DD format.
	Expiration_Date	Optional element. YYYY-MM-DD format.

Action/Sub-Element(s)	Field	Comments
	Verification_Date	Optional element. YYYY-MM-DD format.
	Verified_by_Worker	Optional element.
Add_Dependent > Visas		You can enter many Visa elements.
Add_Dependent > Visas > Visa	ID	Required element. Workday uses the Reference ID to create a unique identifier when creating new records and updating existing records.
	Issuing_Country	Optional element. Defined by Workday integration mapping.
	Type	Required element.
	Issued_Date	Optional element. YYYY-MM-DD format.
	Expiration_Date	Optional element. YYYY-MM-DD format.
	Verification_Date	Optional element. YYYY-MM-DD format.
	Verified_by_Worker	Optional element.
Add_Dependent > Licenses		You can enter many License elements.
Add_Dependent > Licenses > License	ID	Required element. Workday uses the Reference ID to create a unique identifier when creating new records and updating existing records.
	Issuing_Country	Conditional element. Country issuing license. You can include only 1 of these elements: <ul style="list-style-type: none"><li>• Issuing_Authority</li><li>• Issuing_Country</li><li>• Issuing_Country_Region</li></ul> Defined by Workday integration mapping. ISO 3166-1 alpha 3 or alpha 2 format.
	Issuing_Country_Region	Conditional element. Country Region issuing license. You can include only 1 of these elements: <ul style="list-style-type: none"><li>• Issuing_Authority</li><li>• Issuing_Country</li><li>• Issuing_Country_Region</li></ul>

Action/Sub-Element(s)	Field	Comments
		Defined by Workday integration mapping. ISO 3166-1 alpha 3 or alpha 2 format.
	Issuing_Authority	Conditional element. Authority issuing license. You can include only 1 of these elements: <ul style="list-style-type: none"><li>• Issuing_Authority</li><li>• Issuing_Country</li><li>• Issuing_Country_Region</li></ul>
	Type	Required element.
	License_Class	Optional element.
	Issued_Date	Optional element. YYYY-MM-DD format.
	Expiration_Date	Optional element. YYYY-MM-DD format.
	Verification_Date	Optional element. YYYY-MM-DD format.
	Verified_by_Worker	Optional element.
Add_Dependent > Custom IDs		You can enter many Custom ID elements.
Add_Dependent > Custom IDS > Custom ID	ID	Required element. Workday uses ID to create a unique identifier when creating new records and updating existing records.
	Type	Conditionally required if Custom ID data exists on file.
	Issued_by_Organization	
	Issued_Date	Optional element. YYYY-MM-DD format.
	Expiration_Date	Optional element. YYYY-MM-DD format.
	Description	Optional element.
Add_Dependent > Addresses		You can enter many Address elements.
Add_Dependent > Addresses > Address	Last_Modified_Date	Optional element.
	Address_Line_1	Required element.
	Address_Line_2	Optional element.

Action/Sub-Element(s)	Field	Comments
	Address_Line_3	Optional element.
	Address_Line_4	Optional element.
	Municipality	Required element. The address city or town.
	Country	Optional element. The address country.
	Region	Required element. The address region. Defined by Workday integration mapping. ISO 3 character Country Code followed by a dash and a region code. Example: USA-CA, or RUS-MOS.
	Sub_Region	Optional element. Defined by Workday integration mapping. ISO 3166-1 alpha 3 or alpha 2 format.
	Sub_Region_Type	Optional element. Defined by Workday integration mapping.
	Postal_Code	Optional element.
	Usage	Optional element. The usage type for this address, such as HOME, WORK. Defined by Workday integration mapping.
	Usage_Comments	Optional element. Usage comments for this address.
	Is_Public	Optional element. Y or N. If Y, indicates that the address is public.
	Is_Primary	Optional element. Y or N. Indicates that the address is primary.
Add_Dependent > Phones		You can enter many Phone elements.
Add_Dependent > Phones > Phone	Country	Optional element. ISO 3166-1 alpha 3 representation of country code for phone. Limited to only ISO 3166-1 alpha 3 (not 2).
	Phone_Area_Code	Optional element. Area code of the phone number.
	Phone_Number	Required element. Phone number.

Action/Sub-Element(s)	Field	Comments
	Phone_Extension	Optional element. Worker phone extension.
	Device_Type	Required element. The phone device type. Defined by Workday integration mapping.
	Usage	Required element. The usage type for this phone. Examples: HOME, WORK. Defined by Workday integration mapping.
	Usage_Comments	Optional element. Comments about the usage of this phone number.
	Is_Primary	Optional element. Y or N. Indicates that phone is the worker primary phone.
	Is_Public	Optional element. Y or N. Indicates that phone is public.
Add_Dependent > Emails		You can enter many Email elements.
Add_Dependent > Emails > Email	Email_Address	Required if creating new email record.
	Comments	Optional element. General comments about email address.
	Usage	Required if creating new email record. The usage type for this email account. Examples: HOME, WORK. Defined by Workday integration mapping.
	Usage_Comments	Optional element. Comments about the usage of this email address.
	Is_Primary	Optional element. Y or N. Indicates that email address is primary email address for worker.
	Is_Public	Optional element. Y or N. Indicates that email address is public.
Add_Dependent > Instant_Messenger_Accounts		You can enter many Instant_Messenger_Account elements.
Add_Dependent > Instant_Messenger_Accounts >	Address	Required element. The account holder name or identifier.

Action/Sub-Element(s)	Field	Comments
Instant_Messenger_Account		
	Type	Required element. The type of Instant Messenger account. Defined by Workday integration mapping.
	Comments	Optional element. Comments about the account.
	Usage	Required if creating new IM record. The usage type for this IM account. Examples: HOME, WORK. Defined by Workday integration mapping.
	Usage_Comments	Optional element. Comments about the usage of this IM account.
	Is_Primary	Optional element. Y or N. Indicates that IM account is primary account for worker.
	Is_Public	Optional element. Y or N. Indicates that IM account is public.
Add_Dependent > URLs		You can enter many URL elements.
Add_Dependent > URLs > URL	Web_Address	Optional element. A URL for a home or work web site for the worker.
	Web_Comments	Optional element. Comments about the URL.
	Usage	Required if creating new IM record. The usage type for this IM account. Examples: HOME, WORK. Defined by Workday integration mapping.
	Usage_Comments	Optional element. Comments about the usage of this URL.
	Is_Primary	Optional element. Y or N. Indicates that web address is primary web site for worker.
	Is_Public	Optional element. Y or N. Indicates that web address is public.
Add_Dependent > Qualified_Domestic_Relations		You can enter many URL elements.
Add_Dependent >	Benefit_Coverage_Type	Conditionally Required

Action/Sub-Element(s)	Field	Comments
Qualified_Domestic_Relations > Qualified_Domestic_Relation		
	Start_Date	Conditionally Required
	End_Date	Conditionally Required

## Workday Connector for Equifax Verification

### Concept: Workday Connector for Equifax Verification

Note: You might need to take additional steps to enable this feature depending on your organization's subscription service agreement. For more information, see this [Community](#) article.

The Workday Connector for Equifax Verification is part of the HCM ML Features and Third Party Connectors GA innovation service. This connector helps you to:

- Save time and manual effort by automating the process of delivering income and employment data to Equifax for verification.
- Improve the experience of your employees by streamlining the verification process.
- Facilitate authorized access to necessary employee information for each unique verification request from Equifax Work Number® verification services.

### Data Provided to Equifax for Employee Inquiry Matching

To enable Equifax to look up the employee that is the subject of a verification inquiry, the connector sends this employee information to Equifax in a verification inquiry matching file each week:

- Hashed Social Security Number.
- Employment status.
- A unique employee ID number generated by Workday.
- A unique company ID number generated by Workday.

### Verification Service Inquiry Types

After you set up the Workday Connector for Equifax Verification, Equifax can conduct these types of verification service inquiries for individual employees:

Verification Service	Equifax Inquires About
Verification of Employment (VOE)	An employee's current or past employment information on behalf of a third party such as a lender or government agency.
Verification of Income (VOI)	An employee's current or past income information on behalf of a third party, such as a lender or government agency, to assess the employee's financial stability for lending or leasing.  If you aren't a Workday Payroll for the U.S. customer, income data isn't available in your tenant. Therefore, Equifax can't verify employee income through the connector.
Social Services Verification (SSV)	An employee's current or past income or employment information on behalf of a third party,

Verification Service	Equifax Inquires About
	such as a government agency, to determine eligibility for social assistance programs.

### Data Provided to Equifax for Verification Services

Note: If an employee is missing the information in the Fields Required for Verification column below, the connector might not be able to send the employee data to Equifax for use in its verification services.

The connector sends these categories of information to Equifax on a per-inquiry basis for use in Equifax's verification services:

Data Type	Data in Workday	Fields Required for Verification	VOE	VOI	SSV
Workday ID	Employee's Workday ID.	X	X	X	X
Work Location Address	The address for the work location associated with the employee's primary position.		X	X	X
Social Security Number	Employee's Social Security Number.	X	X	X	X
Payroll As Of Date		X	X	X	X
Employee Name	Employee's legal name.	X	X	X	X
Job Title	The title of the employee's primary position.		X	X	X
Employee Status	Employee's position status, such as <i>Active</i> , <i>On Leave</i> , <i>Terminated</i> , or <i>Retired</i> .	X	X	X	X
Most Recent Hire Date	The hire date of the employee's primary position.	X	X	X	X
Original Hire Date	The original hire date	X	X	X	X

Data Type	Data in Workday	Fields Required for Verification	VOE	VOI	SSV
	of the employee's primary position.				
Terminate Date	The termination date of the employee's primary position.		X	X	X
Federal Employer Identification Number	The Federal Employer Identification Number (FEIN) of the company associated with the employee's primary position.		X	X	X
Pay Frequency	Period schedules associated with the pay group that has a regular run category.		X	X	X
Home Address	Employee's full primary home address		X	X	X
Birth Date	Employee's date of birth.		X	X	X
Average Hours per Pay Period	Scheduled weekly hours per pay frequency.			X	X
Rate of Pay	The total base pay from the employee's primary position.			X	X
Rate of Pay Description	The frequency associated with the employee's total base pay.			X	X

Data Type	Data in Workday	Fields Required for Verification	VOE	VOI	SSV
Year				X	X
YTD Total Gross Wages				X	X
Pay Code				X	X
Pay Code Description				X	X
Gross Compensation				X	X
Pay Period Beginning Date					X
Pay Period Ending Date					X
Check Date					X
Pay Period Gross Wages					X
YTD Gross Wages					X
Pay Period Net Wages					X
Pay Period Hours Worked					X

### Disable Workday Connector for Equifax Verification

You can disable the Workday Connector for Equifax Verification by accessing the Set Up Workday Connector for Equifax Verification task and clearing the the Enable Workday Connector for Equifax Verification check box.

### Steps: Set Up Notifications for Workday Connector for Equifax Verification

#### Context

If you have a UMSA subscription service agreement, you can set up notifications for the Workday Connector for Equifax Verification. These notifications help inform you when the connector begins to send employee income and employment data to Equifax for verification services.

Note: The Workday Connector for Equifax Verification doesn't contain any machine learning functionality but it will share the notification functionality and its domain.

## Steps

1. Access the Create Security Policy for Domain task.
    - a) Select *AI Features and Third Party Notification* from the For Domain prompt.
    - b) In the Report/Task Permissions section, add the security groups you want to send notifications to.
    - c) Select the View and Modify check boxes.
  2. **Steps: Set Up Contact Information**  
Ensure that the workers from the security groups you added on the *AI Features and Third Party Notification* domain have work email addresses where they can receive notifications.
  3. **Activate Pending Security Policy Changes.**
  4. Access the Edit Tenant Setup - Notifications task.
    - a) In the Notification Delivery Settings, select System.
    - b) In the Notification Type section, select the Override Parent Notification Type Settings check box for Ascend Notifications.
    - c) Select a routing rule.
- Security: *Set Up: Tenant Setup - BP and Notifications* domain in the System functional area.

## Result

Workday sends the first notification on the day the feature is delivered to your tenant. This notification confirms that the feature is enabled and will begin to send information to Equifax in 30 days.

Workday sends a second notification 15 days after the feature is delivered to your tenant.

Workday sends these notifications to:

- Your notifications page in Workday.
- The email addresses of the workers in the security groups that you added to the *AI Features and Third Party Notification* domain.

These notifications remind you that you can opt out of the service before the end of the 30 days if you choose.

### Related Information

#### Examples

Concept: [Workday AI for Universal Main Subscription Agreement Customers](#)

## Steps: Enable Workday Connector for Equifax Verification

### Prerequisites

Note: You might need to take additional steps to enable this feature based on your organization's subscription service agreement. Your organization is either on the Main Service Agreement (MSA) or the Universal Main Service Agreement (UMSA). To determine your organization's subscription service agreement:

1. Select your profile avatar on [Workday Community](#).
2. Select Profile.
3. On your profile page, select your organization's name, which is beneath your name and next to your job title.
4. View your Subscription Service Agreement value.

If the value is:

- *UMSA*, the feature is automatically available. You can skip the Enable Innovation Services Features and Machine Learning Data Contributions for MSA Customers step. For more information on

Machine Learning data contributions, see [Concept: Workday AI for Universal Main Subscription Agreement Customers](#).

- *MSA*, you must enable this feature through Innovation Services using the Enable Innovation Services Features and Machine Learning Data Contributions for MSA Customers step.

Note: UMSA customers don't have Innovation Services tasks and reports in their tenants as these are for MSA customers only. UMSA customers can ignore all information regarding Innovation Services.

If you have a UMSA subscription service agreement, [Steps: Set Up Notifications for Workday Connector for Equifax Verification](#) on page 1292.

Review [Concept: Workday Connector for Equifax Verification](#) on page 1289.

## Context

You can use the Workday Connector for Equifax Verification to automate delivering your employee income and employment data to Equifax. This connector enables you to seamlessly deliver data to the Equifax Work Number® verification services for your employees with U.S. government IDs.

The Workday Connector for Equifax Verification is enabled either:

- Automatically for HCM customers who have a UMSA subscription service agreement.
- Manually for HCM customers who have a MSA subscription service agreement.

## Steps

1. Customers under the MSA subscription service agreement, [Enable Innovation Services Feature and Machine Learning Data Contributions for MSA Customers](#).

On the Innovation Services Opt-In task, select the HCM ML Features and Third Party Connectors GA service on the Available Services tab in the HCM category.

Note: You might need to take additional steps to enable this feature depending on your organization's subscription service agreement. For more information, see this [Community](#) article.

2. [Set Up Workday Connector for Equifax Verification](#) on page 1295.

## Result

The Workday Connector for Equifax Verification:

- Provides Equifax with a hashed verification inquiry matching file so Equifax can determine whether you have data available about the subject of a unique Equifax verification inquiry.
- Takes a snapshot of your employee income and employment data each week and securely maintains the snapshot of data in Workday.
- Sends relevant employee data from the most recent snapshot to Equifax's verification services after receiving an authorized unique verification inquiry from Equifax.
- Provides you with logs of the verification inquiry events.

## Next Steps

To review the income and employment data sent to Equifax for verification inquiries, you must use the Workday ID (WID) and the Verification Inquiry Date from your verification inquiry transaction log emails to access the Verification of Employment and Income Data for Worker report.

[Related Information](#)

## Examples

[2024R2 Release Note: Workday Connector for Equifax Verification](#)

## Set Up Workday Connector for Equifax Verification

### Prerequisites

Security: *Set Up: Tenant Setup - HCM* domain in the System functional area.

### Context

You can set up the Workday Connector for Equifax Verification to automate delivering your employee income and employment data to Equifax

### Steps

1. Access the Set Up Workday Connector for Equifax Verification task.
2. Verify that the Enable Workday Connector for Equifax Verification check box is selected.
  - If you have a UMSA subscription service agreement, this check box is automatically selected.
  - If you have a MSA subscription service agreement, this check box automatically populates your selection of the HCM ML Features and Third Party Connectors GA check box on the Innovation Services Opt-in task. See [Steps: Enable Workday Connector for Equifax Verification](#) on page 1293.
3. Enter the Email Address for Verification Inquiry for Transaction Log that Workday uses to send transaction logs of Equifax's verification inquiries about your employees.

These encrypted emails include personal information about your employees. We recommend that you:

- Set up a secure inbox that is accessible only by your Human Resources or payroll people who currently assist your employees with income and employment verification inquiries.
- Configure your applicable email server to receive encrypted connections.

Note: Workday automatically creates the Integration System User (ISU) *ISU FOR VOIE EXTRACT - DO NOT EDIT* when you set up the Workday Connector for Equifax Verification. We recommend against modifying or deleting this ISU to ensure the Equifax connector performs correctly. If you opt out of the Workday Connector for Equifax Verification, you can delete the ISU.

### Result

The information that you enter on the Set Up Workday Connector for Equifax Verification task is provided to Equifax for income and employment verification services.

## Concept: Verification Inquiries

### Verification Inquiry Transaction Logs

After you set up the Workday Connector for Equifax Verification, Workday sends you an encrypted email with a verification inquiry transaction log each week. We recommend that you configure your applicable email server to receive encrypted connections.

This email is sent to the distribution email address that you entered in the Email Address for Verification Inquiry Transaction Log field on the Set Up Workday Connector for Equifax Verification task.

The verification inquiry transaction log includes this information on employee data sent to Equifax for verification inquiries:

- The data and time when employee data was sent to Equifax through the connector in response to a verification inquiry.
- A unique transaction ID generated by Workday to identify each verification inquiry.
- The fields that Workday sent to Equifax for an employee's verification inquiry.
- The Workday ID (WID) of the employee who is the subject of Equifax's verification inquiry.

As a best practice:

- Securely store the emails with these verification inquiry transaction logs for your records.
- If you need the transaction logs resent to you, contact Support.

If no employees requested verification inquiries during the week, you won't receive an email with a transaction log because no employee data was sent to Equifax.

### **Verification of Employment and Income Data for Worker Report**

You can use the Verification of Employment and Income Data for Worker report to view the income and employment data that Workday sent to Equifax for verification inquiries for an employee.

This report displays the information that the Workday Connector for Equifax shares about an employee's:

- Employment.
- Income.
- Historical pay periods.

See [Concept: Workday Connector for Equifax Verification](#) on page 1289 for more details about the information that the connector sends to Equifax for verification services.

When you access the Verification of Employment and Income Data for Worker report, consider:

Option	Description
VOIE Worker	You can enter the employee's name, employee ID, or Workday ID (WID) from the verification inquiry transaction log email. For more information about WIDs, see <a href="#">Concept: Integration IDs</a> on page 2304.
Verification Inquiry Date	The default date for this field is the previous Saturday. You can select a date from up to 36 months ago to view employment and income data for past verification inquiries.
Include Income Data	You can only select this check box if you are both a HCM and Payroll for the U.S. customer.

## **Worker Time Block Inbound Connector**

### **Steps: Set Up Worker Time Block Inbound Connector**

#### **Prerequisites**

Set up an external server that your external endpoint and your Connector can access.

Note: While the Worker Time Block Inbound Connector is still available, we recommend using the *Import Reported Time Blocks* web service for improved error handling and performance.

#### **Context**

Set up an integration system that imports worker time blocks from an external endpoint into Workday.

## Steps

1. Configure your external endpoint to generate time block data in a format that the integration supports.  
See: [Reference: Worker Time Block Inbound Connector File Schema on page 1298](#).
2. Access the Create Integration System task and select *Worker Time Block Inbound* from the New Using Template prompt.
3. Create an Integration System User (ISU) and grant the ISU access to these domains:
  - *Integration Event*
  - *Reported Time Batch Event* (business process).

*Reported Time Batch Event* is a role-based security policy. The ISU must be a member of a security group that can start and approve the business process. There must also be a default business process definition that sets the ordering of the 2 steps (Initiation and Approval). Add the security group for the ISU account to the Approval step.

See: [..../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#)

4. Set Up Worker Time Block Inbound Connector Integration Attributes on page 1297.
5. Set Up Integration Retrieval on page 1957
6. Launch an Integration on page 24.

## Set Up Worker Time Block Inbound Connector Integration Attributes

### Prerequisites

Security: *Integration Configure* security domain in the Integration functional area.

Note: While the Worker Time Block Inbound Connector is still available, we recommend using the *Import Reported Time Blocks* web service for improved error handling and performance.

### Context

Configure integration attributes for an existing Worker Time Block Inbound Connector.

## Steps

As a related action on your Worker Time Block Inbound integration, select Integration System > Configure Integration Attributes.

Add a row for each attribute and specify a value:

Option	Description
Input File Format	Indicates if the incoming file is in XML or CSV format. If you leave this field blank, the automatically populated value is CSV.
Input Date Format	Set the format of all date values in the input file. The format must be a Java simple date format. The automatically populated value is <i>yyyy-MM-dd</i> .
Input Date Time Format	Set the format of all date and time values in the input file. The format must be a Java simple date format. The automatically populated value is <i>yyyy-MM-dd HH:mm:ss</i> .
Document Retention Policy	Specify how many days Workday keeps the imported files. The automatically populated retention period is 30 days.

## Concept: Worker Time Block Inbound Connector

Note: While the Worker Time Block Inbound Connector is still available, we recommend using the *Import Reported Time Blocks* web service for improved error handling and performance.

To import time-block records for your workers from an external endpoint into Workday, use the Worker Time Block Inbound Connector. The Worker Time Block Inbound Connector can import detailed time block data for your workers, including associated project, fund, grant, and other related data. With the Worker Time Block Inbound Connector, you can load reported time blocks from manual entry or one-off time blocks that supplement normal time entries. Example: load time block data for time spent taking a training class, working at an extracurricular event, or holiday hours.

### File Format for Worker Time Block Inbound Connector Data

The Worker Time Block Inbound Connector integration imports data in Workday-defined CSV or XML formats.

### Integration Process Flow

The Worker Time Block Inbound Connector imports time data using this process:

1. Your external endpoint generates a file and sends it to a file server known to the integration.
2. You launch the integration, either by schedule or manually.
3. The integration retrieves the file according to the Document Retrieval configuration on the Integration Process Event and applies document tags.  
If the file isn't in the Workday XML format, create a Document Transformation integration that converts the input file into a format supported by Workday.
4. The integration processes the file, then imports the data into Workday.

## Reference: Worker Time Block Inbound Connector File Schema

### CSV Elements

Note: While the Worker Time Block Inbound Connector is still available, we recommend using the *Import Reported Time Blocks* web service for improved error handling and performance.

The CSV file must include these fields, in order:

- Employee\_ID
- Time\_Entry\_Code
- Project
- Project\_Plan\_Task
- Date
- Units
- In\_Date\_Time
- Out\_Date\_Time
- Out\_Reason
- Position\_ID
- Override\_Rate
- Business\_Unit
- Cost\_Center
- Custom\_Organization\_1 through Custom\_Organization\_10
- Custom\_Worktag\_1 through Custom\_Worktag\_15
- Fund
- Grant
- Job\_Profile

- Location
- Program
- Region
- Comment
- Gift
- Worker\_Reference\_Type

Note:

Optional field indicates if the worker is an employee or contingent worker. Valid values:

- E: worker is employee
- C: worker is contingent worker
- (Empty): worker is employee.

## XML Elements

The XML schema for inbound time block data includes these elements:

Element	Description/Notes
TimeBlockInboundFile	1Contains all other elements. Only 1 element per file.
TimeBlockEntry	2Contains 1 instance of all subsequent elements, except as noted. Unlimited number of elements per file.
Employee_ID	3Use only if Contingent_Worker_ID is empty. Must be in XSD <i>string</i> format.
Contingent_Worker_ID	3Use only if Employee_ID is empty. Must be in XSD <i>string</i> format.
Time_Entry_Code	3Must be in XSD <i>string</i> format.
Project	3Optional; if included, must be in XSD <i>string</i> format.
Project_Plan_Task	3Optional; if included, must be in XSD <i>string</i> format.
Date	3Optional; if included, must be in XSD <i>string</i> format.
Units	3Optional; if included, must be in XSD <i>decimal</i> format.
In_Date_Time	3Optional; if included, must be in XSD <i>string</i> format.
Out_Date_Time	3Optional; if included, must be in XSD <i>string</i> format.
Out_Reason	3Must be in XSD <i>string</i> format.
Position_ID	3Must be in XSD <i>string</i> format.
Override_Rate	3Optional; if included, must be in XSD <i>decimal</i> format.
Business_Unit	3Must be in XSD <i>string</i> format.
Cost_Center	3Must be in XSD <i>string</i> format.
Custom_Organization_01 through Custom_Organization_10	3Optional. You can include up to 10 custom organizations, each in its own element. Must be in XSD <i>string</i> format.
Custom_Worktag_01 through Custom_Worktag_15	3Optional. You can include up to 15 custom worktags, each in its own element. Must be in XSD <i>string</i> format.
Fund	3Optional; if included, must be in XSD <i>string</i> format.
Grant	3Optional; if included, must be in XSD <i>string</i> format.
Job_Profile	3Optional; if included, must be in XSD <i>string</i> format.
Location	3Optional; if included, must be in XSD <i>string</i> format.
Program	3Optional; if included, must be in XSD <i>string</i> format.
Region	3Optional; if included, must be in XSD <i>string</i> format.
Comment	3Optional; if included, must be in XSD <i>string</i> format.
Gift	3Optional; if included, must be in XSD <i>string</i> format.

Element	Description/Notes
Worker Reference Type	Optional; indicates if the worker is an employee or contingent worker. Valid values: <ul style="list-style-type: none"> <li>• E: worker is employee</li> <li>• C: worker is contingent worker</li> <li>• (Empty): worker is employee.</li> </ul>

## Student Connectors

### National Student Clearinghouse Connectors

#### Setup Considerations: National Student Clearinghouse Connectors

You can use this topic to help make decisions when planning your configuration and use of National Student Clearinghouse (NSC) connectors. It explains:

- Why to set it up.
- How it fits into the rest of Workday.
- Downstream impacts and cross-product interactions.
- Security requirements and business process configurations.
- Questions and limitations to consider before implementation.

Refer to detailed task instructions for full configuration details.

## What It Is

The NSC connectors in Workday enable you to extract and transmit data to the NSC for their Enrollment Reporting and DegreeVerify services.

Note: Workday does not warrant, guarantee, or represent that Student reporting capabilities comply with National Student Clearinghouse (NSC) compliance standards or requirements. Customers are responsible for independently verifying their compliance with all state and federal legal and regulatory obligations.

## Business Benefits

The integrations make it easier for you to generate enrollment and degree verification reports according to NSC guidelines by exporting data already in your tenant, saving you time and effort.

Workday saves the output report to an SFTP server, and you can configure the integration to deliver the file directly to the NSC for greater efficiency.

## Use Cases

Administrators can:

- Use the *NSC Enrollment Reporting Outbound* integration to generate a report with enrollment data.
- Use the *NSC Degree Verify Outbound* integration to generate a report with degree and graduation data for verification.
- Configure the integrations to report the output data according to your institutional requirements.  
Example: For load status calculations.
- Send the integration output files to the NSC for reporting to loan agencies and the National Student Loan Data System (NSLDS).
- Generate the report as needed to verify the integration output data. Workday provides troubleshooting options for you to run the integration including specific students or excluding a student population.

## Questions to Consider

Subjects	Questions	Considerations
Enrollment Reporting	How does your institution determine a student's load status for the enrollment report?	<p>When determining the enrollment status, Workday calculates the load status based on the student's registered units for all courses in the standard academic period.</p> <p>You can configure the enrollment reporting integration to calculate the load status:</p> <ul style="list-style-type: none"> <li>• Using institution load status rules or financial aid load status rules.</li> <li>• Including or excluding withdrawn units, financial aid units, and audit units.</li> </ul>
Enrollment Reporting	What does your institution consider as effective dates for changes in load status?	<p>For the enrollment report, Workday looks for changes in load status from the <i>Last Enrollment Report Run Date</i> you specify, to the earliest of the:</p> <ul style="list-style-type: none"> <li>• Current date.</li> <li>• End date of the standard academic period that you're reporting.</li> </ul> <p>When the load status doesn't change within this time, Workday looks for added or dropped</p>

Subjects	Questions	Considerations
		<p>registrations that affected the load status in previous academic periods.</p> <p>When the registration changes are:</p> <ul style="list-style-type: none"> <li>• Before the <i>Last Add Date</i>, Workday considers the standard academic period start date as the load status change effective date.</li> <li>• After the <i>Last Add Date</i>, Workday considers the registration add or drop date as the load status change effective date. You can view the process dates of registration changes on the Registration Audit History report.</li> </ul> <p>For students who graduated during the reporting period, Workday reports their graduated status effective date as their conferral date. You can configure the integrations to report a different date. Example: Academic period end date or program completion date.</p>
Enrollment Reporting	How does your institution report enrollment for students on an approved leave of absence?	<p>By default, Workday reports a leave of absence enrollment status for students who began a leave of absence during the reporting academic period. You can set up the enrollment reporting integration to include students on a leave of absence longer than the reporting academic period.</p> <p>You can also configure the integration to report the enrollment status for leave of absence students as withdrawn.</p>
Enrollment Reporting	How does your institution report enrollment for students who dropped some or all of their registrations?	<p>The enrollment reporting integration compares students who are enrolled as of the:</p> <ul style="list-style-type: none"> <li>• <i>Last Enrollment Report Run Date</i> you specify when you launch the integration.</li> <li>• Current date.</li> </ul> <p>You can configure the integration to include or exclude withdrawn units in the load status calculations.</p> <p>Workday reports the students who no longer have registrations as withdrawn, with an enrollment status effective date of when the student dropped their last course registration.</p>
Enrollment Reporting	Which student populations do you want to include in the enrollment report?	<p>When you launch an Enrollment Reporting integration, you can specify the:</p> <ul style="list-style-type: none"> <li>• Office of Postsecondary Education Identification (OPEID) number and branch code of the institution you want to report. The enrollment report includes students who have a primary program of</li> </ul>

Subjects	Questions	Considerations
		<p>study with the specified OPEID and branch code.</p> <ul style="list-style-type: none"> <li>Values to include on the header record of the enrollment report.</li> </ul>
Degree Verify	Which student populations do you want to include in the degree verification report?	<p>When you launch a Degree Verify integration, you can specify the:</p> <ul style="list-style-type: none"> <li>OPEID number and branch code of the institution you want to report. The degree verification report includes graduated students who have a primary program of study with the specified OPEID and branch code.</li> <li>Date range of conferral dates of students to include in the degree verification report.</li> </ul>

## Recommendations

To reduce errors for enrollment reporting:

- Set up programs of study with the most recent version of the Classification of Instructional Programs (CIP) code, and the program duration.
- Set up federal student aid program policies to specify the weeks of instruction, credential level, and special indicator for the program of study.
- Set up typical attendance patterns to exclude noncompulsory academic period types. Example: Summer. To determine continuous enrollment, Workday looks for student registrations in the academic period types that are in the typical attendance pattern.
- Run the First of Term report after the *Last Add Date* to account for any changes in enrollment status while registration changes are open.
- Minimize administrative overrides to add and drop registrations after the *Last Add Date*. Registration changes after this date affect what Workday reports as the program enrollment status effective date.

## Requirements

Set up:

- OPEIDs and branch codes for the campus locations you want to report, so that you can generate separate reports for different locations.
- Federal student aid program policies with these OPEIDs and branch codes for your programs of study. Workday reports the students with a primary program of study linked to the OPEID and branch code that you specify when you launch the integration.

## Limitations

No impact.

## Tenant Setup

No impact.

## Security

Configure these domains:

Domains	Considerations
<i>Integration Build</i> in the Integration functional area.	Enables users to: <ul style="list-style-type: none"> <li>Create or edit an integration.</li> <li>View an integration system.</li> </ul>
<i>Integration Configure</i> in the Integration functional area.	Enables users to configure an integration.
<i>Integration Event</i> in the Integration functional area.	Enables users to: <ul style="list-style-type: none"> <li>Launch an integration.</li> <li>View resulting integration events, including integration output documents.</li> </ul>
<ul style="list-style-type: none"> <li><i>Manage: Academic Records</i> in the Student Records functional area.</li> <li><i>Manage: Financial Aid</i> in the Financial Aid functional area.</li> <li><i>Set Up: Financial Aid Rule Sets and Policies</i> in the Financial Aid functional area.</li> </ul>	Enables users to select an OPEID to launch the NSC integration.

## Business Processes

You can configure a *Document Delivery Service* step on a business process to deliver the integration output files to the NSC through SFTP.

## Reporting

Reports	Considerations
All Integration Systems	Displays all integration systems that you've created.
Integration Events	Displays: <ul style="list-style-type: none"> <li>A summary of integration events that are in process or completed.</li> <li>Details about the status for each integration event.</li> </ul>
View Integration System	Displays details about the integration system, including the integration services, attributes, and maps.

## Connections and Touchpoints

From the Financial Aid feature, you can set up federal student aid program policies on programs of study. Workday determines which students to include in the NSC reports by looking at the OPEID number and branch code on these policies for the students' primary programs of study.

Workday offers a Touchpoints Kit with resources to help you understand configuration relationships in your tenant. Learn more about the [Workday Touchpoints Kit](#) on Workday Community.

## Steps: Set Up Integration to Export Student Degree Data

### Prerequisites

- Review [Setup Considerations: National Student Clearinghouse Connectors](#) on page 1301.

- Security: These domains in the Integration functional area:
  - *Integration Build*
  - *Integration Configure*

## Context

You can create an integration that sends degree and graduation data files to the National Student Clearinghouse (NSC) for their DegreeVerify service.

Note: Workday does not warrant, guarantee, or represent that Student reporting capabilities comply with National Student Clearinghouse (NSC) compliance standards or requirements. Customers are responsible for independently verifying their compliance with all state and federal legal and regulatory obligations.

## Steps

1. Set up Office of Postsecondary Education Identifiers (OPEIDs) for the campus locations you want to report.

See Steps: [Set Up Federal Entity IDs](#).

2. Maintain Federal Student Aid Program Policies.

For the programs of study you want to include in your degree verification report, configure these values on the Maintain Federal Student Aid Program Policy task:

- Default OPEID
- Weeks of Instruction
- Credential Level
- Special Indicator

3. Create Integration System on page 1967.

From the New Using Template prompt, select *NSC Degree Verify Outbound*.

4. (Optional) Select Integration System > Configure Integration Services from the related actions menu of the integration system.

Enable the *NSC Degree Verify Outbound Document Delivery* integration service. When you don't perform this step, you need to retrieve the integration output file and upload it manually to the NSC.

5. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Integration Event* domain in the Integration functional area.

Grant the ISU *Get* and *Put* access to 1 or more of these domains:

- *Manage: Academic Records* in the Student Records functional area.
- *Manage: Financial Aid* in the Financial Aid functional area.
- *Set Up: Financial Aid Rule Sets and Policies* in the Financial Aid functional area.

See [..../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#)

6. Select Integration System > Configure Integration Attributes from the related actions menu of the integration system.

Enter integration service attributes.

7. (Optional) Select Integration System > Configure Integration Field Overrides from the related actions menu of the integration system.

Configure overrides for fields where you want to return different values based on calculated fields or report fields.

Example: To report whether students have a financial block for outstanding balances, NSC specifies to use the *School Financial Block* field. Create a *True/False Condition* calculated field using the Academic Record report field on the Earned Credential business object that evaluates whether

students have a financial block. Configure the *School Financial Block* field override with this calculated field. Workday then reports the *School Financial Block* field as Y for students with a financial block.

Example: By default, Workday reports the *Date Degree Awarded* field as the conferral date. To report a different date, you can configure the *Date Degree Awarded* field override to use 1 of these report fields on the Student Program of Study Record business object:

- Conferral Academic Period End Date
  - Program Completion Date
8. Select Integration System > Configure Integration Maps from the related actions menu of the integration system.  
Map your internal educational credentials to the external values that Workday reports for the *Degree Level Indicator* field.
  9. [Set Up Integration Delivery](#) on page 1952.
  10. [Launch an Integration](#) on page 24.  
Specify any launch parameters that your integration requires to identify your institution and define the scope of the output file.  
Example: The degree verification report includes all students with conferral dates between the dates that you specify on the *From Date* and *To Date* fields when you launch the integration.

[2023R1 What's New Post: National Student Clearinghouse Connectors](#)

## Steps: Set Up Integration to Export Student Enrollment Data

#### Prerequisites

- Review [Setup Considerations: National Student Clearinghouse Connectors](#) on page 1301.
- Security: These domains in the Integration functional area:
  - *Integration Build*
  - *Integration Configure*

#### Context

You can create an integration that sends enrollment data files to the National Student Clearinghouse (NSC) for their Enrollment Reporting service.

Note: Workday does not warrant, guarantee, or represent that Student reporting capabilities comply with National Student Clearinghouse (NSC) compliance standards or requirements. Customers are responsible for independently verifying their compliance with all state and federal legal and regulatory obligations.

#### Steps

1. Set up Office of Postsecondary Education Identifiers (OPEIDs) for the campus locations you want to report.  
See [Steps: Set Up Federal Entity IDs](#).
2. [Create Programs of Study](#).  
Set up these fields on the programs of study:
  - CIP Code
  - Program Duration

### 3. Maintain Federal Student Aid Program Policies.

For the programs of study you want to include in your enrollment report, configure these values on the Maintain Federal Student Aid Program Policy task:

- Default OPEID
- Weeks of Instruction
- Credential Level
- Special Indicator

### 4. Create Integration System on page 1967.

From the New Using Template prompt, select *NSC Enrollment Reporting Outbound*.

### 5. (Optional) Select Integration System > Configure Integration Services from the related actions menu of the integration system.

Enable the *NSC Enrollment Reporting Outbound Document Delivery* integration service. When you don't perform this step, you need to retrieve the integration output file and upload it manually to the NSC.

### 6. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Integration Event* domain in the Integration functional area.

Grant the ISU *Get* and *Put* access to 1 or more of these domains:

- *Manage: Academic Records* in the Student Records functional area.
- *Manage: Financial Aid* in the Financial Aid functional area.
- *Set Up: Financial Aid Rule Sets and Policies* in the Financial Aid functional area.

See [.../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).

### 7. Select Integration System > Configure Integration Attributes from the related actions menu of the integration system.

Specify or enable integration service attributes to configure your integration.

Example: Workday reports students who changed their status to leave of absence during the reporting academic period. To include students that have been on a leave of absence for longer than the reporting academic period, specify a value on the *Duration to Include Leave of Absence Students* integration attribute.

### 8. (Optional) Select Integration System > Configure Integration Field Overrides from the related actions menu of the integration system.

Configure overrides for any fields where you want to return values based on calculated fields or report fields on these business objects:

- Student, for student and contact data.
- Student Program of Study Record, for primary and additional programs of study.

Example: By default, Workday doesn't report a value for the *Good Student* field. You want to report students with a grade point average (GPA) of 3.5 and above as good students to the NSC. Create a *True/False Condition* calculated field that evaluates students against this requirement, and configure the *Good Student* field override with this calculated field. Workday then reports the *Good Student* field as Y for students with a 3.5 GPA and above.

### 9. Select Integration System > Configure Integration Maps from the related actions menu of the integration system.

Map internal values to the external values that Workday reports for these fields:

- *Gender*
- *Race/Ethnicity*
- *Class/Credential*

10.(Optional) Select Integration System > Configure Integration Population Eligibility from the related actions menu of the integration system.

You can specify an additional filter for the students you define in the integration launch criteria.

Example: Your standard Spring academic period contains 3 nonstandard academic periods: an intersession Winter term and 2 Spring terms. You want to run the enrollment report for only the Spring terms. Create a *True/False Condition* calculated field on the Student business object that returns false for the Winter students. Specify this calculated field as the Filter External Field. When you run the integration for the standard Spring academic period, the enrollment report includes only the Spring students and excludes the Winter students.

11.[Set Up Integration Delivery](#) on page 1952.

12.[Launch an Integration](#) on page 24.

Specify any launch parameters that your integration requires to identify your institution and define the scope of the output file.

Example: The enrollment report includes all students with enrollment data changes since the time and date that you specify on the *Last Enrollment Report Run Date* field when you launch the integration.

[2023R2 What's New Post: NSC Enrollment Reporting Outbound Integration](#)

[2023R1 What's New Post: National Student Clearinghouse Connectors](#)

[2022R1 What's New Post: NSC Enrollment Reporting Integration](#)

[2021R2 What's New Post: NSC Enrollment Reporting Integration](#)

## Concept: National Student Clearinghouse Connectors

Workday delivers these integration templates that you can use to extract and transmit data to the National Student Clearinghouse (NSC):

Template	Description
<i>NSC Degree Verify Outbound</i>	Extracts degree and graduation data from Workday and optionally delivers the output file directly to the NSC.
<i>NSC Enrollment Reporting Outbound</i>	Extracts student enrollment data from Workday and optionally delivers the output files directly to the NSC.

Note: Workday does not warrant, guarantee, or represent that Student reporting capabilities comply with National Student Clearinghouse (NSC) compliance standards or requirements. Customers are responsible for independently verifying their compliance with all state and federal legal and regulatory obligations.

The integrations consider which students to report based on the:

- Default OPEID on the federal student aid program policy of the student's primary program of study.
- *OPEID* and *Branch Code* integration criteria you specify when you launch the integration.

You can exclude specific programs of study or students from the output data by configuring these check boxes on the program of study:

- Exclude Program of Study from National Student Clearinghouse Reporting
- Exclude Students in Program of Study from National Student Clearinghouse Reporting

See [Create Programs of Study](#). For students with multiple programs of study, Workday excludes students that have at least 1 program of study with the Exclude Students in Program of Study from National Student Clearinghouse Reporting option selected.

## NSC Degree Verify Outbound

When you launch the *NSC Degree Verify Outbound* integration, Workday outputs the degree and graduation data:

- Following the guidelines specified in the NSC DegreeVerify Programming & Testing Guide.
- In tab-delimited and XLS file formats.

The output degree verification report includes students who complete their program of study within the date range you specify on the integration launch criteria, based on the program conferral date.

When students earn multiple credentials with the same conferral date, Workday reports:

- Separate detail records for each unique credential. Example: Bachelor of Arts and Bachelor of Science degrees.
- A single detail record when the credentials are the same. Example: 2 Bachelor of Arts degrees.

For students with a major program of study bundled with a minor program of study, Workday reports the minor program on the degree verification report when the:

- Minor program of study type is credential granting.
- Default credentials of the major and minor programs match.

## NSC Enrollment Reporting Outbound

When you launch the *NSC Enrollment Reporting Outbound* integration, Workday outputs the enrollment data:

- Following the guidelines specified in the NSC Enrollment Reporting Programming & Testing Guide.
- In tab-delimited and XLS file formats.

The output enrollment report covers all programs of study from all active student records, including students who are registered in an academic period or multiple periods with the same standard start and end dates. When you select multiple academic periods, the enrollment report includes registrations across multiple calendars.

Workday bases all campus-level program information on the primary program of study for the reporting academic period. Examples: Major, credential, and anticipated graduation date.

The integration looks at a student's continuous enrollment when reporting effective dates of enrollment status changes. Workday considers continuous enrollment based on the:

- Academic period types in the typical attendance pattern of the calendar policy for the student's primary program of study.
- Academic periods in which the student has registrations.

### Noncompulsory Academic Periods

Workday recommends that you set up typical attendance patterns to exclude noncompulsory academic period types. Example: Summer. See [Create Typical Attendance Patterns](#).

When a student has registrations in a noncompulsory academic period that isn't in the typical attendance pattern, Workday considers those registrations:

- Depending on the load status in the noncompulsory period, and in the academic periods before and after the noncompulsory period.
- For reporting the program enrollment status and status effective date.

Scenario	Consideration	Example
The student has a load status of less than half time in a noncompulsory academic period.	Workday ignores the noncompulsory period when looking for enrollment status changes.	<p>Your institution considers Summer as a noncompulsory academic period. A student has a load status of:</p> <ul style="list-style-type: none"> <li>• Full time in Spring 2023.</li> <li>• Less than half time in Summer 2023.</li> <li>• Full time in Fall 2023.</li> </ul> <p>When you run the enrollment report in Fall 2023, Workday reports the effective date of the full-time enrollment status as the start date of the Spring 2023 academic period, ignoring the Summer 2023 period.</p>
The student drops all courses during a noncompulsory academic period.	Workday doesn't include this student in the enrollment report in the noncompulsory period.	<p>Adam and Chris are both enrolled full-time in the Spring term and less-than-half-time in the Summer term. You ran a First of Term enrollment report for Summer. Adam then drops all Summer courses, and Chris withdraws from the Summer term.</p> <p>When you run a subsequent enrollment report in the Summer term, Workday:</p> <ul style="list-style-type: none"> <li>• Considers Adam as not enrolled and doesn't include him in the report.</li> <li>• Reports Chris with an enrollment status of W (Withdrawn).</li> </ul>
The student	Workday includes	David and Jamie were enrolled full-

Scenario	Consideration	Example
has a load status of half time or greater during the noncompulsory period, including changes in load status when the student adds or drops a course.	the noncompulsory academic period when looking for enrollment status changes.	time in Spring, and both are half-time in the Summer term. David drops a Summer course, bringing his load status to less than half time. Jamie drops all courses and is no longer enrolled in Summer. Both students return full-time in the Fall term.  When you run the Fall enrollment report, Workday reports both David and Jamie with an effective date of full-time enrollment status as the start date of the Fall academic period.
The student first attends the institution in the noncompulsory period with a load status of less than half time. Their load status doesn't change in the subsequent compulsory academic period.	Workday includes the noncompulsory academic period when looking for enrollment status changes.	A student has a less-than-half-time load status in both Summer and Fall terms for 2023.  When you run the enrollment report in Fall 2023, Workday reports the effective date of the less-than-half-time enrollment status as the start date of the Summer 2023 academic period.

## First of Term and Subsequent Reporting

The NSC accounts for changes in enrollment data across academic periods. Examples: Withdrawals, increased or decreased load statuses.

For the first enrollment report of the academic period, Workday:

- Doesn't compare enrollment data for students from previous academic periods.

- Includes only students enrolled as of the current date.

You can indicate a First of Term report when you launch the integration and configure these launch parameters:

Integration Criteria	Configuration
<i>Last Enrollment Report Run Date</i>	Leave blank.
<i>Standard Report</i>	Check the check box.

Workday recommends that you run the First of Term report after the *Last Add Date* to account for any changes in enrollment status while registration changes are open.

On the First of Term submission, select the *Report Inactive Students for First of Term* integration attribute to include students who initially enrolled for the reporting academic period but are no longer enrolled as of the report date.

For subsequent reports, Workday includes students with enrollment data changes since the date and time you specify in the *Last Enrollment Report Run Date* launch parameter.

#### Reporting Only Graduated Students

Workday enables you to generate an enrollment report with only the students who graduated with a conferral date in the specified academic periods.

To generate this report, enable the *NSC Enrollment Reporting Outbound – Non-Standard Report Options* integration service and configure these launch parameters:

Integration Criteria	Configuration
<i>Report Graduated Students Only</i>	Check the check box.
<i>Last Enrollment Report Run Date</i>	Leave blank.
<i>Standard Report</i>	Clear the check box.

#### Launch/Schedule Options

Workday provides these launch schedule options for National Student Clearinghouse integrations:

- Launch with an *Integration* step on a business process.
- Launch on schedule. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration retrieves any files from the endpoint.
- Launch immediately. You can launch the integration manually.

You can view all launch parameters as integration criteria on the Launch / Schedule Integration task.

For troubleshooting purposes, you can enable the *Debug Service* integration service. Workday provides launch parameters that you can use to specify which students to include or exclude in the output report.

## Reference: NSC Enrollment Reporting Outbound Connector

Note: Workday does not warrant, guarantee, or represent that Student reporting capabilities comply with National Student Clearinghouse (NSC) compliance standards or requirements. Customers are responsible for independently verifying their compliance with all state and federal legal and regulatory obligations.

This topic describes how Workday populates certain campus- and program-level fields in the output file of the NSC Enrollment Reporting Outbound integration:

Campus-Level Field	Excel Column
<a href="#">Enrollment Status on page 1314</a>	I
<a href="#">Status Start Date on page 1316</a>	J
<a href="#">Anticipated Graduation Date on page 1317</a>	Q
<a href="#">Term Begin Date on page 1317</a>	S
<a href="#">Term End Date on page 1317</a>	T
<a href="#">Class/Credential on page 1317</a>	AA
<a href="#">Race/Ethnicity on page 1317</a>	AF

Program-Level Field	Excel Column for Program 1
<a href="#">Program Begin Date on page 1318</a>	BC
<a href="#">Program Enrollment Status on page 1318</a>	BE
<a href="#">Program Enrollment Status Effective Date on page 1320</a>	BF

### Enrollment Status

Workday reports the *Enrollment Status* field based on the status of the student's primary program of study for the reporting period.

Description	Primary Program of Study Status	Enrollment Status
The student has started the program of study and has an academic workload.	<i>In Progress</i>	<p>Based on the load status calculation:</p> <ul style="list-style-type: none"> <li>• F (Full-time)</li> <li>• Q (3/4-time)</li> <li>• H (1/2-time)</li> <li>• L (Less-than-1/2-time or Part-time)</li> </ul>

Description	Primary Program of Study Status	Enrollment Status
The student has discontinued the program.	<i>Discontinued</i>	W (Withdrawn)
The student has been dismissed.	<i>Dismissed</i>	W
The student has withdrawn from the program.	<i>Institutional Withdrawal</i>	W
The student has dropped all registrations since the <i>Last Enrollment Report Run Date</i> value that you specified in the integration launch parameters.	Not applicable. The student is no longer enrolled for the reporting academic period.	W
The student is on an approved leave of absence.	<i>Leave of Absence</i>	<ul style="list-style-type: none"> <li>• A (Approved Leave of Absence).</li> <li>• W, when you select the <i>Report Leave of Absence as Withdrawn</i> integration attribute.</li> </ul>
The student has been suspended.	<i>Suspended</i>	W
The student has completed the requirements for graduation or the program of study in which they were enrolled.	<i>Completed</i>	G (Graduated)
The student is deceased and you completed the <i>Deceased Student Event</i> business process for the student.	Not applicable.	D (Deceased)

The load status calculation uses the student's registered units for all courses in the standard academic period. Workday provides options for you to configure the load status calculation to meet the requirements of your institution.

Default Load Status Calculation	Alternative Load Status Calculation	Configuration for Alternative Load Status Calculation
Based on the institution load status rules of the Load Status Policy.	Calculate the load status using the financial aid load status rules of the Load Status Policy.	<p>On the <i>Load Status Rules</i> integration attribute, select:</p> <ul style="list-style-type: none"> <li>• The <i>Override Default Values</i> check box.</li> <li>• <i>Financial Aid Load Status Rules</i>.</li> </ul>
Includes withdrawn units.	Exclude withdrawn units from the load status calculation.	Select the <i>Exclude Withdrawn Registrations</i> integration attribute.
Excludes financial aid units.	Include financial aid load status units in the load status calculation.	Select the <i>Include Financial Aid Load Units for Load Status Calculation</i> integration attribute.

Default Load Status Calculation	Alternative Load Status Calculation	Configuration for Alternative Load Status Calculation
Excludes audit units.	Include audit units in the load status calculation when using institution load status rules.	<p>On the load status rule set, select the <b>Include Audit Grading Basis</b> check box.</p> <p><a href="#">See Set Up Load Status Policies.</a></p>

## Status Start Date

On the First of Term report, Workday reports the *Status Start Date* field as space fill.

On subsequent reports, Workday reports the *Status Start Date* field as the date of change of the enrollment status for the primary program of study.

Enrollment Status	Status Start Date
Based on the load status: <ul style="list-style-type: none"> <li>• F (Full-time)</li> <li>• Q (3/4-time)</li> <li>• H (1/2-time)</li> <li>• L (Less-than-1/2-time or Part-time)</li> </ul>	<p>The effective date of the current load status, determined as the latest date of the:</p> <ul style="list-style-type: none"> <li>• Start date of the first academic period the student was enrolled in the program of study.</li> <li>• Add or drop course registration date that changed the load status after the <i>Last Add Date</i> within the reporting academic period or previous academic periods.</li> <li>• Start date of the reporting standard academic period during which the load status changed, compared to the prior reporting academic period.</li> </ul> <p>Workday:</p> <ul style="list-style-type: none"> <li>• Accounts for registration unit changes that affect load status. Example: A student takes a variable credit course.</li> <li>• Accounts for backdated registration changes that affect load status. Example: An administrator adds or drops course sections for a student who registered late.</li> <li>• Doesn't account for load status changes within the same day. Example: A student drops a 4-unit course in the morning, which changes their load status from full-time to part-time. They then register for a 4-unit course in the afternoon on the same day, bringing their load status back to full-time. Workday won't report that day as the status start date.</li> </ul>
W (Withdrawn)	<p>The effective date of when the student:</p> <ul style="list-style-type: none"> <li>• Discontinued the program of study.</li> <li>• Was dismissed.</li> <li>• Withdrew from the program.</li> <li>• Dropped all registrations.</li> </ul>

Enrollment Status	Status Start Date
A (Approved Leave of Absence)	The effective date of the leave of absence.
G (Graduated)	<p>The program conferral date.</p> <p>You can report a different date for this field by configuring the <i>Graduated Status Effective Date</i> field override in the Primary Program of Study field override section.</p> <p>Example: You can use these report fields on the Student Program of Study Record business object:</p> <ul style="list-style-type: none"> <li>• Conferral Academic Period End Date</li> <li>• Program Completion Date</li> </ul>
D (Deceased)	The student's date of death.

### Anticipated Graduation Date

Workday reports the *Anticipated Graduation Date* field as the Expected Completion Date on the student's primary program of study record.

### Term Begin Date

Workday reports the *Term Begin Date* field as the Start Date of the standard academic period that you specified in the integration launch parameters.

Alternatively, you can configure this field to report the earliest start date of courses in which the student is enrolled by selecting the *Term Begin and End Dates Using Student Registrations* integration attribute.

### Term End Date

Workday reports the *Term End Date* field as the End Date of the standard academic period that you specified in the integration launch parameters.

Alternatively, you can configure this field to report the latest end date of courses in which the student is enrolled by selecting the *Term Begin and End Dates Using Student Registrations* integration attribute.

### Class/Credential

Workday reports the *Class/Credential* field as the external value from the:

- *Credential* integration map, based on the student's educational credentials.
- *Class* integration map when the credential maps to an external field value of B (Bachelor's), based on the student's class standing.

To report the class and credential to the NSC according to Integrated Postsecondary Education Data System (IPEDS) guidelines, map the corresponding class values for credentials that might require it.

Example: You want to report fifth-year undergraduate students as seniors in a bachelor's degree program to the NSC. Configure the *Class* integration map to associate a class standing of *Fifth Year* to an external field value of R.

### Race/Ethnicity

Workday reports the *Race/Ethnicity* field based on the student's ethnicity and citizenship status.

Description	Race/Ethnicity
The student has a citizenship status mapped to the <i>IPEDS Non-Resident Alien</i> option on the Maintain Citizenship Statuses task.	A (Nonresident Alien)
The student identifies as Hispanic or Latino.	H (Hispanic)
The student has multiple Race/Ethnicity values.	TM (Two or More Race/Ethnicity Categories)
The student has a Race/Ethnicity value.	<ul style="list-style-type: none"> <li>The corresponding external value from the <i>Ethnicity</i> integration map.</li> <li>Space fill, when there is no corresponding mapping.</li> </ul>
The student: <ul style="list-style-type: none"> <li>Doesn't have an ethnicity value.</li> <li>Doesn't identify as Hispanic or Latino.</li> <li>Isn't a nonresident.</li> </ul>	Space fill.

You can report this field as:

- A different value by configuring the *Race/Ethnicity* integration field override.
- Space fill by configuring the *Report Space Fill for Optional Fields* integration attribute.

When you configure both the field override and integration attribute, Workday returns the value from the field override instead of space fill.

### Program Begin Date

Workday reports the *Program Begin Date* field as the date on which the student began attending the program. You can find this value as the Declare Date on the student's program of study record.

You can report a different date for this field by configuring the *Program Begin Date* field override in these override sections:

- Primary Program of Study
- Additional Programs of Study

Example: To return the academic period start date, create a calculated field using the Program Begin Academic Period report field on the Student Program of Study Record business object. Configure the *Program Begin Date* integration field override with this calculated field.

### Program Enrollment Status

Workday reports the *Program Enrollment Status* field based on the student's enrollment status for each of their programs of study. The program-level enrollment status matches the campus-level enrollment status, except when students graduate or withdraw from only 1 of multiple programs of study.

Description	Program of Study Status	Program Enrollment Status
The student has started the program of study and has an academic workload.	<i>In Progress</i>	<p>Based on the load status calculation:</p> <ul style="list-style-type: none"> <li>F (Full-time)</li> <li>Q (3/4-time)</li> <li>H (1/2-time)</li> <li>L (Less-than-1/2-time or Part-time)</li> </ul>

Description	Program of Study Status	Program Enrollment Status
The student has discontinued the program.	<i>Discontinued</i>	W (Withdrawn)
The student has been dismissed.	<i>Dismissed</i>	W
The student has withdrawn from the program.	<i>Institutional Withdrawal</i>	W
The student has dropped all registrations since the <i>Last Enrollment Report Run Date</i> value that you specified in the integration launch parameters.	Not applicable. The student is no longer enrolled for the reporting academic period.	W
The student is on an approved leave of absence.	<i>Leave of Absence</i>	<ul style="list-style-type: none"> <li>• A (Approved Leave of Absence).</li> <li>• W, when you select the <i>Report Leave of Absence as Withdrawn</i> integration attribute.</li> </ul>
The student has been suspended.	<i>Suspended</i>	W
The student has completed the requirements for graduation or the program of study in which they were enrolled.	<i>Completed</i>	G (Graduated)
The student is deceased.	Not applicable.	D (Deceased)

The load status calculation uses the student's registered units for all courses in the standard academic period. Workday provides options for you to configure the load status calculation to meet the requirements of your institution.

Default Load Status Calculation	Alternative Load Status Calculation	Configuration for Alternative Load Status Calculation
Based on the institution load status rules of the Load Status Policy.	Calculate the load status using the financial aid load status rules of the Load Status Policy.	<p>On the <i>Load Status Rules</i> integration attribute, select:</p> <ul style="list-style-type: none"> <li>• The <i>Override Default Values</i> check box.</li> <li>• <i>Financial Aid Load Status Rules</i>.</li> </ul>
Includes withdrawn units.	Exclude withdrawn units from the load status calculation.	Select the <i>Exclude Withdrawn Registrations</i> integration attribute.
Excludes financial aid units.	Include financial aid load status units in the load status calculation.	Select the <i>Include Financial Aid Load Units for Load Status Calculation</i> integration attribute.
Excludes audit units.	Include audit units in the load status calculation when using institution load status rules.	On the load status rule set, select the <i>Include Audit Grading Basis</i> check box.

Default Load Status Calculation	Alternative Load Status Calculation	Configuration for Alternative Load Status Calculation
		<a href="#">See Set Up Load Status Policies.</a>

### Program Enrollment Status Effective Date

Workday reports the *Program Enrollment Status Effective Date* field as the date of change of the enrollment status for the program of study.

Program Enrollment Status	Program Enrollment Status Effective Date
Based on the load status: <ul style="list-style-type: none"> <li>• F (Full-time)</li> <li>• Q (3/4-time)</li> <li>• H (1/2-time)</li> <li>• L (Less-than-1/2-time or Part-time)</li> </ul>	<p>The effective date of the current load status, determined as the latest date of the:</p> <ul style="list-style-type: none"> <li>• Start date of the first academic period the student was enrolled in the program of study.</li> <li>• Declare date when the student began attending their program of study.</li> <li>• Add or drop course registration date that changed the load status after the <i>Last Add Date</i> within the reporting academic period or previous academic periods.</li> <li>• Start date of the reporting standard academic period during which the load status changed, compared to the prior reporting academic period.</li> </ul> <p>Workday:</p> <ul style="list-style-type: none"> <li>• Accounts for registration unit changes that affect load status. Example: A student takes a variable credit course.</li> <li>• Accounts for backdated registration changes that affect load status. Example: An administrator adds or drops course sections for a student who registered late.</li> <li>• Doesn't account for load status changes within the same day. Example: A student drops a 4-unit course in the morning, which changes their load status from full-time to part-time. They then register for a 4-unit course in the afternoon on the same day, bringing their load status back to full-time. Workday won't report that day as the program enrollment status effective date.</li> </ul>
W (Withdrawn)	The effective date of when the student: <ul style="list-style-type: none"> <li>• Discontinued the program of study.</li> <li>• Was dismissed.</li> <li>• Withdrawn from the program.</li> <li>• Dropped all registrations.</li> </ul>
A (Approved Leave of Absence)	The effective date of the leave of absence.
G (Graduated)	The program conferral date.

Program Enrollment Status	Program Enrollment Status Effective Date
	<p>You can report a different date for this field by configuring the Graduated Status Effective Date field override in these field override sections:</p> <ul style="list-style-type: none"> <li>• Primary Program of Study</li> <li>• Additional Programs of Study</li> </ul> <p>Example: Use these report fields on the Student Program of Study Record business object:</p> <ul style="list-style-type: none"> <li>• Conferred Academic Period End Date</li> <li>• Program Completion Date</li> </ul>
D (Deceased)	The student's date of death.

## Student Admissions Connectors

### Steps: Set Up Integration to Import Student Admissions Data

#### Prerequisites

- (Education Test Result Inbound Connector only) Create any custom education tests in your tenant. See [Create Education Tests](#).
- Security: These domains in Integration functional area:
  - *Integration Build*
  - *Integration Configure*

#### Context

You can create integrations to import student test result and transcript files into Workday from an external endpoint, including:

- Education test results for standardized tests. Examples: ACT and SAT.
- Education test results for custom education tests. Examples: Institution-specific tests and standardized tests that Workday doesn't support.
- External transcripts from educational institutions.

Note: Workday designs these integrations based on guidance from the organizations that define the file formats for test results and external transcripts. We recommend that you only work with files from the record provider. If you use files from another source, the integration might fail.

If you need to modify the files, we recommend that you use a text editor to maintain the original file format.

## Steps

1. [Create Integration System](#) on page 1967.

From the New Using Template prompt, select the applicable integration template:

- *ACT Education Test Result Inbound*
- *AP Education Test Result Inbound*
- *Education Test Result Inbound Connector*
- *GMAT Education Test Result Inbound*
- *GRE Education Test Result Inbound*
- *PERT Education Test Result Inbound*
- *SAT Education Test Result Inbound*
- *SPEEDE External Transcript Inbound*
- *TOEFL Education Test Result Inbound*

2. (TOEFL Education Test Result Inbound) Select **Integration System > Configure Integration Services** from the related actions menu of the integration system.

Enable the *Dynamic Maps Service - Country Region* integration service. Workday recommends that you enable this optional service to reduce the number of address-related errors due to invalid country region mapping.

3. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the:

- *Reports: Students* domain in the Student Core functional area.
- *Education Test Result Data Load Event* business process.
- (SPEEDE External Transcript Inbound) *Manage: Student External Transcripts* domain in the Academic Foundation functional area.

See [Steps: Grant Integration or External Endpoint Access to Workday](#).

4. Select **Integration System > Configure Integration Attributes** from the related actions menu of the integration system.

Specify or enable integration service attributes.

Example: The *SAT Education Test Result Inbound* integration template supports file layouts of different years in delimited and fixed-width formats. On the *Input File Layout* attribute, you can specify the layout and format of the files you'll import with the integration.

(SPEEDE External Transcript Inbound) The *Do Not Create Educational Institution* attribute enables you to prevent Workday from creating new educational institutions when importing external transcripts. By default, Workday creates educational institutions when importing transcripts from institutions that don't already exist in Workday.

5. Select **Integration System > Configure Integration Maps** from the related actions menu of the integration system.

Map external values in the input file to internal values in Workday.

6. [Set Up Integration Retrieval](#) on page 1957.

7. [Launch an Integration](#) on page 24.

## Concept: Student Admissions Connectors

Student admissions integrations import test result and transcript files into Workday from an external endpoint. Workday provides these integration templates to support different test result and transcript file formats:

Note: Workday designs these integrations based on guidance from the organizations that define the file formats for test results and external transcripts. We recommend that you only work with files from the record provider. If you use files from another source, the integration might fail.

If you need to modify the files, we recommend that you use a text editor to maintain the original file format.

Template	Description
<i>ACT Education Test Result Inbound</i>	<p>Imports ACT (formerly American College Testing) test results. The template supports the ACT College Score Reporting Service Layout for the current year.</p> <p>On the <i>ACT Reporting Service</i> integration attribute, select <i>ACT Internet Reporting Option - CSV</i>.</p>
<i>AP Education Test Result Inbound</i>	<p>Imports Advanced Placement (AP) Electronic Score Reports in the file format for the current year.</p>
<i>Education Test Result Inbound Connector</i>	<p>Imports generic test result data. The template supports import of test data in a Workday-defined XML file format, for up to 50 test sections.</p>
<i>GMAT Education Test Result Inbound</i>	<p>Imports Graduate Management Admission Test (GMAT) test results. The template supports the:</p> <ul style="list-style-type: none"> <li>GMAT Optional Score Reporting Layout file format.</li> <li>GMAT Focus Edition exam scores.</li> </ul>
<i>GRE Education Test Result Inbound</i>	<p>Imports Graduate Record Examination (GRE) test results. The template supports the GRE Optional Score Reporting Record Layout file format.</p>
<i>PERT Education Test Result Inbound</i>	<p>Imports Postsecondary Education Readiness Test (PERT) test results. The template supports these College Success file formats, and requires that the filenames be unchanged from the standard naming convention:</p> <ul style="list-style-type: none"> <li>Examinee File. Expected filename: examinees-YYYY-MM-DD-hh-mm-ss.csv</li> <li>Test File. Expected filename: tests-YYYY-MM-DD-hh-mm-ss.csv</li> </ul>
<i>SAT Education Test Result Inbound</i>	<p>Imports SAT (formerly Scholastic Assessment Test) test results. The template supports:</p> <ul style="list-style-type: none"> <li>File format versions for the current and previous fiscal years.</li> <li>Only import of SAT scores, and not SAT Subject Test scores.</li> </ul>
<i>SPEEDE External Transcript Inbound</i>	<p>Imports student transcripts from the National Student Clearinghouse Standardization of Postsecondary Education Electronic Data Exchange (SPEEDE) service. The template supports the TS 130 Student Educational Record (Transcript) data standard from the Postsecondary Electronic Standards Council (PESC).</p>
<i>TOEFL Education Test Result Inbound</i>	<p>Imports Test of English as a Foreign Language (TOEFL) test results. The template supports the TOEFL Score Reporting Layout file format.</p>

## Launch/Schedule Options

Workday provides these launch schedule options for Student Admissions integrations:

- Launch with an *Integration* step on a business process.
- Launch on schedule. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration retrieves any files from the endpoint.
- Launch immediately. You can launch the integration manually.

## Reference: Education Test Result Inbound Connector File Schema

To import education test result data into Workday, the Education Test Result Inbound Connector requires all files to be in this XML format.

### XML Elements

The XML schema for inbound education test result data includes these elements:

Element	Level	Details and Validations
Education_Test_Result_Records	1	Top-level element of document.
Education_Test_Result_Record	2	Container for following level 3 elements. Contains all test results for a single academic person. Schema requires at least 1 element and permits multiple elements.
Academic_Person	3	Container for following level 4 elements. Contains all data for an academic person except the test results. Schema requires this element and permits 1 element for each <i>Education_Test_Result_Record</i> .
First_Name	4	Must be in <i>string</i> format.
Last_Name	4	Must be in <i>string</i> format.
Date_of_Birth	4	Must be in <i>date</i> format.
Country_Reference	4	Must be in <i>string</i> format.
Address_Line_1	4	Must be in <i>string</i> format.
Address_Line_2	4	Must be in <i>string</i> format.
Address_Line_3	4	Must be in <i>string</i> format.
Address_Line_4	4	Must be in <i>string</i> format.
City	4	Must be in <i>string</i> format.
State_Province	4	Must be in <i>string</i> format.
Postal_Code	4	Must be in <i>string</i> format.
Telephone_Number	4	Must be in <i>string</i> format.
Email_Address	4	Must be in <i>string</i> format.
Gender	4	Must be in <i>string</i> format.
Ethnicity	4	Must be in <i>string</i> format. Schema permits multiple elements.
Hispanic_or_Latino	4	Must be in <i>boolean</i> format.
Extracurricular_Activity	4	Must be in <i>string</i> format. Schema permits multiple elements.

Element	Level	Details and Validations
Education_Test_Result	3	Container for following level 4 elements. Schema permits multiple elements.
Test_Date	4	Must be in <i>date</i> format.
Registrant_ID	4	Must be in <i>string</i> format.
Section_1_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_2_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_3_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_4_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_5_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_6_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_7_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_8_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_9_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_10_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_11_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_12_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_13_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_14_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_15_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_16_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_17_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_18_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_19_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_20_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_21_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_22_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_23_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_24_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_25_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_26_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_27_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_28_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_29_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_30_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_31_Score	4	Must be in <i>short</i> (32 bit signed integer) format.

Element	Level	Details and Validations
Section_32_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_33_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_34_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_35_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_36_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_37_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_38_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_39_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_40_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_41_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_42_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_43_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_44_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_45_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_46_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_47_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_48_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_49_Score	4	Must be in <i>short</i> (32 bit signed integer) format.
Section_50_Score	4	Must be in <i>short</i> (32 bit signed integer) format.

</xs:complexType>
</xs:element>
</xs:schema>
```

## Student Financial Aid Connectors

### Steps: Set Up Student Alternative Loan Integrations

#### Prerequisites

Create an award item that represents alternative loans.

#### Context

You can create integrations that:

- Help you manage alternative loan application information you receive from a loan servicer.
- Compile and create files with information from certified alternative loan applications for transmission to the loan servicer.
- Import disbursement roster information from the loan servicer.
- Compile and create files with information from changed alternative loan applications to transmit to the loan servicer.

These integrations enable you to keep your information in sync with the loan servicer. They also drive the processing of alternative loans so that you can disburse the awards to students.

## Steps

1. Create Integration System on page 1967.

From the New Using Template prompt, select the applicable integration template:

- *Alternative Loan Application Send Response Inbound*
- *Alternative Loan Application Send Outbound*
- *Alternative Loan Disbursement Roster Inbound*
- *Alternative Loan Application Change Send Outbound*

The *Alternative Loan Application Send Response Inbound* integration template imports these files from the loan servicer:

- Initial loan application certification requests.
- Responses to certified loan applications.
- Responses to loan application changes.

You might need to configure multiple versions of the *Alternative Loan Application Send Response Inbound* template to distinguish between new applications and updates to existing applications if:

- Your loan servicer uses separate file extensions to transmit files to your institution.
- You configure Document Retrieval.

2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

- *Integration Build* and *Integration Configure* in the Integration functional Area.
- *Manage: Student Loan Applications* in the Financial Aid functional Area.

See [..../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).

3. Select Integration System > Configure Integration Attributes from the related actions menu of the integration system.

Enter integration service attributes.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area:

4. Launch an Integration on page 24.

## Steps: Set Up Student Financial Aid Data Integrations

### Context

You can create integrations that export and import student financial aid data to and from the U.S. Department of Education (ED).

## Steps

1. Create Integration System on page 1967.

From the New Using Template prompt, select the applicable integration template:

- *COD Counseling Inbound*
- *COD Inbound*
- *COD Informed Borrower Inbound*
- *COD Loan App and Credit Status Inbound*
- *COD MPN Inbound*
- *COD Outbound*
- *COD TEACH Agreement to Serve Inbound*
- *COD TEACH Grant Entrance Counseling Inbound*
- *ISIR Correction Outbound*
- *ISIR File Inbound*
- *TSM and FAH NSLDS Transaction Inbound*
- *TSM and FAH NSLDS Transaction Outbound*

**Security:** *Integration Build* and *Integration Configure* domains in Integration functional area.

The Configure Integration Services task displays all integration services, including required services. Required integration services aren't editable.

2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

Template	Domains
<i>COD Counseling Inbound</i>	<ul style="list-style-type: none"> <li>• <i>Integration Event</i></li> <li>• <i>Manage: Financial Aid</i></li> </ul>
<i>COD Inbound</i>	<ul style="list-style-type: none"> <li>• <i>Integration Event</i></li> <li>• <i>Manage: Financial Aid</i></li> </ul>
<i>COD Informed Borrower Inbound</i>	<ul style="list-style-type: none"> <li>• <i>Integration Event</i></li> <li>• <i>Integration Reports</i></li> </ul>
<i>COD Loan App and Credit Status Inbound</i>	<ul style="list-style-type: none"> <li>• <i>Integration Event</i></li> <li>• <i>Manage: Student Loan Application</i></li> </ul>
<i>COD MPN Inbound</i>	<ul style="list-style-type: none"> <li>• <i>Integration Event</i></li> <li>• <i>Manage: Financial Aid</i></li> </ul>
<i>COD Outbound</i>	<ul style="list-style-type: none"> <li>• <i>Integration Event</i></li> <li>• <i>Manage: Financial Aid</i></li> </ul>
<i>COD TEACH Agreement to Serve Inbound</i>	<ul style="list-style-type: none"> <li>• <i>Integration Event</i></li> <li>• <i>Manage: Financial Aid</i></li> </ul>
<i>COD TEACH Grant Entrance Counseling Inbound</i>	<ul style="list-style-type: none"> <li>• <i>Integration Event</i></li> <li>• <i>Manage: Financial Aid</i></li> </ul>
<i>ISIR Correction Outbound</i>	<ul style="list-style-type: none"> <li>• <i>Integration Event</i></li> <li>• <i>Manage: ISIR</i></li> </ul>
<i>ISIR File Inbound</i>	<ul style="list-style-type: none"> <li>• <i>Integration Event</i></li> <li>• <i>Manage: ISIR</i></li> </ul>
<i>TSM and FAH NSLDS Transaction Inbound</i>	<ul style="list-style-type: none"> <li>• <i>Integration Event</i></li> <li>• <i>Manage: Packaging Processing</i></li> </ul>
<i>TSM and FAH NSLDS Transaction Outbound</i>	<ul style="list-style-type: none"> <li>• <i>Integration Event</i></li> </ul>

Template	Domains
	<ul style="list-style-type: none"> <li>• <i>Manage: Packaging Processing</i></li> </ul>

See [..../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).

3. Select Integration System > Configure Integration Attributes from the related actions menu of the integration system.  
Enter integration service attributes.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
4. (Inbound integrations) Set Up Integration Retrieval on page 1957.
5. (Outbound integrations) Set Up Integration Delivery on page 1952.
6. Launch an Integration on page 24.

## Steps: Set Up TSM and FAH NSLDS Transaction Outbound Integration

### Prerequisites

- Security:
  - These domains in the Integration functional area:
    - *Integration Build*
    - *Integration Configure*
  - These domains in the Financial Aid functional area:
    - *Manage: Financial Aid Transfer Monitoring Date*
    - *Manage: NSLDS - USA*
    - *Manage: Packaging Processing*

### Context

You can set up the *TSM and FAH NSLDS Transaction Outbound* integration to export requests to the Department of Education for:

- Student financial aid histories (FAH).
- Adding students to Transfer Student Monitoring (TSM).

### Steps

1. Access the Create Integration System task.
  - a) From the New Using Template prompt, select *TSM and FAH NSLDS Transaction Outbound*.
  - b) Click OK.
2. On the Configure Integration Services page, enable the data initialization service that best meets your needs:

Option	Description
TSM and FAH NSLDS Transaction Outbound Data (Filtered)	<p>Has these launch parameters:</p> <ul style="list-style-type: none"> <li>• Transfer Student Monitoring and Financial Aid History Selection</li> <li>• Days Prior to Anticipated Start</li> <li>• Monitoring Duration Days</li> <li>• OPEID</li> <li>• Branch Code</li> </ul>

Option	Description
	<p>Based on Workday-delivered logic, the student record will be included in the output file if they meet the following criteria:</p> <ul style="list-style-type: none"> <li>• The academic unit matches the academic unit of the OPEID branch code (as configured on your federal student aid program policies).</li> <li>• The student's academic record status is <i>Active</i> or <i>Enrolled</i>.</li> <li>• The Transfer Monitoring Date is blank or at least the specified number of days prior to the day configured in the launch parameters.</li> <li>• The student is either: <ul style="list-style-type: none"> <li>• Currently enrolled and has an ISIR record for the current academic year.</li> <li>• Not currently enrolled, the ISIR record for their anticipated start year exists, and the anticipated start date is at least the specified number of days prior to today as configured in the launch parameters.</li> </ul> </li> </ul>
TSM and FAH NSLDS Transaction Outbound Data (Unfiltered)	<p>Has these launch parameters:</p> <ul style="list-style-type: none"> <li>• Transfer Student Monitoring and Financial Aid History Selection</li> <li>• OPEID</li> <li>• Branch Code</li> </ul> <p>Based on Workday-delivered logic, the student record will be included in the output file if they meet the following criteria:</p> <ul style="list-style-type: none"> <li>• The academic unit matches the academic unit of the OPEID branch code (as configured on your federal student aid program policies).</li> <li>• The student's academic record status is <i>Active</i>.</li> </ul>

3. Configure required integration attributes by selecting Integration System > Configure Integration Attributes from the related actions menu of the integration system.
4. [Set Up Integration Sequence Generators](#) on page 1969.
5. [Set Up Integration Delivery](#) on page 1952.
6. Create an integration system user (ISU) for your integration. See [Steps: Grant Integration or External Endpoint Access to Workday](#).
7. [Define Password Rules](#).

Add your ISU to the System Users exempt from password expiration prompt.

8. (Optional) To configure further filtering of your integration data, select Integration System > Configure Integration Population Eligibility from the related actions menu of the integration system.
  - a) From the Filter External Field prompt, select either a boolean field on the Academic Record business object or add a calculated field.
 

Note: If you select a nonboolean field, your integration output will be blank. Workday prioritizes the delivered logic, evaluates the record based on the launch parameters, and then applies the criteria included in the *Integration Population Eligibility* conditions. The delivered logic and launch parameters don't need to be duplicated within the conditions.
  - b) Grant your ISU access to any additional security domains required for the Filter External Field you select.

## Result

When reporting Enrollment Begin Date to NSLDS, Workday uses the Period Start Date of the earliest financial aid period record for which the student has a projected or actual load status other than *Not Enrolled*. If this date is more than 90 days before the current date, NSLDS won't monitor the student even though the integration adds a Transfer Monitoring Date to their financial aid record.

## Next Steps

[Launch an Integration](#) on page 24.

[Transfer Student Monitoring Next Level](#)

## Concept: Student Financial Aid Connectors

Workday provides student financial aid integrations that enable you to exchange data with the U.S. Department of Education (ED) or alternative loan servicers. Student financial aid integrations support these types of transactions:

- Alternative loan applications.
- Common Origination and Disbursement (COD).
- Institutional Student Information Records (ISIR).
- Transfer Student Monitoring (TSM) and Financial Aid History (FAH).

When you use Workday integrations to interchange files with ED, you can import and export files only through your institution's Secure File Transfer Protocol (SFTP) site. If you send and receive files from ED using your institution's Student Aid Internet Gateway (SAIG) Mailbox, you must transfer them to an SFTP site to use them with Workday integrations.

When you use TD Client, include Headers and Trailers in your outbound integration systems to import files to ED.

## Alternative Loan Applications

Template	Description
<i>Alternative Loan Application Send Outbound</i>	<p>Compiles and creates a file with information from certified alternative loan applications to send to the loan servicer.</p> <p>When transmitted, Workday updates the status of the relevant alternative loan applications to <i>Certification: Transmitted</i>.</p> <p>In the outbound file, Workday outputs the File Creation Date and File Transmission Date values</p>

Template	Description
	based on the timestamp of the integration launch in Pacific Standard Time (PST).
<i>Alternative Loan Application Send Response Inbound</i>	<p>Imports alternative loan application information from a loan servicer. The integration supports:</p> <ul style="list-style-type: none"> <li>Initial loan application certification requests.</li> <li>Responses to certified loan applications.</li> <li>Responses to loan application changes.</li> </ul> <p>You might need to configure multiple versions of this template to distinguish between new applications and updates to existing applications if:</p> <ul style="list-style-type: none"> <li>Your loan servicer uses separate file extensions to transmit files to your institution.</li> <li>You've configured Document Retrieval.</li> </ul>
<i>Alternative Loan Application Change Send Outbound</i>	<p>Compiles and creates a file with information from changed alternative loan applications to send to the loan servicer.</p> <p>When transmitted, Workday updates the status of the relevant alternative loan applications to <i>Change: Transmitted</i>.</p> <p>In the outbound file, Workday outputs the File Creation Date and File Transmission Date values based on the timestamp of the integration launch in PST.</p>
<i>Alternative Loan Disbursement Roster Inbound</i>	Imports loan servicer disbursement roster information.

## COD

Template	Description
<i>COD Campus Based Inbound</i>	<p>Imports COD response files from ED related to students' Federal Work-Study earnings for a calendar year. Supports processing of CRCBMYOP message class files from ED.</p> <p>You can view integration event details on the Find COD Campus Based Event Histories report.</p>
<i>COD Campus Based Outbound</i>	<p>Compiles and creates a file with information about students' Federal Work-Study earnings paid in the calendar year. Supports processing of CRCBMYIN message class files from ED.</p> <p>You can view integration event details on the Find COD Campus Based Event Histories report. Outbound file data won't display until you run the <i>COD Campus Based Inbound</i> integration.</p> <p>In the outbound file, Workday outputs the &lt;DocumentID&gt; and &lt;CreatedDateTime&gt; values</p>

Template	Description
	based on the timestamp of the integration launch in PST.
<i>COD Counseling Inbound</i>	<p>Imports entrance and exit loan counseling results data from ED into Workday. Supports processing of CRECMYOP message class files from ED, and these counseling types:</p> <ul style="list-style-type: none"> <li>• DLSEntranceCounseling – Subsidized and Unsubsidized Loans.</li> <li>• DLPEntranceCounseling – Subsidized, Unsubsidized, and PLUS Loans.</li> <li>• TEACHCounseling – Initial and Subsequent Counseling for TEACH Grants.</li> <li>• StudentLoanCounseling – Financial Awareness Counseling.</li> </ul> <p>When you launch the integration, Workday automatically updates the completion date of the action item for students who have awards with counseling action items.</p>
<i>COD Inbound</i>	<p>Imports COD response files generated by ED. Supports processing of COMRECOP message class files from ED.</p> <p>Workday uses the <i>School Message</i> COD XML tag from the COD Outbound file to ensure that the information on the Inbound file matches the correct student, award, and award year.</p> <p>You can view the COD event history for an award by accessing the Total Financial Assistance report.</p>
<i>COD Informed Borrower Inbound</i>	<p>Imports data from ED, such as:</p> <ul style="list-style-type: none"> <li>• <i>Informed Borrowing Completion</i></li> <li>• <i>Informed Borrowing Date of Completion</i></li> <li>• <i>Informed Borrowing ID</i></li> </ul> <p>Supports processing of CRIBYYOP message class files from ED.</p> <p>When you launch the integration and the student doesn't have an award with an Informed Borrower action item, Workday doesn't create or update any data.</p>
<i>COD MPN Inbound</i>	<p>Imports Master Promissory Note (MPN) data from ED. Supports processing of CRPNXOP message class files from ED.</p> <p>When you launch the integration, Workday auto-completes MPN action items for awards with an MPN status of <i>Accepted</i> or <i>Pending</i>.</p>
<i>COD Loan App and Credit Status Inbound</i>	<p>Imports student loan application and credit status data from the COD website. Supports processing of CRCSYOP and CRSPYYOP message class</p>

Template	Description
	<p>files from ED. CRCSYYOP and CRSPYYOP include Grad PLUS and Parent PLUS loan data.</p> <p>Workday compares PLUS loan application information to personal information on a student's Workday profile. Workday matches PLUS loan applications to students based on:</p> <ul style="list-style-type: none"> <li>• The first 2 characters of the student's first name.</li> <li>• The student's full last name.</li> <li>• The student's Social Security Number (SSN).</li> <li>• The student's date of birth.</li> </ul> <p>To view the status of an integration data load, use the <a href="#">View Student Loan Application Credit Status Data Load report</a> (secured to the <i>Manage: Student Loan Application</i> domain). You can find the report on the Child Processes tab of the <i>COD PLUS Inbound</i> integration event.</p>
<i>COD Outbound</i>	<p>Compiles and creates a file with information about students' federal award program details. Sends origination, anticipated disbursement, and actual disbursement data based on the awards in the student's financial aid package. Supports processing of COMRECIN message class files from ED.</p> <p>Workday:</p> <ul style="list-style-type: none"> <li>• Sends full COMRECIN details of awards and disbursements that have a COD status of Ready to Transmit.</li> <li>• Uses the COD XML tag from the COD Outbound file to ensure that the information on the Inbound file matches the correct student, award, and award year.</li> <li>• Uses the COD XML tag from the COD Outbound file to ensure that the information on the Inbound file matches the correct student, award, and award year.</li> <li>• Outputs the &lt;DocumentID&gt;, &lt;CreatedDateTime&gt;, and &lt;FinancialAwardCreateDate&gt; values in the outbound file based on the timestamp of the integration launch in PST.</li> <li>• Saves the COD Origination Status Date on the student award based on the timestamp of the integration launch in PST.</li> </ul> <p>You can view the COD event history for an award by accessing the <a href="#">Total Financial Assistance report</a>.</p>

Template	Description
<i>COD TEACH Agreement to Serve Inbound</i>	Imports the <i>TEACH Agreement to Serve ID</i> of students who complete the TEACH Grant Agreement to Serve requirement for a financial aid award year from ED. Supports processing of CRATYYOP message class files from ED.
<i>COD TEACH Grant Entrance Counseling Inbound</i>	Imports the <i>TEACH Grant Entrance Counseling Date</i> of students who complete the TEACH Grant Entrance Counseling requirement for a financial aid award year from ED. Supports processing of CRACYYOP message class files from ED.

## ISIR

Workday updates ISIR integrations annually to support regulatory changes mandated by ED. See [Setup Considerations: ISIR Processing](#).

Template	Description
<i>ISIR Correction Outbound</i>	Sends your corrections to ED. Supports processing of CORRyyIN message class files from ED. See <a href="#">Steps: Set Up Integration to Export ISIR Corrections</a> .
<i>ISIR File Inbound</i>	<p>Imports the student's ISIR received by the FAFSA Processing System (FPS). Workday automatically attempts to associate ISIRs with existing prospects, applicants, or matriculated students. When the ISIR doesn't match any profile in Workday, Workday creates an ISIR-only record and attempts to match this record to new prospects, applicants, or matriculated students.</p> <p>See <a href="#">Concept: Student Match and Merge</a>.</p> <p>This template supports these message classes:</p> <ul style="list-style-type: none"> <li>• IDSA##OP – Daily ISIRs.</li> <li>• IDAP##OP – Daily ISIRs. ISIRs generated as a result of a paper processed FAFSA.</li> <li>• IGCO##OP – FPS Daily ISIRs. ISIRs generated by institutional corrections.</li> <li>• IGSA##OP – FPS Pushed ISIRs.</li> <li>• IGSG##OP – FPS Pushed ISIRs - System Generated.</li> <li>• ISRF##OP – Requested ISIR Data from the ISIR Datamart.</li> </ul>

## TSM and FAH

Template	Description
<i>TSM and FAH NSLDS Transaction Inbound</i>	Imports Transfer Student Monitoring (TSM) and financial aid history (FAH) data from ED. Supports processing of these message class files from ED:

Template	Description
	<ul style="list-style-type: none"> <li>• FAHEXTOP – Financial Aid History File (Extract Format).</li> <li>• TRALRTOP – TSM Alert File (Extract Format).</li> </ul> <p>Uses the data from the TSM and FAH NSLDS Transaction Outbound file to:</p> <ul style="list-style-type: none"> <li>• Determine the student aid history details to include.</li> <li>• The Transfer Monitoring Date to update.</li> </ul> <p>You can configure a <i>Transfer Monitoring Date</i> disbursement eligibility condition to prevent disbursements to a student until they have a valid Transfer Monitoring Date.</p> <p>See <a href="#">Reference: Disbursement Eligibility Conditions</a>.</p>
<i>TSM and FAH NSLDS Transaction Outbound</i>	<p>Exports requests to ED for:</p> <ul style="list-style-type: none"> <li>• Student financial aid histories (FAH).</li> <li>• Adding students to Transfer Student Monitoring (TSM).</li> </ul> <p>Supports processing of TRNINFIN message class files from ED.</p> <p>The Inform file includes:</p> <ul style="list-style-type: none"> <li>• Enrolled students for the current academic period who have an ISIR applicable to that financial aid award year.</li> <li>• Students with projected enrollment in an academic period that's within the user-configured Days Prior to Anticipated Start of the next academic period.</li> </ul> <p>See <a href="#">Steps: Set Up TSM and FAH NSLDS Transaction Outbound Integration</a> on page 1331.</p>

## Launch/Schedule Options

Workday provides these launch schedule options for the Student Financial Aid integrations:

- Launch with an Integration step on a business process.
- Launch on schedule. You specify a run frequency, and Workday automatically launches the integration. Upon launch, the integration retrieves any files from the endpoint. When you have multiples of the same integration, Workday recommends that you schedule the integrations to run at least 5 minutes apart, to ensure that the integration run timestamps are unique and prevent errors.
- Launch immediately. You can launch the integration manually.

Some integrations have launch parameters that you can enable to perform certain actions upon launch. You can view all launch parameters as integration criteria on the Launch / Schedule Integration task.

Examples:

Integration	Launch Parameter	Description
<i>ISIR Correction Outbound</i>	<i>Federal School Code</i>	Identifies the integration output file to the FPS.
<i>ISIR File Inbound</i>	<i>Check for Contact Information Errors</i>	Load ISIRs regardless of contact information errors. Workday omits these details from the student profile, but maintains them on the ISIR. To identify the ISIRs that need correction, create a custom report.
<ul style="list-style-type: none"> <li><i>Alternative Loan Application Send Response Inbound</i></li> <li><i>COD Loan App and Credit Status Inbound</i></li> </ul>	<i>Check for Contact Information Errors</i>	Load loan applications regardless of address formatting issues or international addresses. Workday: <ul style="list-style-type: none"> <li>Omits flagged address data from the loan application.</li> <li>Relaunches the integration without the flagged address data.</li> <li>Stores the flagged address data so that you can report on it and make corrections.</li> </ul> Workday doesn't process the loan until you correct the address. To make your changes, manually edit the loan application.

[The Next Level: All Things 2022R1 in Financial Aid Part 1 and 2](#)

## Concept: Transfer Student Monitoring and Financial Aid History

Transfer Student Monitoring (TSM) is a process to inform, monitor, and alert institutions to prevent the over- or underawarding of federal student aid. After receiving a transfer student, the institution generates a student roster to send to the Department of Education (ED) through the National Student Loan Data System (NSLDS). Once the roster is received, NSLDS monitors changes to the student's financial aid history (FAH) information from the date that the latest Institutional Student Information Record (ISIR) for the student was received by the institution. The institution is alerted if there are any changes, such as a new loan or revised disbursement amount.

If needed, institutions can request an FAH record for a student if they need additional information about the financial aid the student received during the award year.

Workday delivers:

- Report fields that allow you to track students under monitoring.

- Integrations that support the transmission of student records to submit for monitoring and retrieve FAH data.
- Disbursement eligibility conditions to prevent disbursing awards during the 7-day waiting period after a student has been submitted for monitoring.

## Financial Aid Transfer Monitoring Date

The TSM date automatically populates when a student's record processes through the *TSM and FAH NSLDS Transaction Outbound* integration. This date remains on the student's profile even after the monitoring period is over. The TSM date updates if you resend the student's record through the *TSM and FAH NSLDS Transaction Outbound* integration or if the student is included on the FAH, TSM, or TSM and FAH output file.

Additionally, you can manually update the TSM date or remove the date using the Edit Financial Aid Transfer Monitoring Date task. You can view the transfer monitoring date, if it exists, on the student's Overview report of their Financial Aid profile group.

## Financial Aid History

You can access the student's FAH on the NSLDS tab of the student's Financial Aid profile group. From the tab, you can select an NSLDS transaction to view details of all adverse flags and other FAH details.

FAH records are loaded and stored in Workday. However, they aren't currently used in the delivered federal aid calculations. Therefore, if a student only has partial eligibility remaining for the award year, awards must be manually adjusted. Example: A student had a federal aid disbursement at another institution within the award year and the latest FAH has been loaded.

Related Information

[Transfer Student Monitoring Next Level](#)

## Reference: COD Outbound Integration

This topic describes how Workday populates certain fields in the output file of the *COD Outbound* integration. You can override values by selecting COD > Edit COD Information from the related actions menu of COD-processable awards. For more information, see [Override COD Information](#).

Field in Output File	Field in Workday
<CPSTransactionNumber>	Transaction Number on the ISIR Transaction business object.
<AttendanceCost>	Pell Cost of Attendance on the Financial Aid Period Record business object.
<VerificationStatusCode>	Federal Verification Status on the ISIR Transaction business object.
<StudentEligibilityCode>	If a student doesn't have an eligibility code when you run COD Outbound, Workday determines the code by checking the High School Completion Status field on the student's ISIR. If the value on the ISIR is 4 - <i>None of the Above</i> or blank, Workday evaluates the student's admissions application. In the Application Details section of the application, Workday evaluates whether the Homeschooled field is checked. If unchecked, we use the value in the Student Graduation or Equivalency field. If the value in this field is <i>Did not Graduate, Plan to</i>

Field in Output File	Field in Workday
	<i>Graduate</i> , or blank, Workday doesn't include the student when the COD Outbound integration runs.
<DisbursementReleaseIndicator>	Disbursement Release Indicator on the Student Anticipated Disbursement business object.
<OriginationFeePercent>	Loan Fee Percent on the Student Award business object.
<StudentLevelCode>	Class Standing on the Financial Aid Period Record business object.
<AdditionalEligibilityIndicator>	Pell Additional Eligibility on the Student Award business object.
<WeeksProgramsAcademicYear>	Weeks of Instruction on the federal student aid program policy for the student's program of study.
<SpecialPrograms>	Special Indicator on the federal student aid program policy for the student's program of study.

### Concepts

[Concept: COD Processing and Reporting](#)

## Student Financials Connectors

### Steps: Set Up Integration for Student Financials Data

#### Prerequisites

When using Transact (formerly Cashnet) only, identify these values for the merchant endpoint:

- The *Checkout Request Authentication Key* for the merchant
- The URL of the merchant's website

#### Context

You can create integrations that:

- Send refund request files to third-party credit card processors that use Transact.
- Generate Internal Revenue Service (IRS) Form 1098-T data for enrolled students. You can then manually submit the files to the IRS's Filing Information Returns Electronically (FIRE) service.

#### Steps

1. [Create Integration System](#) on page 1967.

In the New Using Template field on the prompt, select the applicable integration template:

- For refund request data: *Cashnet Refund Outbound*
- For IRS Form 1098-T data: *1098-T E-File Outbound*

2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

- *Integration Build*
- *Integration Event*
- *Manage: Student Financial Accounts*
- *Manage: Student Payment Processing*
- *Student Charge Event* (business process initiating action)
- *Student Payment Event* (business process initiating action)

See [..../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).

3. From the related actions menu of the integration system, select Integration System > Configure Integration Attributes.

Enter integration service attributes.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area

4. (Transact integrations only) Register API Clients.

Register the Workday integration with the Transact endpoint.

5. Launch an Integration on page 24.

## Concept: Student Financials Connectors

Student Financials Connectors enable you to:

- Generate and export files for refund requests to third-party credit card processors that use Transact Integrated Payments (formerly Cashnet), a Workday Cloud Connect Partner.
- Generate Internal Revenue Service (IRS) Form 1098-T data for enrolled students. You can then manually submit the files to the IRS's Filing Information Returns Electronically (FIRE) service.

Workday provides these integration templates:

- *Cashnet Refund Outbound*
- *1098-T E-File Outbound*

## Launch/Schedule Options

Workday provides these launch schedule options for Student Financials Connectors:

- Business Process – Launch the integration by adding an integration step on a business process.
- Immediate Launch – Manually launch the integration at any time.
- Scheduled Launch – Specify a run frequency for Workday to automatically launch the integration. Upon launch, the integration retrieves any files from the endpoint.

The Launch/Schedule Integration task for this integration provides a full list of launch parameters, including descriptions.

## Student Outbound Connector

### Steps: Set Up Student Outbound Connector

#### Prerequisites

Security: These domains in the Integration functional area:

- *Integration Build*
- *Integration Configure*

## Context

You can create an integration that:

- Extracts data of students with changes in their status and profile information.
- Exports this data in an XML file with a Workday-defined format.

You can use this integration for student account provisioning. Example: This connector can integrate with third-party identity management systems and provide access to your network of applications.

## Steps

- [Create Integration System](#) on page 1967.

From the New Using Template prompt, select *Student Outbound Connector*.

- Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Integration Event* domain in the Integration functional area.

(For account provisioning) Grant the ISU *Get* and *Put* access to these domains in the System functional area:

- External Account Provisioning*
- Provisioning Group Administration*

See [..../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).

- Select Integration System > Configure Integration Attributes from the related actions menu of the integration system.

On the *Institutional Academic Unit* integration attribute, specify the institution of the student data you want to export.

- [Set Up Integration Delivery](#) on page 1952.

- (Optional) Create a transformation that converts the integration output files into the required format.

See [Steps: Set Up Document Transformation Connector](#) on page 594.

- [Launch an Integration](#) on page 24.

As you specify the integration launch criteria, consider:

Field	Description
<i>Students</i>	Specify the students that you want to include for the integration.
<i>Start Date</i>	Specify the date range that you want to consider for changes in student data.
<i>End Date</i>	

## Example

You can use the *Student Outbound Connector* integration to send student information to third-party identity management systems during a student onboarding process event. This information defines which students have access to a given downstream service. The account provisioning endpoint can then use this information to open and close accounts for students on downstream services.

To use the integration for account provisioning,

- Add students to account provisioning groups. See [Steps: Set Up Account Provisioning Groups](#).
- Add the integration as a service step to these business processes:
  - Student Onboarding Event*
  - Continuing Student Registration Onboarding Event*

**Related Information****Examples**

[Workday 33 What's New Post: Account Provisioning for Students](#)

**Concept: Student Outbound Connector**

The *Student Outbound Connector* integration template enables you to extract data for students with changes to their status and profile information. The integration exports this data in a Workday-defined XML format.

You can define the scope of the integration output file by specifying students or a date range when you launch the integration.

Based on the integration launch criteria, the output file includes students who:

- Matriculated.
- Have changes to their provision groups.
- Have changes in their data from these events:

Data Change	Event
Student profile information	<ul style="list-style-type: none"> <li>• <i>Contact Change Event</i></li> <li>• <i>Home Contact Change Event</i></li> <li>• <i>Institutional Contact Change Event</i></li> <li>• <i>Legal Name Change Event</i></li> </ul>
Student status	<ul style="list-style-type: none"> <li>• <i>Add Program of Study Event</i></li> <li>• <i>Apply for Program Completion Event</i></li> <li>• <i>Change Expected Program Completion Date Event</i></li> <li>• <i>Change Primary Program of Study Event</i></li> <li>• <i>Change Program of Study Event</i></li> <li>• <i>Change Student Reporting Record Event</i></li> <li>• <i>Confer Program Completion Event</i></li> <li>• <i>Declare Program of Study Event</i></li> <li>• <i>Discontinue Academic Record Event</i></li> <li>• <i>Edit Student Program of Study Status Event</i></li> <li>• <i>Mass Discontinue Event</i></li> <li>• <i>Mass Dismissal Event</i></li> <li>• <i>Mass Suspension Event</i></li> <li>• <i>Remove Program of Study Event</i></li> <li>• <i>Student Dismissal Event</i></li> <li>• <i>Student Institutional Withdrawal Event</i></li> <li>• <i>Student Leave of Absence Event</i></li> <li>• <i>Student Request Return from Leave of Absence Event</i></li> <li>• <i>Student Suspension Event</i></li> </ul>

**Related Information****Examples**

## Student Records Connectors

### Steps: Set Up Integration to Export Student Transcripts

#### Prerequisites

Security: These domains in the Integration functional area:

- *Integration Build*
- *Integration Configure*

#### Context

You can create an integration to send student transcripts to external endpoints in a Workday-defined XML format. The template only retrieves transcript orders that:

- Are in *Pending* status.
- Have a delivery method of *Official Delivery (Electronic)*.
- Have no transcript holds placed on them by a student.

## Steps

1. Create Integration System.

From the New Using Template prompt, select *Transcript Outbound Connector*.

2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

- *Integration Event* in the Integration functional area.
- *Manage: Transcript and Verification* in the Student Records functional area.

See [../../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).

3. Select Integration System > Configure Integration Attributes from the related actions menu of the integration system.

Specify integration service attributes.

4. Set Up Integration Delivery on page 1952.

5. Create a transformation that converts integration output files into the format that the external endpoint requires.

See Steps: Set Up Document Transformation Connector on page 594.

6. Launch an Integration on page 24.

Workday provides these launch parameters:

Integration Criteria	Description
<i>Transcript Order</i>	Specify the transcript orders that you want to include in the integration output file.
<i>Start Date</i> <i>End Date</i>	Specify the date range of transcript orders to include in the output file, based on the request date of the transcript order.
<i>Do Not Update Transcript Order Status</i>	Select this check box to keep the transcript order status as <i>Pending</i> after you run the integration. You can use this check box to test your integration multiple times without changing the transcript order statuses.  When the check box is cleared, Workday changes the transcript order status to <i>Complete</i> when you run the integration.

## Concept: Student Records Connectors

Workday provides integration templates to support sending student records data to external endpoints.

The *Transcript Outbound Connector* integration template enables you to extract transcript data from Workday in a Workday-defined XML file format. You can:

- Transform the XML file to a Postsecondary Electronic Standards Council (PESC), electronic data interchange (EDI), or any state-specific format.
- Deliver the file to another institution directly or through a transcript vendor.

## Launch/Schedule Options

Workday provides these launch schedule options for Student Records integrations:

- Launch with an *Integration* step on a business process.
- Launch on schedule. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration retrieves any files from the endpoint.

- Launch immediately. You can launch the integration manually.

You can view all launch parameters as integration criteria on the Launch / Schedule Integration task.

## Reference: Student Transcript Connector File Schema

This file schema describes the XML elements in the output files of the *Transcript Outbound Connector* integration template. You can use this file schema to examine the structure of your output files.

Element	XSD Schema Sequence

## Reference: PESC Student Transcript Connector File Schema

The following information outlines the fields for the Transcript Outbound Connector file schema when you enable the PESC Transcript Outbound Data integration service.

The file begins with the CollegeTranscript element, which contains two main child elements: TransmissionData and Student. This structure is repeated for each transcript order.

- TransmissionData element: Contains metadata about the transcript document, such as the DocumentID, CreatedDateTime, and Source and Destination information.
- Student element: The core container for all student-specific academic information.

Within each of these repeating elements is a variety of additional elements. For detailed descriptions of individual fields, view your integration Field Attributes or Field Overrides.

### TransmissionData XML Elements

TransmissionData XML Elements	Details
DocumentID	The document's unique identifier.
CreatedDateTime	The date and time the document was created.
DocumentTypeCode	The type and purpose of the document being sent.
TransmissionType	The type of transmission.

TransmissionData XML Elements	Details
DocumentProcessCode	Identifies if the document is a TEST or PRODUCTION document.
Source	Contains information about the sending institution.
Destination	Contains information about the receiving institution.

## Student XML Elements

TransmissionData XML Elements	Details
Person	Contains personal information about the student.
Academic Record	Each element represents a transcript record relevant to the transcript order.
Tests	Represents an education test result.
Test Historical	Represents an education test result for a historical student test articulation.
Note Message	Default value is Official Transcript Notes at the Institutional level.

                </xsd:annotation>
            </xsd:element>
        </xsd:sequence>
    </xsd:complexType>
</xsd:schema>

```

## Setup Considerations: PESC Compliant Transcript Outbound Connector

You can use this topic to help make decisions when planning your configuration and use of the transcript outbound connector integration template. It explains:

- Why to set it up.
- How it fits into the rest of Workday.
- Downstream impacts and cross-product interactions.
- Security requirements and business process configurations.

- Questions and limitations to consider before implementation.

Refer to detailed task instructions for full configuration details.

## What It Is

The Transcript Outbound Connector integration template enables you to extract transcript data from Workday in a Workday-defined XML file format. You can:

- Transform the XML file to a Postsecondary Electronic Standards Council (PESC), electronic data interchange (EDI), or any state-specific format.
- Deliver the file to another institution directly or through a transcript vendor.

## Business Benefits

When you set up the Transcript Outbound Connect to be enabled for PESC XML formatting, the Transcript Outbound Connector ensures your transcript data is compliant with PESC standards, reducing manual processes and administrative overhead.

## Use Cases

Administrators can:

- Use the Transcript Outbound Connector to generate a standardized XML file containing a student's transcript data. This file can then be used to electronically transmit the transcript to another academic institution or a third-party service.
- Configure the integration to deliver the output file directly to a third-party service provider, such as a transcript ordering platform. This eliminates the need for manual data entry or custom data transformations for each external system.
- Run the connector as needed to verify the integration output data. The diagnostic audit file can be used for troubleshooting when a transcript order contains non-compliant data or is excluded from the final output.

## Questions to Consider

Do you need to configure security for the integration?	Yes, the Transcript Outbound Connector uses segmented security to manage access to transcript orders. You must create a user-based and a segment-based security group and assign the appropriate domain security permissions.
Do you need to override the default values for integration attributes?	The PESC integration template includes default attributes such as Document TypeCode, TransmissionCode, and Document ProcessCode. You can override these values as needed, or they will be populated with their default settings in the output XML.
Do you need to map your internal values to external PESC values?	You must configure integration maps to convert your internal values to the specific values required by the PESC standard. If a mapping is not configured for a required field, that field and its parent element will be excluded from the final XML output.
Are there fields you want to override or extend with custom data?	You can use the Configure Integration Field Overrides task to replace a default field value with a custom report field or a calculated field. This

allows you to add new fields or subelements to the XML output.

## Recommendations

To reduce errors and ensure the successful processing of transcripts, follow these best practices when you enable the Transcript Outbound Connector with PESC XML formatting:

- Map all internal values. PESC only accepts certain values for specific fields, so you must map your institution's internal values to the required external PESC values. To ensure all internal values can always be mapped, customers can also configure default values. If a mapping is not configured, the field will not be included in the output file, which can cause the entire transcript order to be excluded if it's a required field.
- Use field overrides judiciously. Field overrides are powerful tools that allow you to replace default values with data from a Custom Report Field (CRF) or a calculated field. However, there are no validations for these overrides, so you are responsible for ensuring that any overridden fields remain PESC compliant.
- Verify recipient information. For successful processing, a transcript order must have these values: Recipient Address, Educational Institution, Organization Name, and Email Address. Ensure that your transcript orders contain at least one of these values before running the integration.
- Check for OPEID on educational institutions. If you select a post secondary educational institution as a recipient, it must have an OPEID. You can update educational institutions to include OPEID to transcript orders from failing when running the integration.

## Requirements

- If you want to enable PESC compliant XML, you must create a new Transcript Outbound Connector Integration System and enable the PESC Transcript Outbound Data integration service.
- You must configure the *Manage: Transcript and Verification* domain to grant constrained users the security permissions needed to select and deliver transcript orders.
- If you plan to use an educational institution as a recipient, the institution must have an OPEID.
- If you choose to use Integration Maps to translate internal values to PESC-compliant external values, you must configure these mappings before running the integration.
- If you plan to use Integration Field Overrides to customize field values, you must ensure that any configured fields and their values are still compliant with PESC standards.

## Limitations

No impact.

## Tenant Setup

No impact.

## Security

Domains	Considerations
<i>Integration Build</i> in the Integration functional area.	Enables users to: <ul style="list-style-type: none"> <li>• Create or edit an integration.</li> <li>• View an integration system.</li> </ul>
<i>Integration Configure</i> in the Integration functional area.	Enables users to configure an integration. This is required to configure the integration services, attributes, and maps for the connector.
<i>Integration Event</i> in the Integration functional area.	Enables users to:

Domains	Considerations
	<ul style="list-style-type: none"> <li>Launch an integration.</li> <li>View resulting integration events, including integration output documents.</li> </ul>
<i>Manage: Educational Institution</i>	Enables users to configure OPEIDs on Educational Institutions.
<i>Manage: Transcript and Verification</i>	Enables users to select transcript orders to be included in integration requests.

## Business Processes

You can configure a Document Delivery Service step on a business process to deliver the integration output files to a third-party server through SFTP.

## Reporting

Reports	Considerations
All Integration Systems	Displays all integration systems that you've created.
Integration Events	<p>Displays:</p> <ul style="list-style-type: none"> <li>A summary of integration events that are in process or completed.</li> <li>Details about the status for each integration event.</li> </ul>
View Integration System	Displays details about the integration system, including the integration services, attributes, and maps.

## Connections and Touchpoints

Workday offers a Touchpoints Kit with resources to help you understand configuration relationships in your tenant. Learn more about the [Workday Touchpoints Kit](#) on Workday Community.

# Student Recruiting Connectors

## Steps: Set Up Integration for Student Recruiting

### Prerequisites

Security: These domains in the Integration functional area:

- Integration Build*
- Integration Configure*

### Context

You can implement an integration to import data from ACT Enroll files into Workday and create student prospects in Workday. ACT Enroll provides access to data for students who have taken the ACT test or PreACT and opted into the ACT Educational Opportunity Service (EOS).

Workday recommends that you retrieve the CSV files directly from the ACT Enroll search service. The CSV file must contain a header row.

## Steps

1. Create Integration System on page 1967.

From the New Using Template prompt, select *ACT EOS Search Service Student Prospect Inbound*.

2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

- *Integration Event* in the Integration functional area.
- *Reports: Students* in the Student Core functional area.

See [..../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).

3. Select Integration System > Configure Integration Attributes from the related actions menu of the integration system.

Specify or enable integration service attributes to configure your integration.

4. Select Integration System > Configure Integration Maps from the related actions menu of the integration system.

Map external values to the internal values that Workday imports for:

- Educational interest.
- Ethnicity.
- Gender.

5. Set Up Integration Retrieval on page 1957.

6. Launch an Integration on page 24.

Specify any launch criteria to filter results by:

- Academic level and unit.
- Anticipated start academic term.
- Prospect type.
- Location and other criteria.

## Concept: Student Recruiting Connectors

Student recruiting integrations import student ACT and PreACT data into Workday from the ACT Enroll student search service. ACT Enroll provides:

- A wide variety of student geographic, personal, and academic characteristics for prospective students.
- Access to data for students who have taken the ACT test or PreACT assessment and opted into the ACT Educational Opportunity Service (EOS).

Workday provides the ACT EOS Search Service Student Prospect Inbound integration template to support retrieving ACT Enroll search service files. You can use the integration template to import ACT Enroll files and create corresponding student prospects in Workday.

The integration template:

- Supports retrieval of ACT Enroll files in Comma-Separated Value (CSV) format only.
- Supports current Encoura Standard Export Data Layout file formats.
- Doesn't support other ACT file formats or retired ACT EOS formats.

## Launch/Schedule Options

Workday provides these launch schedule options for Student Recruiting integrations:

- Launch with an Integration step on a business process.
- Launch on schedule. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration retrieves any files from the endpoint.
- Launch immediately. You can launch the integration manually.

You can view all launch parameters as integration criteria on the Launch / Schedule Integration task.

## Student Transaction Log Outbound Connector

### Steps: Set Up Integration to Export Student Transaction Log Data

#### Prerequisites

- Determine which Student-related transactions that you want to include in the integration output. A transaction in Workday is either an Event Lite or a Business Process Event.
- (Optional) To transform the XML output file into another format, create an XSLT file that defines the transformation.
- Security: These domains in the Integration functional area:
  - *Integration Build*
  - *Integration Configure*

#### Context

You can create an integration that:

- Monitors your tenant for Student-related transactions that you specify.
- Exports an XML file with transaction records for each specified transaction from Workday.

#### Steps

1. [Create Integration System](#) on page 1967.

From the New Using Template prompt, select *Student Transaction Log Outbound Connector*.

2. (Optional) Select Integration System > Configure Integration Services from the related actions menu of the integration system.

Enable the *Web Service Task for Transaction Log* integration service. This service enables you to attach a custom XSLT file to the integration. The integration can then transform the integration output file into the format defined in the XSLT file.

3. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

- *Integration Event* in the Integration functional area.
- Any domain that secures an *Event Lite* that you want the integration to monitor for changes.

See [..../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).

4. (Required only for custom XSLT attachment) Select Integration System > Configure Integration Attachment Service from the related actions menu of the integration system.

From the Attachment prompt, select an XSLT file or *Create Integration Service Attachment*.

5. Select Integration System > Configure Integration Attributes from the related actions menu of the integration system.

Specify integration service attributes.

6. [Set Up Integration Subscriptions](#) on page 1968.

Select the transactions that Workday monitors for changes.

7. [Set Up Integration Delivery](#) on page 1952.

Specify how the integration system delivers the output file to an external endpoint.

8. [Launch an Integration](#) on page 24.

Schedule how often the integration system runs, which entry and effective date ranges it covers, and which Student-related transactions and *Event Lites* the integration reports on.

## Reference: Student Transaction Log Outbound Connector File Schema

The Student Transaction Log Outbound Connector generates a file named `StudentTransactionLog.xml` each time it runs.

Element Name	Description	Datatype
<code>Transaction_Logs_for_Student_Dis</code>	Top-level element. Contains 1 or more <code>Transaction_Log_Data</code> elements.	N/A
<code>Transaction_Log_Data</code>	Contains multiple subelements. Refers to 1 transaction or Event Lite for 1 student.	N/A
<code>Transaction_Log_Description</code>	Summarizes the contents of the transaction log.	<code>String</code>
<code>Transaction_Effective_Moment</code>	Date and time that the transaction is effective in Workday.	<code>DateTime</code>
<code>Transaction_Entry_Moment</code>	Date and time that you entered the transaction into Workday.	<code>DateTime</code>
<code>Transaction_Log_Type_Reference</code>	Refers to the transaction type for this transaction. This value is either an Event Lite or Business Process. Contains 1 or more ID elements.	Reference
<code>Transaction_Target_Reference</code>	Refers to the target of the transaction. Contains 1 or more ID elements.	Reference
<code>Is_Rescind_Or_Rescinded</code>	Indicates if you rescinded the transaction.	Boolean
<code>Is_Correction_Or_Corrected</code>	Indicates if you corrected the transaction.	Boolean

## The Common Application Inbound

### Steps: Set Up Common Application Inbound Integration

#### Prerequisites

- Set up the document types for the Institution Academic Unit. Workday requires this configuration only if you want to import PDF documents as Student application documents.
- Security: These domains:
  - Integration Build* in the Integration functional area.
  - Integration Configure* in the Integration functional area.
  - Set Up: Maintain Student Document Types* in the Academic Foundation functional area.

#### Context

You can set up integrations to import first-year student applicant data into Workday from *The Common Application*.

The integration relies on ISO codes for country and state fields when importing address information. The integration also relies on CEEB codes when importing educational institutions attended by the student. Some student applications can fail to load if the file contains no ISO codes for country and state or CEEB code for educational institutions.

Workday recommends that you create 2 integrations:

- An integration that imports student data including educational institutions. Run this integration regularly by schedule.
- An integration that imports student data and excludes educational institutions. Run this integration manually if student data fails to load due to invalid education institution codes.

## Steps

1. Access your *The Common Application* account and copy the *Workday Global Template - Main* template. You use the copy with your integration.
2. Add these member questions to your copy of the template:
  - Primary\_Program\_of\_Study
  - Anticipated\_Start (Preferred Start Term)
  - Anticipated\_Load\_Status (Student Status). Workday populates a value of *Full Time* automatically if you don't provide a value.

You define these member questions in *The Common Application* when you enter your membership profile. Workday provides Reference IDs as Export codes for each of the choice values.

Enable export codes for these member questions. Ensure that the export codes match the corresponding Workday Reference IDs.

3. (Optional) Add 1 or more of these optional member questions. Ensure that the labels match these values exactly:
  - Campus\_Location
  - Gender\_Identification
  - Program\_Focus
  - Program\_of\_Study 2 (Major 2)
  - Program\_of\_Study 3 (Major 3)
  - Pronoun
  - Sexual\_Orientation
4. (Optional) Add custom member questions.

To output the file configuration on the Common App website, append each custom member question with 2 underscores and a question type:

- \_\_TextType
- \_\_SingleSelectType
- \_\_MultiSelectType
- \_\_DateType
- \_\_NumericType

Example: Requests\_Additional\_Time\_\_TextType.

5. (Recommended) Enable The Common Application Scheduled Delivery Service in your *The Common Application* account.
6. Access the Maintain Student Document Types task.  
Add entries for any documents that *The Common Application* includes.
7. [Create Integration System](#) on page 1967.  
From the New Using Template prompt, select *The Common Application (First Year) Inbound*.

8. (Optional) Select Integration System > Configure Integration Services from the related actions menu of the integration system.

Enable 1 or more of these optional integration services:

Service	Description
<i>The Common Application Inbound - Profile</i>	Enables you to enable 1 or more of these services: <ul style="list-style-type: none"> <li>• <i>The Common Application Inbound - Education</i></li> <li>• <i>The Common Application Inbound - Testing</i></li> <li>• <i>The Common Application Inbound - Documents</i></li> </ul>
<i>The Common Application Inbound - Education</i>	Enables the integration to import education-specific data.
<i>The Common Application Inbound - Testing</i>	Enables the integration to import test results.
<i>The Common Application Inbound - Documents</i>	Enables the integration to import ZIP files containing PDFs of supporting documents. Examples: Counselor reports, teacher recommendations.

9. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

- *Integration Event* in the Integration functional area.
- *Reports: Students* in the Student Core functional area.

(Optional) Grant the ISU access to these additional domains to access additional services and functionality:

Domain	Description
<i>Manage: Student External Transcripts</i> in the Academic Foundation functional area.	Enables access to the <i>Transcript</i> service.
<i>Manage: Student Test Results</i> in the Academic Foundation functional area.	Enables access to the <i>Educational Tests</i> service.
<i>Questionnaire Creation and Distribution</i> in the System functional area.	Enables access to Questionnaires functionality.

See Steps: [Grant Integration or External Endpoint Access to Workday](#).

10. Select Integration System > Configure Integration Attributes from the related actions menu of the integration system.

Specify or enable integration service attributes to configure your integration.

- For attributes without default values, add a row and specify a Value.
- For attributes whose default values you want to change, select the Override Template Values check box and specify a new Value.
- Optionally, use the Restricted to Environment field to specify a value that applies to a particular environment.

As you configure attributes on the *The Common Application Inbound - Profile* integration service, consider:

Attribute	Description
<i>Re-submit Failed Records Without Invalid Addresses and/or Phone Numbers</i>	Use to import student applications that previously failed due to phone number or address errors. When this attribute is True, Workday provides a <i>Diagnostic_Audit_Common_App_-Address_and_Phone_Errors.html</i> output file that you can use to review any errors. You can then use the Manage Incorrect Contact Information for Students report to resolve the errors.
<i>Exclude Addresses</i>	Use to exclude addresses on student applications that previously caused applications to fail due to address formatting errors.
<i>Exclude External Educational Institutions</i>	Use to: <ul style="list-style-type: none"> <li>• Exclude importing unofficial GPA transcript information provided by the student.</li> <li>• Exclude secondary and post-secondary education institutions that the student attended. The integration matches on the CEEB code of the education institution when it imports the education institutions that the student attended.</li> </ul>

11. Select Integration System > Configure Integration Maps from the related actions menu of the integration system.

Map external values in the input file to internal values in Workday.

Security: *Integration Build* and *Integration Configure* domains in Integration functional area.

12. [Set Up Integration Retrieval](#) on page 1957.

Add entries for *ZIP* and *XML* in the File Name/Pattern prompt.

13. [Launch an Integration](#) on page 24.

#### Related Information

##### Tasks

[Manage Contact Information Errors for Student Applications](#)

##### Reference

[2021R2 What's New Post: Common Application Integration](#)

[2021R2 What's New Post: Student Application Contact Information Errors](#)

## Concept: The Common Application Inbound Integration

The Common Application Inbound integration imports student applicant data and supporting files into Workday from *The Common Application*. Workday provides the *The Common Application (First Year) Inbound* integration template. You can use the integration template to build integration systems that import first-year student applicant data from *The Common Application*.

The integration imports Common Application data in these categories:

- Profile.
- Family.
- Education (Optional).
- Test Results, including self-reported scores (Optional).
- Writing (disciplinary and criminal history).
- Attachments, including recommendations, writing samples, transcripts, and reports (Optional).

The integration supports a defined subset of the common question fields available for *The Common Application*. Additionally, the integration supports a limited number of member question fields, including:

- Primary Program of Study.
- Anticipated Start.
- Anticipated Load Status.
- Program of Study 2.
- Program of Study 3.
- Program Focus.
- Campus Location.
- Gender Identification.
- Sexual Orientation.
- Pronoun.

Use Workday custom objects or a questionnaire with a separate custom integration if you want to load additional fields from *The Common Application* into Workday.

### Required File Name Pattern for PDF Attachments

Integrations based on the *The Common Application (First Year) Inbound* integration template can import ZIP files that contain PDF files. The PDF filenames must have this format:

<TERM>-<CAID>!\_<FORM>\_FY.pdf (Example: Fall2019-21384352!\_AP\_FY.pdf). Work with your *The Common Application* representative to ensure that the PDFs follow this required name pattern.

- *CAID*: Common Application ID. Unique 8-digit ID assigned to all Common Application applicants
- *TERM*: Export code of the Term the applicant has selected for that institution. Workday requires the (!) character.
- *FORM*: The type of PDF generated. The code must match the external values that you configured for the Admissions Document Type Integration map. Example: *AP* for application, *WS* for writing supplement.
- *FY* represents First Year Applicant Type. Workday hardcodes this value. The integration supports only first-year applicants.

### Launch/Schedule Options

Workday provides these launch schedule options for integrations based on the *The Common Application (First Year) Inbound* template:

- Launch with an *Integration* step on a business process.
- Launch on schedule. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration retrieves any files from the endpoint.

- Launch immediately. You can launch the integration manually.

## Global Payroll Connect

### Concept: Global Payroll Connect

Global Payroll Connect helps you:

- Manage payroll processing across the globe by efficiently reviewing payroll related information to support decision making.
- Elevate the payroll experience for pay admins and workers with different features that provide a single view from multiple payroll vendors.
- Configure earnings, deductions, and payroll processing information.
- Set up integrations or APIs that send worker data, such as hire, compensation, benefits, time off, and termination events to third-party payroll vendors.
- Set up APIs to receive data from third-party payroll vendors, such as external payroll results, external payslips, tax documents, and other payroll documents.
- Reconcile data between Workday and third-party payroll vendors.
- Leverage powerful analytics to create and manage custom reports to assist in analyzing or auditing payroll data.
- Create and maintain payroll processing checklists for third-party payroll pay groups.

Global Payroll Connect also includes all the capabilities of Cloud Connect for Third-Party Payroll which helps you:

- Search for changes from the primary payroll integration runs that match certain criteria.
- Configure and reconcile payroll-related information between Workday and third-party payroll systems.
- Manage and track errors returned by a third-party payroll system for worker changes.
- Upload documents from an external system into Workday, and purge documents for both active and terminated employees.
- Enter earnings and deductions for inclusion in payroll processing that aren't part of regular compensation or benefits.
- Capture and output worker data changes, in order of occurrence and within an effective range.
- Import external payroll documents, payroll results, and payslips from third-party payroll systems into Workday.
- Analyze external payroll results from both third-party systems and Workday payroll in a single report.
- Specify the time to send relevant information to a third-party payroll system for a new hire or termination.
- Define groups of employees, what payroll changes to include, extract the data changes and send them to third-party payroll systems with scheduled intervals or ad-hoc runs.
- Merge output files from multiple integration runs and send a single output file.

# Third-Party Payroll Setup

## Third-Party Payroll Organizations

### Steps: Establish Third-Party Payroll Organization

#### Context

Set up an organization for third-party payroll. These steps apply to Workday Payroll Interface, and Workday Payroll Effective Change Interface.

#### Steps

1. [Create External Payroll Organization Type on page 1392](#).
2. [Assign Roles to External Payroll Organization on page 1393](#).
3. [Create External Payroll Reorganization on page 1393](#).
4. [Create External Payroll Company on page 1394](#).
5. (Optional) [Create Superior Payroll Organizations on page 1395](#).

#### Next Steps

Create and assign pay groups.

Related Information

#### Concepts

[Concept: Workday Payroll Interfaces on page 1496](#)

#### Tasks

[Steps: Set Up Workday Payroll Interface on page 1699](#)

## Create External Payroll Organization Type

#### Prerequisites

Security: *Set Up: Payroll Interface* domain in *Payroll Interface* functional area.

#### Context

Create an organization type for pay groups.

Workday requires the payroll company to determine the details of a transfer from pay group to pay group. When an employee transfers pay groups, Workday needs to be able to report if the new pay group is in a new payroll company. Without a payroll company, Workday isn't able to infer this staffing event logic and the vendor might not handle the transaction correctly.

#### Steps

1. Access the *Maintain Organization Types* task.
2. Select *Custom*. Select *Edit*.
3. Add a row to the grid.
4. Set an *Organization Type Name* for your external payroll provider or an organization hierarchy above your pay groups.
5. To specify that an organization has parent and child organizations of the same type, select *Allows Hierarchy*. This enables inclusion of pay groups in a payroll company.
6. For *Used by Organization Subtypes*, select *Pay Group*.

7. For Rolls Up Organization Type, select *Pay Group*. You can assign pay groups to organizations of this type.

## Next Steps

Add payroll roles to the organization type.

Related Information

### Tasks

[Steps: Establish Third-Party Payroll Organization on page 1392](#)

[Steps: Set Up Workday Payroll Interface on page 1699](#)

## Assign Roles to External Payroll Organization

### Prerequisites

Security: *Set Up: Assignable Roles* domain in *Organizations and Roles* functional area.

Create an organization type for external payroll processing by using the Maintain Organization Types task.

### Context

Specify which roles are valid for an external payroll organization type, such as Payroll Partner and Payroll Interface Partner. You are only required to perform this task once, typically during initial setup.

The Payroll Partner and Payroll Interface Partner roles are delivered with Workday. If you configured other roles for payroll, follow this procedure to add those roles to the organization type.

### Steps

1. Access the Maintain Assignable Roles task.
2. Go to the Payroll Interface Partner role or the appropriate payroll role in your organization.
3. At the Enabled for Organization Types prompt, select the organization type that you created for external payroll processing.
4. Repeat the steps for the Payroll Partner role or other payroll role that is specific to your organization security configuration.

### Result

When you create a payroll company, you can assign these roles to workers. The Organization Types report also displays these roles for the payroll organization type.

## Next Steps

Create a reorganization that specifies the effective date of the payroll organization.

Related Information

### Tasks

[Steps: Establish Third-Party Payroll Organization on page 1392](#)

[Steps: Set Up Workday Payroll Interface on page 1699](#)

## Create External Payroll Reorganization

### Prerequisites

Security: *Set Up: Reorganization* domain in *Organizations and Roles* functional area.

## Context

A reorganization enables you to structure your external payroll organization and specify its effective date. You are only required to perform this task once, typically during initial setup. You might also perform this task if you specify a different effective date for another payroll organization.

## Steps

1. Access the Create Reorganization task.
2. Provide a Reorganization Name. Example: *Create Pay Company*.
3. Specify the Reorganization Date.
4. (Optional) Enter the reorganization description.

## Next Steps

Create a custom organization for an external payroll company.

Related Information

### Tasks

[Steps: Establish Third-Party Payroll Organization on page 1392](#)

[Steps: Set Up Workday Payroll Interface on page 1699](#)

## Create External Payroll Company

### Prerequisites

Security: *Create: Custom Organization* domain in *Organizations and Roles* functional area.

- Create an organization type that supports external payroll processing.
- Add roles to the organization type.
- Create a reorganization that specifies the effective date of the payroll organization.

## Context

Create a custom organization that represents an external payroll company. You create a separate payroll company in Workday for each payroll company in the external payroll system. Typically, you match the names of the corresponding payroll companies in both Workday and the external system.

## Steps

1. Access the Create Custom Organization task.
2. Select the Custom Organization Type that you created for external payroll processing. Select the Reorganization that you created to support the payroll organization structure.
3. Click OK.
4. Enter the Availability Date.
5. In the Organization Name field, enter the company code that identifies the payroll company in the external system.
6. (Optional) In the Organization ID field, enter an ID or description of the payroll company.
7. (Optional) To combine the organization name and ID for display in Workday, select the  *Include Organization ID in Name* check box.

Note: This step is optional for payroll companies, but not pay groups. At the pay group level, Workday requires you to concatenate the organization name and ID in the integration files.

8. At the Organization Subtype prompt, select *Pay Group*.
9. At the Organization Visibility prompt, enter who can view the organization and its members.
- 10.(Optional) Select or create an External URL.

**11. Assign employees to the organization payroll roles:**

- a) Add a row to the Assign Roles grid.
- b) At the Role prompt, select the Payroll Interface Partner role or the equivalent payroll role in your organization.
- c) To restrict this role to a single worker, select the Restrict to Single Assignment check box.
- d) At the Worker prompt, select an employee to assign to this role. If the Restrict to Single Assignment check box isn't selected, you can assign more than 1 employee.
- e) Repeat these steps for the Payroll Partner role or similar payroll role in your organization.

**12. Click OK.**

**13. Edit the reference ID for the payroll company:**

- a) As a related action on the payroll company, select Integration IDs > Edit Reference ID.
- b) In the Reference ID Value field, enter the company code that you set earlier.  
If you use ADP PayForce, the reference ID must match the company code that ADP Connection provides in its request message. This code ensures that Workday retrieves the correct pay groups for this payroll company.

## Next Steps

- Assign pay groups to the payroll company.
- (Optional) Create a superior organization to roll up multiple payroll companies that share a common integration system.

## Related Information

### Tasks

[Steps: Establish Third-Party Payroll Organization on page 1392](#)

[Steps: Create and Assign Third-Party Payroll Pay Groups on page 1396](#)

[Steps: Set Up Workday Payroll Interface on page 1699](#)

## Create Superior Payroll Organizations

### Prerequisites

- Create a payroll organization type. To indicate that the organization supports a pay group hierarchy, select the Allows Hierarchy check box.
- Create a reorganization that specifies the effective date of the payroll organization.
- Security: *Create: Custom Organization* domain in the Organizations and Roles functional area.

### Context

To establish a hierarchy that consists of multiple payroll companies that share a common integration system, create a superior organization.

### Steps

1. Access the Create Custom Organization task.
2. Select the Custom Organization Type that you created for external payroll processing and the Reorganization that you created to support the payroll organization structure.
3. Specify the Availability Date.
4. Enter an Organization Name.  
The name of a superior organization doesn't need to correspond to any value in the external payroll system.
5. (Optional) In the Organization ID field, enter an ID for the superior organization.
6. (Optional) If you want to combine the organization name and ID for display in Workday, select the Include Organization ID in Name check box.

7. At the Organization Subtype prompt, select *Pay Group*.
8. At the Organization Visibility prompt, specify who can view the superior organization and its members.
9. (Optional) Select an External URL to link to a website for related information.
10. Assign employees to the organization payroll roles:
  - a) Add a row to the Assign Roles grid.
  - b) At the Role prompt, select the Payroll Interface Partner role (or the equivalent payroll role in your organization).
  - c) If you want to restrict this role to a single worker, select the Restrict to Single Assignment check box.
  - d) At the Worker prompt, select an employee to assign to this role. If the Restrict to Single Assignment check box isn't selected, you can assign more than 1 employee.
  - e) Repeat these steps for the Payroll Partner role (or similar payroll role in your organization).
11. For each subordinate payroll company, assign the superior organization:
  - a) Access the View Custom Organization report.
  - b) Select the payroll company at the Organization prompt.
  - c) As a related action on the organization, select Reorganization > Change Superior Organization.
  - d) At the Reorganization prompt, select the reorganization that you created to support the payroll organization structure.
  - e) Select the New Superior Organization at the prompt.

## Result

Access the View Custom Organization report to verify the organization hierarchy:

- For each payroll company, the report displays the superior organization in the Top Level Organization and Superior fields.
- For the superior organization, the report displays the subordinate payroll companies in the Subordinates field.

## Next Steps

After you create the superior organization, assign it to your payroll companies.

### Tasks

[Steps: Establish Third-Party Payroll Organization](#) on page 1392

[Steps: Set Up Workday Payroll Interface](#) on page 1699

## Third-Party Payroll Pay Groups

### Steps: Create and Assign Third-Party Payroll Pay Groups

#### Prerequisites

Define the external payroll organization.

#### Context

Create and assign pay groups for third-party payroll. These steps apply to Workday Payroll Interface and Workday Payroll Effective Change Interface.

## Steps

1. [Create or Edit Period Schedule for Payroll Interface on page 1397](#).
2. Set up a pay run category for third-party payroll processing.

Select these options:

- Use in Payroll Interface.
- (Optional) Use State Supplemental Flat Tax Rate.

[See Steps: Set Up Pay Run Categories.](#)

3. [Create Pay Group for Third-Party Payroll on page 1399](#).

Create pay groups and assign a run category and period schedule to each group.

4. [Assign Pay Group to Payroll Company on page 1401](#).

5. [Assign Pay Group to Employee on page 1401](#).

6. Access the Maintain External Pay Period Status task.

As you complete the task, consider:

Option	Description
Pay Groups for Payroll Interface	Select the external pay groups.
Pay Period Selection Option	Select an option: <ul style="list-style-type: none"> <li>• <i>Use Earliest Open Pay Period</i></li> <li>• <i>Use Pay Period for Current Date</i></li> </ul>

(Optional) Delete pay groups that you don't want to update.

Security: *Set Up: Payroll Interface (Update Pay Period Status)* domain in Payroll Interface functional area.

7. (Optional) [Manage Payroll Integration System for Pay Group on page 1402](#).

## Next Steps

Define payroll earnings and deductions.

Related Information

### Concepts

[Concept: Workday Payroll Interfaces on page 1496](#)

### Tasks

[Steps: Set Up Workday Payroll Interface on page 1699](#)

## Create or Edit Period Schedule for Payroll Interface

### Prerequisites

Security: *Set Up: Period Schedule* domain in Project Tracking functional area.

Define pay frequencies for payroll interface.

### Context

Create a period schedule for pay groups:

- Select the pay frequency.
- Specify the start date, end date, and payment date for each pay period in a calendar year.

Workday uses the period schedule pay frequency for annualization of compensation and benefit contributions. Workers inherit their pay frequency from the period schedule for their pay group.

This topic describes how to create period schedules. You can also import period schedules from a spreadsheet using Workday Enterprise Interface Builder (EIB).

Note: Ensure that you have at least one period in your period schedule with dates before the effective date of your first Workday Payroll or HR transactions.

## Steps

1. Access the Create Period Schedule task.
2. Select *Payroll* in the Usage field. If creating a shared period schedule, select *Time Tracking*.
3. (Optional) To prevent weekend payment dates, complete the Payment Date Auto-Adjust section.  
To change payment dates from Saturday to the preceding Friday, enter *-1* in the Saturday field.
4. Add a row for the first period in the schedule.
5. Enter the Period Start Date, Period End Date, and the Payroll Payment Date if it differs from the period end date.
6. (Optional) If the payment date is always the same number of days after the period end date, and you want Workday to set it:
  - a) To save the period schedule, click OK.
  - b) From the period schedule name, select the related action Period Schedule > Edit.
  - c) Expand the Payroll section.
  - d) Enter a value for the Payment Date Offset Days Default.
7. (Optional) To create a forward accrual for the period, complete the Payroll GL Accruals section.

Note: You can't change these fields after the payroll process status is Complete.

Option	Description
Create Forward Accrual	If the pay period spans multiple reporting periods and to estimate payments to a reporting period end, create a forward accrual.
Days to Accrue	Number of days in the pay period for which to estimate payments.  Workday creates the forward accrual as a ratio of Days to Accrue over Days in Basis.
Days in Basis	Number of work or calendar days in a full financial reporting period. Typically the recent full pay period.
Accrual Date	Date on which to create the forward accrual. Used for the accounting entry. Typically the last day of the accounting period.
Accrual Reversal Date	Date to reverse the accrual. Can be any day after the accrual date, but is typically the first day of the next accounting period.

8. (Optional) Add a row to the Payroll Settlement Date Overrides section to define different payment dates per country. Example: Define override dates for countries with different bank schedules to ensure that payments occur on bank working days.

Option	Description
Country	Workday applies the Override Date when the bank account receiving the payment is in this country. You can view the bank account country on the Bank Account task.

Option	Description
Override Date	Overrides the Payroll Payment Date. For on-cycle payments only.  Workday applies the Override Date during settlement, but displays the default payment date on the payroll results and the payslip.

## Result

Payroll is calculated for the pay period. The Payroll check box in the Used In section is highlighted. Fields for the period aren't editable.

## Next Steps

- Create a run category for payroll processing that uses the period schedule.
- Create pay groups for the period schedule.
- Every calendar year, update the period schedule.

## Related Information

### Tasks

[Steps: Create and Assign Third-Party Payroll Pay Groups on page 1396](#)

## Create Pay Group for Third-Party Payroll

### Prerequisites

Security: *Set Up: Payroll Interface* domain in *Payroll Interface* functional area.

Create a run category to associate with the pay group.

### Context

Create 1 or more pay groups for third-party payroll processing. You create a separate pay group for each group of employees who have the same pay frequency.

(ADP PayForce Version 2 only) ADP PayForce maps their pay frequencies (1 character long) to Workday pay groups. Pay groups that you use in the ADP PayForce integration must end with a character that matches with the pay frequency in Workday. Example: If the pay frequency in ADP PayForce is Weekly, the corresponding pay group in Workday must end with W.

### Steps

1. Access the Create Pay Group task.
2. Define the pay group organization:

Option	Description
Availability Date	Date when the pay group is first available to assign to workers.
Organization Name	Pay group code in the external payroll system.  Typically, external systems combine a pay company code with a pay group code to create a unique identifier. If the identifier is ABC1, the pay company code is ABC and the pay group code is 1.  Note: Enter an organization name if you plan to use the pay group with the Payroll Effective

Option	Description
	Change Interface integration or Workday won't let you launch the integration for that pay group.
Organization Code	Name of the payroll company that the pay group belongs to in the external payroll system.  This value is the pay company code (such as ABC) and matches an Organization Name that you previously defined.
Include Organization ID in Name	To combine the organization name and ID for identification purposes, select this check box. Select this check box for proper identification of the pay group in integration files.
Organization Subtype	Select <i>Pay Group</i> .
Organization Visibility	Who can view the organization and its members?
External URL	To link to a website for related information, select or create an External URL.  Example: Create a link to your external payroll provider website to access tools and resources for payroll processing.

3. On the Pay Group tab:

- a) Select the Used in Payroll Interface check box to specify that an external payroll provider handles payroll for this pay group.
- b) Select the Country for the pay group.

Supported countries are defined in the Payroll Interface category of the Edit Tenant Setup - HCM task.

Workday uses the currency for this country as the first-level default when performing any currency conversions.

4. On the Pay Group Details grid, assign a run category and period schedule to the pay group:

- a) Add a row to the grid.
- b) Select a Run Category for the pay group. If the pay group is a payroll interface pay group, you can only assign 1 run category.
- c) To use the default period schedule, click Use Run Category Defaults. If you want to select a different period schedule, click Specify Run Category Details and then select a Period Schedule at the prompt.
- d) (Optional) To override the first processing pay period, select a pay period for the Override First Processing Period that is before the pay period you'll run the integration for. Example: You create a new pay group and set the Override First Processing Period to January 2022. When you run the integration for January 2022 for the new pay group, the integration fails indicating that there needs to be an earlier pay period. Set the Override First Processing Period to a period before January 2022, such as December 2021, when running the integration for January 2022.

5. If you want to enable others to modify this pay group, click the Assign Roles tab and select additional owners for the pay group.

## Next Steps

- Assign the pay group to a payroll company.

- Assign employees to the pay group.
- To ensure that the integration selects the correct period each time it runs, maintain the calculation status of the pay group pay periods.

Related Information

#### Tasks

[Steps: Create and Assign Third-Party Payroll Pay Groups on page 1396](#)

### Assign Pay Group to Payroll Company

#### Context

Assign one or more pay groups to a custom payroll company that you created for external payroll processing.

#### Steps

1. Access the View Organization report for the custom payroll company.
2. As a related action on the payroll company, select Reorganization > Assign Included Organizations.
3. At the Reorganization prompt, select the reorganization that you created to support the payroll organization structure.
4. At the Includes Organizations prompt, select the pay groups that you want to assign to this payroll company.

#### Result

You can view the pay group structure by accessing the following reports:

- The View Organization report displays the payroll company's subordinate pay groups in the Includes field.
- The View Pay Group report displays the payroll company that the pay group belongs to in the Included In field.

Related Information

#### Tasks

[Steps: Create and Assign Third-Party Payroll Pay Groups on page 1396](#)

### Assign Pay Group to Employee

#### Prerequisites

Security: *Manage: Service Center* domain in *System* functional area.

#### Context

Assign a pay group to an employee or employee position.

Pay group assignments can also be a part of any staffing business processes that include the Assign Pay Group subprocess.

#### Steps

1. Access the Assign Pay Group task or, as a related action on a worker, select Payroll > Assign Pay Group.
2. In the Effective as of field, specify the date when the pay group assignment is effective.  
The effective date must be on or after a worker hire date, and before the period start date for the worker first pay period.

3. Select the Worker for the pay group assignment. If you accessed this task as a related action on a worker, Workday already selects the worker.
4. If the worker holds more than 1 position, select the Position.  
 Note: For international assignments, assign the primary position for the third-party pay group. Workday includes additional jobs in the third-party pay groups.
5. In Proposed Pay Group, select the pay group to assign.  
 The prompt only displays pay groups that have an availability date equal to or later than the Effective as of date.
6. Click Submit.

[Steps: Create and Assign Third-Party Payroll Pay Groups on page 1396](#)

## Manage Payroll Integration System for Pay Group

### Prerequisites

- Security: *Set Up: Payroll Interface* domain in the *Payroll Interface* functional area.
- Set up a *Payroll Effective Change Interface* or *Payroll Interface* integration.
- Define the Pay Groups for your integration.

### Context

If both of these conditions are true:

- You're running the integration for the first time in production.
- You're running the integration with the Primary Run launch parameter enabled.

Then access each Pay Group and set the Created Date Time field to the beginning of the pay period. If you don't complete these steps, then Workday automatically sets Created Date Time to the day before the payroll run date.

You can set the Created Date Time for Additional Run to enable Payroll Effective Change Interface to run as frequently as every 4 hours.

### Steps

1. Access the Maintain Payroll Integration System for Pay Group task.
2. Select the Pay Group.
3. Add 1 row to the Last Extract Created grid for each Payroll Interface integration.
4. Select an Integration System for each row.
5. Set the Created Date Time to the beginning of the pay period.
6. (Optional) Set the Created Date Time for Additional Run to match the *Created Date Time* field.  
 This optional step enables you to run the integration more frequently than once per day.

[Steps: Create and Assign Third-Party Payroll Pay Groups on page 1396](#)

## Third-Party Payroll Earnings and Deductions

### Steps: Define Third-Party Payroll Earnings and Deductions

#### Prerequisites

Set up pay groups for third-party payroll.

See [Steps: Create and Assign Third-Party Payroll Pay Groups](#).

#### Context

Define the earnings and deductions for your pay groups. If the pay groups share earning and deduction codes in an external payroll system, you can assign multiple pay groups to a single earning or deduction. The earnings and deductions use each pay group frequency unless you enter an override frequency.

These steps apply to these Workday integrations:

- Data Changes on Demand
- Payroll Effective Change Interface
- Payroll Interface

#### Steps

1. [Manage External Payroll Earnings](#) on page 1403.
2. [Manage External Payroll Deductions](#) on page 1406.
3. [Manage External Payroll Input for Worker](#) on page 1410.

To include general or voluntary deductions in payroll integrations, set up external payroll input for employees.

Related Information

#### Concepts

[Concept: Workday Payroll Interfaces](#) on page 1496

#### Tasks

[Steps: Set Up Workday Payroll Interface](#) on page 1699

## Manage External Payroll Earnings

#### Prerequisites

- To define compensation elements, use the [Maintain Compensation Elements](#) task.
- To define benefit plan details, use the [Create Benefit Plan](#) or [Edit Benefit Plan](#) task:
  - For health care plans, specify values in the Plan Costs section of the Benefits Rates and Eligibility grid.
  - For insurance plans, examine the Employee Cost is Pre-tax and Employer Cost is Non-taxable check box settings. The settings and tags you assign to the earnings determine the earnings included in an integration.
- If the same external code applies to more than 1 earning in Workday, configure your tenant to accept duplicate external codes. Access the [Edit Tenant Setup - HCM](#) task, and in the Payroll Interface section, select the [Enable External Payroll Code](#) check box. Earning codes must be unique in your Workday tenant. The check box provides flexibility when an external payroll endpoint uses the same code for different earnings. Example: An earning that is before tax for 1 pay company and after tax for another.
- If needed, configure your tenant to support multiple jobs in the Position Setup Options field on the [Edit Tenant Setup - HCM](#) task.
- Security: *Set Up: Payroll Interface* domain in *Payroll Interface* functional area.

## Context

Define external payroll earnings in Workday.

These steps use the Maintain External Payroll Earnings task to define all the external payroll earnings by configuring 1 earning per row. You can also define them individually using these tasks:

- Create External Payroll Earning
- Edit External Payroll Earning
- View External Payroll Earning
- Copy External Payroll Earning

You can also use these web services to upload and change external payroll earnings:

- Get External Payroll Earnings
- Put External Payroll Earning

## Steps

1. Access the Maintain External Payroll Earnings task.
2. Insert a row for each earning.
3. Specify a unique earning Name and Code.

The Code typically corresponds to the earning codes in an external payroll endpoint. The third-party payroll integrations apply changes to the Name value for an existing earning to *all* workers with that earning. The integrations include those workers in the integration output file in the next integration run.

4. If the earning is position-based, select Position Based.  
You typically select this option for earnings of workers who have multiple jobs.
5. If you enabled non-unique external payroll codes in your tenant and you want to assign the same external code to multiple earnings, edit the value in the External Payroll Code field.  
By default, the External Payroll Code matches the Code. The *Get Payees* web service returns both values.
6. Select 1 or more Pay Groups.
7. If the earning is an adjustment, a goal amount, or an input for a recurring earning, select the Allowed Payroll Input Type:

- Select *Adjustment* for one-time payments that are sent in pay data integrations. *Adjustment* is the only type of payroll input accepted for earnings that are mapped to compensation elements, time off, or benefit plans.
- Select *Goal Amount* for a payment that is valid until a goal amount is reached. When you select *Goal Amount*, select *Input*.
- Select *Input* for a recurring earning that isn't associated with a benefit plan.
- Select *Ongoing* for an input that you want to output in the Payroll Input Earnings and Deductions data section.
- If you select *Input* or *Adjustment*, the Start Date and End Date set for the external payroll input for the worker determines if the earning belongs in pay data integrations or regular payroll integrations. If the Start Date and End Date for an external payroll input are the same, the input displays in the Payroll One Time Payment section of the integration output.
- If you select *Ongoing*, the external payroll input displays in the Payroll Input Earnings and Deductions data section of the integration output. This location applies regardless of the Start Date and End Date for the external payroll input for the worker.
- 8. If the earning corresponds to compensation, such as regular base pay, an allowance, or a bonus, select the Compensation Element.
- 9. Select 1 Benefit Tags per earning type. For compensation elements or time off, leave this field blank. Workday uses the Benefit Tags to retrieve the amount from the benefit plan definition. The Benefit

Tags apply to the Benefits Rates and Eligibility grid on the View Benefit Plans report for the benefit plan.

Option	Description
<i>Fair Market Value</i>	<p>Associate this tag with all earnings that represent the fair market value (FMV) of healthcare coverage for adult children not qualifying as a dependent under state law.</p> <p>For earnings set to <i>Fair Market Value</i>, Workday multiplies the fair market value of the plan by the number of eligible dependents to calculate the income amount.</p>
<i>Flex Credits</i>	<p>Associate this tag with all earnings that represent benefit flex credits. The integration then picks up the applicable flex credit value from the benefit plans and benefit group coverages you specify on the earning definition.</p>
<i>Taxable Benefit</i>	<p>Associate this tag with all earnings that represent an employer-paid taxable benefit. The integration then picks up the applicable Employer Cost (Taxable) value from the benefit plans you specify on the earning definition.</p> <p>Note: Don't use this tag for earnings that represent imputed income for GTL (Group Term Life Insurance), instead use the <i>Taxable Benefit - Imputed Income for GTL</i> tag.</p>
<i>Taxable Benefit - Imputed Income for GTL</i>	<p>Associate this tag with all earnings that represent imputed income for group term life (employee, dependent, or spouse coverage). The integration then picks up these values from the benefit plans you specify on the earning definition:</p> <ul style="list-style-type: none"> <li>• Employee cost (pre and post-tax)</li> <li>• Employer cost (taxable and non-taxable)</li> <li>• Coverage amount</li> <li>• Covered person type (employee, dependent or spouse)</li> <li>• Covered person birth dates</li> </ul> <p>Note: Don't use this tag for earnings that represent employer-paid taxable benefits, instead use the the <i>Taxable Benefit</i> tag.</p>

- 10.If the earning applies to a benefit plan, such as a flex credit for medical or dental coverage, select Benefit Plans.
- 11.If the earning applies to specific benefit groups, select Benefit Group Coverage.

- 12.(Optional) At the Scheduling prompt, specify when to record the earning if the frequency differs from the pay group frequency.  
If you pay an employee weekly, but a flex credit has a monthly frequency, select the weekly pay period to apply the earning.  
Workday uses scheduling information to calculate the number of remaining pay periods during benefit plan enrollment, not for integration purposes. The external payroll endpoint maintains earning and deduction schedules.
- 13.If the earning frequency differs from the pay group frequency for each employee, specify an Override Frequency.  
If you leave this field blank, Workday calculates the earning amount based on the employee pay group frequency.
- 14.If the earning is for paid time off, select Time Off.
- 15.Assign 1 or more Time Calculation Tags.
- 16.To exclude the earning from outbound integrations, select Inbound Only.
- 17.Assign 1 of your Groups to the earning.  
Earnings assigned to the same group will display under that group in reports.

## Result

When launched, a payroll integration or a pay data integration selects the earnings defined for each pay group.

You can view external payroll earnings:

- To examine the earnings linked to a benefit plan, access the View Benefit Plan report. The Earnings and Deductions field displays the payroll earnings associated with the plan.
- To examine worker payroll earnings, access the worker profile and click the Pay profile group. The Payroll Interface Earnings/Deductions tab displays the earning amounts and frequency calculations for each benefit plan. It also displays the total amounts for any earnings linked to multiple plans and any flex credits.

You can see the settings on the View External Payroll Earnings report. You can also manage individual earnings on this report. From the related action menu on an earning, select Payroll Interface, then select 1 of the tasks.

## Next Steps

For one-time adjustments to earnings, specify the adjustment amount using the Maintain External Payroll Input for Worker task.

Related Information

### Tasks

[Steps: Define Third-Party Payroll Earnings and Deductions on page 1403](#)

### Reference

[Reference: Edit Tenant Setup - HCM](#)

## Manage External Payroll Deductions

### Prerequisites

- To define benefit plan details, use the Create Benefit Plan or Edit Benefit Plan task:
  - For health care plans, specify values in the Plan Costs section of the Benefit Rates and Eligibility grid.
  - For insurance plans, examine the Employee Cost is Pre-tax and Employer Cost is Non-taxable check boxes. These settings and the tags assigned to the deductions determine the deduction amounts included in an integration.

- If the same external code applies to multiple deductions, configure your tenant to enable duplicate external codes. Access the Edit Tenant Setup - HCM task. In the Payroll Interface section, select the Enable External Payroll Code check box. Ensure that deduction codes are unique in your Workday tenant. This setting provides flexibility when an external payroll endpoint uses the same code for different deductions. Example: A deduction that is pretax for 1 pay company and post-tax for another.
- If needed, configure your tenant to support multiple jobs in the Position Setup Options field on the Edit Tenant Setup - HCM task.
- Security: *Set Up: Payroll Interface* domain in *Payroll Interface* functional area.

## Context

Create payroll deductions for third-party processing. Specify deduction codes, assign tags to deductions, select an override frequency, and map the deductions to Workday benefit plans. You can configure general and voluntary deductions, such as membership dues, that aren't associated with Workday benefit plans.

Set up separate deductions for each type of benefit plan cost. Example: Benefit plans can have both pretax and post-tax employee costs, and a nontaxable employer cost. Create a deduction for each cost type, and then assign the applicable benefit plans to the deduction.

Workday treats taxable employer costs and flex credit amounts for benefit plans as earnings. To set up earnings for these plan amounts, use the Maintain External Payroll Earnings task.

In addition to regular payroll deductions, use this task to set up adjustments or unpaid time off for Payroll Interface integrations. If you don't reduce base pay by paid time off, then you typically set up paid time off as a deduction.

These steps use the Maintain External Payroll Deductions task to define all the external payroll deductions on 1 page, 1 row per earning. You can also define them individually using these tasks:

- Create External Payroll Deduction
- Edit External Payroll Deduction
- View External Payroll Deduction
- Copy External Payroll Deduction

You can also use these web services to upload and change external payroll deductions:

- Get External Payroll Deductions
- Put External Payroll Deduction

## Steps

1. Access the Maintain External Payroll Deductions task.
2. Insert a row for each deduction.
3. Specify a Name and Code.

The Code typically corresponds to the deduction codes in an external payroll endpoint. If you edit the Name value for an existing deduction, Payroll Interface considers this action a change for *all* workers with that deduction. Payroll Interface includes all of those workers in the integration output file of the next integration run.

4. If the deduction is based on a position, select Position Based.

You typically select this option for earnings for workers who have multiple jobs.

5. If you enabled nonunique external payroll codes and you want to assign the same external code to multiple deductions, edit the External Payroll Code value.

By default, the External Payroll Code matches the Code. The Get\_Payees web service returns both values.

6. Select 1 or more Pay Group.

7. If the deduction is an adjustment, a goal amount, or an input for a recurring deduction, select the Allowed Payroll Input Type:

- For one-time deductions that are sent in pay data integrations, select *Adjustment*. *Adjustment* is the only type of payroll input enabled for deductions that are mapped to time off or benefit plans.
- For a deduction that is valid until a goal amount is reached, select *Goal Amount*. Example: Goal amounts apply to 401K loan repayments or to charitable contributions toward a pledge amount. When you select *Goal Amount*, you also select *Input*.
- For ongoing general or voluntary deductions sent in regular payroll integrations, or for adjustments to recurring deductions sent in pay data integrations, select *Input*.

If both *Input* and *Adjustment* are selected, Workday determines if the deduction belongs in pay data integrations or regular payroll integrations. The determination is based on the deduction Start Date and End Date set in the Maintain External Payroll Input for Worker task.

8. Select 1 Benefit Tags per deduction type. For general or voluntary deductions, leave the Benefit Tags field blank.

Workday uses the Benefit Tags to retrieve the amount from the benefit plan definition or to obtain the employee election percentage. The Benefit Tags apply to the Benefits Rates and Eligibility grid on the View Benefit Plans report for the benefit plan.

Option	Description
Employee Cost (post-tax)	Associate this tag with all deductions that represent benefit employee post-tax costs. The integration picks up the applicable post-tax cost value from the benefit plans that you specify on the deduction definition.
Employee Cost (pre-tax)	Associate this tag with all deductions that represent benefit employee pre-tax costs. The integration picks up the applicable pre-tax cost value from the benefit plans you specify on the deduction definition.
Employer Cost	Associate this tag with all deductions that represent an employer-paid non-taxable benefit. The integration picks up the applicable employer cost non-taxable value from the benefit plans you specify on the deduction definition.
Employer Percent Contribution	Associate this tag with all deductions that represent employer contributions to retirement savings plans. The contributions are represented as a percentage of the salary. The integration picks up the applicable employer percent contribution value from the benefit plans you specify on the deduction definition.
Percent Deduction	Associate this tag with all deductions that represent benefit employee percentage deductions such as defined contributions. The integration picks up the applicable percentage value from the benefit plans that you specify on the deduction definition.

9. If the deduction applies to 1 or more benefit plans, select the Benefit Plans.  
Multiple benefit plans and providers can use a single code. Example: Associate a dental pretax deduction with dental plans with a single deduction code, such as DNT, for the same deduction type.
- 10.(Optional) At the Scheduling prompt, specify when to take the deduction if its frequency differs from the pay group frequency.  
If you pay an employee weekly, but a deduction has a monthly frequency, select the weekly pay period.  
Workday uses scheduling information to calculate the number of remaining pay periods for benefit plan enrollment, not for integration purposes. Earning and deduction schedules are maintained in the external payroll endpoint.
- 11.Select an Override Frequency on the pay component if the deduction frequency for HSA or FSA plans differs from the pay group frequency.  
If you leave this field blank, Workday calculates the deduction amount based on the employee pay group frequency.
- 12.If the deduction is for time off, select Time Off.
- 13.To exclude the deduction from outbound Payroll Interface integrations, select Inbound Only.
- 14.Assign 1 of your Groups to the earning.  
Earnings assigned to the same group will display under that group in reports.

## Result

When launched, payroll integrations select the deductions defined for each pay group.

You can view external payroll deductions:

- To examine deductions linked to a benefit plan, access the View Benefit Plan report. The Earnings and Deductions field displays the payroll deductions associated with the plan.
- To examine worker payroll deductions, access the worker profile and click the Pay profile group. The Payroll Interface Earnings/Deductions tab displays the deduction amounts and frequency calculations for each benefit plan. The tab displays the total amounts for deductions linked to multiple plans.

You can see the settings on the View External Payroll Deductions report. You can also manage individual earnings on this report. From the related action menu on an earning, select Payroll Interface, then select 1 of the tasks.

## Next Steps

For general or voluntary deductions or one-time adjustments, set deduction amounts using the Maintain External Payroll Input for Worker task.

[Reference: Edit Tenant Setup - HCM](#)

## Maintain External Payroll Input Reasons

### Prerequisites

Security: Set Up: Payroll Interface domain in Payroll functional area.

## Context

You can set up and maintain reasons associated with external payroll input to improve traceability. You can track the reasons why external payroll input requires a reference specific to your organization. You define the reasons based on your organization's business requirements. Examples: typos, late submissions of time, or equity vesting.

## Steps

1. Access the Maintain External Payroll Input Reasons task.

2. Enter a reason in the Reason Name field.

Click the plus icon to enter multiple reasons in the grid.

Note: All reasons in the Used column are unselected until the reason is associated with a worker.

3. Access the Maintain External Payroll Input for Worker task for the specific workers who you want to tag with reasons.

Security: *Worker Data: Payroll Interface (Payroll Input by Worker)* domain in *Payroll* functional area.

4. Select the reason from the External Payroll Input Reason prompt.

## Result

When you return to the Maintain External Payroll Input Reasons task after you have assigned a reason to worker, Used is selected for that reason.

### Related Information

#### Concepts

[Concept: External Payroll Inputs](#) on page 1411

## Manage External Payroll Input for Worker

### Prerequisites

Security: *Worker Data: Payroll Interface (Payroll Input by Worker)* domain in *Payroll* functional area.

Define earnings and deductions for the worker pay group organization using these tasks:

- Maintain External Payroll Earnings
- Maintain External Payroll Deductions

## Context

Configure external payroll input for earnings and deductions that aren't part of regular compensation or benefits. External payroll input includes general or voluntary deductions. Examples:

- Enrollment fees.
- Charitable contributions.
- Membership dues.
- 401K loans.

External payroll input also includes single adjustments to earnings or deductions.

Workday retains an external payroll input after a worker's position ends.

## Steps

1. Access the Maintain External Payroll Input for Worker task.

2. As you complete this task, consider:

Option	Description
Start Date End Date	For a one-time adjustment, the End Date must match the Start Date. For general, voluntary, or on-going deductions, you usually set the End Date to a different pay period than the Start Date or leave it blank.
Position	If a worker has multiple positions, select 1.
Worktag	<i>Cost Center</i> is the only valid worktag.
Batch ID	Batch ID must be defined with Usage set to <i>Payroll Interface</i> .
Input Value	Accepts positive and negative values. Example: To perform a reversal, specify a negative value.
Unit	Accepts positive and negative values.
Rate	Accepts positive and negative values.
Percentage	Accepts positive and negative values.
Adjustment	Automatically selected for an earning or deduction set up with an Allowed Payroll Input Type of <i>Adjustment</i> . However, if an earning or deduction has an Allowed Payroll Input Type of both <i>Input</i> and <i>Adjustment</i> , select the Adjustment check box.
External Payroll Input Reason	Select an external payroll input reason from the prompt when available.

## Result

Workday processes payroll input:

- If you selected the Adjustment check box, the input is sent in a pay data integration.
- If you cleared the Adjustment check box, and:
  - Start Date and End Date are in the same pay period. The input is sent in a pay data integration.
  - Start Date and End Date are in different pay periods. The input is sent in a regular payroll integration.

## Next Steps

To delete external payroll inputs, access the Delete External Payroll Input by Batch task.

To view information for external payroll inputs, access the View External Payroll Input by Worker(s) report.

Related Information

### Tasks

[Steps: Define Third-Party Payroll Earnings and Deductions on page 1403](#)

### Concept: External Payroll Inputs

External payroll inputs enable you to create earnings or deductions that aren't part of regular compensation or benefits. External payroll inputs include general or voluntary deductions. Examples:

- Enrollment fees.
- Charitable contributions.
- Membership dues.
- 401K loans.

An external payroll input also includes single adjustments to earnings or deductions.

For position-based external payroll inputs, Workday retains the Position value for position-based external payroll inputs after the worker position ends. You can continue to identify the position associated with the external payroll input.

The currency for an external payroll input determines the decimal precision for the input amount. Example: EUR supports a decimal precision of 2. JPY supports only whole numbers.

## Changing External Payroll Inputs

When you change an existing external payroll input, the Data Changes Audit for the Payroll Effective Change Interface (PECI) integration contains:

- Removal of the existing external input and prior value.
- Addition of the external input with the new value.

Example	Outcome
<p>You add an external payroll input for a worker's Spot Bonus:</p> <ul style="list-style-type: none"> <li>• Amount is 2000 USD.</li> <li>• Start Date is 12/28/2021.</li> </ul> <p>You then change the amount of the Spot Bonus to 3000 USD. The PECI integration processes the external payroll input change by:</p> <ul style="list-style-type: none"> <li>• Removing the original external payroll input with the 2000 USD amount.</li> <li>• Adding the external payroll input with the changed 3000 USD amount.</li> </ul>	<p>The Data Changes Audit report displays the complete prior value for the original 2000 USD spot bonus and the complete current value for the changed 3000 USD value.</p>
<p>You update an existing on-going payroll input deduction with a start date of 1/1/2020 with an end date of 1/1/2022.</p>	<p>The PECI integration processes the external payroll input change by:</p> <ul style="list-style-type: none"> <li>• Removing the original external payroll input without the end date reference as of the original start date (1/1/2020).</li> <li>• Adding the external payroll input with the added end date reference as of the original start date (1/1/2020).</li> <li>• Adding the external payroll input end date as of the end date (1/1/2022)</li> </ul>

The Payroll Input ID value remains the same for both the removal of the original external payroll input and the addition of the changed external payroll input. This ID enables the external payroll system to identify that the external payroll inputs are the same.

## Reversing External Payroll Inputs

When you reverse an external payroll input for a worker, the Payroll Effective Change Interface integration Data Changes Audit report displays effective changes with:

- The prior value.

- The current value.

Workday combines input changes older than 6 months into a single effective change in the Data Changes Audit report. Changes that are within the past 6 months display as individual effective changes.

[Override Currency Decimal Precision](#)

## External Vendor Mapping and Associations

### Create External Payroll Vendor Mapping

#### Prerequisites

- Obtain the target tenant names from your external payroll vendor for mapping to your Workday tenants.
- Security: *Security Administration* domain in the System functional area.

#### Context

You can map your tenants to the external payroll vendor and assign a single X.509 private key pair to each mapping.

You create a separate mapping for each Workday environment where you enable any available features for the external vendor.

#### Steps

1. Access the Create External Payroll Vendor Mapping task.
2. As you complete the task, consider:

Option	Description
External Payroll Vendor	Select the payroll vendor for this mapping.
Environment	Select the Workday environment to map to the external vendor.

3. If you didn't create the selected External Payroll Vendor using the Create External Payroll Vendor task, consider:

Option	Description
Target Environment	Select the vendor environment for this mapping.
Target Tenant Name	Enter the external payroll tenant name provided by your vendor.

4. On the Public Private Key Pairs grid, select a Key Pair to use for the mapping, or select Create x509 Private Key Pair to create a new pair.  
If you create a new pair, you must select the Do Not Allow Regeneration check box. Optionally, select the Enable Security Emails check box on the Edit Tenant Setup - Security task to receive X.509 certificate expiration email notifications.
5. Select the Active check box for the key pair you want to use.

- If you created the selected vendor using the Create External Payroll Vendor task, complete the Feature Configuration grid.

Option	Description
Feature	Select the feature to configure for the vendor.
Attribute	Add a row for each available attribute and enter the Value that meets your objectives. For endpoint attributes, enter the external endpoint to use for this vendor. If the endpoint you provided isn't valid, contact the endpoint owners to make the endpoint available in the Domain Name System.

## Maintain Pay Group Vendor Associations

### Prerequisites

Security: *Set Up: Payroll Interface* domain in the Payroll Interface functional area

### Context

Use this task to associate a pay group with an external vendor for features, such as:

- Additional Payroll Data
- Data Changes on Demand
- Event Outbound Notifications
- Global Payroll Hub
- REST API External Tax Documents
- REST API Payslips

Note: You can't map a single pay group to multiple external payroll vendors.

### Steps

- Access the Maintain Pay Group Vendor Associations task.
- In the grid, select your external vendor in the External Payroll Vendor column.
- Select the Feature to associate with the vendor.
- Select the pay groups for that feature in the Pay Group column.
- In the Payroll Organization Type column, select the organization type for the custom organization or payroll entity that includes the pay group.

## Third-Party Payroll Concepts

### Concept: Multiple Pay Groups in Payroll Integrations

Workday enables you to create:

- A hierarchical organization that has multiple pay groups.
- Payroll companies that roll up to a superior payroll organization.

Workday Payroll Interface supports payroll organizations that have different:

- Earnings and deductions.
- External processing requirements.
- Pay frequencies.

A single integration system can support this type of organization structure if the external system processes payroll companies in the same way. Workday Payroll Interface enables you to create an integration system and configure the output file to match your provider's requirements.

When you launch the integration, you can include multiple pay groups with different pay frequencies in the same integration run. Workday:

- Processes each pay group.
- Applies the calculation logic based on each group's pay frequency.
- Generates a single output file that has a header record for each pay group followed by its member data.

Payroll integrations can produce only 1 output file per run. If you need to send separate files for each pay group in your payroll organization, launch the integration multiple times.

### **Reference: Payroll Integration Output and Audit Files**

Workday attaches audit reports and output files to the Reports and Other Output Files section of each integration event for:

- Payroll Effective Change Interface
- Payroll Interface Connector
- Worker Effective Change Interface

After an integration runs, you can access the Integration Events report to view the audit files. Select the event to open the View Background Process page, and navigate to the Output Files tab. Workday expires and deletes audit files 90 days after Workday creates them.

### **Security Prerequisites**

To view payroll extract files, you need *View* access to any 1 of these domains:

- *Reports: Pay Calculation Results for Pay Group (Results) - CAN*
- *Reports: Pay Calculation Results for Pay Group (Results) - FRA*
- *Reports: Pay Calculation Results for Pay Group (Results) - UK*
- *Reports: Pay Calculation Results for Pay Group (Results) - USA*

### **Data Changes Audit**

The Data Changes Audit report is a readable version of the integration output file that lists workers changes and the values that changed in the effective sequence.

Workday generates the report when you:

- Disable the *Suppress Audit Files* integration attribute.
- Enable the *Suppress Audit Reports For Job Size* integration attribute.

The report has these components:

#### Extract Summary

Displays:

- Selection criteria for the payroll extract.
- Pay group name.
- Payroll company name.
- Period start and end dates.

#### Payee Details

Provides summarized and detailed views of employee data changes, and displays the payee count.

The summarized view displays:

- IDs
- Employee names.
- Categories of changed data (PICOF only).

The detailed view displays:

- Current field values.
- Prior values when the data has changed.
- Transaction log details with effective dates and entry dates (for PECI and WECI, only if the Transaction Log Data Section is enabled).

Workday highlights new records in green and deleted records in gray.

To toggle between views for all employees, click Show or Hide or select an employee in the summary list to view their details.

## Diagnostic Audit

The Diagnostic Audit file helps you troubleshoot integration errors. The report includes details on all employees that the integration processed when creating the payroll extract.

Workday generates the report when you:

- Disable the *Suppress Audit Files* integration attribute.
- Enable the *Suppress Audit Reports For Job Size* integration attribute.

Use this report information to determine why the output included or excluded:

- Current properties.
- Employee processing details.
- Transaction log details.
- Validation messages.

In some cases, employees had transactions that didn't affect the set of data configured in the payroll extract. In other cases, the integration encountered an error while processing these employees.

You can also use the Diagnostic Audit file to increase the performance of a payroll integration. The audit lists the transaction log entries that the integration processed for each employee. If many employees in the diagnostic audit file don't have relevant data changes, you can reconfigure the integration transaction log service to exclude some transaction types.

If you see a worker in the Diagnostic Audit but not in the Data Changes Audit, the integration reviewed the worker but didn't detect any actual value changes for the enabled fields.

## Payroll Extract

The payroll extract file contains the actual data created by the payroll integration. This file is in XML format.

## Messages Audit

The Messages Audit is a zip file that contains a summary of web service requests and responses in XML format. Workday generates this audit report for troubleshooting. When you enable the *Suppress Worker Messages Audit* integration attribute, Workday doesn't include *Get Payees* responses for each worker in the audit file.

The Messages Audit zip file contains these files:

- Integration\_system.xml: All configurations of the integration system, such as integration attributes and integration mappings.
- Launch\_event.xml: All launch parameters used the integration run.
- Performance Summary.html: Timing of the top 10 slowest performing fields from the integration run. Also includes the top 10 slowest workers and field timings that impacted performance. You can use this file to troubleshoot and help increase performance.
- Summary.xml: All resolved values used for the integration event as a result of the values in the Launch\_event.xml parameters, such as the pay period dates and entry dates.

## Schema XSD

The Schema XSD file defines the content and the structure of the payroll extract. It includes only the data sections and fields that you've enabled for your integration system. Workday generates this file every time the integration runs; the file uses your integration configuration as of the moment that the integration ran.

The file is always named PICommonOutput.xsd. You can only generate this file by running the integration.

## Rescinds and Corrections Report

The Rescinds and Corrections report provides information about any rescinds and corrections that are in the integration output file.

**Note:** The Rescinds and Corrections report is only supported for the *Payroll Interface* integration.

This report has these components:

### Extract Summary

Displays:

- Included changes.
- Pay groups and selection criteria for the payroll extract.
- Pay group name.
- Payroll company name.
- Period start and end dates.
- Updated from and to dates.

### Payee Details

Provides summarized and detailed views of employee rescinds and corrections, and displays the payee count. The summarized view displays:

- Employee names.
- IDs.
- Data about the original transaction.
- Whether the transaction is a correction or rescinded.

The detailed view displays:

- Transaction name.
- Entry moment of rescind or correction.
- Original effective date.
- New effective date (if changed).

To toggle between views for all employees, click Show or Hide or select an employee in the summary list to view their details.

## Reference: Workday Payroll Interface Terms

External deduction	Benefit plan deductions and general or voluntary deductions that apply to employee pay. Each deduction has a code in Workday that corresponds to the code used in an external payroll system. Deductions can include pre-tax and post-tax employee benefit costs, non-taxable employer benefit costs, payroll adjustments, and unpaid time-off.
External earning	A compensation element or benefit plan that applies to employee pay. Each earning has a code in Workday that corresponds to the code used in an external payroll system. Earnings can include base pay, allowances, taxable benefits, one-time payments, and paid time-off.
Pay data	One-time payments, payroll adjustments, and paid or unpaid time-off that is only valid for a single pay period or payroll run. Third-party payroll providers typically process pay data separately from regular payroll data. As a result, you might need to create a second integration system because the configuration can be different.
Pay group	A group of employees who have the same pay frequency and period schedule. Structure your pay groups in Workday to reflect the requirements for loading data into your provider system.
Payroll company	An organization that contains one or more pay groups. You can set up your payroll company structure in Workday to match the structure in your payroll provider system. You can add an optional third level to the hierarchy in Workday by creating superior organizations to the payroll company.
Payroll extract	A file that contains payroll-related HR data that Workday generates in a payroll integration. You can configure the contents of a payroll extract to meet your provider requirements. Payroll extracts can include all employees in a pay group or only those employees whose data has changed.
Payroll Interface	Workday integration connector for third-party payroll integration. Payroll Interface is also the name of the Workday integration template for building an integration system to the payroll provider of your choice.
Period schedule	A payroll calendar that specifies the start date, end date, and payment date for each pay period in a calendar year. Each pay period also has a status that indicates whether processing is <i>Not Yet Started</i> , <i>In Progress</i> , or <i>Complete</i> . When you launch payroll

	integrations, Workday uses the period status to select the next open period to process.
Primary Payroll Interface	An integration system can be designated as a Primary Payroll Interface. A Primary Payroll Interface is used for regularly scheduled integration runs. The Primary Payroll Interface updates each pay group with a Last Successful Run Date as well as changing period statuses to <i>In Progress</i> on the first run of the pay period. A Primary Payroll Integration is typically not be used for ad hoc or correction runs.
Run category	Type of payroll run to associate with a pay group. Each run category has a period schedule. Workday only uses regular run categories for third-party payroll.
Staffing events	Employee hires, terminations, leaves of absence, and transfers between pay groups or payroll companies that Workday reports in payroll extracts.
Related Information <b>Concepts</b> Concept: <a href="#">Workday Payroll Interfaces</a> on page 1496	

## Additional Payroll Data

### Steps: Set Up Additional Payroll Data

#### Prerequisites

Your third-party payroll vendor must:

- Develop and maintain the APIs for the feature and the country-specific payroll data.
- Store and manage the data that Workday displays and sends to the external payroll system.

Workday recommends that you confirm with your third-party payroll vendor that they support this feature.

#### Context

You can set up the Additional Payroll Data feature to:

- Send additional payroll data from Workday to a third-party payroll vendor.
- Enable workers and future hires to input additional payroll data through employee self-service (ESS).

This feature helps you:

- Collect data for country-specific payroll fields that aren't supported in Workday.
- Make payroll processing more efficient by reducing manual effort.

The data that you send to your third-party payroll vendor isn't stored in Workday. Workday only displays additional payroll data.

The worker whose additional payroll data is being updated must exist and have the same ID in both Workday and the third-party payroll system.

## Steps

- 1. Edit Domain Security Policies.**

Configure security policies for these domains in the Payroll Interface and Global Payroll Connect functional areas:

Option	Description
<i>Self-Service: Payroll Interface (Additional Payroll Data)</i>	Enables workers, including future workers, to input additional payroll data through ESS.
<i>Worker Data: Payroll Interface (Additional Payroll Data)</i>	Enables payroll administrators to input additional payroll data for workers.

- 2. Create External Payroll Vendor Mapping.**

- 3. Maintain Pay Group Vendor Associations.**

From the Feature prompt, select *Additional Payroll Data*.

4. (Optional) Configure the Additional Payroll Data report to display on the Pay profile group of the worker profile:

- Access the Configure Profile Group task.
- Select the *Pay for Worker Profile* profile group.
- Add Additional Payroll Data to the list of reports and select your preferred order for display.

When you configure access for the *Pre-Employee as Self* security group on the *Self-Service: Payroll Interface (Additional Payroll Data)* domain, Workday also displays Additional Payroll Data for pre-hires on the worker profile.

5. (Optional) Access the Create Business Process Definition (Default Definition) task.

Create the definition for the *Maintain Additional Payroll Data* business process step if it doesn't exist in your tenant.

6. (Optional) To add the *Maintain Additional Payroll Data* step in your business processes, access the Business Process Definitions task.

- Select *Maintain Additional Payroll Data*, and from the related actions menu, select Business Process Policy then Edit.
- Select employee self-service and manager self-service security groups for APD in the Security Groups field from the *Who Can Start the Business Process* section of Edit Business Process Security Policy.

## 7. (Optional) Steps: Configure Business Process Definitions.

Add an *Action* step to these business processes:

- *Add Additional Job*
- *Assign Pay Group*
- *Change Job*
- *Edit Position*
- *Hire*
- *Onboarding*
- *Start International Assignment*
- *Termination*

Enter Action for the Type column, and Maintain Additional Payroll Data for the Specify column. From the Group column, select the security groups for APD. Add this step after the completion step on the business process.

For *Hire*, you must ensure that Workday outputs new employees to the third-party payroll vendor before the *Maintain Additional Payroll Data* step. Run the certified payroll integration before this step to output the new employees.

When you add the *Maintain Additional Payroll Data* step on the *Termination* business process, Workday only enables administrators to view Additional Payroll Data for terminated workers. Terminees can't view their own payroll data on the worker profile.

If you configure the *Assign Pay Group* business process as part of another business process and you add the *Maintain Additional Payroll Data* step on both business processes:

- The additional business process executes the *Maintain Additional Payroll Data* step.
- The *Assign Pay Group* business process skips the *Maintain Additional Payroll Data* step.

Note: If you have an existing *Maintain Local Payroll Data* step in your business processes, you need to remove it before adding the *Maintain Additional Payroll Data* step.

## Result

Payroll administrators and workers, including future workers, can enter additional payroll data through Workday.

Workday:

- Reaches out to the endpoint of the third-party payroll vendor.
- Sends the additional payroll data that the worker or pre-hire entered to the third-party payroll vendor for validation.

The third-party payroll vendor:

- Authorizes whether you have access to the additional payroll data.
- Persists changes in their system based on the additional payroll data that you or the worker entered.
- Returns available forms and fields to display for workers in Workday.
- Returns errors for you to review.

## Next Steps

For new workers, you must run a certified payroll integration before entering additional payroll data. This step helps ensure that the new worker is in the system of the third-party payroll vendor system before you use the additional payroll data for the new worker in Workday.

You can access the Additional Payroll Data report to view workers' additional payroll data. Workers and pre-hires can view their own payroll data by accessing the:

- My Additional Payroll Data report.
- Additional Payroll Data card on the Pay worklet of the Benefits and Pay hub.

Administrators, pre-hires, and workers can also view additional payroll data on the worker profile when you have configured it to display.

#### Related Information

##### Examples

##### [2024R2 Feature Release Note: Additional Payroll Data](#)

## Concept: Additional Payroll Data

Additional payroll data:

- Is country-specific data required for payroll.
- Might not currently be supported in Workday.

Workers who belong to third-party pay groups and payroll administrators who manage those pay groups can use this feature to input workers' additional payroll data.

Workday enables you to enter additional payroll data and immediately pass it to a third-party payroll vendor without leaving Workday. Based on data requirements provided by the payroll vendor:

- Workday displays pages for you to enter and modify a worker's additional payroll data. The additional payroll data displays in Workday in the third-party payroll vendor format.
- Workday sends the new and changed additional payroll data directly to the third-party payroll vendor. The third-party payroll system saves the additional payroll data that you entered in Workday. None of the data persists in Workday.

The third-party payroll vendor controls:

- Validations performed during data entry and upon submission.
- Details on the country-specific data, including names of fields and options.
- Whether records can be added, edited, or deleted.
- Whether workers can upload, view, and delete attachments.

This integration depends on the availability of the third-party APIs and data through your external payroll vendor.

## Concept: Attachments for Additional Payroll Data

Workday enables workers to upload files on additional payroll data forms, provided that your third-party payroll vendor supports attachments.

Your vendor determines the maximum number of files a worker can upload, whether the attachment field is required, and if workers can delete their uploaded files.

## Supported File Types and Sizes

Workday supports:

- Attachments in these formats on additional payroll data forms:
  - CSV
  - DOC
  - DOCX
  - JPG
  - JPEG
  - PDF
  - PNG
  - XLS
  - XLSX

- A maximum file size of:
  - 2 MB for individual attachments.
  - 10 MB when the worker attaches multiple attachments at once.

### **Attachment Security**

The third-party payroll vendor is responsible for scanning all files uploaded by users for viruses and other malicious content. Workday also performs a virus scan when retrieving the attachment.

The vendor's retention policy dictates how long files remain in their system.

## **Data Changes on Demand**

### **Setup Considerations: Data Changes on Demand**

You can use this topic to help make decisions when planning your configuration and use of Data Changes on Demand (DCoD). It explains:

- Why to set it up.
- How it fits into the rest of Workday.
- Downstream impacts and cross-product interactions.
- Security requirements and business process configurations.
- Questions and limitations to consider before implementation.

Refer to detailed task instructions for full configuration details.

### **What It Is**

The Data Changes on Demand is an integration that enables you to make flexible requests for external pay groups from Workday to your third-party payroll systems. It is a full-stack REST API that provides field level change detection and returns the current snapshot for each worker in a JSON format.

### **Business Benefits**

Data Changes on Demand simplifies the process of integrating with a third-party payroll vendor by reducing the deployment time to implement a new payroll country compared to our other third-party payroll connectors.

You can use Data Changes on Demand to enable your third-party payroll systems to make payroll interface pay group data requests from Workday for:

- Full pay groups or specific workers.
- Full data sections or specific data fields.

When sending worker data to third-party payroll systems using Data Changes on Demand, you don't have to:

- Schedule integration runs.
- Use file-based outputs from Workday.
- Adhere to Workday interpretation of staffing event codes and business logic.

### **Use Cases**

You can use DCoD when:

- You have multiple payroll vendors with multiple countries, and want to implement more countries with less implementation time.
- Your payroll vendor requires a full-stack integration.

- Your payroll vendor can make the data requests from Workday.
- Your payroll vendor needs to interpret raw data based on their own business and system requirements instead of having to adhere to Workday interpretation of staffing event codes and business logic.
- You converted to Workday from a legacy third-party ERP (Enterprise Resource Party) that used a full-stack integration model.

### Questions to Consider

Question	Considerations
What connector does your third-party payroll vendor have?	Consider using a Workday-certified connector available through a Workday Global Payroll partner ecosystem. These solutions can simplify the process of integrating with a third-party payroll vendor.
What type of payroll integration does your vendor require?	Consider Data Changes on Demand if your vendor requires a full-stack integration. If your vendor requires a top-of-stack integration or simple CSV or XML file formats, consider the <i>Payroll Interface</i> integration.
Can I use DCoD with multiple third-party payroll vendors?	Yes. Even though you can only have 1 DCoD integration system in your tenant, only the Integration System Users (ISU) configured on the Create External Payroll Vendor Mapping task can make DCoD requests. Each external payroll vendor mapping must have 1 unique ISU associated with it. When a vendor uses an ISU to make a DCoD request, Workday sends the acknowledgement for that event back to that specific vendor.
Do you have a data warehouse that you need to transmit worker data to from Workday for the same pay group you need to integrate with your third-party payroll vendor?	DCoD doesn't support using the same pay group for multiple external payroll vendors, including data warehouses. We recommend you use DCoD for the third-party payroll vendor integration and WECI for transmitting worker data to the data warehouse.
Do you have a data warehouse that requires you to refresh data from Workday more than once a day?	With Data Changes on Demand, you can transfer data whenever a change event occurs. You don't need to schedule an integration run with the Data Changes on Demand feature.
Do you need to request specific data for specific workers?	You can use the <i>Data Changes On Demand</i> integration template to enable your third-party payroll systems to make payroll interface pay group data requests from Workday using the globalPayroll/effectiveChanges REST API for specific data fields. For more information, see: <a href="#">Reference: Data Sections for Data Changes on Demand</a> on page 1437.
Do you need an integration that produces an output file?	After you make a DCoD request from your third-party system, you'll get a notification in the third-party payroll system when the request

Question	Considerations
	completes. You can copy the document ID from the notification, and run it with the GET blobitory API to retrieve the JSON file.
Does your third-party system not adhere to Workday interpretation of staffing event codes and business logic, like when using the <i>Payroll Effective Change Interface</i> integration?	With DCoD, the third-party payroll system can interpret raw data instead of having to adhere to Workday interpretation of staffing event codes and business logic.
Do you only need to include workers with changes in the data transfer?	By default, DCoD only includes workers with changes. You change this setting with the fullSnapshot response filter.
How wide of a range in time do you need the integration to report for a single change event?	<p>When you set the allEffective request parameter as true, you can only specify a 3-month range for the effectiveFrom and effectiveTo range. Otherwise, there's no limit.</p> <p>You also can't run the integration when you specify a date/time that is greater than a 2-month span for these request parameters:</p> <ul style="list-style-type: none"> <li>• entryMomentFrom</li> <li>• entryMomentTo</li> </ul>
Do you need to update country-specific payroll data that Workday doesn't support for your third-party payroll systems?	Workday enables you to enter country-specific payroll data and immediately pass it to a third-party payroll vendor without leaving Workday. For more information, see: <a href="#">Concept: Additional Payroll Data</a> on page 1422.
Do you want to send hire and termination data automatically to your third-party payroll vendor?	You can configure the <i>Event Outbound Notifications</i> integration template so Workday can send <i>Hire</i> and <i>Termination</i> transaction event notifications to your third-party payroll system with reference IDs and effective moments. These notifications enable your third-party payroll system to know when to request that data from Workday.
Do you need to send notifications from Workday to your third-party payroll system to know when to request data from Workday?	You can use the <i>Event Outbound Notifications</i> integration template so Workday can send hire and termination event notifications to your third-party payroll systems so your third-party payroll system knows when to request that data from Workday.
Do you need to send notifications to workers from your third-party payroll system, such as errors they need to fix?	You can use the globalPayroll/notifications REST API to enable your third-party payroll systems to send custom notifications to Workday groups or specific users. For more information, see <a href="#">Steps: Set Up Inbound Notifications</a> on page 1493

## Recommendations

Workday strongly recommends that you:

- Work with a payroll vendor to configure Data Changes on Demand.
- Don't add a business process to the Data Changes on Demand integration.

- Maintain these field values in your third-party system for workers and pay groups since the third-party payroll system is making the request:
  - entryMomentFrom
  - entryMomentTo
  - effectiveFrom
  - effectiveTo

## Requirements

Perform upfront analysis with your third-party payroll vendor. Work with your payroll vendor to determine any additional data that the vendor requires you to transmit.

Data Changes on Demand requires grid. You can have grid enabled for only 1 active tenant in an environment, either implementation or implementation preview, at a time.

You must specify a date in the effectiveFrom request parameter that's within an existing pay period.

## Limitations

Data Changes on Demand doesn't support:

- Benefit elections that have a deduction begin date that is earlier than a worker's hire date.
- Contingent workers in output files. If your company employs contingent workers, you can use the *Worker Effective Change Interface* integration to transmit contingent worker data.
- One-time payments that are beyond 2 years.
- Time tracking entries that are beyond 1 year.
- Unpaid time off.
- Time Tracking shift dates, but does support calculated dates.
- Orchestration. You can only have 1 Data Changes on Demand integration system in your tenant.
- Processing over 50,000 active employees.
- Dynamic calculated compensation plans. Consider using event-driven calculated compensation plans instead.
- The ability to configure the order of the effective changes in the output.
- More than a 3-month range for the effective date request parameters when you set the allEffective request parameter as true.
- More than a 2-month range for the entry moment request parameters.
- The Third-Party Payroll Errors report.
- Hire Data Checkpoint.
- Adding associated pay groups to more than 1 external payroll vendor on the Maintain Pay Group Vendor Associations task.

You can only have up to:

- 5 in-progress events for jobs containing 2 or more workers for a specific vendor.
- 25 in-progress events for jobs containing 1 worker for a specific vendor.

## Tenant Setup

Contact Customer Care to set up your tenant for grid.

## Security

Data Changes on Demand requires an associated *Integration System User* (ISU) account. ISUs enable you to give integrations security access to only the domains needed to run the integration. The ISU requires access to these domains:

<p><i>Get and Modify</i> access to the <i>Manage: Data Changes On Demand</i> domain in the Global Payroll Connect functional area.</p> <p><i>View</i> access to at least 1 of these domains in the Integration functional area:</p> <ul style="list-style-type: none"> <li>• <i>Integration Build</i></li> <li>• <i>Integration Debug</i></li> <li>• <i>Integration Event</i></li> </ul>	<p>To run the Data Changes on Demand REST API.</p>
<p><i>View and Get</i> access to the <i>Reports: Data Changes On Demand Results</i> domain in the Global Payroll Connect functional area.</p>	<p>To view the JSON data output the integration reports.</p>

## Business Processes

No impact.

## Reporting

No impact.

## Integrations

With the *Event Outbound Notifications* integration, you can set up outbound notifications from Workday to third-party payroll systems after hire and termination transaction events occur, so your third-party payroll systems know when to request data changes for these workers.

## Connections and Touchpoints

Workday offers a Touchpoints Kit with resources to help you understand configuration relationships in your tenant. Learn more about the [Workday Touchpoints Kit](#) on Workday Community.

## Steps: Set Up Data Changes on Demand

### Prerequisites

Workday strongly recommends that you:

- Work with a payroll vendor to configure Data Changes on Demand (DCoD).
- Don't add a business process to the *Data Changes on Demand* integration.

When the total number of active employees in all the pay groups that you're processing exceeds 50,000, the integration immediately stops processing. Work with your implementer to split up the pay groups.

The total number of pay groups processing must be 150 or fewer.

You must:

- Perform upfront analysis with your third-party payroll vendor. Work with your payroll vendor to determine any additional data that the vendor requires you to transmit.
- Establish third-party payroll organizations.
- Create future pay periods before the year that they're active to prevent the integration from capturing the addition of a current pay period within the current pay period.

- Establish third-party pay groups.
- Define third-party payroll earnings and deductions.
- Set up your tenant for grid.
- Set custom organization membership rules to semidynamic.

Note: If you require dynamic membership rules, enable the Enable Dynamic Membership Rule Evaluation Optimization check box on the Edit Tenant Setup - HCM task.

## Context

Set up DCoD so you can enable your third-party payroll systems to query data on demand from Workday for payroll interface pay groups.

## Steps

1. [Create Integration System User for Data Changes on Demand](#) on page 1429.
2. [Edit Domain Security Policies](#).

Grant the integration system user access to these domains

Access Considerations	Domains
<i>Modify</i>	The <i>Manage: Data Changes On Demand</i> domain in the Payroll Interface functional area and these domains in the Integration functional area: <ul style="list-style-type: none"> <li>• <i>Integration Build</i></li> <li>• <i>Integration Configure</i></li> <li>• <i>Integration Debug</i></li> </ul>
<i>Put and Get</i>	<i>Reports: Data Changes On Demand Results</i> domain in the Global Payroll Connect functional area.

3. [Activate Pending Security Policy Changes](#).
4. [Register API Clients for Integrations](#).

Enter these values:

Field	Value
Scope (Functional Areas)	<ul style="list-style-type: none"> <li>• <i>Integration</i></li> <li>• <i>Global Payroll Interface Connect</i></li> </ul>
Include Workday Owned Scope	Select if you want to use a Bearer token to pull documents instead of using the Basic Auth web service invocation type. See <a href="#">Using OAuth 2.0 with the REST API</a> and <a href="#">Steps: Configuring OAuth 2.0 for Your REST API Client</a> for more information.

**5. Create Integration System** on page 1967.

Select *Data Changes On Demand* from the New Using Template prompt.

Note: Create only 1 integration system for DCoD regardless of the number of third-party payroll systems that you use. Multiple third-party payroll systems can make DCoD REST API data requests.

Don't:

- Configure the integration field attributes.
- Assign an integration system user (ISU).
- Configure a business process on the integration.

Security: These domains in the Integration functional area:

- *Integration Build*
- *Integration Configure*

**6. (Optional) Access the Create External Payroll Vendor task.**

If you're not using a pre-configured third-party payroll system, select *Data Changes on Demand* from the Features prompt.

Security: *Set Up: Payroll Interface* domain in the Payroll Interface functional area.

**7. Create External Payroll Vendor Mapping** on page 1413.

- a) Create or select a Key Pair on the Public Private Key Pairs grid.

If you create a new pair, you must select the Do Not Allow Regeneration check box.

- b) On the Feature Configuration grid:

1. Add a row and select *Data Changes on Demand* from the Feature prompt.
2. Select *Integration System User* from the Attribute prompt and select the ISU from the Value prompt.
3. Select *Acknowledgment Endpoint* from the Attribute prompt and enter the endpoint for the Value field.

**8. Maintain Pay Group Vendor Associations** on page 1414.

Select:

- *Data Changes on Demand* from the Feature prompt.
- The external payroll company.

Note: Third-party payroll systems can only:

- Use the ISU you configured for the third-party payroll system and feature on the Create External Payroll Vendor Mapping task.
- Make DCoD requests for the pay groups you defined on the Maintain Pay Group Vendor Associations task for the third-party payroll system and feature.

Related Information

**Concepts**

[Setup Considerations: Payroll Interfaces](#) on page 1496

## Create Integration System User for Data Changes on Demand

### Prerequisites

Security: *Integration Security* domain in the Integration functional area.

### Context

You can create an integration system user (ISU) for the Data Changes on Demand feature, enabling you to assign the ISU to a security group with permissions to access the required integrations.

## Steps

1. Access the Create Integration System User task.  
Workday automatically populates the value in the Session Timeout Minutes with zero to prevent the integration system user session from expiring. Expired sessions can cause the integration to stop before it successfully completes.
2. From the related actions menu of the system user you created, select Security Profile > Assign Integration System Security Groups.
3. From the Integration System Security Group to Assign prompt, select a security group with access to these domains:

Domain	Action
<i>Get and Modify access to the Manage: Data Changes On Demand domain in the Global Payroll Connect functional area.</i>	To run the Data Changes on Demand REST API.
<i>View access to at least 1 of these domains in the Integration functional area:</i> <ul style="list-style-type: none"> <li>• <i>Integration Build</i></li> <li>• <i>Integration Debug</i></li> <li>• <i>Integration Event</i></li> </ul> <i>View and Get access to the Reports: Data Changes On Demand Results domain in the Global Payroll Connect functional area.</i>	To view the JSON data output the integration reports.

4. (Optional) If the integration system user authenticates with a username and password:
  - a. Access the Maintain Password Rules task.
  - b. On the System Users Exempt from password expiration field, add your integration system user.

## Concept: Data Changes On Demand

### Retrieve Output File

After you make a DCoD request from your third-party system, you'll get a notification in the third-party payroll system when the request completes. In the notification, you can retrieve the document ID and run the My Reports API to retrieve the JSON output file:

```
https://{{hostname}}/ccx/cc-blobitory/{{tenant}}/{{collectionDocumentID}}
```

To view the output file, the integration system user must have security access to the *Reports: Data Changes On Demand Results* domain in the Payroll Interface functional area.

The default document retention policy for the JSON file is 60 days.

For more information, see [Concept: My Reports API](#) on page 1986.

### Maintain Values in Third-Party System

We recommend you maintain the entryMomentFrom field values in your third-party payroll system for individual workers to prevent duplicate data.

Example: Your third-party payroll system makes a DCoD request for a pay group every day at 12:00 PM. On 2024-04-26T15:00, worker A has a compensation change. At 17:00, the vendor makes another DCoD request only for worker A. After the integration run completes, we recommend you store the last successful run date value to 2024-04-26T17:00 for that worker in your third-party payroll system similar to how you store the last successful run date of 2024-04-26T12:00 for the entire pay group. On 2024-04-27T12:00, the third-party payroll system specifies the requestCriteria.entryMomentFrom value

as 2024-04-26T12:00 and specifies the requestCriteria.workerOverrides.entryMomentFromOverride for worker A as 2024-04-26T17:00.

## Concept: PECI and DCoD Comparison

Feature	Payroll Effective Change Interface Connector	Data Changes on Demand
Grid for Tenant	Required.	Required.
Pay Group Assignment in Staffing Events	Supported with the Assign Pay Group task.	Supported with the Assign Pay Group task.
Payroll Company Setup	Supported with the Create Custom Organization task.	Supported with the Create Custom Organization task.
Regular Earnings	Supported with the Maintain External Payroll Earnings task.	Supported with the Maintain External Payroll Earnings task.
Regular Deductions	Supported with the Maintain External Payroll Deductions task.	Supported with the Maintain External Payroll Deductions task.
Payroll Calendar	Supported with the Create Period Schedule task.	Supported with the Create Period Schedule task. Even though you can specify the effectiveTo request parameter as any date in the future, you must specify the effectiveFrom parameter date that includes a created period. Example: You set the effectiveFrom date as 2027-01-01 and the effectiveTo as 2099-01-01 for a pay group that already has the 2027-01-01 to 2027-01-31 pay period created and visible on the pay group.
Output File	The integration outputs separate file-based XML files for each pay group that it processes. You can configure the integration to combine the output files for multiple pay groups into 1 XML file. The output file sorts the effective changes by effective moment and entry moment.	The integration outputs separate JSON files for each pay group that it processes. After you make a request from your third-party system, you'll get a notification in the third-party payroll system when the request completes. You can copy the document ID from the notification, and run it with the GET blobitory API to retrieve the JSON files.
Flexible Field Attributes	Not supported. You can set the configuration and then run the integration.	Supported. When you make each REST request, you can specify the specific set of fields you want.

Feature	Payroll Effective Change Interface Connector	Data Changes on Demand
Vendor-Owned Integration Schedule	Not supported. You schedule integration runs within Workday.	Supported. You must configure schedules with the third-party payroll system.
CCTPP Certification Required for Implementation	Yes.	No.
Effective Stack Integration	Supported.	Supported.
Specify Changes to Include	<p>You can enable integration attributes to always include or include with specific changes, such as during a pay group event, these data sections:</p> <ul style="list-style-type: none"> <li>• Compensation Earnings and Deductions</li> <li>• Additional Data</li> <li>• Personal Data</li> <li>• Position Data</li> <li>• Compensation Data</li> <li>• Compensation Plans</li> <li>• Person Communication Data</li> <li>• Worker Status</li> <li>• Person Identification Data</li> <li>• Contract Data</li> <li>• Collective Agreements Data</li> <li>• Payment Election Data</li> </ul> <p>For other data sections, PECL:</p> <ul style="list-style-type: none"> <li>• Only reports sections that contain changed values.</li> <li>• Reports all values for a data section that includes a change.</li> <li>• Reports field override values when another value in that section has changed.</li> </ul>	Supported. You don't need to configure a request parameter.
Field Overrides	Supported. You can add field overrides from the Configure Field Overrides task from the related actions menu of the integration.	Not supported.
Multi-Instance Field Overrides	Supported for multi-instance fields with Reference ID Types.	Not supported.
Security for Field Overrides	The integration system user requires <i>View</i> access to the	Not supported.

Feature	Payroll Effective Change Interface Connector	Data Changes on Demand
	fields used in the document field overrides.	
Time Tracking and Time Off Data Sections	Supported.	Not currently supported.
Extract Full File	Supported. You can enable the Full Snapshot launch parameter.	Supported. You can set the request parameter fullSnapshot as true.
Business Process Orchestration	Not supported. You can't have more than 1 PECI integration on a business process.	Not supported. You can only have 1 Data Changes on Demand integration system in your tenant.
Additional Pay Periods	Supported. The number of additional pay periods you enter can't exceed the number of pay periods possible in a 13-month time period.	Supported. The number of additional pay periods you enter doesn't have a limit. Though, with the extendedAllEffectiveTo request parameter, you can only specify up to a 93-day range from the effectiveTo request parameter.
Incremental Effective Range	Limited to 13 months.	No limit.
Job Change Reason Only	Supported when you select the <i>Job Change Reason Only (Secondary)</i> value on the Include Position Data Section integration attribute.	Supported automatically.
Compensation Change Reason Only	Supported when you select the <i>Compensation Change Reason Only (Secondary)</i> value on the Include Compensation Data Section integration attribute.	Supported automatically.
Audit HTML Files	Supported. The integration providesn these audit files that you can also enable to be deliverable and appended with audit document tags that you specify: <ul style="list-style-type: none"> <li>• DataChangesAudit.html</li> <li>• DiagnosticAudit.html</li> </ul>	Not supported.
Primary Integration Runs	Supported. You can use the Primary Run launch parameter when scheduling integration runs.	Not applicable since the vendor makes the integration requests.
Ad Hoc Integration Runs	Supported.	Not applicable since the vendor makes the integration requests.

Feature	Payroll Effective Change Interface Connector	Data Changes on Demand
Retroactive Changes	Supports changes that the users entered in the current pay period for a prior period.	Supports changes that the users entered in the current pay period for a prior period.
Retroactive Non-Effective Dated Changes	Supported. A current pay period integration run consolidates changes that the users entered in a prior period into a single DTA change.	Supported. A current pay period integration run consolidates changes that the users entered in a prior period and sets the effective date as the last moment of the previous period.
Indirect Changes	Supported when you disable the transaction log. Example: The integration reports a change to a cost center name.	Supported.
Abort Running Process	Supported. You can abort the integration event while it's in-progress.	Supported. You can abort the integration event within Workday while it's in-progress.
Effective and Entry Dates	Supported. The integration reports the effective and entry dates for each transaction.	Supported. The integration reports the effective and entry dates for each transaction.
Multiple Changes per Pay Period	Supported. The integration reports each transaction separately. Example: The integration reports 2 address changes on different dates with different effective dates.	Supported. The integration reports each transaction separately.
Transaction Log Service	Supported.	Not applicable.
Extract Prior Values	Supported. The integration includes prior values in the output for any changed field.	Supported. The integration includes prior values in the output for any changed field.
Field-Level Change Detection	Not supported.	Supported.
Derived Event Codes	Supported. The integration handles certain staffing event codes directly in the output XML.	Not supported. Instead, your payroll vendor can interpret raw data based on their own business and system requirements.
Expanded Effective Changes	Supported when you enable the Expanded Effective Changes integration service. The integration reports each transaction separately even if there are multiple transactions that have the same effective date.	Supported. By default, the integration reports each transaction separately even if there are multiple transactions that have the same effective date.
Net Effective Changes	Supported.	Not supported.
Pay Group Limit	250,000 active payees.	50,000 active payees.

Feature	Payroll Effective Change Interface Connector	Data Changes on Demand
Workday Maintained Last Successful Run Date (LSRD)	Supported. The LSRD must be within the last: <ul style="list-style-type: none"> <li>• 2 months for primary runs.</li> <li>• 6 months for ad-hoc runs.</li> </ul>	Not supported. You must maintain LSRD values in your third-party system for workers and pay groups since the third-party payroll system is making the request.  You must specify less than a 2 month span for the entryMomentFrom and the entryMomentTo parameters.
Worker LSRD	Supported.	Supported.
Contingent Workers	The integration doesn't support contingent workers in the output files. If your company employs contingent workers, you can use the <i>Worker Effective Change Interface</i> integration to transmit contingent worker data.	The integration doesn't support contingent workers in the output files. If your company employs contingent workers, you can use the <i>Worker Effective Change Interface</i> integration to transmit contingent worker data.
Automatically Send Hire and Termination Data	Supported with the <i>Event-Driven Integration for Third-Party Payroll</i> integration service.	Supported with the <i>Event Outbound Notifications</i> integration.
Correction and Rescind Support	Supported. The integration handles certain staffing event codes directly in the output XML.	Supported. If you want to see more details on specific transactions, you can use the Transaction Logs data section.

## Concept: Data Changes on Demand Change Detection

You can select from 2 change detection methods with Data Changes on Demand. The appropriate method depends on whether an integration is the first run of the effective range or an incremental run. The methods are:

### All Effective Changes

When you set allEffective as true, the payroll extract includes all changes to employee data that are effective between the effective from and effective to date range. This payroll extract occurs regardless of the entry date of the changes in Workday that's relative to the entryMomentTo date. When transactions in Workday have an effective date in a future effective range, Workday excludes them from a payroll extract. Workday includes transactions when their effective date is in the effective range that the integration is processing. Use this option for the first initial run of a new effective range.

### Incremental Effective Changes

When you set allEffective as false and you're running this for any additional runs for the effective range, the payroll extract includes only:

- Changes that you entered in Workday between the entry moment from and entry moment to.

- Changes that are effective on or before the effective to date.

## Entry-Dated Changes

Note: An allEffective run won't pick up changes to entry-dated changes made before the entryMomentFrom date or after the entryMomentTo date but are effective in the effective range.

DCoD handles effective moments for non-effective dated transactions when processing a:

- Current period by setting the effective date to the entry date.
- Prior period by setting the effective date to the last date of the period and the time to 00:00:00.000.
- Future period by setting the effective date to the first date of the period and the time to 00:00:00.000.

## How Dates Affect Payroll Extracts

Dates can help you understand the changes that payroll integrations pick up.

### Past EntryMomentTo Date

If you specify a past EntryMomentTo, the integration context for data will be as of the EntryMomentTo date and not as of the current moment event run time.

Example: A one-time payment was entered 2025-04-01 and is effective 2025-03-15. You launch the integration 2025-04-03 with these parameter values:

- entryMomentFrom = 2025-03-01T12:00:00.000
- entryMomentTo = 2025-03-31T12:00:00.000
- effectiveFrom = 2025-03-01T12:00:00.000
- effectiveTo = 2025-03-31T12:00:00.000
- allEffective = true

The integration doesn't report the one-time payment because the context of the event is looking at data as of the entryMomentTo date which is 2025-03-31 and doesn't capture the 2025-04-03 entry. So even though its an all effective run, the context of data viewing is always as of the entryMomentTo date.

### Future EntryMomentTo Date

If you specify an EntryMomentTo that is in the future instead of the current moment, there will be a gap in captured transactions that at run time hasn't happened yet which can lead to missed reporting on the next event when the entryMomentTo becomes the entryMomentFrom.

Example: You launch the integration 2025-04-03T12:00:00.000 with these parameter values:

- entryMomentFrom = 2025-04-02T12:00:00.000
- entryMomentTo = 2025-04-03T18:00:00.000
- EffectiveFrom = 2025-04-01
- EffectiveTo = 2025-04-30

Because you launched the integration 2025-04-03T12:00:00.000, with an entryMomentTo of 2025-04-03T18:00, there is a 6 hour window of time that doesn't exist yet. When you run the next integration event, the entryMomentTo of event 1 becomes the entryMomentFrom of event 2, and the integration doesn't go back in time to recapture that entry range, and therefore, the integration misses any transactions that have been entered after 2025-04-03T12:00 and the actual moment of 2025-04-03T18:00.

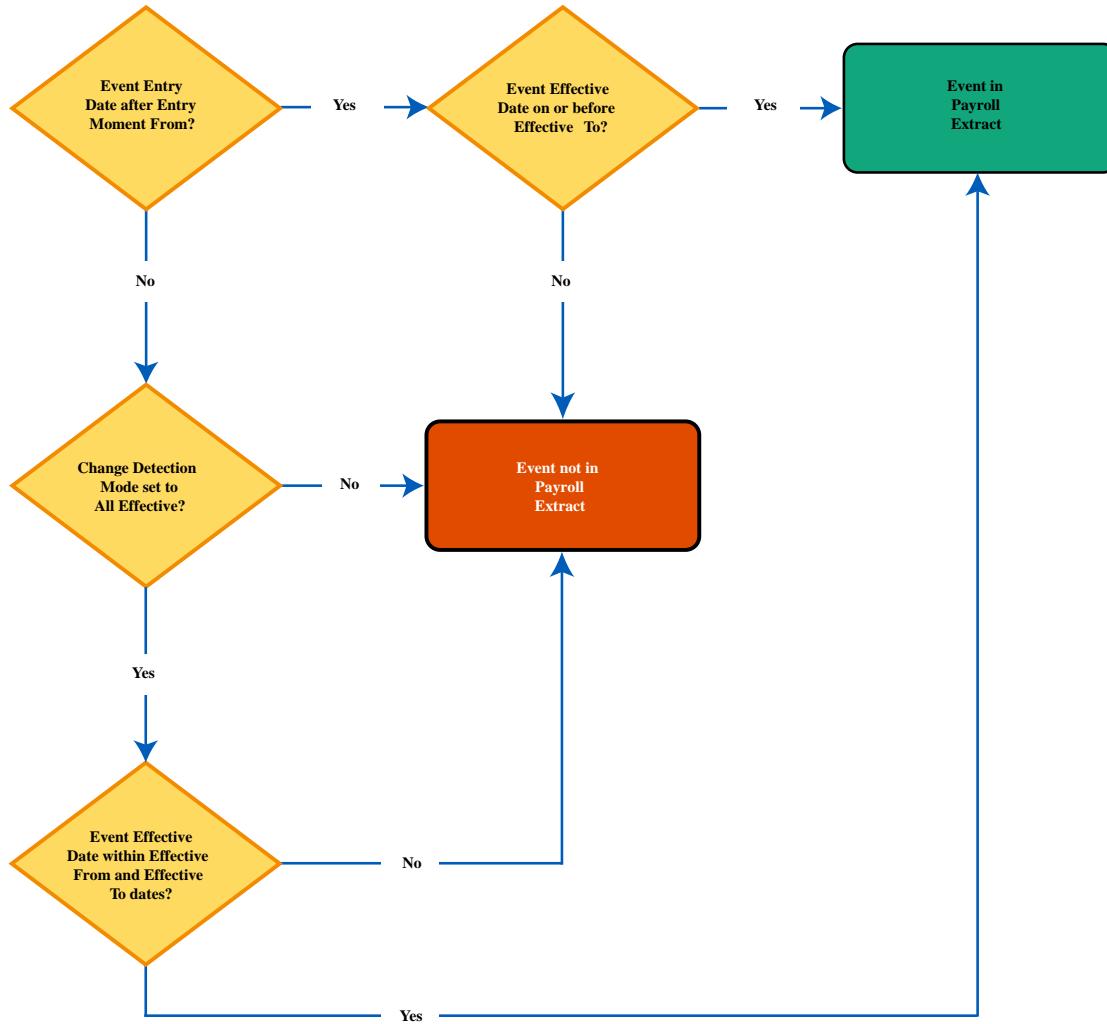

## Effective and Entry Date Relationships

If you discover that events are missing from a payroll extract, look at the relationship between:

- The entry moment from date.
- The effective from date.
- The effective to date.

- The event entry date.
- The event effective date.

This diagram displays how dates affect event selection relative to the entryMomentTo date of the event:

## Reference: Data Sections for Data Changes on Demand

You can specify specific data sections you want Data Changes on Demand to report with the field path IDs within the REST request file.

To include specific subfields, use the parent data section field path ID with the subfield name with:

- A period (.) between the parent field and the subfield names.
- No spaces between words.

Examples:

- `$.workers.workerStatus.status`

- `$.workers.workerStatus.active`
- `$.workers.workerStatus.activeStatusDate`

Field path IDs aren't case-sensitive.

If you want to include all subfields in a data section, specify the field path ID with a period (.) and an asterisk (\*) at the end of it. Examples:

- `$.workers.compensations.*`
- `$.workers.benefitsEarningsAndDeductions.*`
- `$.workers.compensationEarningsAndDeductions.*`
- `$.workers.costingAllocations.*`
- `$.workers.compensationPlans.allowancePlans.*`
- `$.workers.personalDataByCountries.personalData.disabilityStatuses.*`

The External Code field attribute reports the external code regardless if you enable the Enable External Payroll Code option on the Edit Tenant Setup - HCM task or not.

Note: All fields are v1 unless specified. If you want to include field attributes that aren't in v1, update the effectiveChanges request body `requestCriteria.fields.fieldSetVersion` to v2.

Data Sections	Fields	Field Path ID	Notes
Worker Status	<ul style="list-style-type: none"> <li>• Status</li> <li>• Is Active</li> <li>• Active Status Date</li> <li>• Is Terminated</li> <li>• Termination Date</li> <li>• Hire Date</li> <li>• Original Hire Date</li> <li>• Is Hire Rescinded</li> <li>• Hire Reason</li> <li>• Is Worker Rehire</li> <li>• End Employment Date</li> <li>• Continuous Service Date</li> <li>• First Day of Work</li> <li>• Expected Retirement Date</li> <li>• Seniority Date</li> <li>• Union Seniority Date</li> <li>• Severance Date</li> <li>• Retirement Date</li> <li>• Creditable Service</li> <li>• Benefits Service Date</li> <li>• Company Service Date</li> </ul>	<code>\$.workers.workerStatus</code>	The Pay Status Code field, available for U.S. Federal customers, is only supported for leave types, not Time Off types.

Data Sections	Fields	Field Path ID	Notes
	<ul style="list-style-type: none"> <li>• Time Off Service Date</li> <li>• Vesting Date</li> <li>• Pay Through Date</li> <li>• Resignation Date</li> <li>• Primary Termination Reason</li> <li>• Primary Termination Category</li> <li>• Secondary Termination Reason</li> <li>• Local Termination Reason</li> <li>• Is Regrettable Termination</li> <li>• Termination Last Day of Work</li> <li>• Date Entered Workforce</li> <li>• Last Date for Which Paid</li> <li>• Expected Date of Return</li> <li>• Is Not Returning</li> <li>• Is Return Unknown</li> <li>• Retirement Eligibility Date</li> <li>• Termination Notification Date</li> <li>• Agreement Signature Date</li> <li>• Dismissal Process Start Date</li> <li>• Notice Period Start Date</li> <li>• Pay Status Code</li> <li>• Pay Company Transfer In</li> <li>• Pay Company Transfer Out</li> </ul>

Data Sections	Fields	Field Path ID	Notes
			external payroll earning or not. The Units field is required when you request Time Off Earning and Deductions / Time Off Entries data section.
Time Off Earning and Deductions / Time Off Entries / Worktags	<ul style="list-style-type: none"> <li>• Worktag Dimension</li> <li>• Worktag Code</li> <li>• Worktag Name</li> </ul>	\$.workers.timeOffEarnings	and Deductions.groupedTimeOffEntries
Grouped Time Off Earnings and Deductions	<ul style="list-style-type: none"> <li>• Position ID</li> <li>• External Payroll Code Name</li> <li>• External Payroll Code (v2) Position Based</li> <li>• Time Off Type</li> <li>• Unit of Time</li> <li>• Grouped Time Off Entry</li> </ul>	\$.workers.groupedTimeOffEntries	Earnings and Deductions Off Entry field attribute reports manual and automated time off adjustments.  You can't include both the Time Off Earning and Deductions data section and the Grouped Time Off Earnings and Deductions data section in the same Data Changes on Demand request
Grouped Time Off Earnings and Deductions / Grouped Time Off Entries	<ul style="list-style-type: none"> <li>• Leave Start Date</li> <li>• Leave End Date</li> <li>• Units</li> <li>• Worktag</li> </ul>	\$.workers.groupedTimeOffEntries	Earnings and Deductions.groupedTimeOffEntries supports these work schedule configurations: <ul style="list-style-type: none"> <li>• All Days</li> <li>• Workdays (Non-Holiday)</li> </ul> The integration doesn't support time off adjustments for this data section.  Don't use this attribute with any other work schedule configuration.  To group time off, you must assign workers to a work schedule calendar.  The integration:

Data Sections	Fields	Field Path ID	Notes
			<ul style="list-style-type: none"> <li>Groups time off by time off types for full days.</li> <li>Reports separate groupings for hourly workers with multiple time off entries with different time off types but still equal to a full day.</li> </ul> <p>The Days to Include value and the work schedule calendar settings determine how Workday breaks up or groups time off days. Example: The Days to Include setting is <i>Workdays (Non-Holidays)</i>, and you set the work schedule calendar to Monday through Friday. Workday doesn't include Saturdays and Sundays. When a worker takes a time off event on Friday and Monday, Workday groups the time off. With this same configuration, and when the worker takes time off for Friday, Monday, and Tuesday, Workday also groups the days together as a single Time Off Grouping with 3 units. If you need separate entries, use the Days to Include setting of <i>All Days</i> with the Monday through Friday work schedule calendar. Workday then considers the weekends as valid days and breaks up a Friday request and a Monday request, creating 2 separate</p>

When your tenant time zone is in Pacific Daylight Time (PDT), the field doesn't display in the output. When you override the tenant time zone and use the Transaction Log data section, we recommend that you configure this field.</p> <p>Note: Enable the Original Event field to include the Transaction Entry Moment, Transaction Effective Moment, and Transaction Effective Moment in Initiator Time Zone fields in the output.</p> <p>When third-party payroll vendors specify the field path ID when making an API request, the integration returns the WID of the overall parent event relationship so you can synchronize data when there's a correction or rescind on the sub process business process. If there isn't a parent event, then both the original event WID</p>

Data Sections	Fields	Field Path ID	Notes
			and parent event WID are the same.

## Reference: Data Changes on Demand Request Criteria Parameters

This topic contains request criteria details for the POST /effectiveChanges API request.

### Request Headers

When making each API request, we recommend you specify these headers so we can measure performance impact:

Header	Description
wd-external-request-id	Specify a unique identifier for each request.
wd-external-application-id	Specify the third-party system's internal source identifier, such as pay group, country, or integration ID. This is up to the third-party payroll vendor depending on how they want to categorize the requests and can differ for each request. If the third-party payroll system doesn't have an internal source identifier, you can use <code>dcod</code> .
wd-external-originator-id	Specify an originator ID that identifies who is making the request. This should be the third-party payroll system name. If you have a custom payroll system, use the tenant name; otherwise, if no name exists, use <code>custom</code> .

### Request Criteria

Data Changes on Demand returns Entry and Effective Moments in Pacific Standard Time in the JSON file.

Filter	Type	Valid Values	Notes
entryMomentFrom	DateTime	YYYY-MM-DDT00:00:00.000	Required. Specify the date/time in Pacific standard time. You can't run the integration when you specify a date/time with the entryMomentTo parameter that is greater than a 2 month span.
entryMomentTo	DateTime	YYYY-MM-DDT00:00:00.000	Required. Specify the date/time in Pacific standard time.  Don't specify an EntryMomentTo date that's in the future because the EntryMomentTo date of an event becomes

Filter	Type	Valid Values	Notes
			the <code>EntryMomentFrom</code> of the next event. For more information, see <a href="#">Concept: Data Changes on Demand Change Detection</a> on page 1435.
<code>effectiveFrom</code>	Date	YYYY-MM-DD	Required.
<code>effectiveTo</code>	Date	YYYY-MM-DD	Required.
<code>allEffective</code>	Boolean	true or false	<p>Optional. When set as true, you can only specify up to a 93-day range for the <code>effectiveFrom</code> and <code>effectiveTo</code> range.</p> <p>When set as:</p> <ul style="list-style-type: none"> <li>True, Workday includes all changes effective within the current effective range regardless of when someone enters the changes. Workday also includes changes completed between the <code>entryMomentFrom</code> and the <code>entryMomentTo</code> dates and that are effective before or within the current effective range. Use this parameter when you run the first integration of a new effective range or if you only create a single extract per effective range.</li> <li>False, the integration reports only changes to</li> </ul>

Filter	Type	Valid Values	Notes
			<p>employee data that occurred between the entryMomentFrom and the entryMomentTo dates that are effective in the current or previous effective range.</p> <p>Example: You set these values:</p> <ul style="list-style-type: none"> <li>• entryMomentFrom = 2024-04-01T01:00:00.000</li> <li>• entryMomentTo = 2024-04-02T01:00:00.000</li> <li>• effectiveFrom = 2024-04-01</li> <li>• effectiveTo = 2024-04-30</li> </ul> <p>When you set allEffective as false, the integration reports only changes entered between 2024-04-01 at 1:00 and 2024-04-02 at 1:00 that are effective before or within the current effective range.</p> <p>When you set allEffective as true, the integration reports all changes effective from 2024-04-01 to 2024-04-30 regardless of when they were entered and any changes entered between 2024-04-01 at 1:00 and 2024-04-02 at 1:00 that are effective before or within the current effective range.</p>
extendedAllEffectiveTo	Date	YYYY-MM-DD	Optional. If you set allEffective as true, you can't specify a value for this parameter.

Filter	Type	Valid Values	Notes
			<p>Example: You set these values:</p> <ul style="list-style-type: none"> <li>entryMomentFrom = 2024-04-01T01:00:00.000</li> <li>entryMomentTo = 2024-04-02T01:00:00.000</li> <li>effectiveFrom = 2024-04-01</li> <li>effectiveTo = 2024-04-30</li> <li>extendedAllEffectiveTo = 2024-05-31</li> </ul> <p>In this example, the April effective range uses allEffective = false behavior while the May effective range uses allEffective = true behavior.</p> <p>When effectiveTo and extendedAllEffectiveTo are equal, the integration uses allEffective = false behavior for the entire effective range.</p>
includeRequestCriteriaInResponse	Boolean	true or false	<p>Optional. When set as:</p> <ul style="list-style-type: none"> <li>true, the API response includes the API requestCriteria.</li> <li>false, the API response doesn't include the API requestCriteria.</li> </ul>
fields	Multi-instance	Both: <ul style="list-style-type: none"> <li>fieldSetVersion</li> <li>onlyInclude</li> </ul>	<p>Both are required. The valid fieldSetVersion value is v1.</p> <p>For more information, see: <a href="#">Reference: Data Sections for Data Changes on Demand on page 1437</a>.</p>
organizations	Multi-instance	Must be 1 or more payroll interface pay groups.	Required.
excludeWorkers	Boolean	true or false	Optional. When set as:

Filter	Type	Valid Values	Notes
			<ul style="list-style-type: none"> <li>• true, the event excludes workers you specify in the workers request parameter.</li> <li>• false, the workers you specify in the workers request parameter are the only workers included in the event.</li> </ul>
workers	Multi-instance	WID or reference ID type and ID  Example: Employee_ID=12345	Optional.
workerOverrides	Multi-instance	Both: <ul style="list-style-type: none"> <li>• WID or reference ID type and ID</li> <li>• entryMomentFromOverride dateTime</li> </ul>	Optional.
responseFilter	Multi-instance	See <a href="#">Response Filters</a> on page 1480.	Optional.
forceRerun	Boolean	true or false	Optional. When set as: <ul style="list-style-type: none"> <li>• true, and requesting a duplicate API request, Workday initiates a new event.</li> <li>• false and requesting a duplicate API request, Workday provides the response of the original request.</li> </ul>
schemaOnly	Boolean	true or false	Optional. When set as: <ul style="list-style-type: none"> <li>• true, the integration requests a schema only.</li> <li>• false, the integration launches a DCoD request.</li> </ul>

## Response Filters

Filter	Type	Valid Values	Notes
additionalNameTypes	Multi-instance	Additional name type instances	Optional. Applies to the additional name type data in the Personal data section. The integration only includes the additional name types that you specify. If you don't specify any, the integration doesn't output any name types.
organizationTypes	Multi-instance	Organization type instances	Optional. Applies to the Position Organization data section. The integration only includes the organization types that you specify. If you don't specify any, the integration doesn't output any types.
organizationRoles	Multi-instance	Organization role instances	Optional. Applies to the Organization Roles data section. The integration only includes the organization roles that you specify. If you don't specify any, the integration doesn't output any organization roles.
paymentElectionRules	Multi-instance	Payment election rule instances	Optional. Applies to the Payment Election data section. The integration only includes the pay elections with election rules that you specify. If you don't specify any, the integration doesn't output any payment elections.
countryNameFormat	Text ENUM	COUNTRY_NAME, ISO_3166-1_ALPHA-2_CODE or ISO_3166-1_ALPHA-3_CODE	Optional. If you don't specify, the default is ISO_3166-1_ALPHA-2_CODE.
countryRegionNameFormat	Text ENUM	COUNTRY_REGION_ID, COUNTRY_REGION_NAME	Optional. If you don't specify, the default is ISO_3166-2_COUNTRY_REGION_CODE.

Filter	Type	Valid Values	Notes
		ISO_3166-2_CODE, or ISO_3166-2_COUNTRY_REGION_CODE	
configurableCompensationBasis	String instance	WID or reference ID type and ID	Optional. When indicated, the integration reports the configurable compensation basis. See <a href="#">FAQ: Payroll Effective Change Interface</a> for information about eligibility rules. If you don't specify an ID, the integration doesn't output the configurable compensation basis.
reportPostTermCompensation	Boolean	true or false	Optional. When set as true, the integration reports post termination compensation. When a worker doesn't have post termination compensation, the integration reports zeroes in this section.
excludeAdditionalJobs	Boolean	true or false	Optional. When set as true, the integration only reports primary jobs.
includeEndedContracts	Boolean	true or false	Optional. When set as: <ul style="list-style-type: none"> <li>• true, the integration includes contracts with end dates that are prior to the effective from date.</li> <li>• false, the integration includes contracts snapshots within the entry range dates.</li> </ul>
fullSnapshot	Boolean	true or false	Optional. When set as: <ul style="list-style-type: none"> <li>• true, the integration includes all workers within the request with</li> </ul>

Filter	Type	Valid Values	Notes
			<p>and without changes in the output.</p> <ul style="list-style-type: none"> <li>• false, the integration includes only workers with changes in the output.</li> </ul>

## FAQ: Data Changes on Demand

- What are the info blocks within the Data Changes on Demand (DCoD) API response? on page 1482
- How do I get details on the reference IDs and WIDs that are utilized in the API call? on page 1483
- Why are my benefit plan values not present within the DCoD response? on page 1483
- What is the difference between Payroll One-Time Payments (OTP) and Compensation One-time-Payments (OTP)? on page 1484
- Are compensation change eligibility rules detected as a change in DCOD? on page 1484
- Why is my OTP not reporting or being returned in the DCoD response? on page 1484
- Why didn't I get an Event Outbound Notification for my new hire when the pay group assignment is outside of the hire completion step? on page 1484
- Why don't I see the payment election values within my API response? on page 1484

What are the info blocks within the Data Changes on Demand (DCoD) API response?

An effective change block in field 1 can generate an info block on field 2 when the current value of field 2 doesn't match the value for field 2 as of the entry and effective moment of the effective changes on field 1. This is informational only and doesn't indicate there is an effective change for field 2.

Example:

```
"positions": [
  {
    "iid": {"val": "d35ac53466464b0bb56bf4f5e74b4bfd"},
    "positionId": {"val": "P-00388"},
    "primaryJob": {"val": "true"},
    "jobTitle": {"val": "Consultant"},
    "businessTitle": {
      "val": "Sr. Product Consultant"
    },
    "info": [
      {
        "eff": "2025-06-15T00:00:00.000-07:00",
        "ent": "2025-07-30T15:57:18.569-07:00",
        "c": "Consultant"
      }
    ]
  }
]
```

```

        }
    ],
    "workerType": {"val": "REGULAR"},
    "positionTimeType": {"val": "Full_time"},
    "isJobExempt": {"val": "false"},
    "scheduledWeeklyHours": {
        "val": "38",
        "ecs": [
            {
                "eff": "2025-06-15T00:00:00.000-07:00",
                "ent": "2025-07-30T15:57:18.569-07:00",
                "p": "40",
                "c": "38"
            }
        ]
    },
}

```

The businessTitle value of Sr . Product Consultant wasn't the businessTitle value as of the scheduledWeeklyHours effective change entry and effective moment. Instead, the info block on businessTitle is indicating the value as of the scheduledWeeklyHours effective changes entry and effective moment, which was Consultant.

You can think of info blocks as the value during a related effective change. This means that if something is on a timeline, DCoD is stating that at the time of 2025-06-15, the business title wasn't Sr. Product Consultant but Consultant. This way you can fill in the retro change within the payroll system to state that at the time of 2025-06-15, the business title was Consultant. You shouldn't assume anything outside of that exact date and time.

How do I get details on the reference IDs and WIDs that are utilized in the API call?

There is a *Get References* web service that you can run to obtain the reference IDs and WIDs of each organization. For more information:

- Go to Integrations > Get\_References in the Workday Web Services (WWS) Directory: <https://community.workday.com/sites/default/files/file-hosting/productionapi/index.html>
- See Concept: Get Reference SOAP Web Service Guidelines and Troubleshooting on page 2333

Why are my benefit plan values not present within the DCoD response?

The Benefit Earnings and Deductions data section only outputs benefit plan data that you mapped through the external earning and external deductions configuration. The benefit plan only outputs values that have a greater than 0 value. For

What is the difference between Payroll One-Time Payments (OTP) and Compensation One-time-Payments (OTP)?

Are compensation change eligibility rules detected as a change in DCOD?

Why is my OTP not reporting or being returned in the DCoD response?

Why didn't I get an Event Outbound Notification for my new hire when the pay group assignment is outside of the hire completion step?

Why don't I see the payment election values within my API response?

more information, see [Steps: Define Third-Party Payroll Earnings and Deductions](#) on page 1403.

The Payroll OTP data section is driven by External Payroll Inputs and the Compensation OTP data section is driven by compensation OTPs or scheduled bonus payments.

Workday doesn't support the detection of changes to Configurable Compensation Basis values that result from the compensation eligibility rule changes related to the configurable compensation basis. Example: If a worker moves from position A (eligible) to position B (not eligible), the configurable compensation basis loss is detected. However, if the configurable compensation basis eligibility rule is updated and the eligible population changes, this isn't detected by the integration.

You must set up the mapping for earnings and deductions to both compensation OTPs and external payroll input OTPs for DCoD to report results. For more information, see [Steps: Define Third-Party Payroll Earnings and Deductions](#) on page 1403.

To receive a notification, you must configure the pay group assignment step before the hire completion step on the hire business process. You can pull the data with DCoD after the worker has been assigned the pay group and within the effective changes API call.

You must specify a value for the paymentElectionRules response filter in your API request. For more information, see [Reference: Data Changes on Demand Request Criteria Parameters](#) on page 1475.

## Event Outbound Notifications

### Steps: Set Up Event Outbound Notifications

#### Prerequisites

Confirm that your third-party payroll system can accept Event Outbound Notifications with a valid endpoint.

#### Context

You can set up Event Outbound Notifications from Workday to third-party payroll systems after hire or termination transaction events occur. The Event Outbound Notifications feature supports corrections for these event types but doesn't support rescinds.

We recommend you set up Event Outbound Notifications so you know when to request data changes on demand for these workers with the Data Changes on Demand feature.

Event Outbound Notifications doesn't currently support Hire Data Checkpoint.

## Steps

- Access the Edit Tenant Setup - Integrations task.

In the Integration Subscription Settings section, clear the Disable Integration Subscriptions check box.

**Security:** Set Up: Tenant Setup - Integrations domain in the System functional area.

- Create Integration System User for Event Outbound Notifications on page 1487.
- Create Integration System on page 1967 and select *Event Outbound Notifications* from the New Using Template prompt.
- Note: Only create 1 integration system for the Event Outbound Notifications feature regardless of the number of third-party payroll systems that you use.
- Set Up Integration Subscriptions on page 1968.

- In the Event Subscriptions section, select *Hire - Hire Employee Event and Termination - Terminate Employee Event* for the Subscribe to specific Transaction Types field.

**Note:** Set the *Assign Pay Group* step on the *Hire* business process for the pay groups as or before the *Completion* step.

- On the Launch Integration, select Add.
- On the Run As field, select the ISU you created in step 2.

On the Integration Criteria grid, set all the Value Type values to *Determine Value and Runtime*, and set these values:

Field	Value
Worker	Transaction Targets as Workers
Transaction Log	Transaction Log
Transaction Type	Transaction Types
Transaction Effective Date	Transaction Effective Moment
Transaction Completion Moment	Transaction Entry Moment
Transaction Correction Completion Moment	Transaction Correction Completion Moment
External Payroll Vendors	External Payroll Vendor
Organizations	Organization for Notification

- (Optional) If you're not using a preconfigured third-party payroll system, access the Create External Payroll Vendor task and select *Event Outbound Notifications* on the Features prompt.

**Security:** Set Up: Payroll Interface domain in the Payroll Interface functional area.

- Create External Payroll Vendor Mapping on page 1413.

- [.../.../authentication-and-security/security-for-integrations/access-to-external-endpoints/utr1471451793602.dita](https://.../authentication-and-security/security-for-integrations/access-to-external-endpoints/utr1471451793602.dita).

Select the Do Not Allow Regeneration check box.

- (Optional) If you're not using a preconfigured third-party payroll system, on the Feature Configuration grid, add a row with these values:

Field	Value
Feature	<i>Event Outbound Notifications</i>
Attribute	<i>Worker Event Types</i>
Attribute	<i>Delivery Endpoint</i>

## Result

When a hire or termination event occurs for a worker in a pay group you mapped, Workday sends a notification to the third-party payroll system endpoint you specified.

### Endpoint Notifications

#### Hire Notification

```
{
  "transactionCompletionMoment": "2024-06-02T22:26:15.922Z",
  "transactionEffectiveDate": "2024-06-14",
  "businessProcessType": {
    "id": "08e574a19f6b400fac5dbe71ea854f1d",
    "descriptor": "Hire",
    "Business_Process_Type": "Hire Employee"
  },
  "worker": {
    "id": "c4dac401eb4710001592daff2c210000",
    "Employee_ID": "27560"
  },
  "transactionLog": {
    "id": "c4dac401eb471000158ba092eb1c0000"
  },
  "organization": {
    "id": "edfab73bfb3e49c5959c3bf9d111f9cd",
    "descriptor": "Third Party - Green Planet Acquisition",
    "Organization_Reference_ID": "3rd_Party_Green_Planet_Acquisition"
  }
}
```

#### Hire Correction Notification

```
{
  "transactionCompletionMoment": "2024-06-02T22:26:15.922Z",
  "correctionCompletionMoment": "2024-06-04T22:29:02.918Z",
  "transactionEffectiveDate": "2024-06-20",
  "businessProcessType": {
    "id": "08e574a19f6b400fac5dbe71ea854f1d",
    "descriptor": "Hire",
    "Business_Process_Type": "Hire Employee"
  },
  "worker": {
    "id": "c4dac401eb4710001592daff2c210000",
    "Employee_ID": "27560"
  },
  "transactionLog": {
    "id": "c4dac401eb471000158ba092eb1c0000"
  },
  "organization": {
    "id": "edfab73bfb3e49c5959c3bf9d111f9cd",
    "descriptor": "Third Party - Green Planet Acquisition",
    "Organization_Reference_ID": "3rd_Party_Green_Planet_Acquisition"
  }
}
```

[2024 R2 Feature Release Note: Third-Party Payroll Event Outbound Notifications](#)

## Create Integration System User for Event Outbound Notifications

### Prerequisites

Security: *Integration Security* domain in the Integration functional area.

### Context

You can create an integration system user (ISU) for the Event Outbound Notifications feature, enabling you to assign the ISU to a security group with permissions to access the required integrations.

### Steps

1. Access the Create Integration System User task.

Workday automatically populates the value in the Session Timeout Minutes with zero to prevent the ISU session from expiring. Expired sessions can cause the integration to stop before it successfully completes.

2. From the related actions menu of the ISU you created, select Security Profile > Assign Integration System Security Groups.
3. From the Integration System Security Group to Assign prompt, select a security group with these security constraints:

Access	Security
View and Get	<i>Business Process Administration</i> domain in the System functional area.
View and Put	<p>These domains in the Integration functional area:</p> <ul style="list-style-type: none"> <li>• <i>Integration Event</i></li> <li>• <i>Integration Process</i></li> </ul> <p>If you don't have Put access on these security domains, you can't set the ISU as the Run As User when setting up the integration subscription.</p>

4. [Activate Pending Security Policy Changes](#).
5. (Optional) If the integration system user authenticates with a username and password:
  - a. Access the Maintain Password Rules task.
  - b. Add the integration system user in the System Users Exempt from password expiration field.

## Global Payroll Hub

### Setup Considerations: Global Payroll Hub

You can use this topic to help make decisions when planning your configuration and use of the Global Payroll Hub. It explains:

- Why to set it up.
- How it fits into the rest of Workday.
- Downstream impacts and cross-product interactions.
- Security requirements and business process configurations.
- Questions and limitations to consider before implementation.

Refer to detailed task instructions for full configuration details.

## What It Is

The Global Payroll Hub enables you to process payroll and perform time sensitive actions on vendor-provided payroll data for multiple countries at a time in 1 place.

## Business Benefits

- View all the external pay groups that you're responsible for across pay vendors.
- View payroll status for pay groups even if you have separate third party vendors for different regions.
- View high-level information related to the pay period. Example: The status of the pay processing and if there are any items that need your attention.
- Drill into payroll details to see more information for the current, previous, or next pay periods, as well as off-cycle pay runs to improve efficiency.
- Quickly view information related to employee counts and total payment breakdowns, as well as important dates for payroll processing.
- Analyze variances with Workday's intuitive interface so you can visualize the difference between the amounts for the current and previous pay periods and see why these variances occur.
- Create and manage a checklist for third-party payroll to help you keep track of your payroll processing progress.
- Manage and keep track of your third-party payroll processing progress with checklists and attachments.

## Use Cases

You can see the payroll status for all your pay groups at the same time.

You have a third-party payroll vendor for EMEA countries, and another third-party vendor for Japan and Korea, you can use the Details page to:

- Approve payroll for the Japan pay group.
- See that a worker is missing payroll data.
- Review an off-cycle payroll run for a pay group in GPH to verify the number of employees processed and the total pay.

You review an on-cycle payroll run for a pay group to analyze variances of the current and previous periods for the gross and net pay in the hub. Example: There's a 1.6% increase from the last pay period and you can see the difference because 2 different workers have a different net pay.

You can use the comments and attachments feature on the Global Payroll Hub to:

- Attach files like tax forms, direct deposit authorizations, or timesheets directly within the checklist for easy access.
- Reference supporting documents (such as benefit plan documents or deduction tables) to ensure accurate payroll processing.
- Allow multiple team members to access and verify documents without relying on external systems or emails.

## Questions to Consider

Questions	Considerations
How many payroll systems do you use?	You can use GPH if you use third-party payroll vendors.
What countries do you pay workers in?	To ensure you have a global view of your payroll, GPH presents information across countries and currencies. You can use different payroll vendors in different countries to display payroll data in GPH.

Questions	Considerations
Which external payroll vendors do you use?	For certain payroll partners, Workday provides a seamless integration. Other third-party vendors must build REST APIs for the landing page and you need to set these vendors up in Workday.
What external pay groups do you have in Workday?	To ensure existing external pay groups display in GPH, map pay group associations in Workday.
What type of integration do you need to use the Global Payroll Hub (GPH)?	The Global Payroll Hub (GPH) doesn't require a specific integration to function. Its primary purpose is to centralize and display information related to pay groups and pay periods, as provided by payroll vendors. Rather than accessing multiple vendor systems to track payroll status, you can leverage the GPH to view this information in 1 unified interface. The hub is designed to enhance visibility and streamline access, independent of the underlying integration mechanisms.

## Recommendations

No impact.

## Requirements

You'll need to set up your third-party payroll vendor in Workday if it isn't a payroll partner. Your third-party payroll vendor must build the REST APIs for the landing page and field data that Workday displays and sends to the external payroll system.

## Limitations

No impact.

## Tenant Setup

On the Configure Home Page Content task, you can add the Global Payroll Hub worklet.

## Security

*Manage:* Global Payroll Processing domain in the Global Payroll Connect functional area to access and take action on the third-party payroll data.

*View:* Global Payroll Hub domain in the Global Payroll Connect functional area for access for users.

## Business Processes

No impact.

## Reporting

No impact.

## Integrations

No impact.

## Connections and Touchpoints

Workday offers a Touchpoints Kit with resources to help you understand configuration relationships in your tenant. Learn more about the [Workday Touchpoints Kit](#) on Workday Community.

[Related Information](#)

[Reference](#)

[2024R2 Feature Release Note: Global Payroll Hub](#)

## Steps: Set Up Global Payroll Hub

### Prerequisites

Your third-party payroll vendor must build REST APIs for the landing page to field data that Workday displays and sends to the external payroll system.

### Context

The Global Payroll Hub (GPH) enables you to process payroll and perform time-sensitive actions on vendor-provided payroll data for multiple countries at a time in 1 place.

With GPH, you can:

- View all the external pay groups that you're responsible for.
- View payroll status for external pay groups even if you have separate third party vendors for different regions.
- View high-level information related to the pay period. Example: The status of the pay processing and if there are any items that need your attention.
- Drill into payroll details to see more information for the current, previous, or next pay periods, as well as off-cycle pay runs to improve efficiency.
- Quickly view information related to employee counts and total payment breakdowns, as well as important dates for payroll processing.
- Analyze variances with Workday's intuitive interface so you can visualize the difference between the amounts for the current and previous pay periods and see why these variances occur.
- Access third-party payroll tasks, such as running calculations, through Workday.

Note: You need to set up your third-party payroll vendor in Workday with Steps 1 and 2b if the vendor isn't 1 of the these payroll partners:

- CloudPay
- Deel Global Payroll
- PwC
- SHAPEiN
- Strada

### Steps

1. (Optional) Access the Create External Payroll Vendor task.

Add your third-party payroll vendor and select the *Global Payroll Hub* feature.

Security: *Set Up: Payroll Interface* domain in the Payroll Interface functional area.

2. [Create External Payroll Vendor Mapping](#) on page 1413.

Map your third-party payroll vendor if it isn't in Workday.

- a) On the Public Private Key Pairs grid, either select an x509 key pair from the list or create a new key pair and select the Active check box. If you create a new pair, select the Do Not Allow Regeneration check box.

- b) (Optional) On the Feature Configuration grid:

Option	Description
Feature	Add a row and select <i>Global Payroll Hub</i> .
Attribute	Select <i>Initiating Endpoint</i> .
Value	<p>Enter the external endpoint to use for the vendor.</p> <p>The format is:</p> <pre>https://vendorendpoint.com/ payProcessingFeature</pre>

3. [Edit Domain Security Policies](#).

Configure access for payroll administrators of the *Manage: Global Payroll Processing* domain in the Global Payroll Connect functional area. Configure access for users of the *View: Global Payroll Hub* domain in the Global Payroll Connect functional area.

4. [Maintain Pay Group Vendor Associations](#) on page 1414.

Enter the following:

Option	Description
External Payroll Vendor	Select your vendor.
Feature	<i>Global Payroll Hub</i>
Pay Group	Select the vendor-associated pay groups to include in GPH.
Payroll Organization Type	<i>External Payroll</i>

5. (Optional) [Set Up Global Payroll Processing Checklists](#) on page 1491.

6. (Optional) Access the Configure Home Page Content task.

Add the Global Payroll Hub worklet to the Workday Home page menu.

Security: *Set Up: Tenant Setup - Worklets* domain in the System functional area.

## Result

Access the Global Payroll Processing task to view your vendor-provided data on the GPH Summary page.

## Set Up Global Payroll Processing Checklists

### Prerequisites

Security: The *Set Up: Global Payroll Processing Checklist* domain in the Global Payroll Connect functional area.

### Context

The Global Payroll Processing checklist enables you to create and manage checklists for third-party payroll to help you keep track of your payroll processing progress.

## Steps

1. Access the Maintain Payroll Processing Checklist Templates task.
2. Select the Used in Payroll Interface check box.
3. Complete the grid:

Item Group	Enter a name for this section of the checklist.
Item	Enter a name for the checklist item row.
Task/Report	Select a payroll task or report for this checklist item row.
External URL	<p>Either:</p> <ul style="list-style-type: none"> <li>• Select an existing URL.</li> <li>• Click Create External URL to add a new external URL.</li> </ul> <p><i>Security: Manage: External URLs domain in the System functional area.</i></p>
Due At	Select a due date or create a recurring date.
Assign To	Select the assignee for the task or report that needs to complete that step.
Instructions	You can provide additional instructions on the checklist that provides a useful reference to the assignee.

4. To add the checklist to your pay group, access the Global Payroll Hub.
5. Click Create on the Checklist column for your pay group.
6. Select the Checklist Template.
7. Select the Confirm check box and click OK.
8. (Optional) If you will add attachments to checklists, access the Edit Tenant Setup - System task and select Allow All File Types or Allow ONLY Specific File Types and select any these supported attachment types:
  - PDF
  - PNG
  - JPG
  - XLS
  - XLSX
  - DOC
  - DOCX

## Result

In the Global Payroll Hub, click View in the Checklist column for your pay group to take action on the checklist.

## Inbound Notifications

### Steps: Set Up Inbound Notifications

#### Prerequisites

Workday strongly recommends that you work with a payroll vendor to configure Inbound Notifications.

#### Context

Set up the Inbound Notifications REST API so you can notify specific workers or role groups in Workday with custom messages that include links that users can copy, such as errors that they need to fix in the third-party payroll system.

#### Steps

1. [Create Integration System User for Inbound Notifications](#) on page 1494.
2. [Edit Domain Security Policies](#) to grant the integration system user access to these domains:

Access Considerations	Domains
<i>View, Modify, and Get</i>	<i>Manage: Global Payroll Inbound Notifications</i> domain in the Global Payroll Connect functional area.

3. [Activate Pending Security Policy Changes](#).
4. [.../authentication-and-security/authentication/oauth/dan1370797831458.dita](#) and enter these values:

Field	Value
Scope (Functional Areas)	<ul style="list-style-type: none"> <li><i>Integration</i></li> <li><i>Global Payroll Connect</i></li> </ul>

5. (Optional) If you're not using a pre-configured third-party payroll system, access the Create External Payroll Vendor task and select *Inbound Notifications* on the Features prompt.

Security: *Set Up: Payroll Interface* domain in the Payroll Interface functional area.

6. [Create External Payroll Vendor Mapping](#) on page 1413.

- a) Create or select a Key Pair on the Public Private Key Pairs grid.

See [.../authentication-and-security/security-for-integrations/access-to-external-endpoints/utr1471451793602.dita](#).

- b) On the Feature Configuration grid:

1. Add a row and select *Inbound Notifications* for the Feature.

2. Select *Integration System User* for the Attribute and select the ISU for the Value.

Note: Third-party payroll systems can only use the ISU you configured for the third-party payroll system and feature on the Create External Payroll Vendor Mapping task.

#### Examples

[2024 R2 Feature Release Note: Global Payroll Connect Inbound Notifications REST API](#)

## Create Integration System User for Inbound Notifications

### Prerequisites

Security: *Integration Security* domain in the Integration functional area.

### Context

You can create an integration system user (ISU) for the Inbound Notifications feature, enabling you to assign the ISU to a security group with permissions to access the required integrations.

### Steps

1. Access the Create Integration System User task.

Workday automatically populates the value in the Session Timeout Minutes with zero to prevent the ISU session from expiring. Expired sessions can cause the integration to stop before it successfully completes.

2. From the related actions menu of the ISU you created, select Security Profile > Assign Integration System Security Groups.
3. From the Integration System Security Group to Assign prompt, select a security group with these security constraints:

Access	Security
<i>View, Modify, and Get</i>	<i>Manage: Global Payroll Inbound Notifications</i> domain in the Global Payroll Connect functional area.

4. [Activate Pending Security Policy Changes](#).
5. (Optional) If the integration system user authenticates with a username and password:
  - a. Access the Maintain Password Rules task.
  - b. Add the integration system user in the System Users Exempt from password expiration field.

### Reference: Inbound Notifications Request Samples

Note: Any links the third-party payroll system provides in the notification aren't clickable, but the user can copy them.

For routing, if you send Additional Payroll Data in the featureConfiguration request parameters, you must specify:

- Feature properties, such as PayGroup, and ActedOnUser.
- A valid pay group that has a pay group vendor association to the Additional Payroll Data feature.

#### Sending a Notification to Organizations Recipients Sample

```
{
  "featureConfiguration": {
    "feature": {
      "id": "Feature_ID=Additional_Payroll_Data" },
    "properties": [
      {"id": "ActedOnUser", "value": "Employee_ID=27559" },
      {"id": "payGroup", "value": "Organization_Reference_ID=PAY_GROUP-16-194" }
    ]
  },
  "recipient": {
    "organizationRecipients": [
      {"organization": {
        "id": "Organization_Reference_ID=PAY_GROUP-4-15" },
        "roles": [

```

## Sending a Notification to Worker Recipients Sample

```
{  
  "featureConfiguration": {  
    "feature": {  
      "id": "Feature_ID=Additional_Payroll_Data"},  
    "properties": [  
      {"id": "ActedOnUser", "value": "Employee_ID=27559"},  
      {"id": "payGroup", "value": "Organization_Reference_ID=PAY_GROUP-16-194"}  
    ]  
  },  
  "recipient": {  
    "workerRecipients": [{"id": "Employee_ID=21008"}]  
  },  
  "message": {  
    "title": "Test Notification",  
    "body": "This is just a test!",  
    "link": "https://workday.com",  
    "translations": [{  
      "title": "Notification de test",  
      "body": "C'est juste un test!",  
      "languages": [{"id": "User_Language_ID=fr_FR"}, {"id": "User_Language_ID=fr_CA"}]  
    },  
    {  
      "title": "Notificación de prueba",  
      "body": "¡Esto es solo una prueba!",  
      "languages": [{"id": "User_Language_ID=es"}]  
    }  
  ]  
}
```

## Payroll Interfaces

### Concept: Workday Payroll Interfaces

Workday Payroll Interfaces (Payroll Effective Change Interface and Payroll Interface), enable you to manage payroll data and send it to an external payroll provider. You can:

- Set up a payroll organization.
- Define earnings and deductions.
- Capture changes to employee data.
- Configure a payroll extract to deliver to an external system.

There are different ways to integrate with Workday Payroll Interfaces. You can:

- Create an integration with an integration template.
- Have Workday Professional Services create a custom solution.
- Build your own custom integration.

Payroll Interfaces are integration templates with a configurable set of HCM data. Because payroll providers only need a subset of the employee data in Workday, you can specify:

- Data elements to include in payroll extracts.
- When to include the data elements.

When launched, the integration captures changes to employee data for the pay group and pay period. The integration creates an output file in XML or CSV format. You can:

- Deliver the output file to an external system.
- Perform additional transformations to the output file.
- Use Workday audit reports to identify changes for manual data entry into an external system.

You can create full extracts of employee data with integrations that use the Payroll Interface templates. This option:

- Helps during initial implementation.
- Supports payroll providers that require full files.
- Enables system resynchronization.

For information on what the specific integration includes when running a full extract run, see:

- [Steps: Create Third-Party Payroll Integration](#) on page 1700
- [Concept: Payroll Effective Change Interface](#) on page 1509

[Concept: Multiple Positions in Payroll Interface](#) on page 1725

##### Tasks

[Steps: Set Up Workday Payroll Interface](#) on page 1699

[Steps: Set Up Payroll Effective Change Interface](#) on page 1526

## Setup Considerations: Payroll Interfaces

You can use this topic to help make decisions when planning your configuration and use of payroll interfaces. It explains:

- Why to set them up.
- How they fit into the rest of Workday.
- Downstream impacts and cross-product interactions.

- Security requirements and business process configurations.
- Questions and limitations to consider before implementation.

Refer to detailed task instructions for full configuration details.

## What It Is

A payroll interface enables you to connect with a third-party payroll vendor to send and receive payroll data. Workday provides 2 options for connecting to a third-party payroll vendor. You can either:

- Use a prebuilt connector available through the partner program.
- Build a custom integration using a Workday integration template.

Payroll interfaces support:

- Full-stack integration, which transmits each payroll change for each worker sequentially and includes the effective date and data entry date for each change. You can build a full-stack integration using the *Payroll Effective Change Interface* integration template in Workday.
- Top-of-stack integration, which transmits only the differences between 2 points in time for each worker to the third-party payroll vendor. You can build a top-of-stack integration using the *Payroll Interface* integration template in Workday.

## Business Benefits

Both Payroll Effective Change Interface and Payroll Interface enable you to:

- Send and receive payroll data to/from a third-party payroll vendor.
- Process country-specific global payroll.
- Maintain a single engagement platform, using Workday as the single source of truth for payroll data.

In addition, Payroll Effective Change Interface enables you to:

- View and change third-party payroll data directly in Workday.
- Reduce troubleshooting time by viewing payroll errors at the worker level.
- Send new-hire and termination data to third-party payroll vendors immediately upon creation; maintain local payroll data with no delay.
- Track the status of the integration and identify any necessary corrective actions without leaving Workday.
- Reconcile data in third-party payroll with data in Workday, automatically.

## Use Cases

Payroll Effective Change Interface:

- Your payroll vendor requires a full-stack integration.
- You converted to Workday from a legacy third-party ERP.
- You have up to 250,000 workers per pay group.

Payroll Interface:

- Your payroll vendor requires a top-of-stack integration.
- Your payroll vendor requires simple CSV or XML file formats.

## Questions to Consider

Question	Considerations
Is there a prebuilt connector that meets your third-party payroll needs?	Consider using a Workday-certified connector. These prebuilt and documented integrations are available through a Workday partner or Workday Professional Services. These solutions can

Question	Considerations
	simplify the process of integrating with a third-party payroll vendor.
What type of integration works better for your third-party payroll vendor?	Work with your third-party payroll vendor to determine whether a full-stack integration or top-of-stack integration is better. The payroll interface that you select will depend primarily on the type of integration your third-party vendor requires.
Does your third-party payroll vendor require you to send HCM data in the output files?	If your third-party payroll vendor requires you to transmit HCM data along with payroll data, you can add Worker Effective Change Interface in addition to your payroll interface.
Do you want to use an existing pay group within Workday?	You must create a new external pay group. You can't convert an already used Workday pay group to an external pay group.
Does your company employ contingent workers?	If you have contingent workers in your workforce, you can add Worker Effective Change Interface in addition to your payroll interface. Because you can't assign contingent workers to pay groups, Payroll Effective Change Interface and Payroll Interface don't support contingent workers.
Do you have workers that have or will have international assignments?	Payroll Effective Change Interface and Payroll Interface support workers that have an international assignment. You can only change a worker's primary position that's assigned to an external pay group with an international assignment that's assigned to an external pay group.
Do you have Workday users who aren't in the Pacific Standard Time (PST) time zone?	When the integration evaluates fields users enter in the UI, such as Last Successful Run Date, the integration converts that time to the Pacific Standard Time (PST) time zone.

## Recommendations

Workday strongly recommends that you engage either:

- A Workday consulting partner if you plan to use a prebuilt connector.
- Workday Professional Services if you plan to build a custom connector.

If your third-party payroll vendor can consume a full-stack integration, Workday recommends:

- Payroll Effective Change Interface.
- Worker Effective Change Interface if you have contingent workers.
- Event-Driven Integration for Third-Party Payroll.
- Global Payroll Reconciliation integration.
- Local Payroll Data integration.

## Requirements

Perform upfront analysis with your third-party payroll vendor. Determine the type of integration that they require and the specific data they require you to transmit.

Payroll Effective Change Interface requires grid; you can only have 1 Grid-enabled active implementation or preview tenant at a time.

To use Event-Driven Integration for Third-Party Payroll, available with Payroll Effective Change Interface, you or your payroll vendor must build 2 endpoints to:

- Deliver new-hire and termination information to third-party payroll vendors in real-time, enabling payroll administrators to act on the information immediately.
- Retrieve status and errors from third-party payroll vendors, enabling you to view and correct errors directly in Workday, without needing to access external applications.

In addition, you must add Event-Driven Integration for Third-Party Payroll steps to the *Hire* and *Termination* business processes.

## **Limitations**

- Workday payroll interfaces don't include contingent workers in their output files. If your company employs contingent workers, you can use Worker Effective Change Interface to transmit contingent worker data.
- Payroll Interface doesn't capture out-of-order retroactive insertions. Example: You add an allowance plan with an effective date of 3/1/19 and run the integration successfully. You then update the allowance plan with an effective date of 2/1/19. Workday doesn't display the retroactive update in the output.
- Adding new pay periods during an integration run may cause discrepancies with historical data. Consider creating your pay periods before the scheduled integration.

## **Tenant Setup**

Contact Customer Care to set up your tenant for grid.

## **Security**

Security setup varies between integration types and specific integrations. Non-EIB integrations require an associated *Integration System User* (ISU) account. ISUs enable you to give an integration *Get* and *Put* access to only the domains it needs to run the integration.

## **Business Processes**

No impact.

## **Reporting**

- *Data Changes Audit* report
- *Maintain Errors from Third-Party Payroll* report
- *Third-Party Payroll Errors* report

## **Integrations**

- ADP Pay force
- Event-Driven Integration for Third-Party Payroll
- Global Payroll Reconciliation
- Local Payroll Data
- Payroll Effective Change Interface Merge Files
- Worker Effective Change Interface

## Connections and Touchpoints

Workday offers a Touchpoints Kit with resources to help you understand configuration relationships in your tenant. Learn more about the [Workday Touchpoints Kit](#) on Workday Community.

## Reference: Find Your Third-Party Payroll Interface Integration

Compare the Payroll Effective Change Interface Integration and the Payroll Interface Integration in Workday.

Feature	Payroll Effective Change Interface Integration	Payroll Interface Integration
Grid for Tenant	Required.	Not required.
Pay Group Assignment in Staffing Events	Supported with the Assign Pay Group task.	Supported with the Assign Pay Group task.
Payroll Company Setup	Supported with the Create Custom Organization task.	Supported with the Create Custom Organization task.
Regular Earnings	Supported with the Maintain External Payroll Earnings task.	Supported with the Maintain External Payroll Earnings task.
Regular Deductions	Supported with the Maintain External Payroll Deductions task.	Supported with the Maintain External Payroll Deductions task.
Payroll Calendar	Supported with the Create Period Schedule task.	Supported with the Create Period Schedule task.
Integration Launch Parameters	<p>You can use these parameters on the Launch/Schedule Integration task:</p> <ul style="list-style-type: none"> <li>• Pay Group</li> <li>• Pay Period Selection Option</li> <li>• Primary Run</li> <li>• Pay Group Members</li> <li>• Exclude Members/Only Include Members</li> <li>• Change Detection</li> <li>• Full Snapshot</li> <li>• Last Successful Run Date</li> </ul>	<p>You can use these parameters on the Launch/Schedule Integration task:</p> <ul style="list-style-type: none"> <li>• Last Successful Run</li> <li>• Pay Group Members</li> <li>• Pay Period Selection Option</li> <li>• Basic Staffing Transaction Log Types</li> <li>• Change Detection</li> </ul>

Feature	Payroll Effective Change Interface Integration	Payroll Interface Integration
Time Tracking and Time Off Data Sections	Supported.	Supported.
Contracts and Collective Agreements Data Sections	Supported.	Supported.
Extract Full File	Supported. You can enable the Full Snapshot launch parameter.	Supported. You can enable the PI Full Extract With No Diff Launch Parameter.
Business Process Orchestration	Not supported. You can't have more than 1 PECL integration on a business process.	Supported. You can orchestrate multiple Payroll Interface integrations on a business process.
Specify Changes to Include	<p>You can enable integration attributes to always include or include with specific changes, such as during a pay group in event, these data sections:</p> <ul style="list-style-type: none"> <li>• Compensation Earnings and Deductions</li> <li>• Additional Data</li> <li>• Personal Data</li> <li>• Position Data</li> <li>• Compensation Data</li> <li>• Compensation Plans</li> <li>• Person Communication Data</li> <li>• Worker Status</li> <li>• Person Identification Data</li> <li>• Contract Data</li> <li>• Collective Agreements Data</li> <li>• Payment Election Data</li> </ul> <p>For other data sections, PECL:</p> <ul style="list-style-type: none"> <li>• Only reports sections that contain changed values.</li> <li>• Reports all values for a data section that includes a change.</li> <li>• Reports field override values when another value in that section has changed.</li> </ul>	You can enable integration attributes to always include or include only when there's a change for each data section.
Look Ahead Functionality  Example: Terminations on last day of pay period.	Not supported.	Supported. You can use these attributes to report certain transactions within a specified time period after the pay period end date:

Feature	Payroll Effective Change Interface Integration	Payroll Interface Integration
		<ul style="list-style-type: none"> <li>• Period Look Ahead All Effective Lookup</li> <li>• Period Look Ahead Days</li> <li>• Period Look Ahead Payee Status</li> </ul>
Additional Pay Periods	Supported. The number of additional pay periods you enter can't exceed the number of pay periods possible in a 13-month time period.	Not supported.
Field Overrides	Supported. You can add field overrides from the Configure Field Overrides task from the related actions menu of the integration.	Supported. You can add field overrides with a custom integration service.
Multi-Instance Field Overrides	Supported for multi-instance fields with Reference ID Types.	Not supported.
Security for Field Overrides	The integration system user requires <i>View</i> access to the fields used in the document field overrides.	The integration system user requires <i>Get</i> access to the fields used in the document field overrides.
Job Change Reason	Supported with the Position Data section field attribute and with an integration system map.	Not supported.
Audit Document Tags	Supported. You can enable both the DataChangesAudit.html and DiagnosticAudit.html files to be deliverable and appended with audit document tags you specify.	Supported. You can enable both the DataChangesAudit.html and DiagnosticAudit.html files to be deliverable and appended with audit document tags you specify.
Last Successful Run Date (LSRD) Restrictions	Yes. The LSRD must be within the last: <ul style="list-style-type: none"> <li>• 2 months for primary runs.</li> <li>• 6 months for ad-hoc runs.</li> </ul>	No.
Top of Stack Transactions	No. The integration can't return top-of-stack transactions only. The integration returns a full stack of transactions and consolidates any data elements that you need to transmit as a single transaction.	Yes. The integration only returns top-of-stack transactions.
Retroactive Changes	Supports changes that the users entered in the current pay period for a prior period.	Supports changes that the users entered in the current pay period for a prior period.
Retroactive Non-Effective Date Changes	Supported. A current pay period integration	Supported. The integration reports changes that the users

Feature	Payroll Effective Change Interface Integration	Payroll Interface Integration
	run consolidates changes that the users entered in a prior period into a single DTA change.	entered in the prior period if they are at the top of the stack when you run the integration for the current pay period.
Indirect Changes	Supported when you disable the transaction log. Example: The integration reports a change to a cost center name.	Not supported. Example: The integration doesn't report a change to a cost center name.
Abort Running Process	Supported. You can abort the integration event while it's in-progress.	Not supported.
Primary Payroll Integration	Supported. You can use the same integration as both the primary and ad hoc integration. Enable the Primary Run launch parameter.	Supported. Use separate integrations for primary and ad hoc runs. Enable the Primary Payroll Integration integration system attribute.
Effective and Entry Dates	Supported. The integration reports the effective and entry dates for each transaction.	Not supported. The integration only reports single effective dates.
Multiple Changes per Pay Period	Supported. The integration reports each transaction separately. Example: The integration reports 2 address changes on different dates with different effective dates.	Not supported. The integration only reports 1 top-of-stack row with the most recent staffing event. Example: The integration reports 2 address changes on different dates as a single change with the most recent effective date.
Full Stack of Changes	Supported. The integration reports each transaction separately with 1 exception for effective-dated changes. The integration reports: <ul style="list-style-type: none"> <li>The most recently entered change when multiple effective-dated changes of the same transaction type and data elements, such as salary compensation changes, are effective on the same day.</li> <li>Each transaction separately for noneffective date changes, such as personal data changes, even if they occur on the same day.</li> </ul>	Not supported. The integration reports 1 top-of-stack row with the most recent staffing event and all transactions as a single change stack of change event.

Feature	Payroll Effective Change Interface Integration	Payroll Interface Integration
Expanded Effective Changes	Supported. The integration reports each transaction separately even if there are multiple transactions that have the same effective date.	Not supported. The integration reports 1 top-of-stack row with the most recent staffing event and all transactions as a single change stack of change event.
Correction and Rescind Support	Supported. The integration handles certain staffing event codes directly in the output XML.	Limited support. You can use the Rescinds and Corrections report to view information about any rescinds and corrections that are in the integration output file.
Output Files	The integration produces separate output files for each pay group that it processes. You can configure the integration to combine the output files for multiple pay groups into 1 file. The output file sorts the effective changes by effective moment and entry moment.	The integration provides 1 consolidated file containing data for all pay groups.
Extract Prior Values	Supported. The integration includes prior values in the output for any changed field.	Supported. Enable the Include Prior Values integration attribute.
Pay Group Limit	250,000 active payees.	No limit.

## Payroll Effective Change Interface Connector

### Setup Considerations: Payroll Effective Change Interface

You can use this topic to help make decisions when planning your configuration and use of *Payroll Effective Change Interface* integration (PECI). It explains:

- Why to set it up.
- How it fits into the rest of Workday.
- Downstream impacts and cross-product interactions.
- Security requirements and business process configurations.
- Questions and limitations to consider before implementation.

Refer to detailed task instructions for full configuration details.

### What It Is

PECI is a full-stack integration. It transmits each payroll change for each worker sequentially and includes the effective date and data entry date for each change.

### Business Benefits

PECI enables you to:

- Easily send payroll data to and receive payroll data from a third-party payroll vendor.
- Process global payroll for specific countries.
- Use Workday as the single source of truth for payroll data.

- View and change third-party payroll data directly in Workday.
- Customize the payroll data that you want to send to a third-party payroll vendor.
- Reduce troubleshooting time by viewing payroll errors at the worker level.
- Send hire and termination data to a third-party payroll vendor immediately upon creation.
- Track the status of the integration and identify any necessary corrective actions without leaving Workday.
- Transmit worker data with the Data Initialization Service (DIS) rather than a web service, providing better performance of data transmissions.

## Use Cases

You can use PECL when:

- Your payroll vendor requires a full-stack integration.
- You converted to Workday from a legacy third-party ERP that used a full-stack integration model.
- You need to refresh internal data warehouses with Workday data several times per day.

## Questions to Consider

Question	Considerations
What connector does your third-party payroll vendor have?	Consider using a Workday-certified connector available through a Workday Global Payroll partner ecosystem. These solutions can simplify the process of integrating with a third-party payroll vendor.
What payroll integration does your vendor require?	Consider PECL if your vendor requires a full-stack integration.  If your vendor requires a top-of-stack integration or simple CSV or XML file formats, consider the <i>Payroll Interface</i> integration.
Do you have a data warehouse that requires you to refresh data from Workday more than once a day?	You can configure PECL to run up to once a day.  If you're using the Effective Stack Sync Service, you can configure PECL to run as frequently as 4 times a day or every 6 hours.
Do you want to send hire and termination data automatically to your third-party payroll vendor?	You can configure event-driven integration in PECL to send <i>Hire</i> and <i>Termination</i> events automatically. Workday can then update your external payroll data immediately with these events.
During your organization's hire process, do your workers need to enter certain mandatory payroll information themselves, such as government IDs?	You can configure the <i>Payroll Effective Change Interface</i> template and the <i>Hire</i> business process so Workday sends all relevant information to third-party payroll after the workers complete all their required onboarding fields.

## Recommendations

Workday strongly recommends that you engage Workday Professional Services or a Workday certified implementation partner to build a PECL integration.

Workday also strongly recommends that you work closely with your third-party payroll vendor before creating a data scrambling plan.

PECI integrations run on grid. Grid is a shared resource in your Workday tenant. If you're scheduling multiple integrations on grid, Workday recommends that you stagger your integration schedule.

When scheduling multiple integrations to run in parallel, consider:

- Job size, or number of workers you process in an integration. For PECI integrations, consider the number of workers in the pay group you process.
- The number of integrations you run at the same time. Example: If the maximum size of your pay group is 5,000 workers, you can run 4 integrations in parallel. If the maximum size of your pay group is 12,000 workers, you can run 2 integrations in parallel.

Integrations that process 12,000 or more workers require additional considerations. Workday recommends that you work with Workday Professional Services or a Workday certified implementation partner to set up your resource strategy.

Workday recommends that you set pay period intervals no longer than monthly for normal payroll processing in order to avoid impacting processing time.

For optimal processing time, use a *Last Successful Run Date* value of:

- 2 months or sooner for primary integrations.
- 6 months or sooner for ad hoc integrations.

If your third-party payroll vendor can consume a PECI integration, Workday recommends:

- Enabling the *Event-Driven Integration for Third-Party Payroll* integration service if you want to send *Hire* and *Termination* events immediately.
- *Global Payroll Reconciliation* integration if you want to identify discrepancies between data in Workday and data in your third-party payroll system.

## Requirements

Perform upfront analysis with your third-party payroll vendor. Determine the specific data that the vendor requires you to transmit.

PECI requires grid. You can have grid enabled for only 1 active tenant in an environment, either implementation or implementation preview, at a time.

## Limitations

Adding new pay periods during an integration run may cause discrepancies with historical data. Consider creating your pay periods before the scheduled integration.

PECI uses a worker's position to determine which costing allocations to include in an integration event. If a worker:

- Hasn't had a costing allocation before, the worker position uses the costing allocations from the position restrictions.
- Has had a previous costing allocation but you add a new costing allocation on the worker position, PECI doesn't include that new costing allocation in the integration event.

PECI doesn't support:

- Benefit elections that have a deduction begin date that is earlier than a worker's hire date.
- Contingent workers in output files. If your company employs contingent workers, you can use the *Worker Effective Change Interface* integration to transmit contingent worker data.
- Compensation one-time payments with scheduled payment dates beyond 2 years in the past from the current period start date. For more information, see the Compensation One Time Payment description in [Reference: Data Sections for Payroll Effective Change Interface](#) on page 1552.
- Time tracking entries that are beyond 1 year.
- Time Tracking shift dates, but does support calculated dates.
- Unpaid time off.

- Orchestration. You can add PECL to only 1 business process.
- Processing over 250,000 active employees.
- Future change detection beyond 13 months from current period.
- Dynamic calculated compensation plans. Consider using event-driven calculated compensation plans instead.
- Displaying noneffective dated stack sequences in descending order.

## Tenant Setup

Contact Customer Care to set up your tenant for grid.

## Security

PECL requires an associated *Integration System User* (ISU) account. ISUs enable you to give integrations security access to only the domains needed to run the integration. The ISU requires Get and Put access to the domains that secure the integration data sources.

Consider the security authorization that you want to grant for these actions.

Domain	Considerations
These domains in the Integration functional area: <ul style="list-style-type: none"> <li>• <i>Integration Build</i></li> <li>• <i>Integration Configure</i></li> </ul>	Create the PECL integration.
These domains in the Integration functional area: <ul style="list-style-type: none"> <li>• <i>Integration Build</i></li> <li>• <i>Integration Configure</i></li> <li>• <i>Integration Debug</i></li> </ul>	Launch the PECL integration.
<i>Integration Build</i> in the Integration functional area.	View the launched PECL integration.
These domains in the Payroll Interface functional area: <ul style="list-style-type: none"> <li>• <i>Set Up: Payroll Interface</i></li> <li>• <i>Set Up: Payroll Interface (Update Pay Period Status)</i></li> </ul>	Run the PECL integration in primary mode.
Any 1 of these domains: <ul style="list-style-type: none"> <li>• <i>Reports: Pay Calculation Results for Pay Group (Results)</i> - CAN in the CAN Payroll functional area.</li> <li>• <i>Reports: Pay Calculation Results for Pay Group (Results)</i> - FRA in the FRA Payroll functional area.</li> <li>• <i>Reports: Pay Calculation Results for Pay Group (Results)</i> - UK in the UK Payroll functional area.</li> <li>• <i>Reports: Pay Calculation Results for Pay Group (Results)</i> - USA in the USA Payroll functional area.</li> </ul>	View the PECL integration data changes and diagnostic audit files.
These domains in the Payroll Interface functional area: <ul style="list-style-type: none"> <li>• <i>Set Up: Payroll Interface</i></li> <li>• <i>Manage: External Payroll Errors</i></li> </ul>	View the PECL integration outputs and standard reports using the All Payroll Integration Event Error Message report data source. This report data source provides access to all external payroll

Domain	Considerations
	error messages associated with PECL and <i>Event-Driven Integration</i> runs.
These domains in the Payroll Interface functional area: <ul style="list-style-type: none"><li>• <i>Set Up: Payroll Interface</i></li><li>• <i>Manage: External Payroll Errors</i></li></ul>	View and manage the errors returned by your external payroll vendor for PECL and <i>Event-Driven Integration</i> runs using: <ul style="list-style-type: none"><li>• The Third Party Payroll Errors report. This report provides access to errors from both PECL and event-driven integration.</li><li>• The Maintain Errors from Third-Party Payroll task. This task enables you to view and mark errors as you resolve them.</li></ul>
<i>Set Up: Payroll Interface</i> in the Payroll Interface functional area	Generate the Data Changes Audit report with the Enable Data Changes Audit for Faceted Search attribute enabled. This enables PECL to send the data audit results of the event to the Data Changes Audit report.

## Business Processes

To use the *Event-Driven Integration for Third-Party Payroll* integration service with PECL, you must add *Event-Driven Integration for Third-Party Payroll* steps to the *Hire* and *Termination* business processes.

## Reporting

Reports	Considerations
Data Changes Audit	Displays the results of your integration events. Use these PECL integration attributes to refine how the report generates results. <ul style="list-style-type: none"><li>• The <i>Enable Data Changes Audit for Faceted Search</i> attribute makes searching the report for specific results easy.</li><li>• The <i>Suppress Worker Message Audits for Job Size</i> attribute overrides the default suppression of message audits when the integration job size exceeds 5,000 workers.</li><li>• The <i>Suppress Audit Reports for Job Size</i> attribute overrides the default suppression of audit reports when the job size exceeds 30,000 workers.</li></ul>
Third-Party Payroll Errors	Displays a comprehensive list of payroll errors returned by your external payroll vendor for the criteria that you select. To use this report, your third-party payroll vendor must run the <i>Payroll Interface: Put Integration Event Error Message Set</i> web service to make data available for reporting. To enable notifications for this report, you can access the Configure Global Payroll Notifications task. This task generates the default Workday

Reports	Considerations
	<p>notification. Use the Edit Tenant Setup - Notifications task if you want to include other types of notifications.</p> <p>To track errors in this report, the Maintain Errors from Third-Party Payroll task provides a check box so you can easily mark errors you resolved.</p>
View Payroll Integration System for Employee	<p>Displays the last successful run date for workers by the effective date that you select. Use this report for ad hoc <i>Payroll Effective Change Interface</i> integration runs.</p>

## Integrations

- *Event-Driven Integration for Third-Party Payroll*
- *Global Payroll Reconciliation*

## Connections and Touchpoints

Workday offers a Touchpoints Kit with resources to help you understand configuration relationships across your tenant. Learn more about the [Workday Touchpoints Kit](#) on Workday Community.

## Concept: Payroll Effective Change Interface

Payroll Effective Change Interface enables you to capture all Workday events with effective dates in the sequence that they occurred.

With Payroll Effective Change Interface, you can:

- Capture all personal and job or position data within Workday HCM.
- Capture all staffing events and data changes in the pay period.
- Configure the required data elements and custom fields that third-party payroll vendor requires.
- Format and validate data to conform to the requirements of your payroll vendor.
- Transfer only those changes relevant to your third-party payroll vendor.
- Run the Payroll Data Audit report to see what data the integration captured, selected, and sent to your third-party payroll vendor.
- Perform additional transformations to the output file. Deliver the output XML file to your third-party payroll vendor.
- Create full extracts of employee data to help with initial implementation or enable resynchronization between Workday and the external vendor.
- Run the Maintain Errors from Third-Party Payroll task to view and correct errors reported by your payroll vendor within Workday. This report consolidates all Payroll Effective Change Interface and

Event-Driven Integration errors into 1 view. You can also run the Third-Party Payroll Errors report, which you can customize according to your specific objectives.

Payroll Effective Change Interface integrations run on grid. Worker Effective Change Interface integrations also run on grid. Consider your priorities and performance expectations when you schedule your Payroll Effective Change Interface integrations.

To help prevent the Payroll Effective Change Interface integration from timing out, we limit the data for each worker to 100 megabytes. When workers exceed the limit, the integration skips these workers and continues processing. The integration then completes with errors and indicates the skipped workers.

Note: When the integration generates the schema and output files for field overrides, it might not correctly describe where the integration reports the `isAdded`, `isUpdated`, or `isDeleted` annotations when there's field overrides nested in other field overrides, such as a nested document structure for field overrides.

## Supported Types of Extract

Payroll Effective Change Interface supports:

- All Effective extract: All worker data changes effective within the pay period regardless of entry date.
- Incremental extract: Worker data changes effective within the current or prior pay periods entered after the last successful integration run datetime.

## Payroll Effective Change Interface Launch Parameters

Launch Parameter	Description	Enabled by Integration Service
Pay Group	<p>Specify 1 or more pay groups to include in the integration run.</p> <p>The integration processes all current active workers in the pay group, as well as terminated workers where the specified pay group was their last pay group.</p>	Payroll Effective Change Interface - Launch Parameters
Pay Period Selection Option	<p>Specify the pay period for the integration run:</p> <ul style="list-style-type: none"> <li>• <i>Use Pay Period for Current Date</i>: Workday selects the pay period based on the pay period that the current date lands, regardless of the pay period status in the pay group.</li> <li>• <i>Use Earliest Open Pay Period</i>: Workday selects the earliest pay period with an <i>In Progress</i> status, regardless of whether it's future dated. When no pay periods are in progress, Workday selects the earliest <i>Not Yet Started</i> pay period.</li> </ul>	Payroll Effective Change Interface - Launch Parameters

Launch Parameter	Description	Enabled by Integration Service
Primary Run	<p>Define that this integration run isn't ad hoc. Workday recommends selecting this option when scheduling the integration. Workday updates the last successful run date to the current date after you run the integration.</p> <p>Once enabled, Workday ignores the rest of the launch parameters, even when you populate them.</p>	Payroll Effective Change Interface - Launch Parameters
Pay Group Members	Specify individual workers to include or exclude from the integration run. Use this launch parameter with the Exclude Members/Only Include Members launch parameter. Workday recommends you use a unique identifier such as a WID or worker ID as using the name can affect performance.	Payroll Effective Change Interface - Launch Parameters
Exclude Members/Only Include Members	Specify workers that you want to include or exclude that you listed in the Pay Group Members launch parameter.	Payroll Effective Change Interface - Launch Parameters
Change Detection	<p>Specify the changes that you want the integration to include:</p> <ul style="list-style-type: none"> <li><i>Include only changes entered since the last successful run:</i> An incremental run where Workday only includes changes since the last successful run and effective within the current or prior pay period.</li> <li><i>Include all changes effective in the pay period:</i> Workday includes all changes effective within the current pay period regardless of when someone entered it. Workday also includes changes completed since the last successful run and effective within the current or prior pay period.</li> </ul>	Payroll Effective Change Interface - Launch Parameters
Full Snapshot	Select to capture all workers, terminated or active, assigned to	Payroll Effective Change Interface - Launch Parameters

Launch Parameter	Description	Enabled by Integration Service
	<p>the pay group with information that's active as of the end date of the processing pay period and as of the entry date (execution date) of the integration.</p> <p>The Full Snapshot launch parameter seeds the client downstream payroll processor with all the worker information, before launching the integration for the first time.</p> <p>Example: Run the Full Snapshot parameter for the 2020-12-1 through 2020-12-31 period to prepare for processing the 2021-01-3 payroll. For the processed pay group, the parameter sends:</p> <ul style="list-style-type: none"> <li>• All active employees in the pay group as of the effective date 2020-12-31, and entry time of the integration run.</li> <li>• All terminated employees that were part of the pay group at the time of termination.</li> <li>• Information for all active and terminated workers effective as of 2020-12-31, and as of the entry moment of the integration run.</li> </ul> <p>Workday doesn't provide change detection when running Full Snapshot, so disable the Transaction Log or the output file will be empty.</p> <p>If you've Sync Employment/Contract End Date on the Edit Tenant Setup - HCM task enabled, PECI doesn't report the end date until the contract end date is effective.</p> <p>The integration doesn't report these one-time events when running Full Snapshot:</p> <ul style="list-style-type: none"> <li>• One-time payments</li> <li>• Time-off</li> </ul>	

Launch Parameter	Description	Enabled by Integration Service
	<ul style="list-style-type: none"> <li>Time blocks</li> </ul> <p>These are individual and period specific events; therefore, PECL reports them in standard change detection events when within the entry and effective date ranges.</p>	
Last Successful Run Date	<p>The date and time of the last successful run date. Editable.</p> <p>The integration captures all completed changes since this date and time and effective as of the current or prior pay period.</p> <p>For primary runs, the integration doesn't use the Last Successful Run Date; it uses the last extraction date from the Maintain Payroll Integration Systems for Pay Group task.</p>	Effective Stack (Worker) - DIS
Merging Pay Groups	Specify all the pay groups that you want to merge with the pay group from the parent integration run.	Payroll Effective Change Interface - Merge Files Launch Parameters
Merging Past Events	Specify the integration events that you want to merge with the parent integration event.	Payroll Effective Change Interface - Merge Files Launch Parameters
Update Worker Last Successful Run Date	Select to update the last successful run date for each worker to the start date and time of the integration run.	Worker Last Successful Run Date - Launch Parameters
Effective Stack Sync Run	Disable the Transaction Log service configured for this integration. The integration runs in full Effective Stack mode for the entire employee population.	Payroll Effective Change Interface - Effective Stack Sync Service

Contingent Worker	No	Yes
Event Driven Integration (EDI)/Outbound Notifications	Yes	No

### Concept: Payroll Effective Change Interface Change Detection

You can select from 2 change detection methods when running a Payroll Effective Change Interface (PECI) integration. The appropriate method depends on whether an integration is the first run of the pay period or an incremental run. The methods are:

Include all changes effective in the pay period.

Select this method for the first launch of the integration in a pay period. The payroll extract includes all changes to employee data that are effective in the current pay period. This payroll extract occurs regardless of the entry date of the changes in Workday. When transactions in Workday have an effective date in a future pay period, Workday excludes them from a payroll extract. Workday includes transactions when their effective date is in the pay period that the integration is processing.

Include only changes entered since the last successful run.

Select this method when you launch a subsequent run after the first run of a pay period. The payroll extract includes only:

- Changes that you entered in Workday after the date of the last successful run.
- Changes that's effective in the current pay period or a prior pay period.

Note: An all effective run won't pick up changes to entry-dated objects made before the last successful run date but are effective in the current processing period.

### Change Detection for Primary and Ad Hoc Integrations

For primary integration runs, Workday updates each pay group processed with a Last Successful date and time. Workday also updates the period status to *In Progress* after the first run for a period.

- The *Primary* integration is for scheduled payroll interface runs. When the Primary Run launch parameter is checked, Workday considers the integration run as a primary run. The Primary integration run performs change detection automatically. The integration includes all effective changes for pay periods whose status is *Not Yet Started*. The integration includes only changes since the last successful run when the pay period status is *In Progress*. The integration requires only 2 launch parameters, Pay Group, and Pay Period Selection Option. When run, the integration automatically updates the Last Successful Run date of the pay group. The integration changes the pay period status (if needed) from *Not Yet Started* to *In Progress*. The integration selects all effective

records if the period status is *Not Yet Started*. The integration selects incremental changes only if the period status is *In Progress*.

When you don't select the Primary Run launch parameter, the payroll integration doesn't update the pay period status.

Note: After the last payroll run for a given pay group/pay period combination, manually set the pay period status to *Complete*.

- *Ad Hoc* integration runs are for unscheduled payroll runs, usually after correcting a previous error. It doesn't update pay group or pay period status. When running ad hoc integrations, Workday disables these options:
  - Number of Additional Pay Periods - PECI only runs for the current pay period.
  - Enable Data Changes Audit For Faceted Search - Workday doesn't include ad hoc integration run audits in the report.
  - Workers using PECI Event Driven Integration (EDI) - The ad hoc runs disregard EDI worker events. If you already sent the worker's hire event to the vendor, it will pick up the hire again if you set the pay period and LSRD to pick up the hire.
  - Disabled Launch Parameters - Ad hoc runs use all the launch parameter values you populate.

When you configure the Worker Last Successful Run Date – Launch Parameters integration service and enable the Update Worker Last Successful Run Date launch parameters with an ad-hoc integration run for a worker, the next primary integration run doesn't include worker changes already sent through the ad-hoc integration.

Example: You scheduled batch runs for every day at 12pm. On 4/26/23 at 3pm, worker A has a compensation change. At 5pm, you launch an ad-hoc run and enable the Update Worker Last Successful Run Date launch parameter. After the integration run completes, Workday sets the worker LSRD to 4/26/23 5pm. On 4/27/23 at 12pm, the regular scheduled primary batch run initiates and uses:

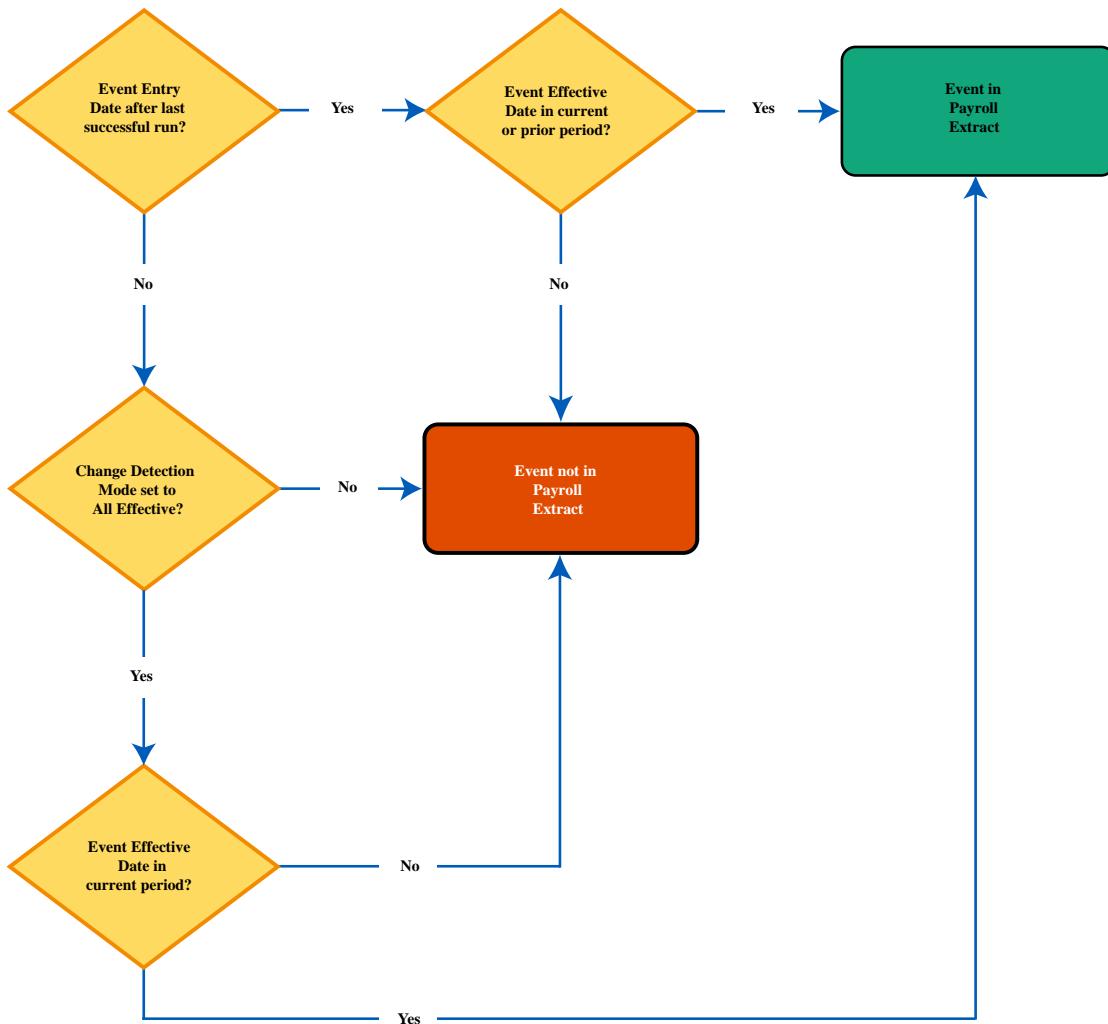

- 4/26 5pm for Worker A's LSRD.
- 4/26 12pm for the remaining workers' LSRD in that same pay group.

## How Dates Affect Payroll Extracts

Dates can help you understand the changes that payroll integrations pick up. If you discover that events are missing from a payroll extract, look at the relationship between:

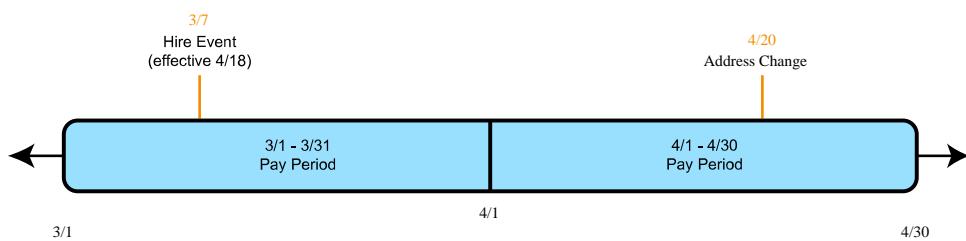

- The last successful run date.
- The pay period start date.
- The event entry date.
- The event effective date.

This diagram displays how dates affect event selection:

### Change Detection Timeline

This timeline displays a series of transactions for the same employee over a two-month period:

Example: You completed an address change on May 19 that's effective June 1. You execute the Payroll Effective Change Interface integration on May 22 using an incremental change detection for the May pay period with a last successful run date of May 15. The integration doesn't pick up the change since it's only looking for changes effective before May 31. To pick up the change, you can run an integration for the June pay period for all effective changes. If you want the June 1 change to be picked up in May, enable the Additional Pay Period attribute set to 1 and run as a primary integration.

You corrected the address change event on May 25 to use the word Street instead of Avenue with the same effective date of June 1. You executed the integration on May 27 with a Last Successful run date of May 22 that was primary with an additional pay period of 1. The integration only picks up the correction change of Street to Avenue. If you run the same integration with the Last Successful Run Date of May 15 again, it picks up a change of the original address to the Avenue address and ignores the Street address. Because the Last Successful Run Date is before the original address change, there's no address correction to report and the integration doesn't report the Street change.

## **Concepts**

[Setting up Grid for a Tenant](#)

### **Concept: Payroll Effective Change Interface Audit Report**

You can use the Data Changes Audit report to search effective changes from your primary integration events to audit and reconcile global payroll data.

You can also use the Data Changes Audit report to:

- Manually enter changes into a third-party system. Example: You have a country that has a small set of employees. Therefore, you don't need to build an integration for a small subset of payroll changes.
- Check for errors. Example: You view the report data and compare it to the data in the third-party system.
- Export relevant changes for auditing purposes.

To access the report and see the results of the primary integration event, you must:

- Have access to the *Payroll Interface Group* security group.
- Have *Get* and *Put* access to the *Set Up: Payroll Interface* domain.
- Enable the *Enable Data Changes Audit For Faceted Search* integration attribute.

You can't select all the workers and view the Data Changes Audit Detail report when there are more than 500 workers on the report.

You can also use these worklets to identify payroll issues that occur in third-party payroll systems:

- Third-Party Payroll Errors by Severity
- Worker Changes Sent to Third-Party Payroll
- Workers Sent to Third-Party Payroll

Example: The third-party payroll system generates an error. The payroll partner identifies the error in Workday using one of these worklets on the Pay Cycle Command Center dashboard.

Related Information

## **Tasks**

[Steps: Set Up Payroll Effective Change Interface](#) on page 1526

[Create the Payroll Interface Security Group](#)

### **Concept: Merge Integration Outputs**

You can merge the output files of the Payroll Effective Change Interface connector. This feature enables you to:

- Send a single file to your third-party payroll vendor, instead of 1 file for each pay group.
- Avoid the limit on the total number of active members in all the pay groups that you're processing. Any 1 pay group must still be below that limit. However, the total number of active members in the merged output file can exceed that limit.

To merge the files, your Payroll Effective Change Interface connector uses a business process to call a separate merge file integration. The business process calls this integration repeatedly until the integration processes all of the pay groups. The integration attaches the merged output file to the last process call to the merge integration.

If a failure occurs for a pay group, you can rerun the Payroll Effective Change Interface. After resolving the issues that caused the failure, you specify the pay groups to run again, and specify the previously completed successful integration events. The integration merges the output files from each event into a single output file.

## Concept: Entry Dated vs. Effective Dated Transactions

Payroll Effective Change Interface (PECI) supports entry-dated and effective-dated business processes. Payroll Effective Change Interface outputs data based on the type of dating. You can anticipate what to expect in the output files based on the type of dating.

### Entry-Dated Changes

Entry-dated fields use the entry moment of the transaction as the effective date. Example:

- Effective Moment  
2022-19-01T14:20:00.536-08:00
- Entry Moment  
2022-19-01T14:20:00.536-08:00

For entry-dated changes, the extract includes the changes the next time you run the integration:

- Effective Date set to Entry Date, if running for the current period.
- Effective Date set to the last moment of the previous period, if you're running for the previous period.

### Transactional Behavior of Entry Dated Events

These samples assume that the last successful run date of the integration (primary or ad hoc) is just before the transactions:

Transaction	Number of Effective Changes	Outcome
Rescind in the current pay period.	1	<p>Event Code: DTA.</p> <p>Integration updates the respective data section.</p> <p>Transaction included with current value.</p> <p>Effective moment is the entry moment of the transaction.</p>
Correct information, then rescind transaction.	2	<p>1. Event Code: DTA.</p> <p>Integration updates the edited section with current and prior values.</p> <p>Effective date is the entry</p>

Transaction	Number of Effective Changes	Outcome
		<p>moment of the transaction.</p> <p>2. Event Code: DTA.</p> <p>Edited section updated with current and prior values.</p> <p>Effective date is the entry moment of the rescind transaction.</p>
Running for all effective changes.	Zero	No output.

#### Sample Entry Dated Transaction: ID Information

The current pay period is 2022-06-01 to 2022-06-30. Edit the ID information for a worker, providing a National ID on 2022-06-01. Launch Payroll Effective Change Interface on 2022-06-01 after the change, and set the LSRD before the transactions.

Transaction: ID Information	Number of Effective Changes	Outcome
Rescind in the current pay period on 2022-06-05.	1	<p>Event Code: DTA</p> <p>Personal Identification data section updates.</p> <p>National ID updates with current value (deleted).</p> <p>Effective moment is the entry moment of the rescind transaction (2022-06-05T14:35:06.811-0700).</p>
Correct information, then rescind	2	1. Event Code: DTA.

Transaction: ID Information	Number of Effective Changes	Outcome
transaction on 2022-06-05.		<p>Personal Identification section updated with current value (National ID) and prior value (blank).</p> <p>Effective date is the entry moment of the transaction (2022-06-05T14:35:06.811-07)</p> <p>2. Event Code: DTA.</p> <p>Edited section updates with current and prior values.</p> <p>Effective date is the entry moment of the rescind transaction (2022-06-05T15:35:06.811-07)</p>
Run the integration for all effective changes.	Zero	No output.

Hire a worker with a hire date that is effective in the future. Add a government ID or other entry dated personal information after the hire is complete but before the hire effective date. Launch Payroll Effective Change Interface integration after the hire and government ID change.

Transaction: ID Information	Number of Effective Changes	Outcome
Hire a new worker with a hire date that is effective in the future. Run the integration for all effective changes for	1	<p>Event Code: HIR</p> <p>The integration rolls up the event code DTA for the government ID change</p>

Transaction: ID Information	Number of Effective Changes	Outcome
the future pay period.		into the HIR event even if you haven't enabled the Roll Up Entry Dated Changes attribute. When you run an All Effective extract for the future that includes the future dated hire, the government ID can't have an effective date that is earlier than the hire effective date for a new hire since it's an entry dated change.
Rehire a terminated worker with a hire date that is effective in the future into the same pay group the worker was previously in. Run the integration for incremental changes for the current pay period.	2	Event Code: DTA.  Integration updates the edited section with current and prior values.  Effective date is the entry moment of the transaction.  Since the worker is still eligible for review as a terminated worker in the same pay group they were rehired into, the integration

Transaction: ID Information	Number of Effective Changes	Outcome
		captures the entry dated government ID change as an entry dated change before the hire effective date. The integration doesn't roll the government ID change into the HIR event code whether you have the Roll Up Entry Dated Changes attribute enabled or not.

### Effective-Dated Changes

For effective-dated changes, the extract includes a staffing event when the effective date occurs in the pay period that the integration processes.

When there are multiple changes that are effective on the same date, PECI collapses all changes into a single effective change with the Entry Date as of the most recent transaction.

Note: If you don't want all the transactions in 1 single effective change, you can enable the Effective Stack - Expanded Effective Changes integration service.

With custom objects, ensure:

- You add an effective date to them to enable change detection.
- You use different effective dates to enable change detection between integration runs.

### Configuring an Effective Date for Non-Effective Dated Transactions

You can enable the Configuring an Effective Date for Non-Effective Dated Transactions integration attribute when configuring PECI attributes to set the effective date to the entry date. The last successful run date drives entry-dated transactions. Using this integration attribute to configure the effective date for an entry-dated transaction doesn't change the

## Future Dated Changes

data that the integration returns; it only changes the effective moment.

Note: When adding or changing a dependent for a worker, you must enter an Effective Date within Workday. However, when running PECI for that worker, the integration outputs the effective date as the entry date because the dependent event is non-effective dated.

The output file doesn't display future dated changes if the Effective To Date you specify when launching the integration is before the event. The output only displays the change when the effective range includes the future end date. Example: There's a termination on 2022-2-28. You run the integration for the February pay period. You won't see the termination in the output until you run it for the March pay period because the termination isn't effective until the day after the termination (2022-3-1). When you enable the Reporting for Termination on Last Day of Pay Period attribute when running the integration for the February or March pay period, the integration includes the termination.

## Related Information

### Tasks

[Configure Payroll Effective Change Interface Integration Attributes and Maps on page 1534](#)

### Concept: PECI Transaction Logs

You can use Payroll Effective Change Interface (PECI) transaction logs to flag the integration to review a worker.

Transaction logs don't indicate whether the integration reports a change. Example: A compensation event has an entry date of 2020-15-5 and an effective date of 2020-6-1. Workday creates a corresponding transaction log with the same dates. When you run a PECI integration that accommodates the same dates, the integration reviews the worker. When the integration doesn't detect changes because you don't enable the fields with changes, the integration doesn't report the worker in the output.

To display changes in the transaction log:

- The effective moment of the change must match the entry moment.
- The change must have a corresponding business process change.
- The change must be a direct change.

Transaction logs don't display changes that either:

- Have an entry date but no effective dates.
- Have no corresponding business process change, such as changes to job profiles.
- Are indirect changes, such as a worker assignment to a different manager.

When enabling transaction logs, only worker-level events trigger PECI to review the worker. The integration doesn't create a worker transaction log when you make an indirect change.

Example: You enable transaction logs for your PECI integration and subscribe to all types of transactions.

Worker	Change Type	PECI Triggered to Review Worker?	Changes Included in Integration Output?
George	<ul style="list-style-type: none"> <li>• George's compensation is increased.</li> <li>• The name of the cost center that George is assigned to has changed.</li> </ul>	Yes	<p>Yes.</p> <p>Although the cost center name change is indirect, George's compensation change is a direct change. This direct change has a qualifying transaction log that matches the transaction log subscription configuration on the integration system.</p> <p>Therefore, George is included in PECI's review, and both the indirect and direct changes are reported in the output.</p>
Marie	The name of the cost center that Marie is assigned to has changed.	No	<p>No.</p> <p>The change is indirect because the change is on the cost center and not a direct transaction log for Marie. Marie doesn't have any qualifying transactions and isn't included in PECI's review.</p> <p>Therefore, Marie isn't included in the output.</p>

### Tasks

[Steps: Set Up Frequent Integration Runs for Payroll Effective Change Interface](#) on page 1529

### Reference

[Reference: Data Sections for Payroll Effective Change Interface](#) on page 1552

## Steps: Set Up Payroll Effective Change Interface

### Prerequisites

When you implement Payroll Effective Change Interface, Workday strongly recommends that you engage:

- Workday Professional Services
- A Workday Consulting Partner

Professional Services or a Consulting Partner can best assist you to deploy this connector.

When the total number of active employees in all the pay groups that you're processing exceeds 250,000, the connector immediately stops processing. Work with your implementer to split up the pay groups.

The total number of pay groups processing must be 150 or fewer within a single event.

You must:

- Establish third-party payroll organizations.
- Create future pay periods before the year that they're active to prevent the integration from capturing the addition of a current pay period within the current pay period.
- Establish third-party pay groups.
- Define third-party payroll earnings and deductions.
- Set up your tenant for grid.
- Review Setup Considerations for Payroll Interfaces.

Note: To avoid performance issues, Workday strongly recommends you set custom organization membership rules to semidynamic. If you require dynamic membership rules, we strongly recommend you enable the Enable Dynamic Membership Rule Evaluation Optimization check box on the Edit Tenant Setup - HCM task.

## Context

You can set up this integration to send and receive payroll data to and from your third-party payroll vendor. Payroll Effective Change Interface is a full-stack integration that transmits each payroll change for each worker sequentially. Each change includes the effective date and data entry date. You can view the data you receive directly in Workday.

## Steps

1. Access the Create Integration System task.

Enter *Payroll Effective Change Interface* in the New using Template prompt.

Security: These domains in the Integration functional area:

- *Integration Build*
- *Integration Configure*

2. [Set Up Payroll Effective Change Interface Integration Services](#) on page 1532.

3. Grant the integration system user Get and Put access to these domains:

- *Set Up: Payroll - Pay Group Specific*
- *Set Up: Payroll Interface*

Also grant access to at least 1 of these domains:

- *Integration Build*
- *Integration Event*
- *Integration Process*

All field attributes are accessible after you configure these domains. Any field overrides, however, require View access to additional security domains.

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

4. [Configure Payroll Effective Change Interface Integration Attributes and Maps](#) on page 1534.
5. [Select and Set Up Connector Output Fields](#) on page 1977.

6. (Optional) [Add Custom Fields to Connector Output](#) on page 1978.

Payroll Effective Change Interface already supports integration field overrides, so as a related action on the integration system, select Integration System > Configure Integration Field Overrides.

For each field in the grid, select the Override External Field prompt and the report field or calculated field. You can save your changes only when:

- Each Name value is unique within each section of a document.
- Each Name value is unique within a document. The only exception is when the field override has the same data type as the associated Override External Field value.

Note: Payroll Effective Change Interface doesn't support custom maps for field overrides.

7. (Optional) [Test Payroll Effective Change Interface Field Overrides](#) on page 1548.

8. [Set Up Integration Delivery](#) on page 1952.

9. [Set Up Integration Sequence Generators](#) on page 1969.

Complete this step when you enable the *Filename Sequence Generator* integration service.

10. Create a transformation that converts integration output files into the format required by the external endpoint.

[See Steps: Set Up Document Transformation Connector](#) on page 594.

11. (Optional) Set up frequent integration runs.

When you require frequent updates to internal data warehouses, you can set up the integration to run more frequently than the once-daily recommendation.

[See Steps: Set Up Frequent Integration Runs for Payroll Effective Change Interface](#) on page 1529.

12. [Launch an Integration](#) on page 24.

Don't run Payroll Effective Change Interface more than once per day per pay group, unless you set up the integration to run more frequently. The integration is resource-intensive. Workday recommends running it only once per day unless you have a business need that requires you to run it more frequently. Example: You need to refresh internal data warehouses with Workday data several times per day. Typically, running the integration more than once per day isn't necessary because the integration returns a full stack of transactions.

You can protect the performance and availability of your tenant. If necessary, you can cancel a Payroll Effective Change Interface integration run while its Integration Event Trigger child process is in a state of *Processing*. Access the Process Monitor report and find the integration event. Then select Background Process > Abort as a related action on the process. Workday updates the status of the child process accordingly. Workday also changes the status of the integration event to *Failed*. Workday adds a new integration message to the integration event that states that Workday canceled the integration.

13. (Optional) [Set up Event-Driven Integration for Third-Party Payroll](#).

When your external payroll vendor returns errors for you to resolve, Event-Driven Integration enables you to view and correct them directly in Workday.

[See Steps: Set Up Event-Driven Integration for Third-Party Payroll](#) on page 1647.

14. Review and correct any errors reported to you by your third-party payroll vendor.

[See Reference: Third-Party Payroll Reporting](#) on page 1627.

15. (Optional) [Access the Maintain Dashboards](#) report.

Verify you the enabled tabs for the Pay Cycle Command Center dashboard. When they aren't, run the Bulk Enable Tabs for Workday Delivered Dashboards task.

Add a tab to the Pay Cycle Command Center dashboard and add these worklets.

Worklet	Domain
Third-Party Payroll Errors by Severity	<i>Manage: External Payroll Errors</i> <i>Set Up: Payroll Interface</i>

Worklet	Domain
Worker Changes Sent to Third-Party Payroll	<i>View: Maintain Payroll Interface</i>
Workers Sent to Third-Party Payroll	<i>View: Maintain Payroll Interface</i>

Note: When you add a worklet to the dashboard, the Required for Groups column automatically displays the security groups enabled for the domain that secures the worklet.

You can select the prompt set Pay Group, Sent From & Sent Before for Pay Cycle Command Center to enable these prompts for the worklets.

- Pay Group
- Sent Before
- Sent From

Security: *Set Up: Tenant Setup - Worklets* domain in the System functional area.

#### Steps: Set Up Frequent Integration Runs for Payroll Effective Change Interface

##### Prerequisites

Set up a Payroll Effective Change Interface integration for your pay group.

##### Context

You can set up Payroll Effective Change Interface to run more frequently than the typical once-daily recommendation. This one-time setup enables you to refresh internal data warehouses as frequently as every 6 hours.

##### Steps

1. [Set Up Payroll Effective Change Interface Integration Services](#) on page 1532.
  - a. Enable the Transaction Log integration service and click OK.
  - b. Enable the Payroll Effective Change Interface – Effective Stack Sync integration service and click OK.
2. Access the [Maintain Payroll Integration Systems for Pay Group](#) task.

Security: *Set Up: Payroll Interface* domain in the Payroll Interface functional area.

3. Enter the last successful run date in these fields:

- Created Date Time
- Created Date Time for Additional Run

This action is a one-time setup. Workday automatically increments the Created Date Time for Additional Run field based on your integration run frequency.

4. [Launch an Integration](#) on page 24.

You can run the integration up to once a day. While using the Effective Stack Sync Service with the Primary Run launch parameter enabled, you can run the integration as frequently as 4 times a day or every 6 hours.

## Result

The integration evaluates the *Created Date Time for Additional Run* field to ensure that duplicates don't display in the output files. The final run of the day detects any indirect and unreported changes not included in the daily integration runs.

## Example

A worker's manager changes, but because it's an indirect change the integration doesn't include that change in the output files. The final daily synchronization run detects the indirect change and includes it in the output files.

[Setup Considerations: Payroll Interfaces](#) on page 1496

## Steps: Automatically Update Worker Last Successful Run Date for Ad Hoc Integrations

### Prerequisites

Set up a *Payroll Effective Change Interface* integration for the pay group with the workers you want to update.

### Context

You can automatically update the last successful run date for specific workers included in an ad hoc *Payroll Effective Change Interface* integration. Updating this date for the workers enables Workday to avoid duplicating the changes in the next *Primary* integration.

Note: If event-driven integration is in progress for a worker, the ad hoc integration doesn't update the last successful run date.

### Steps

1. [Manage Payroll Integration System for Pay Group](#) on page 1402.

Add the *Payroll Effective Change Interface* integration system that you want to use.

2. Access the *Payroll Effective Change Interface* integration you want to use.

3. From the related actions menu on your integration, select **Integration System > Configure Integration Services**.

Enable the *Worker Last Successful Run Date - Launch Parameters* service.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

4. [Launch an Integration](#) on page 24.

- Select the pay group members that you want to include in the ad hoc run.
- For *Exclude Members/Only Include Members*, select *Only include specified members*.
- Select the *Update Worker Last Successful Run Date* check box.

## Result

Workday automatically updates the last successful run date for the workers.

## Next Steps

Access the View Payroll Integration Systems for Employee report to verify the last successful run date updates for the workers.

### Steps: Manually Update Worker Last Successful Run Date for Ad Hoc Integrations

#### Prerequisites

- Set up a *Payroll Effective Change Interface* integration for the pay group you want to use.
- Security: *Set Up: Payroll Interface* domain in the Payroll Interface functional area.

#### Context

You can use this task to manually override last successful run dates for workers. Updating this date ensures that the next primary run doesn't duplicate these worker changes.

Note: If event-driven integration is in progress for a worker, you can't override the last successful run date for that worker.

This task is an alternative to using the Update Worker Last Successful Run Date launch parameter for ad hoc integration runs. Selecting that parameter automatically updates the last successful run dates.

#### Steps

1. [Manage Payroll Integration System for Pay Group](#) on page 1402.
2. Access the Maintain Payroll Integration Systems for Employee task.
3. As you complete this task, consider:

Option	Description
Pay Group	Select the pay group for the workers.  Note: You see pay groups to select only after you complete step 1.
Integration System	Select the <i>Payroll Effective Change Interface</i> integration system that you want to use.
Pay Period Selection Option	Select the same option that you use in primary runs.
Workers	Select the workers whose last successful run date you want to override.
Created Date Time for Worker	Enter the date and time to override the last successful run date. <ul style="list-style-type: none"> <li>• This date can't be later than the current date.</li> <li>• This date should be later than the last successful run date for the pay group.</li> </ul>

4. Workday displays the list of workers you're updating. You can make changes before submitting the update.

## Result

The last successful run date for the selected workers changes to the date and time you entered.

## Next Steps

Access the View Payroll Integration Systems for Employee report to see the updated last successful run dates for the workers.

## Set Up Payroll Effective Change Interface Integration Services

### Prerequisites

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

### Context

Select the optional services to enable for the integration.

### Steps

1. From the related actions menu of the integration, select Integration System > Configure Integration Services.
2. In the Integration Services grid, select the Enabled check box for each optional integration service you want to activate.

The Configure Integration Services task displays both optional and mandatory services. You can only enable these optional services.

Option	Description
Transaction Log Service	<p>Enables the integration to subscribe to events in Workday. The integration can then filter worker data for changes associated with those events. Filtering improves performance by not comparing all worker data for changes.</p> <p>When enabled, the integration doesn't detect indirect changes, such as a worker assignment to a different manager. However, the integration detects an indirect change when the worker has a qualifying transaction based on the transactions you're subscribed to that makes them eligible for further review.</p> <p>When configuring the transaction log section by selecting Integration System &gt; Configure Integration Transaction Log, select the Workday transactions that you want the integration to monitor for changes. When you enable the Subscribe to all Business Process Types except option, the integration doesn't output any Transaction Log that is an Event Lite Type, such as a worker's time off.</p> <p>Note: Workday recommends that you select Subscribe to all Transaction Types except and specify transaction types that you don't need. If in doubt, don't filter out a transaction type.</p>

Option	Description
Effective Stack - Expanded Effective Changes	<p>Enables the integration to include expanded data change details for the same effective date. You can enable this option if you need to trace transaction events. Enable all fields on the Transaction Log data section when enabling this option. The transaction logs display what transaction created the effective change and what kind of transaction, such as a rescind or correction transaction.</p> <p>This option doesn't support entry data roll up configurations.</p> <p>When you enabled this service and a worker has time off during a pay group transfer, the integration output won't display all the effective changes for the time off during the pay group transfer.</p>
Payroll Effective Change Interface - Include Sections Configuration Service	Includes all data sections, including data sections that have no changes.
Filename Sequence Generator	Applies a unique name to each integration file by using the Workday sequence generator.
Payroll Effective Change Interface - Merge Files Launch Parameters	Merges the output files from multiple pay groups.
Worker Last Successful Run Date - Launch Parameters	Displays the <i>Update Worker Last Successful Run Date</i> launch parameter on the Launch/Schedule Integration task.
Payroll Effective Change Interface - Configurable Output Service	Enables the integration to create an Excel workbook of payroll effective changes from your PECL integration.
Payroll Effective Change Interface - Effective Stack Sync Service	When you configure the integration to run frequently during the day, this service enables you to run a final synchronization run. The final sync run captures any indirect changes and ensures that the integration doesn't output duplicates to the extract. Enable this service simultaneously with the Transaction Log service. Use for primary integration runs only.
Payroll Effective Change Interface - Event Driven Integration for Third Party Payroll	Enables Workday to send information automatically to a third-party payroll provider through a business process step. You can enable this option for 1 primary integration per pay group.
Payroll Effective Change Interface / Payroll Interface Integration Command Center	This service enables you to use this integration for Payroll Interface Integration Command Center (ICC) configurations. Also enable the Enable Data Changes Audit For Faceted Search attribute to use this integration for ICC configurations. Displays the Integration

Option	Description
	Command Center Run Type launch parameter on the Launch/Schedule Integration task.

## Next Steps

Set up the integration attributes and maps.

### Configure Payroll Effective Change Interface Integration Attributes and Maps

#### Prerequisites

Create a *Payroll Effective Change Interface* integration.

Security: *Integration Configure* domain in the Integration functional area.

#### Context

You can configure required and optional attributes for your integration system, enabling you to customize how the integration reports the data changes.

The integration map enables you to map an internal value to a different external value in the output file.

#### Steps

- From the related actions menu on your integration, select **Integration System > Configure Integration Attributes**.
- As you complete the task, consider:

Option	Description
Override Integration Event Field	<p>Disable this attribute if you intend to upload external payroll errors on the Third-Party Payroll Errors report. Workday recommends this configuration.</p> <p>When enabled, this attribute retains the Background Process WID value in the <b>Integration_Event</b> field in the Summary section.</p>
Override Pay Group WID Field	<p>When you enable the integration attribute, the integration includes the pay group WID in the Summary Section of the XML output and schema files. If your third-party payroll system uses a statically stored schema file and you enable the integration attribute, you must share a new schema file with the third-party payroll system. Even if you don't anticipate using the new attribute, we recommend you:</p> <ol style="list-style-type: none"> <li>Enable the attribute.</li> <li>Run the integration to generate the latest schema file.</li> <li>Upload the schema file to your third-party payroll vendors.</li> <li>Disable the attribute.</li> </ol> <p>You can do this so your third-party payroll vendors have the latest schema in case you want to enable the integration attribute later on.</p>

Option	Description
Output Document Tags	<p>Appends document tags to the output file. You can create your own document tags or select from available document tags. Examples: ADP, Testing.</p> <p>You can use the same output document tag as an input document tag for document transformation.</p>
Payroll Country	Country where employees reside. Doesn't change the integration output.
Payroll Vendor	Payroll vendors for reporting. Doesn't change the integration output.
Payroll Vendor, if Other selected	<p>If your external payroll vendor for the integration isn't available for selection in the <i>Payroll Vendor</i> attribute:</p> <ul style="list-style-type: none"> <li>Select the value <i>Other</i> in the <i>Payroll Vendor</i> attribute.</li> <li>Add the name of your vendor in this integration attribute.</li> </ul> <p>Contact Workday Support if you want to add your external payroll vendor to the <i>Payroll Vendor</i> attribute permanently.</p>
Exclude Last Successful Run Date Update for Status(es)	Select the statuses to exclude to prevent Workday from automatically updating the last successful run date for a pay group or worker.
Include Personal Data Section	<p>Include the Personal Data Section and Personal Data By Country Data Section when there's a change to the Person Identification Data Section.</p> <p>The integration only reports the Personal Data By Country Data Section for a country where a worker's secondary job is located.</p>
Include Personal Data By Country Data Section	<p>Include the Personal Data By Country Data Section when there's a change to the Personal Data Section, even when there isn't a change in the Personal Data By Country data section.</p> <p>This helps you ensure that the integration outputs the Personal Data By Country Data Section when the data exists so that your third-party payroll system knows which data section to map the data from when a worker has multiple jobs in different countries.</p>
Include Person Identification Data Section	Include the Person Identification Data Section when there's a change to the Personal Data Section or Personal Data By Country Data Section.
Payroll Company Organization Type	The organization type that identifies a payroll company. If left blank, the integration obtains

Option	Description
	the pay group organization through the payroll company. The integration requires this attribute only for a pay group included in multiple organizations.
Configure Effective Date for Non-Effective Dated Transactions	<p>Only applicable when you run the integration with the Use Earliest Open Pay Period for the pay group and are processing a prior or future period.</p> <p>When you select Pay Period for Current Date while running the integration, the integration reports the change with an effective date of the entry moment.</p> <p>Only affects noneffective-dated transactions when processing a prior or future period based on the current date.</p> <ul style="list-style-type: none"> <li>• If this attribute is:</li> <li>• Enabled: Sets the effective date to the entry date.</li> <li>• Disabled and processing a prior period: Sets the effective date to the last date of the period and the time to 23:59:59.999.</li> <li>• Disabled and processing a future period: Sets the effective date to the first date of the period and the time to 00:00:00.000.</li> </ul> <p>Example of processing a prior period: There's an entry dated change of August 15 in a processing prior period of July. If this attribute is:</p> <ul style="list-style-type: none"> <li>• Disabled: The integration reports the change with an effective date of July 31 at 11:59:59PM (the last day of the pay period that's 1ms before midnight).</li> <li>• Enabled: The integration reports the change with an effective date of the entry moment August 15th.</li> </ul> <p>Example of processing for a future period: There's an entry date change of August 15 in a processing future period of September. If this attribute is:</p> <ul style="list-style-type: none"> <li>• Disabled: The integration reports the change with an effective date of September 1 at 12:00:00AM (the first day of the pay period at midnight).</li> <li>• Enabled: The integration reports the change with an effective date of the entry moment of August 15 (the entry date).</li> </ul>
Override Descriptor with Reference ID	The selected field returns the Reference ID instead of the descriptor when:

Option	Description
	<ul style="list-style-type: none"> <li>You enable this attribute.</li> <li>The integration returns no mapped value.</li> </ul>
Suppress Worker Message Audits For Job Size	<p>When the job size is greater than 5,000 workers, the integration automatically excludes message audits. You can override the automatic suppression of message audits by setting this attribute to <i>Always Include</i>.</p>
Suppress Audit Reports For Job Size	<p>When the job size is greater than 30,000 workers, the integration automatically always selects to exclude audit reports. You can override the automatic suppression of audit reports by setting this attribute to <i>Always Include</i>.</p>
Required Field Validation	<p>For employees who fail 1 or more required field validations:</p> <ul style="list-style-type: none"> <li><i>Exclude</i> reports an error and excludes employee from extract.</li> <li><i>Include</i> reports a warning and includes an employee in extract.</li> </ul> <p>If you don't configure this attribute, the integration uses the <i>Exclude</i> action.</p>
Max Length Field Validation	<p>For employees who have any field data exceeding the maximum length configured for the field:</p> <ul style="list-style-type: none"> <li><i>Include</i> reports a warning, truncates the data, and includes the employee in the extract.</li> <li><i>Exclude</i> reports an error and excludes employee from extract.</li> </ul> <p>If you don't configure this attribute, the integration uses the <i>Include</i> option.</p>
Prevent Output File Delivery When Error	<p>Enable this attribute to prevent the delivery of the output file when the integration status is <i>Completed with Errors</i>.</p>
Organization Type for ORG Event	<p>This organization type generates a staffing event for an organization change (ORG) when an employee changes organizations but doesn't change pay groups.</p>
Date Format	<p>Enter the format for date type fields in the output file.</p>
Date Time Format	<p>Enter the format for date-time fields in the output file.</p>
Audit Document Tags	<p>The integration appends the audit tags that you enter to the output files DataChangesAudit.html and</p>

Option	Description
	DiagnosticAudit.html. It sets the files as <i>Deliverable</i> .
Modify Output File Name	<p>Select how you want the integration to generate names for output files. If you don't make a selection, the integration appends the pay group name in parentheses to the filename.</p> <p>Select:</p> <ul style="list-style-type: none"> <li>• <i>Do Not Append After Generated Sequence</i> for a filename that doesn't include the pay group name in the file extension.</li> <li>• <i>Remove Special Characters and Spaces</i> to have only letters and numbers from the original filename.</li> <li>• <i>Replace Pay Group Name with Unique Identifier</i> to replace each pay group name, in sequence, with a unique numeric identifier, beginning with zero.</li> </ul>
Include Secondary Event Code	Enable this attribute to include the secondary event code in the output when a higher-priority event occurs. Enabling this attribute helps prevent the output of a higher-priority event suppressing the secondary event code you select, such as ORG.
Exception Handling Mode for DIS	Enable this attribute to report Data Initialization Service (DIS) exceptions as errors or warnings. By default, the integration logs exceptions as informational messages.
Enable Data Changes Audit For Faceted Search	<p>Enable this attribute to make data changes for primary run integration events available for reporting. This attribute doesn't affect the data changes audit HTML delivered in the output files.</p> <p>Enable this attribute to use this integration with the Payroll Interface Integration Command Center along with the <i>Payroll Effective Change Interface / Payroll Interface Integration Command Center integration service</i>.</p>
Additional Primary Integration	<p>Enable this attribute when you have multiple <i>Payroll Effective Change Interface</i> integration systems for a single pay group. You can then run any of the additional integrations as primary integrations for specific purposes.</p> <p>When you select this attribute, you can also configure these integration field attributes in the Pay Group Summary section:</p> <ul style="list-style-type: none"> <li>• <i>Additional Primary Integration System</i></li> <li>• <i>Last Processed Periods</i></li> <li>• <i>Last Processed Periods From</i></li> </ul>

Option	Description
	<ul style="list-style-type: none"> <li>• <i>Last Processed Periods To</i></li> </ul> <p>These fields can help you troubleshoot a primary integration.</p> <p>Workday stores the processing and additional pay periods for a primary integration. Workday displays these periods in the Last Processed Period(s) column on the Maintain Payroll Integration Systems for Pay Group task.</p> <p>Workday compares these pay periods for each subsequent primary integration run to the last processed pay periods. The comparison determines whether to process a pay period incrementally or all effective.</p> <p>If a prior primary integration:</p> <ul style="list-style-type: none"> <li>• Has processed a pay period, the current primary integration processes the pay period incrementally.</li> <li>• Hasn't processed the pay period, the current primary integration processes the pay period as all effective.</li> </ul> <p>We recommend that you use this attribute only for your additional <i>Payroll Effective Change Interface</i> integrations for the pay group.</p> <p>Example: Use this attribute for a separate integration system for time off processing.</p> <p>We also recommend that you don't configure the attribute if your integration uses these services:</p> <ul style="list-style-type: none"> <li>• <i>Payroll Effective Change Interface – Effective Stack Sync Service</i></li> <li>• <i>Payroll Effective Change Interface – Event Driven Integration for Third Party Payroll</i></li> <li>• <i>Worker Last Successful Run Date – Launch Parameters</i></li> </ul>
Append Country to Output File Name	Appends the two-digit country code for the pay group to the end of the output filename. For merge integrations, configure this attribute on the <i>PECI - Merge Files Integration Template</i> instead.
Report Deleted One-Time Payment Effective Same Day As Transfer	Report deleted one-time payments that have the same effective date as a pay group transfer during the events you specify.
Country Code Type or Name	Controls the type of country code in the output file. If you don't configure this attribute, the integration uses the ISO 3166-1 Alpha 2 country code.
Country Region Type or Name	Specify the country region ISO code or name for the integration to output and to override

Option	Description
	<p>the Override Descriptor with Reference ID attribute.</p> <p>If you don't enable this attribute or the Override Descriptor with Reference ID attribute, the integration outputs the country region name.</p>
<b>Additional Name Types</b>	<p>Specifies the <i>Additional Name Types</i> to include in the output file. If you don't configure this attribute, the integration includes no <i>Additional Name Types</i>. It only includes additional names with one of the types in the output file.</p>
<b>Address Usage Type</b>	<p>In combination with <i>Address Usage</i>, the integration outputs addresses with the selected <i>Address Usage Type</i>.</p>
<b>Address Usage</b>	<p>In combination with <i>Address Usage Type</i>, the integration outputs addresses with the selected <i>Address Usage</i>.</p> <p>The integration includes primary addresses for the <i>Address Usage Type</i> if:</p> <ul style="list-style-type: none"> <li>• You don't select an <i>Address Usage</i>.</li> <li>• A worker doesn't have an address for the selected <i>Address Usage</i> and <i>Address Usage Type</i>.</li> </ul>
<b>Phone Usage Type</b>	<p>The integration outputs the primary phone numbers for the selected <i>Phone Usage Type</i>.</p>
<b>Phone Number Parsing</b>	<p>Specifies whether the integration outputs phone numbers as <i>Parsed</i> or <i>Unparsed</i>. Set this attribute to <i>Unparsed</i> to output phone numbers exactly as users enter them in Workday.</p>
<b>Phone Number Format</b>	<p>Specifies the format in which the integration outputs phone numbers.</p>
<b>Email Usage Type</b>	<p>The integration outputs primary email addresses for the select <i>Email Usage Type</i>.</p>
<b>Report Only Primary Position</b>	<p>To report changes only for workers' primary position, select:</p> <ul style="list-style-type: none"> <li>• <i>Only When All Positions Are In The Same Pay Group</i> to include a worker's primary position when the worker has multiple positions in the same pay group. This option includes changes for a worker in a secondary pay group but not changes related to a nonprimary position.</li> </ul> <p><i>Always</i> to include the worker's primary position when the worker has multiple positions in the same pay group or in different pay groups. This option doesn't include any changes for a worker in a secondary pay group.</p>

Option	Description
	<p>If you don't select an option for this attribute, the output file includes all position data for employees who have multiple jobs.</p> <p>When you enable the attribute, the integration doesn't report these sections relating to the non-primary position:</p> <ul style="list-style-type: none"> <li>• Position</li> <li>• Compensation</li> <li>• Compensation Plans</li> <li>• Compensation Earnings and Deductions</li> </ul> <p>Example:</p> <p>Worker 1 has a primary job in the US and a secondary non-primary job in Canada. When you set the attribute to:</p> <ul style="list-style-type: none"> <li>• <i>Only When All Positions Are In The Same Pay Group</i>, the integration reports:           <ul style="list-style-type: none"> <li>• US pay group primary job details.</li> <li>• Canada pay group worker details but not non-primary position details.</li> </ul> </li> <li>• <i>Always</i>, the integration:           <ul style="list-style-type: none"> <li>• Reports the US pay group primary job details.</li> <li>• Excludes the worker from the Canada pay group.</li> </ul> </li> </ul> <p>When you don't set the attribute, the integration reports both the US pay group primary job and Canada pay group non-primary job details.</p> <p>Worker 2 has a primary job and a secondary non-primary job both in the same US pay group. When you set the attribute to:</p> <ul style="list-style-type: none"> <li>• <i>Only When All Positions Are In The Same Pay Group</i>, the integration:           <ul style="list-style-type: none"> <li>• Reports the primary job details.</li> <li>• Excludes the non-primary job details.</li> </ul> </li> <li>• <i>Always</i>:           <ul style="list-style-type: none"> <li>• Reports the primary job details.</li> <li>• Excludes the non-primary job details.</li> </ul> </li> </ul> <p>When you don't set the attribute, the integration reports both the primary job and non-primary job details in the US pay group.</p>

Option	Description
Payment Election Rules	The integration outputs only payment elections matching 1 of the selected rules.
Return leave(s) with Payroll Effect only	The integration only outputs leaves that have payroll effect set to <i>true</i> .
Organization Type for Organization	The integration outputs organizations with matching organization types entered.
Organization Role for Position	The integration outputs assigned roles with matching organization roles entered.
Number of Additional Pay Periods	<p>Specifies the number of additional pay periods to include. The number of additional pay periods you enter can't exceed the number of pay periods possible in a 13-month time period.</p> <p>Integrations for subsequent pay periods don't include events already reported for the additional pay periods.</p> <p>You can use this attribute with:</p> <ul style="list-style-type: none"> <li>• <i>Primary</i> integrations.</li> <li>• Integrations configured for <i>Event-Driven Integration for Third-Party Payroll</i>.</li> <li>• <i>Ad hoc</i> integrations if you enable the <i>Update Last Successful Run Date</i> launch parameter.</li> </ul> <p>You can't use this attribute if you enable the <i>Full Snapshot</i> launch parameter.</p>
Maximum Number of Future Days	<p>Enable to control the number of future days for which the integration can look ahead.</p> <p>The Number of additional pay periods can have a value that exceeds the 93 look ahead range. In that case, the integration only looks ahead at the number of periods that fall within the Maximum Number of Future Days Limit. To allow up to 13 months or 57 weeks, set the value to 403.</p>
Roll Up Entry Dated Changes	<p>Configure this attribute to display entry-dated changes in the <i>Hire</i> business process. Configure this attribute even if a business process other than <i>Hire</i> enters that data.</p> <p>Roll up entry-dated changes won't occur when both of these conditions are true:</p> <ul style="list-style-type: none"> <li>• You're rehiring a worker into the same pay group that you terminated them from.</li> <li>• You configured your <i>Hire</i> business process with the <i>Assign Pay Group</i> for <i>Hire</i> step before or as the <i>Completion</i> step.</li> </ul>

Option	Description
	<p>Rolls up entry-dated changes of the most recent change into the <i>HIR</i> event code. To roll up changes for a <i>Hire</i> event, enable the attribute, and select the sections and additional changes that you need entry dates for. Example: When you set the Roll Up Entry Dated Changes attribute to <i>Personal</i>, hire a new worker, and enter their birth date (an entry-dated field) on the hire date, the PECI output contains 1 effective change with the code <i>HIR</i> that includes the birth date.</p>
Report Post Termination Compensation	<p>Enable this attribute for the integration to report post-termination compensation details in these sections for all workers:</p> <ul style="list-style-type: none"> <li>• Compensation</li> <li>• Compensation Plans</li> <li>• Compensation Earning and Deductions</li> </ul> <p>If the terminated employees don't have post-termination compensation, the integration reports zeroes for the compensation-related fields.</p>
Reporting for Termination on Last Day of Pay Period	<p>Applies only to terminations with an effective date on the last day of the current pay period. Doesn't apply to termination rescindment or corrections. Don't use with <i>Number of Additional Pay Periods</i>.</p> <p>When the termination date is the last day of the pay period, the effective date of the termination is the day after, which is the first day of the next period.</p> <p>When you:</p> <ul style="list-style-type: none"> <li>• Enable the attribute, the integration examines the period end date plus 1 day and captures the termination in the current period, although the termination isn't effective until the next pay period. Therefore, the integration reports a <i>TERM</i> staffing event code for the current period and next period.</li> <li>• Don't enable the attribute, the integration only reports the termination in the next pay period.</li> </ul> <p>When there's a termination transaction on the last day of the pay period, the integration looks ahead 1 day and captures both the termination and any subsequent events that occur the following day. Example: If you terminate a worker on the last day of a pay period and then rehire them the first day of the next period, the</p>

Option	Description
	change detection captures both the termination detail and the rehire detail that is effective on the first day of the next period. This assumes the same integration event captures both the termination and hire transaction.
Effective Date for Currency Conversion	If you don't configure this attribute, the integration uses <i>Period End Date</i> .
Output Unrounded Time Tracking Calculated Quantities	When you disable this attribute, Workday rounds the Time Tracking quantity values to 2 decimal places. When enabled, Workday rounds the values to six 6 decimal places.
Configure Rescind Rehire Staffing Event	When set, rescinding a rehire event will generate an HIR-R staffing event. When not set, rescinding a rehire event will generate a TERM staffing event.
Return End Date in Current Processing Pay Period	<p>When enabled, the integration sends the end date for either or both of these sections in the current processing pay period:</p> <ul style="list-style-type: none"> <li>• <i>Compensation Plans Section</i></li> <li>• <i>Contracts Section</i></li> </ul> <p>When not selected, it sends the end date when effective.</p> <p>When you enable this attribute, disable the transaction log service so PECI displays the end date in the current period.</p>
Number of Years Limit for Terminated Employees	<p>Specifies how long to include terminated workers in output files. The default value of 2 applies if you don't enter a value. The 2-year default limit for terminations doesn't affect the 2-year one-time payment reporting limit.</p> <p>Note: The integration doesn't apply this attribute when you run the integration with the Full Snapshot launch parameter.</p>
Enable Hire Data Checkpoint	<p>Enable this option and add the <i>Hire Data Checkpoint for Third Party System</i> step on the <i>Hire</i> business process after the hire completion step. Workday then sends all relevant information to the third-party system after the workers complete the required onboarding fields. The integration won't send the data until all business process steps before the integration completes the <i>Hire Data Checkpoint for Third Party System</i> step.</p> <p>The integration doesn't send the data when you configure both of these steps on the <i>Hire</i> business process:</p> <ul style="list-style-type: none"> <li>• <i>Hire Data Checkpoint for Third Party System</i></li> </ul>

Option	Description
	<ul style="list-style-type: none"> <li>• <i>Transmit Employee Data to Third Party Payroll</i></li> </ul> <p>For primary integration runs only. When you run the integration on ad hoc, it bypasses the <i>Hire Data Checkpoint for Third Party System</i> step on the <i>Hire</i> business process. Example: Your <i>Hire</i> business process requires you to enter payment elections before the <i>Hire Data Checkpoint for Third Party System</i> step, but you run an ad hoc integration and don't enter the payment elections. The integration then generates an HIR event.</p> <p>You don't automatically get the Roll Up Entry Dated Changes functionality when you enable the <i>Hire Data Checkpoint</i> integration attribute.</p> <p>You can use the Workers Not Processed by PECI Events report to view workers that the integration run didn't process because the integration didn't reach the <i>Hire Data Checkpoint for Third Party System</i> step for the worker.</p> <p>Note: When it's after 90 days of the hire event completion date and you make a change to a worker that hasn't reached the <i>Hire Data Checkpoint for Third Party System</i> step on the <i>Hire</i> business process, the integration still sends the change even though the Workers Not Processed By PECI Events report doesn't display the worker.</p>
Exclude Amount Field for Percentage Based Plans	<p>Enable this option and select 1 or both of these Compensation Plans subsections to exclude percentage-based amounts in the output:</p> <ul style="list-style-type: none"> <li>• <i>Allowance Plans</i></li> <li>• <i>Bonus Plans</i></li> </ul> <p>This can help integration performance for the Compensation Plans data section when the integration runs for workers with percent-based bonus or allowance plan changes where you don't need the integration to calculate the amount field.</p>
Include Compensation Earnings and Deductions Data Section	<p>When set to <i>Always</i>, the integration includes the Compensation Earnings and Deductions Data section, even if the integration doesn't detect a change for that section.</p> <p>When set to <i>During PGI Event</i>, the integration includes the Compensation Earnings and Deductions Data section for PGI events, even if the integration doesn't detect a change for that section.</p>

Option	Description
	<p>When set to <i>Report Removal During PGO and PCO Events</i>, the integration reports zeroes for pay group out (PGO) and pay company out (PCO) events.</p> <p>When not set, the integration only includes the data sections with changes.</p> <p>Note: When you correct a transfer to a later date that includes a compensation change, the integration might not output the Compensation Earnings and Deductions Data Section on the corrected PGI staffing event unless you select the <i>During PGI Event</i> or the <i>Always</i> option.</p>
<b>Include Additional Data Section</b>	<p>When set to <i>Always</i>, the integration includes the Additional Data Section, even if it detects no changes in the section. When not set, it only includes the data sections in which it detects changes.</p>
<b>Include Personal Data Section</b>	<p>When set to <i>Always</i>, the integration includes the Personal Data Section and Personal Data By Country Data Section, even if it detects no changes in those sections. When set to <i>During PGI Event</i>, the integration includes the Personal Data Section and Personal Data By Country Data Section for PGI events, even if it detects no changes for those sections. When not set, it only includes changed data sections in the output. The integration only reports the Personal Data By Country data section for a country where a worker's secondary job is located.</p>
<b>Include Position Data Section</b>	<p>Specifies when the integration includes the Position Data Section.</p> <p>When set to:</p> <ul style="list-style-type: none"> <li>• <i>Always</i>, the integration includes this section, even if it detects no changes in that section.</li> <li>• <i>During PGI Event</i>, the integration includes this section for PGI events, even if it detects no changes in that section.</li> <li>• <i>Job Change Reason Only (Secondary)</i> and there's only a Job Change Reason change. The integration includes this section with the prior and current values for the job change reason.</li> <li>• <i>Post Termination (Secondary)</i>, the integration includes this data section with the position data as of the termination date when you run a full snapshot integration.</li> </ul>

Option	Description
	<p>When not set, the integration output includes only data sections in which it detects changes.</p> <p>To include this data section after worker termination, set both <i>Always</i> and <i>Post Termination (Secondary)</i>.</p>
Include Compensation Data Section	<p>Specifies when the integration includes the Compensation Data Section:</p> <ul style="list-style-type: none"> <li>When set to <i>Always</i>, the integration includes this section, even if it detects no changes in the section.</li> <li>When set to <i>As Of Termination Date (Secondary)</i>, the integration includes this section with the compensation effective as of the termination date.</li> <li>When set to <i>Compensation Change Reason Only (Secondary)</i>, the integration includes this section with the compensation change reason even when that's the only change.</li> <li>When set to <i>During PGI Event</i>, the integration includes this section for PGI events, even if it detects no changes in the section.</li> </ul> <p>When not set, it only includes the data sections in which it detects changes.</p>
Include Compensation Plans Data Section	<p>Specifies when the integration includes the Compensation Plans Data section:</p> <ul style="list-style-type: none"> <li>When set to <i>Always</i>, the integration includes this section, even if it detects no changes in the section.</li> <li>When set to <i>During PGI Event</i>, the integration includes this section for PGI events, even if it detects no changes in the section.</li> <li>When set to <i>As Of Termination Date (Secondary)</i>, the integration includes this data section with the compensation effective as of the termination date.</li> </ul> <p>When not set, it only includes the data sections in which it detects changes.</p>
Include Person Communication Data Section	<p>When set to <i>Always</i>, the integration includes the Person Communication Data Section, even if it detects no changes in the section. When not set, it only includes the data sections in which it detects changes.</p>
Include Worker Status Data Section	<p>When set to <i>Always</i>, the integration includes the Worker Status Data Section, even if it detects no changes in that section. When not</p>

Option	Description
	set, it only includes the data sections in which it detects changes.
Include Person Identification Data Section	When set to <i>Always</i> , the integration includes the Person Identification Data Section, even if it detects no changes in the section. When not set, it only includes the data sections in which it detects changes.
Include Contract Data Section	When set to <i>Always</i> , the integration includes this section even when it doesn't detect changes. When set to <i>During PGI Event</i> , the integration includes this section for PGI events. When set to <i>Exclude Ended Contracts</i> , the integration excludes contracts with end dates before the worker rehire date. This setting also excludes these contracts when you select <i>Always</i> or <i>During PGI Event</i> .
Include Collective Agreements Data Section	When set to <i>Always</i> , the integration includes this section even when it doesn't detect changes. When set to <i>During PGI Event</i> , the integration includes this section for PGI events.
Include Payment Election Data Section	When set to <i>Always</i> , the integration includes this section even if it doesn't detect changes. When set to <i>During PGI Event</i> , the integration includes this section for PGI events. When not set, the integration includes only sections that have changes.
Document Retention Policy	Days to retain the output file.

3. From the related actions menu on the integration system, select Integration System > Configure Integration Maps.
4. In the Integration Maps grid, add a row for each tenant value. Select the Internal Value and enter the External Value for the output file.
5. (Optional) Provide a Default Value for data elements for values that you haven't mapped.

#### Test Payroll Effective Change Interface Field Overrides

##### Prerequisites

Security: These domains in the System functional area:

- *Custom Report Creation*
- *Manage: All Custom Reports*

## Context

When creating field overrides for Payroll Effective Change Interface integration (PECI), test the calculated field in a report before adding it to the integration to ensure the values the integration returns are correct and the performance isn't greatly affected. Test all production scenarios, such as bulk import or organization changes as these can affect performance depending on the report fields you use in the calculated field. Make sure that the value of the calculated field changes with the worker event when you expect it.

Note: If the calculated field has more than 8 levels in the hierarchy, you might see a performance impact. Ensure that you test all scenarios, including mass updates, if you're using calculated fields with multiple conditions.

## Steps

1. Access the Create Custom Report task and select these values:

Field	Value
Report Type	<i>Advanced</i>
Optimized for Performance	<i>De-select</i>
Data Source	<i>Worker from Prompt</i>

2. On the Columns tab, select the calculated field you want to test on the Field column.
3. On the Filter tab, add a row on the Filter on Instances grid and configure a worker filter condition. Example: Set the filter to prompt for an employee ID so the report only runs for that worker with these values:

Field	Value
And/Or	<i>And</i>
Field	<i>Employee ID</i>
Operator	<i>equal to</i>
Comparison Type	<i>Prompt the user for the value</i>
Comparison Value	<i>Default Prompt</i>

4. On the Prompts tab, select these values for the Runtime Date Prompts:

Field	Value
Effective Date	<i>Prompt for effective as of date</i>
Entry Date	<i>Prompt for entry date and time</i>

5. Run the report and test the effective and entry date of the event during runtime.

Example: A worker event has an effective date of 2020-10-13 and an entry date of 2020-10-20T09:30. You run the report with an effective date of 2020-10-13 and entry date of 2020-10-20T09:25. You then run the report a second time with an effective date of 2020-10-13 and entry date of 2020-10-20T09:35. This tests if the calculated field value changes with the value of the event. If the value doesn't change, then the PECI integration probably won't pick up the change. Conduct a similar test by changing the effective date using 2020-10-12 and 2020-10-12 while keeping the same entry date of 2020-10-20T09:35. This ensures the integration reports the proper effective date for when the change takes effect.

## Steps: Configure Merge Integration Outputs

### Prerequisites

Set up a Payroll Effective Change Interface integration before you modify it to merge integration outputs.

## Context

Configure your Payroll Effective Change Interface integration to combine the output files for several pay groups into 1 file. To merge files, you create a separate merge integration. You can then configure your Payroll Effective Change Interface integration services to enable merge file launch parameters. Then, you link and configure your integration to use the merge integration as part of a business process to merge the files.

## Steps

1. [Create Integration System](#) on page 1967.  
Enter *PECI - Merge Files Integration Template* at the New using Template prompt.
2. (Optional) Enable Filename Sequence Generator to use a sequence generator to apply a unique filename.
3. Create an integration system user (ISU) and grant the ISU access to the *Payroll Administrator* group.  
See: [Steps: Grant Integration or External Endpoint Access to Workday](#)
4. (Optional) [Set Up Integration Sequence Generators](#) on page 1969.
5. On your Payroll Effective Change Interface integration, select Integration System > Configure Integration Services from the related actions menu of the *Payroll Effective Change Interface* integration and enable Merge Files Launch Parameters.
6. Select Business Process > Create, Copy, or Link Definition or Business Process > Edit from the related actions menu of the *Payroll Effective Change Interface* integration and accept the automatically populated values.
7. In the grid, add a new step of Type *Integration*, and set Order so that the step is the last step in the business process.
8. Select Configure Integration System on the new step, then select the merge integration you created earlier.

## Merge Integration Outputs

### Prerequisites

- Configure your *Payroll Effective Change Interface* (PECI) integration to merge integration outputs.
- Security: *Integration Event*, *Integration Process*, and *Integration Build* domains in the *Integration* functional area.

## Context

Launch a primary or ad hoc integration to merge the outputs from several pay groups into 1 output file. You can also merge previously completed *Payroll Effective Change Interface* integration events.

## Steps

1. Select Integration > Launch / Schedule from the related action menu of your *Payroll Effective Change Interface* integration.
2. Enter the pay groups that you want to merge in the Pay Group field, and leave the Merging Pay Groups field blank.

When you need to merge pay groups that in total exceed the 250,000 worker limit, enter the additional pay groups in the Merging Pay Groups field.

Example: You have 3 pay groups that you need to merge: pay group 1 has 200,000 workers, pay group 2 has 50,000 workers, and pay group 3 has 100,000 workers. You can't run PECI for all 3 pay groups because the population of 350,000 exceeds the 250,000 limit. To merge all 3 pay groups, enter pay group 1 and pay group 2 in the Pay Group field and enter pay group 3 in the Merging Pay Groups field. The integration launches for pay groups 1 and 2. After this integration event

completes, Workday automatically launches a second integration event for pay group 3. After the second integration event completes, the Merge step on the business process combines pay group 1, pay group 2, and pay group 3 into 1 output file from the second event.

3. (Optional) To merge with another integration event, select the Primary Run check box and specify a successfully completed integration event that didn't generate a merge file for that event on the Merging Past Events field.

Example: You run integration A for pay group 1 on Monday. You then run integration B for pay group 2 on Tuesday and reference the completed integration A event on the Merging Past Events field. After the integration B event completes, the integration generates an output file for pay group 2. Then the integration merges the two files to include both pay group 1 and pay group 2 into a single output file.

## Next Steps

Access Process Monitor. After the PECI integration completes for the pay groups, the integration outputs a file for each pay group. After the Merge integration step completes in the integration business process, the integration outputs an XML file with the merged pay groups attached to the last merge integration process on the Output Files tab.

The merged file contains the top-level element <peci:Worker\_Effective\_Stack\_Aggregate>.

## Reference: Correctable and Rescindable Business Processes for Payroll Effective Change Interface

Workday provides examples of Payroll Effective Change Interface behavior when you correct or rescind previously completed, commonly used business processes. See [Payroll Effective Change Interface Business Process Examples](#).

Business Process	Correctable	Rescindable	Entry or Effective Dated
<i>Hire Worker</i>	X	X	Effective
Job Change <ul style="list-style-type: none"><li>• <i>Add Additional Job</i></li><li>• <i>Transfer, Promote, or Change Job</i></li><li>• <i>Assign Collective Agreement</i></li><li>• <i>Start International Assignment</i></li><li>• <i>Terminate Employee</i></li></ul>	X	X	Effective
Job Change <ul style="list-style-type: none"><li>• <i>Change Business Title</i></li><li>• <i>End Collective Agreement</i></li></ul>		X	Effective
Organization <ul style="list-style-type: none"><li>• <i>Change Organization Assignments</i></li></ul>	X	X	Effective

Business Process	Correctable	Rescindable	Entry or Effective Dated
Personal Data Change <ul style="list-style-type: none"> <li>• <i>Edit Personal Information</i></li> <li>• <i>Maintain Names</i></li> <li>• <i>Edit ID Information</i></li> <li>• <i>Edit Other IDs</i></li> <li>• <i>Edit Passports and Visas</i></li> <li>• <i>Edit Licenses</i></li> <li>• <i>Edit Government IDs</i></li> </ul>		X	Entry, except Maintain Names
Personal Data Change <ul style="list-style-type: none"> <li>• <i>Contact Change</i></li> </ul>	X	X	Effective
Payroll <ul style="list-style-type: none"> <li>• <i>Assign Pay Group</i></li> </ul>		X	Effective
Time and Leave <ul style="list-style-type: none"> <li>• <i>Enter Time Off</i></li> <li>• <i>Place Worker on Leave</i></li> <li>• <i>Return Worker from Leave</i></li> </ul>	X	X	Effective

**Related Information****Reference****Payroll Effective Change Interface Correctable and Rescindable Business Processes****Reference: Data Sections for Payroll Effective Change Interface**

You can configure these integration field attributes for data you want to include in the Payroll Effective Change Interface (PECI) output files.

Note: When you configure integration field attributes, you must select the parent field attribute for the field.

Example: You select the Include in Out put check box for all the fields in the Personal Data Section. Also

select the Include in Output check box for the Personal Data Section in the Effective Stack Worker folder for the integration to output that data.

When you select *Always Include*, the integration might not always include data when there's an effective change that's effective before the pay group entry.

The External Code field attribute reports the external code regardless if you enable the Enable External Payroll Code option on the Edit Tenant Setup - HCM task or not.

Data Sections	Fields	Notes	
Pay Group Summary	<ul style="list-style-type: none"> <li>Additional Primary Integration System</li> <li>Last Processed Periods</li> <li>Last Processed Periods From</li> <li>Last Processed Periods To</li> <li>Additional Run Updated From</li> </ul>	<p>When you configure the Additional Primary Integration System field, you can also enable the Last Processed Period fields. Including these fields can help troubleshooting the Pay Group Summary section in the integration output file.</p> <p>You can configure the Additional Run Updated From field when you use the Payroll Effective Change Interface – Effective Stack Sync Service integration service.</p>	
Extended Period	<ul style="list-style-type: none"> <li>Extended Period WID</li> </ul>	You can't configure this field attribute, but the integration includes it in the output file.	
Worker Summary Data Section	<ul style="list-style-type: none"> <li>WID</li> <li>Name</li> <li>Employee ID</li> <li>Effective Moment To Override</li> <li>Currency Conversion Effective Date Option</li> <li>Change Detection Override</li> <li>Extended Change Detection Override</li> <li>On Payroll Effect Leave</li> </ul>	<p>Currency Conversion Effective Date Option is the only field attribute that you can configure in this data section. The integration always outputs these fields from this section:</p> <ul style="list-style-type: none"> <li>WID</li> <li>Name</li> <li>Employee ID</li> </ul> <p>The integration outputs these fields when they're applicable to the data:</p> <ul style="list-style-type: none"> <li>Effective Moment To Override</li> </ul>	

Data Sections	Fields	Notes	
		<ul style="list-style-type: none"> <li>• Currency Conversion Effective Date Option</li> <li>• Updated From Override</li> <li>• Change Detection Override</li> <li>• Extended Change Detection Override</li> </ul> <p>The integration doesn't output the rest of the fields.</p>

Data Sections	Fields	Notes	
		<p>Compensation Earning and Deductions data section.</p> <p>Workday converts the currency for the Compensation Earnings and Deductions sections based on the country currency of the assigned country of the pay group. When you have a worker with compensation plans in a different currency than their pay group, PECI reports the compensation plans in the Compensation Plans section and the Allowance Plan section but not in the Compensation Earning and Deduction section.</p> <p>Example: The worker is getting paid in United Arab Emirates Dirham (AED) but you need the Compensation Earning and Deduction section converted to Euros (EUR). Ensure you have the currency conversion rates set up with the Maintain Currency Conversion Rates task so PECI can report the amount in the Compensation Earnings and Deductions section.</p> <p>PECI doesn't support dynamic calculated compensation plans. Consider using event-driven calculated compensation plans instead.</p>	
Compensation Earnings and Deductions / Compensation Element	<ul style="list-style-type: none"> <li>• ID</li> <li>• Name</li> <li>• Mapped Value</li> </ul>		

Data Sections	Fields	Notes	
Work Schedule Calendar Section	<ul style="list-style-type: none"> <li>• Work Schedule Calendar ID</li> <li>• Work Schedule Calendar Name</li> </ul>	<p>The integration supports calendars that you create from these tasks:</p> <ul style="list-style-type: none"> <li>• Assign Work Schedule</li> <li>• Assign Custom Work Schedule</li> <li>• Create Work Schedule Calendars</li> </ul> <p>The integration doesn't support:</p> <ul style="list-style-type: none"> <li>• Schedule overrides, such as ad hoc schedule events.</li> <li>• Time Tracking data, such as time blocks.</li> <li>• Calendar events or details on the calendar such as meals or breaks.</li> <li>• Workday Scheduling.</li> </ul> <p>In some cases, the integration might not detect inherited calendars, such as when you use custom-calculated fields in the eligibility rules. If the integration doesn't detect inherited calendars, we recommend you use assignment calendar events for change detection. We also recommend not overlapping assignments that overlap effective dates due to PECL limitations that can result in integration errors.</p>

Time Off Earnings and Deductions / Time Off Entry / Worktag	<ul style="list-style-type: none"> <li>• Worktag Dimension</li> <li>• Worktag Code</li> <li>• Worktag Name</li> </ul>		
Time Off Earnings and Deductions / Grouped Time Off Entry	<ul style="list-style-type: none"> <li>• Leave Start Date</li> <li>• Leave End Date</li> <li>• Units</li> <li>• Worktag</li> </ul>	<p>Payroll Effective Change Interface integrations support these work schedule configurations:</p> <ul style="list-style-type: none"> <li>• All Days</li> <li>• Workdays (Non-Holiday)</li> </ul>	

Data Sections	Fields	Notes	
		<p>Don't use this attribute with any other work schedule configuration.</p> <p>To group time off, you must assign workers to a work schedule calendar.</p> <p>The integration:</p> <ul style="list-style-type: none"> <li>• Groups time off by time off types for full days.</li> <li>• Reports separate groupings for hourly workers with multiple time off entries with different time off types but still equal to a full day.</li> </ul> <p>The Days to Include value and the work schedule calendar settings determine how Workday breaks up or groups time off days. Example: The Days to Include setting is <i>Workdays (Non-Holidays)</i>, and you set the work schedule calendar to Monday through Friday. Workday doesn't include Saturdays and Sundays. When a worker takes a time off event on Friday and Monday, Workday groups the time off. With this same configuration, and when the worker takes time off for Friday, Monday, and Tuesday, Workday also groups the days together as a single Time Off Grouping with 3 units. If you need separate entries, use the Days to Include</p>	

Data Sections	Fields	Notes	
		<p>setting of <i>All Days</i> with the Monday through Friday work schedule calendar. Workday then considers the weekends as valid days and breaks up a Friday request and a Monday request, creating 2 separate blocks. For more information, see:</p> <ul style="list-style-type: none"> <li>• <a href="#">Create Work Schedule Calendars</a></li> <li>• <a href="#">Troubleshooting: Absence Occurrences</a></li> </ul> <p>You can't configure the Units field attribute, but the integration includes it in the output file.</p>	
Time Off Earnings and Deductions / Grouped Time Off Entry / Worktag	<ul style="list-style-type: none"> <li>• Worktag Dimension</li> <li>• Worktag Code</li> <li>• Worktag Name</li> </ul>		
Time Tracking	<ul style="list-style-type: none"> <li>• Position ID</li> <li>• External Payroll Code Name</li> <li>• External Code</li> <li>• External Payroll Code</li> <li>• Override Rate</li> <li>• Currency</li> <li>• Worktag</li> <li>• Time Tracking Entry</li> </ul>	<p>Set up:</p> <ul style="list-style-type: none"> <li>• The external earning before approving the associated time block.</li> <li>• Time tracking with the Maintain External Payroll Earnings task for the pay group that you're running the integration for.</li> </ul> <p>The integration only reports approved time events from the associated business process. Example: After you set up the time tracking earning on the Maintain External Payroll Earnings task and then approve the time block</p>	

Data Sections	Fields	Notes	
		<p>entries, the integration reports them in the Time Tracking data section.</p> <p>When you enter a time block entry and approve it for greater than 1 year ago relative to the processing period end date, the integration won't report it. To report the time block, make a prior period the current processing period so that the entry is within 1 year.</p> <p>Example: Today is 2022-09-08. You enter a time block for 2021-08-01. You then run PECL for the September 2022 pay period. The integration doesn't include the time block entry. You update the current processing period to July 2022 and run the integration for the earliest open period and process July 2022. Since the time block entry is within 1 year of the processing period end date (2022-7-31), the integration includes it in the output.</p>	
Time Tracking / Worktag	<ul style="list-style-type: none"> <li>• Worktag Dimension</li> <li>• Worktag Code</li> <li>• Worktag Name</li> </ul>

When your tenant time zone is in Pacific Daylight Time (PDT), the field doesn't display in the output. When you override the tenant time zone and use the Transaction Log data section, we recommend that you configure this field.</p> <p>Note: Enable the Original Event field to include the Transaction Entry Moment, Transaction Effective Moment, and Transaction Effective Moment in Initiator Time Zone fields in the output.</p> <p>You can't configure these field attributes, but the integration includes them in the output file:</p> <ul style="list-style-type: none"> <li>• TransactionType</li> <li>• Transaction Effective Moment</li> <li>• Transaction Entry Moment</li> </ul> <p>When you enable the Overall Parent Event field attribute, the integration returns the WID of the</p>	

Data Sections	Fields	Notes	
		overall parent event relationship so you can synchronize data when there's a correction or rescind on the sub process business process. If there isn't a parent event, then both the original event WID and parent event WID are the same.	

### Reference: File Schema for Payroll Effective Change Interface

When you run the integration, the schema file is output in the file named:

- <Integration Name>\_<Date>\_<SequenceNumber>.xsd

The schema is similar to this basic example, but we recommend you don't reference it for development. We recommend you pull the schema file that Workday generates after an integration event instead.

### Reference: Staffing Events in Payroll Effective Change Interface Extracts

Depending on the transactions you enter for a worker, you might see a combination of staffing events in the extract. Example:

Correction Use Case	Staffing Event Codes with Expanded Effective Changes Service Off (Default Setup)	Staffing Event Codes with Expanded Effective Changes Service Enabled
You correct a hire date to an earlier effective date.	HIR and DTA	HIR-C
You correct a hire date to a future effective date.	HIR-R and HIR	HIR-R and HIR
You correct a termination date to an earlier effective date.	TERM-C and DTA	TERM-C
You correct a termination date to a future effective date.	TERM-R and TERM	TERM-R and TERM

When a key field is changed by a transaction, then PECL reports `isDeleted` and `isAdded` for the effective changes. Example: You enter a leave of absence in Workday that's effective 2025-04-01. PECL reports an LOA staffing event effective 2025-04-01. You then enter a return from leave with last day of leave 2025-05-15. PECL returns 2 staffing events when processing just the return from leave transaction:

- 1 LOA-C staffing event code effective 2025-04-01 with the Leave of Absence data section with an `isDeleted` attribute and an `isAdded` attribute.
- 1 RFL staffing event code with an effective end date of 2025-05-16.

The integration doesn't include these events in the output file, if you don't enable the Leave of Absence data section:

- CONT-LOA
- LOA
- LOA-C
- LOA-R
- RFL
- RFL-R

For rescinded staffing events, the information in the status section matches the status of the original event.

The PECL extract reports worker changes for a specific period of time but might not report the individual changes sequentially. Example: The last event reported for a worker's position might be the prior position rather than the most current position.

To avoid missing data, ensure you evaluate event details when you transform the PECL extract file. The details indicate if the event was an addition or a deletion.

If there's an HIR event code, sections might have prior values or the integration might annotate the sections with `isAdded` during the *hire* event. If there's a PCI event, there's also a possibility that section have prior values. Treat HIR or PCI event codes as a net-new hire or a rebase of an existing record.

#### Expanded Effective Changes Service

When you enable the *Effective Stack - Expanded Effective Changes* service, the integration:

- Includes the HIR-C event when you correct a hire date to an earlier effective date.
- Doesn't include the CONT-LOA event code.

#### Hires and Rehires

For hiring and inbound transfer events, Workday includes all data sections in the payroll extract, because the payroll provider might not have any existing data for those employees.

The integration generates either a TERM event or an HIR-R event, when you either:

- Rescind a rehire event.

- Correct a rehire event to a future effective date.

Enable the *Configure Rescind Rehire Staffing Event* integration attribute to control this behavior.

Pre-hire information, such as home and work address are effective-dated fields. Example: When you specify a date for the addresses that's after the hire effective date, the integration reports 2 different effective changes for the hire and for the address changes. If the addresses and the hire date have the same effective date, the integration rolls up the address entry into the hire event.

Pay Company Out (PCO) / Pay Company In (PCI) and Pay Group Out (PGO) / Pay Group In (PGI) Events.

For PCO events, the integration includes the Position End Date. For PCI events, the integration includes all the Job Transfer details, including Job Change Reason. Example: When you transfer a worker to a new organization, the integration doesn't report a Job Change Reason for the PCO event, but reports it for the PCI event.

When you rescind a company employee transfer:

- The initial transfer reports a PGO or PCO event code for the old pay group and a PGI or PCI event code for the new pay group.
- After rescinding, the integration generates opposite event codes that effectively reverses the previous change. Therefore, the integration reports a PGI or PCI event code for the original pay group and a PGO or PCO event code for the rescinded pay group.

Staffing Event Code	Definition	Status Event Date	Data Included
CONT-LOA	Continuous leave of absence. A worker returns from leave and immediately goes on leave again. The leave must be back-to-back and can be any type of leave. Example: a worker returns from parental leave on the 15th and goes on personal leave on the 16th.	Same date as original leave effective date.	Leave of Absence section.
DTA	Other data changes.	Effective date of data changes.	Changed sections only.
HIR	New hire into a pay group.	Hire date.	All sections for employee.
HIR-C	Correction to the hire event. Correcting the hire date by moving it to an earlier effective date generates this event.	Hire date.	Status section.

Staffing Event Code	Definition	Status Event Date	Data Included
HIR-R	Rescind the new hire event.	Hire date.	Status section.
LOA	On leave of absence. The First day of leave. integration won't report 2 simultaneous LOA's for the same worker without an RFL between them. The integration only reports an LOA when the worker goes on their first leave. If the worker is still on leave and you add a second leave, the integration reports a DTA code.		Status and Leave of Absence sections.
LOA-C	Correction to end date or type of leave of absence.	Day of return from leave.	Status and Leave of Absence sections.
LOA-R	Rescind leave of absence.	First day of leave.	Status and Leave of Absence sections.
ORG	Change organization but don't change pay group.  Note: Change to different pay group within the same organization doesn't generate a secondary ORG event.	Date of position change.	All sections for employee.

Staffing Event Code	Definition	Status Event Date	Data Included
PCI	<p>Transfer:</p> <ul style="list-style-type: none"> <li>• To this pay group.</li> <li>• From a pay group in a different payroll company.</li> </ul> <p>For payees with multiple positions, this code applies only to the first position transferred. Payroll Effective Change Interface performs an ADD operation for additional position transfers for the same payee. No staffing event occurs for these ADD operations.</p> <p>When a worker has a PCI and RFL for the same pay group on the same day, the integration reports the PCI event code. If you want to report on individual transactions, enable the <i>Effective Stack - Expanded Effective Changes</i> integration service.</p>	Date of pay group reassignment.	All sections for employee reassigned.
PCO	<p>Transfer:</p> <ul style="list-style-type: none"> <li>• From this pay group.</li> <li>• To a pay group in a different payroll company.</li> </ul> <p>For payees with multiple positions, this code applies only to the last position transferred. Payroll Effective Change Interface performs a REMOVE operation for additional position transfers for the same payee. No staffing event occurs for these REMOVE operations.</p>	Date of pay group reassignment.	<p>These sections:</p> <ul style="list-style-type: none"> <li>• Personal</li> <li>• Person Identification</li> <li>• Status</li> <li>• Position</li> <li>• Compensation</li> <li>• Compensation Plans</li> <li>• Benefits Earnings &amp; Deductions</li> <li>• Compensation Earnings &amp; Deductions</li> <li>• Payroll Input Earnings &amp; Deductions</li> </ul>

Staffing Event Code	Definition	Status Event Date	Data Included
PGI	Transfer: <ul style="list-style-type: none"><li>• To this pay group.</li><li>• From another pay group in the same payroll company.</li></ul>	Date of pay group reassignment.	These sections: <ul style="list-style-type: none"><li>• Personal</li><li>• Person Identification</li><li>• Status</li><li>• Position</li></ul>
PGO	Transfer: <ul style="list-style-type: none"><li>• From this pay group.</li><li>• To another pay group in the same payroll company.</li></ul>	Date of pay group reassignment.	These sections: <ul style="list-style-type: none"><li>• Personal</li><li>• Person Identification</li><li>• Status</li><li>• Position</li></ul>
RFL	Return from leave of absence.	First day back at work.	Status and Leave of Absence sections.
RFL-R	Correction to end date of leave of absence.	First day back at work.	Status and Leave of Absence sections.
TERM	No longer employed. Employee status changes from active to terminated.	Termination date.	These sections: <ul style="list-style-type: none"><li>• Personal</li><li>• Person Identification</li><li>• Status</li><li>• Position</li><li>• Compensation</li><li>• Compensation Plans</li><li>• Benefits Earnings &amp; Deductions</li><li>• Compensation Earnings &amp; Deductions</li><li>• Payroll Input Earnings &amp; Deductions</li></ul>
TERM-C	Correct termination event. Termination date. Correcting the termination date by moving it to an earlier effective date generates this event. Status changes from active to terminated.	Termination date.	Status section.
TERM-R	Rescind the termination event. Correcting the termination date by moving it to a future effective date generates this event. Status changes from terminated to active.	Termination date.	Status section.

#### Payroll Effective Change Interface Business Process Examples

#### Reference: Third-Party Payroll Reporting

Workday provides these reporting objects that simplify the process of viewing, correcting, and auditing third-party payroll integration events.

To Do	Reporting Object	Setup
Display third-party payroll integration errors on custom reports.	All Payroll Integration Event Error Message report data source	Security: <i>Set Up: Payroll Interface</i> domain in the Payroll Interface functional area.
Display all effective changes related to an integration event on custom reports.	Effective Change report data source	Security: <i>View: Maintain Payroll Interface</i> domain in the Payroll Interface functional area.
Perform faceted searches detailing effective changes for <i>Payroll Effective Change Interface</i> primary integration runs.	Data Changes Audit report	Configure the <i>Enable Data Changes Audit for Faceted Search</i> attribute on the <i>Payroll Effective Change Interface</i> integration template.  Note: The Data Changes Audit report doesn't list integration events if there isn't a change in the event.
View and correct errors your third-party payroll vendor returns. Provides a consolidated view of errors from: <ul style="list-style-type: none"> <li>• <i>Payroll Effective Change Interface</i></li> <li>• Event-Driven Integration for Third-Party Payroll</li> </ul>	Maintain Errors from Third-Party Payroll report	Work with your third-party payroll vendor to ensure that they set up the corresponding Workday Web Services (WWS) in their environment.  To enable notifications for this report, you can access the Configure Global Payroll Notifications task. This task generates the default Workday notification. Use the Edit Tenant Setup - Notifications task if you want to include other types of notifications.  Note: This report uses computed data sources, and there is a delay between the data being loaded and it being available in the user interface.
View errors your third-party payroll vendor returns for: <ul style="list-style-type: none"> <li>• <i>Payroll Effective Change Interface</i></li> <li>• Event-Driven Integration for Third-Party Payroll</li> </ul>	Third-Party Payroll Errors report	Work with your third-party payroll vendor to ensure that they set up the corresponding Workday Web Services (WWS) in their environment. ## FAQ: Payroll Effective Change Interface

### Why did PECL report a compensation change for a worker who doesn't have any compensation changes?

This issue could happen because there's an indirect change, such as compensation frequency, that has impacted the worker. Access the compensation plan for the worker and see what has changed, such as the frequency.

### Why did PECL unexpectedly add an End Date to an Allowance or Compensation Plan for a worker?

This issue could happen because either:

- The worker isn't eligible for the allowance or compensation plan according to the eligibility rules.
- You edited an existing plan for the worker. When you edit an existing plan, PECL treats this change as an addition of a new plan and sets the old plan's End Date to 1 day before the new plan's Start Date.

### Why didn't PECL report a deleted time tracking entry?

Reasoning	Details
The manager hasn't approved the time entry.	For PECL to report time tracking entries, the manager must: <ul style="list-style-type: none"> <li>• Approve the time entries.</li> <li>• Reapprove deleted time entries that the manager previously approved.</li> </ul>
The net effect doesn't change after the user deleted the time tracking entry.	Example: A worker submits a time tracking entry of 8 hours. The manager approves the time entry. Then the worker deletes the same 8-hour entry, and the manager reapproves the deletion. Both of these transactions are within the entry range of the integration event, which has a net result of no change. The sequence is 0 -> 8 -> 0, so the net change is 0 -> 0.

### Are compensation change eligibility rules detected as a change in PECL?

Workday doesn't support the detection of changes to Configurable Compensation Basis values that result from the compensation eligibility rule changes related to the configurable compensation basis. Example: If a worker moves from position A (eligible) to position B (not eligible), the configurable compensation basis loss is detected. However, if the configurable compensation basis eligibility rule is updated and the eligible population changes, this isn't detected by the integration.

### Troubleshooting: Compensation-Related Changes with PECL

- [The integration is reporting incorrect compensation changes.](#) on page 1629
- [The integration deleted the entire compensation plan history.](#) on page 1630
- [The integration isn't reporting the change in the Earnings and Deductions section.](#) on page 1630
- [The integration isn't reporting the Compensation Earnings and Deductions section for a pay group transfer with a compensation change.](#) on page 1630

### The integration is reporting incorrect compensation changes.

PECL is reporting an incorrect compensation change, such as reporting:

- The wrong start date.

- A canceled compensation change.

Cause: You ran the integration to report changes that occurred before the correction.

Solution: Security: *Integration Event* domain in the Integration functional area.

Access the Launch / Schedule Integration task and enter a date that's after the correction for the Last Successful Run Date launch parameter.

### **The integration deleted the entire compensation plan history.**

PECI deleted the entire compensation plan history after you rescinded the compensation plan and initiated another compensation plan.

Cause: You rescinded the compensation data change and then submitted another compensation data change effective the same day with the same position ID but a different WID. Because you rescinded the compensation change, and then initiated a new compensation change, they have different WIDs. Therefore, PECI treats them as different positions.

Solution: Next time you make an update to an existing compensation change, and initiate another compensation data change instead of rescinding the change. Correct the existing compensation change.

### **The integration isn't reporting the change in the Earnings and Deductions section.**

You mapped the external earnings and deductions correctly, but PECI isn't reporting the change in the Earnings and Deductions data section.

Cause: There are currency conversion rates in the tenant that are either zero or you haven't specified from the source currency to the target currency. This can occur when the currency of the pay group doesn't match the currency of the associated plan.

Solution:

#### **Steps**

Security: *Set Up: Currency (Compensation functional area)* domain in the Core Compensation area.

1. Access the Currency Rates as of Date report to verify you've configured the correct currency conversion for the associated plan.
2. Access the Maintain Currency Conversion Rates task and edit currency exchange rate.

### **The integration isn't reporting the Compensation Earning and Deductions section for a pay group transfer with a compensation change.**

PECI isn't reporting the Compensation Earning and Deductions section with isUpdated for a compensation change for the PGI event.

Cause: You transferred a worker to a different pay group that included a compensation change then corrected the job change to a later date. The integration didn't report the compensation change again when reporting the correction.

Solution:

#### **Steps**

Security: These domains in the Integration functional area:

- *Integration Configure*
  - *Integration Event*
1. From the related actions menu on your integration, select Integration System > Configure Integration Attributes.
  2. Set the Include Compensation Earnings and Deductions Data Section attribute to *Report Removal During PGO and PCO Events*.

3. Access the Launch / Schedule Integration task and run the integration to report the correction.

[Maintain Currency Conversion Rates](#)

### Troubleshooting: One-Time Payments with PECL Integration

This topic provides strategies for diagnosing and resolving these Payroll Effective Change Interface (PECI) integration one-time payment problems:

- You configured the integration with the necessary data sections and field attributes, but it's not reporting one-time payments. [on page 1631](#)
- The Payroll Effective Change Interface integration isn't reporting deleted one-time payments. [on page 1631](#)
- The Payroll Effective Change Interface reports one-time payments for a worker's previous position in their current position. [on page 1631](#)
- The integration doesn't correctly report a retroactive one-time payment in the prior pay group for a worker who moved pay groups. [on page 1632](#)

#### You configured the integration with the necessary data sections and field attributes, but it's not reporting one-time payments.

Cause: You didn't configure the external earnings for the pay groups.

Solution:

#### Steps

Security: Set Up: Payroll Interface domain in *Payroll Interface* functional area.

1. Access the Maintain External Payroll Earnings task and select the pay groups that you're running the integration for.
2. Add or edit an existing row for the compensation element associated to the one-time payment and specify at least the:
  - Name
  - Code
  - Pay Groups
  - Compensation Elements

Cause: You're running a full snapshot PECL integration.

Solution: On the Launch / Schedule Integration task, disable the Full Snapshot launch parameter and either:

- Enable the Primary Run launch parameter.
- Run an ad hoc integration.

The integration won't report one-time payments when you run a full snapshot integration. A full snapshot integration is designed to load an empty payroll system. One-time payments are individual and period-specific events; therefore, the integration only picks them up in ad hoc and primary runs when you disable the Full Snapshot launch parameter.

#### The Payroll Effective Change Interface integration isn't reporting deleted one-time payments.

Cause: A worker has a previously reported one-time payment and later has a pay group transfer with the same effective date. You then ran the integration without enabling the Report Deleted One-Time Payment Effective Same Day As Transfer integration attribute.

Solution: Security: Integration Build domain in *Integration* functional area.

1. Access the View Integration System report.

2. As a related action, select Integration System > Configure Integration Attributes.
3. Enable the Report Deleted One-Time Payment Effective Same Day As Transfer integration attribute.

**The Payroll Effective Change Interface reports one-time payments for a worker's previous position in their current position.**

Cause: You entered a Scheduled Payment Date for the one-time payment during a pay period for the worker's current position. The integration reports one-time payments on the scheduled payment date, not the effective date.

Solution: Set the Scheduled Payment Date and the Effective Date of the one-time payment to the same date of the worker's previous position. Then, run the integration for their prior pay group, for the pay period that includes the scheduled payment date.

**The integration doesn't correctly report a retroactive one-time payment in the prior pay group for a worker who moved pay groups.**

Cause: You processed the retroactive one-time payment after you moved the worker to the new pay group. Example: You ended the worker's previous job in the previous period. You then added a one-time payment for the worker making it retroactive with a payment date in the last period. The worker is technically no longer eligible for review in the prior pay group during the current period.

Solution: Run PECL as an ad hoc run for the worker for the prior period and prior pay group to capture the one-time payment.

Related Information

**Tasks**

[Manage External Payroll Earnings](#) on page 1403

**Troubleshooting: PECL Didn't Report a Time Tracking Entry**

Cause	Solution
You didn't map a time calculation tag that's associated with the time entry to an external earning.	<p>Security: <i>Set Up: Payroll Interface</i> domain in Payroll Interface functional area.</p> <ol style="list-style-type: none"> <li>1. Access the Maintain External Payroll Earnings task.</li> <li>2. Assign 1 or more Time Calculation Tags for the earning</li> </ol>
The time tracking entry is for an international assignment position and you didn't enable Position Setup Options on the Edit Tenant Setup - HCM task.	<ol style="list-style-type: none"> <li>1. Access the Edit Tenant Setup - HCM task.</li> </ol> <p>Security: <i>Set Up: Tenant Setup - HCM</i> domain in System functional area.</p> <ol style="list-style-type: none"> <li>2. Enable the Position Setup Options option and select <i>Multiple Jobs</i>.</li> <li>3. Access the Assign Pay Group task to assign the pay group for the international assignment position.</li> </ol> <p>Security: <i>Manage: Service Center</i> domain in System functional area.</p> <ol style="list-style-type: none"> <li>4. Access the Maintain External Payroll Earnings task and select the Position Based option for the external earnings code for the pay group.</li> </ol> <p>Security: <i>Set Up: Payroll Interface</i> domain in Payroll Interface functional area.</p>

Cause	Solution
You processed the time tracking entry after you moved the worker to the new pay group.  You ended the previous job for the worker in the previous period. You then added a time tracking entry for the worker, making it retroactive with an effective date in the prior period. The worker is technically no longer eligible for review in the prior pay group during the current period.	Run an ad hoc integration event for the worker either: <ul style="list-style-type: none"> <li>• For the prior period and prior pay group to capture the time tracking entry.</li> <li>• With the LSRD prior to the pay group transfer (the effective range can be after the time entry effective date).</li> </ul>

### Troubleshooting: Performance Issues in PECI

This topic provides strategies for diagnosing and resolving these Payroll Effective Change Interface (PECI) integration problems:

- Your integration is referencing a poor performing report field. [on page 1633](#)
- Your integration is referencing the Is Manager report field. [on page 1634](#)
- Your integration is referencing the Terminated (based on report date) report field. [on page 1635](#)
- Your integration is referencing dynamic rules but you don't have Dynamic Membership Rule Evaluation Optimization enabled. [on page 1635](#)
- Your integration is referencing the Job Classifications - Job Profile report field. [on page 1636](#)

#### Your integration is referencing a poor performing report field.

Cause: You configured 1 or more of these report fields in a calculated field that you used as a field override in PECI:

- Worker Events Completed
- Staffing History – All
- Staffing History – Approved
- Worker History

Solution: Create a calculated field that prompts for the *Worker* business process. Use this calculated field where the integration references the report field. Then apply the parameter and field override assignments so the integration can determine the prompt value during run time to achieve the best performance.

#### Steps

1. Access the Create Calculated Field task.

Enter these values:

Option	Description
Field Name	Worker Business Process Prompt
Business Object	<i>Global</i>
Function	<i>Prompt for Value</i>
Field Type	<i>Multi-Instance</i>
Business Object	<i>Worker Business Process</i>
Required check box	Select

Security: *Custom Field Management* domain in the System functional area.

2. Access the View Calculated Field report.

Select the poor performing calculated field from the Calculated Field prompt.

On the Where Used tab, find where the integration is referencing the poor performing calculated field.

Security: Custom Report Creation and Custom Field Management domains in the System functional area.

3. On your integration, replace the poor performing calculated field with the *Worker Business Process Prompt* calculated field.

4. Select Integration System > Configure Integration Field Overrides from the related actions menu of the integration system.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

5. To enter the parameter and field override assignments, navigate to 1 of these integration documents:

- Worker Status Data Section
- Personal Data Section
- Person Communication Data Section
- Additional Information

6. Add a new row on the Parameters grid with these values:

Option	Description
Name	Worker History
Data Type	<i>Worker Event History with Filter Parameters</i> (on the <i>Worker</i> business object)
Value Type	<i>Determine Value at Runtime</i>
Value	<i>Worker Event History with Filter Parameters</i>

7. Fill out the Transaction Types field on the External Parameter Assignment(s) section on the Parameters grid and click OK.

8. Select Integration System > Configure Integration Field Overrides from the related actions menu of the integration system again.

Navigate to the same integration document where you applied the field overrides and external parameter assignments.

On the Extended Fields grid, add a new row with *Worker Business Process Prompt* as the Value.

In the External Parameter Assignment(s) section of the Extended Fields grid, select these values:

Option	Description
Value Type	<i>Document Parameter</i>  Note: When you select <i>Document Parameter</i> as the value type, the integration doesn't support effective stack change detection logic when there are multiple changes effective in the processing period.
Value	<i>Worker History</i>

Your integration is referencing the Is Manager report field.

Cause: You configured the Is Manager report field in a calculated field that you used as a field override in PECI.

Solution: For the best performance, use the Role field in the Effective Stack Worker / Position Data Section / Assigned Role data section to identify if the worker is a manager after processing the integration.

### Steps

1. Access the View Calculated Field report.

Select the poor performing calculated field from the Calculated Field prompt.

On the Where Used tab, find where the integration references the poor performing calculated field.

Security: *Custom Report Creation* and *Custom Field Management* domains in the System functional area.

2. Select Integration System > Configure Integration Field Overrides from the related actions menu of the integration system and remove the poor performing calculated field.

3. Select Integration System > Configure Integration Attributes from the related actions menu of the integration system.

For the Organization Role for Position integration attribute, select *Manager* for the Value.

4. Select Integration System > Configure Integration Field Attributes from the related actions menu of the integration system.

Select the Include in Output check box for the Role field attribute in the Position Data Section / Assigned Role data section.

5. Run the integration and then use the Role field in the Effective Stack Worker / Position Data Section / Assigned Role data section to identify if the worker is a manager in the output file.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

### Your integration is referencing the Terminated (based on report date) report field.

Cause: You configured the Terminated (based on report date) report field in a calculated field that you used as a field override in PECI.

Solution: To avoid excluding workers, use the Terminated report field instead.

### Steps

1. Access the Edit Calculated Field task.

Select the calculated field from the Calculated Field prompt.

Security: *Custom Field Management* domain in the System functional area.

2. Replace any references of the Terminated (based on report date) report field with the Terminated report field.

### Your integration is referencing dynamic rules but you don't have Dynamic Membership Rule Evaluation Optimization enabled.

Cause: You have dynamic rules set up for your integration but haven't selected the Enable Dynamic Membership Rule Evaluation Optimization check box.

Solution:

### Steps

1. Access the Edit Tenant Setup - HCM task.

Security: *Set Up: Tenant Setup - HCM* domain in the System functional area.

2. Select the Enable Dynamic Membership Rule Evaluation Optimization check box under the Payroll Interface section.

## Your integration is referencing the Job Classifications - Job Profile report field.

Cause: You configured the Job Classifications - Job Profile report field in a calculated field that you used as a field override in PECI.

Solution:

### Steps

1. Access the Create Calculated Field task.

Security: *Custom Field Management* domain in the System functional area.

2. Enter these values:

Option	Description
Field Name	Worker Job Classifications
Business Object	<i>Position and Job - All Staffing Models</i>
Function	<i>Look up related value</i>
Lookup field	<i>Job Profile</i>
Return Value	<i>Job Classifications</i>

3. Access the View Calculated Field report, and select the poor performing calculated field on the Calculated Field prompt.

Security: *Custom Report Creation* and *Custom Field Management* domains in the System functional area.

4. On the Where Used tab, find where the integration references the poor performing calculated field.
5. Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
6. Replace the poor performing calculated field with the Worker Job Classifications calculated field.

## Payroll Interface Integration Command Center

### Setup Considerations: Payroll Interface Integration Command Center

You can use this topic to help make decisions when planning your configuration and use of the Payroll Interface Integration Command Center (ICC). It explains:

- Why to set it up.
- How it fits into the rest of Workday.
- Downstream impacts and cross-product interactions.
- Security requirements and business process configurations.
- Questions and limitations to consider before implementation.

Refer to detailed task instructions for full configuration details.

### What It Is

The Payroll Interface Command Center:

- Sends data to third-party systems in every 15 minutes based on one-time configurations

- Provides a centralized place to manage multiple Payroll Effective Change Interface (PECI) integration runs.

## Business Benefits

ICC enables you to automate and control data extraction and transfer to external systems for prioritized transaction types. It's also 1 central hub where you can:

- Access tasks to view, setup, and maintain configurations.
- View and manipulate the data queue of prioritized transactions across all ICC configurations.
- Manage data transferring down times.
- View audit reports and review completed integration events.

## Use Cases

You have multiple countries and multiple third-party payroll systems that you need to prioritize and transfer payroll data to and monitor.

Your batch file runs once a day, but you need to monitor for specific events, such as time offs, and send these events more frequently to your external system.

## Questions to Consider

Questions	Considerations
Can your external system accept multiple PECI output files a day?	ICC priority events send 1 worker per file and can send up to 100 files every 15 minutes. ICC batch event sends 1 file per pay group.
How many times a day do you have a scheduled integration batch run?	ICC enables you to schedule 1 batch run a day because it's managing both batch runs and priority runs. ICC runs priority runs every 15 minutes.
Do you have multiple PECI integration runs scheduled?	Disable scheduled integration runs when including the PECI integration in an ICC configuration. The ICC configuration incorporates a new schedule.
Do you need to prioritize certain transactions over others to your external payroll system?	<p>You can use the Manage Payroll Interface Integration Command Center Data Queue task on the Payroll Interface Integration Command Center dashboard to:</p> <ul style="list-style-type: none"> <li>See the priority order of queue items across multiple configurations.</li> <li>Who the integration will send in the next 15-minute priority event launch.</li> <li>Remove or override the priority of a queue item for a worker</li> </ul> <p>Every 15 minutes, the integration sends the top 100 workers among all configurations with the highest priority to the third-party vendor.</p>

## Recommendations

We recommend that you don't use integration schedules to schedule PECI integrations that you use in the ICC configurations. You can schedule integration batch runs within the ICC configurations.

## Requirements

You must have an integration system user (ISU) for the PECL integration. You must also have 1 ISU associated with the *Queue Populator* integration for ICC. This ISU is different from the ISU that's associated with the PECL integration.

Enable this integration attribute and service on the PECL integration that you want to use within an ICC configuration:

- *Enable Data Changes Audit for Faceted Search* integration attribute.
- *Payroll Effective Change Interface / Payroll Interface Integration Command Center* integration service.

The PECL integration that you configure ICC for must not have any scheduled batch runs outside of the ICC configuration schedule.

## Limitations

You can only:

- Have up to 25 active ICC configurations.
- Use the PECL integration with ICC.

ICC doesn't support the:

- *Additional Primary Integration* integration attribute.
- *Event Driven Integration (EDI)* integration service.
- *Merge Files Launch Parameters* integration service.

If you monitor for Hire transactions:

- Set the Assign Pay Group step within the *Hire* business process or set it as the completion step.
- And you use the Hire Data Checkpoint for Third Party System step on the *Hire* business process, the hire transaction creates a queue item but the integration doesn't return results in the priority run if the business process doesn't reach the step yet. The integration reports the hire on the next batch run after the step completes.

## Tenant Setup

No impact.

## Security

Domains	Considerations
<p><i>Business Process Administration</i> domain in the System functional area.</p> <p>These domains in the Integration functional area:</p> <ul style="list-style-type: none"> <li>• <i>Integration Build</i></li> <li>• <i>Integration Debug</i></li> <li>• <i>Integration Event</i></li> <li>• <i>Set Up: Payroll Interface</i></li> <li>• <i>Set Up: Payroll - Pay Group Specific</i></li> </ul>	Create and assign 1 Integration System User (ISU) with Get and Put access to these domains.
<p>These domains in the Integration functional area:</p> <ul style="list-style-type: none"> <li>• <i>Integration Build</i></li> <li>• <i>Integration Configure</i></li> <li>• <i>Integration Event</i></li> </ul>	<ul style="list-style-type: none"> <li>• Enable the integration service on your PECL integration.</li> <li>• Configure the integration attribute on your PECL integration.</li> </ul>

Domains	Considerations
<i>Manage: Payroll Interface Integration Command Center Data Queue</i> domain in the Payroll Interface functional area.	Enables specific users to view, prioritize, or remove data queue items on the Manage Payroll Interface Integration Command Center Data Queue task.

## Business Processes

No impact.

## Reporting

Report	Considerations
Payroll Interface Integration Command Center Activities Audit Report	View ICC configurations and activities.
Payroll Interface Integration Command Center Data Audit Report	View data ICC sent to the external system.

## Integrations

Use the PECI integration to create ICC configurations.

## Connections and Touchpoints

Workday offers a Touchpoints Kit with resources to help you understand configuration relationships in your tenant. Learn more about the [Workday Touchpoints Kit](#) on Workday Community.

## Steps: Set Up Payroll Interface Integration Command Center

### Prerequisites

Stop any existing scheduled *Payroll Effective Change Interface* integration batch runs for the integration you want to enable for Payroll Interface Integration Command Center (ICC).

### Context

ICC provides tasks and reports that enable you to automate and control data extractions and transfers to external payroll systems for prioritized transactions using the *Payroll Effective Change Interface* integration.

### Steps

- Access the Edit Tenant Setup - Integrations task.  
In the Integration Subscription Settings section, clear the Disable Integration Subscriptions check box.  
*Security: Set Up: Tenant Setup - Integrations* domain in the System functional area.
- Create a *Payroll Effective Change Interface* integration with 1 associated integration system user (ISU).  
See [Steps: Set Up Payroll Effective Change Interface](#).
- [Create Integration System User for ICC](#) on page 1640
- [Set Up Payroll Effective Change Interface Integration Services](#)  
Enable the *Payroll Effective Change Interface / Payroll Interface Integration Command Center* integration service.
- [Configure Payroll Effective Change Interface Integration Attributes and Maps](#)  
Enable the *Enable Data Changes Audit For Faceted Search* integration attribute.

6. [Steps: Configure Payroll Interface Integration Command Center on page 1641.](#)
7. [\(Optional\) Configure Data Transferring Activity on page 1643.](#)

When your third-party system has maintenance windows that prevent you from sending data, you can schedule down-time for the integrations to pause and resume.

#### Related Information

#### Examples

[2023R2 What's New Post: Payroll Interface Integration Command Center](#)

### Create Integration System User for ICC

#### Prerequisites

Security: *Integration Security* domain in the Integration functional area.

#### Context

You can create an integration system user (ISU) for the Payroll Interface Integration Command Center (ICC) dashboard, enabling you to assign the ISU to a security group with permissions to access all tasks and reports ICC requires.

#### Steps

1. Access the Create Integration System User task.  
Workday automatically populates the value in the Session Timeout Minutes with zero to prevent the integration system user session from expiring. Expired sessions can cause the integration to stop before it successfully completes.
2. From the related actions menu of the system user you created, select Security Profile > Assign Integration System Security Groups.
3. From the Integration System Security Group to Assign prompt, select a security group with Get and Put access to the *Business Process Administration* domain in the System functional area and these domains in the Integration functional area:
  - *Integration Build*
  - *Integration Debug*
  - *Integration Event*
  - *Set Up: Payroll Interface*
  - *Set Up: Payroll - Pay Group Specific*
4. From the related actions menu of your integration system, select Workday Account > Edit.
5. From the Workday Account prompt, select your integration system user.  
Workday automatically populates the locale and display language for integration data if you don't make changes to these sections:
  - Account Preferences
  - Global Preferences
  - Search Preferences
 An outbound integration sends data in the preferred language and an inbound integration saves data in the preferred language.
6. [\(Optional\) If the integration system user authenticates with a username and password:](#)
  - a. Access the Maintain Password Rules task.
  - b. On the System Users Exempt from password expiration field, add your integration system user.

## Steps: Configure Payroll Interface Integration Command Center

### Prerequisites

Configure a *Payroll Effective Change Interface* (PECI) integration with these options:

- Integration attribute *Enable Data Changes Audit For Faceted Search*. See: [Configure Payroll Effective Change Interface Integration Attributes and Maps](#) on page 1534.
- Integration service *Payroll Effective Change Interface / Payroll Interface Integration Command Center*. See: [Set Up Payroll Effective Change Interface Integration Services](#) on page 1532.
- No scheduled batch runs.

Security: *Set Up: Tenant Setup - Worklets* domain in the System functional area and these domain in the Payroll Interface functional area:

- *Set Up: Payroll Interface*
- *Manage: Payroll Interface Integration Command Center Data Queue*

### Context

You can configure the Payroll Interface Integration Command Center (ICC) dashboard with tasks and reports that enable you to:

- Create ICC configurations.
- Prioritize the data that you send for each configuration.
- Send prioritized data in near real-time using the PECI integration.

### Steps

1. [Create Integration System User for ICC](#) on page 1640.

Create and assign 1 integration system user (ISU) to the PECI integration with *Get* and *Put* access to these domains:

- *Set Up: Payroll - Pay Group Specific* in the Core Payroll functional area.
- *Set Up: Payroll Interface* in the Payroll Interface functional area.

Grant access to the ISU with at least 1 of these domains in the Integration functional area:

- *Integration Build*
- *Integration Event*
- *Integration Process*

Note: You can associate only 1 ISU with the

*Payroll Interface Integration Command Center Queue Populator* integration for the Payroll Interface Integration Command Center (ICC). This ISU isn't the same ISU associated with the PECI integration.

2. [Configure Dashboard Content](#).

As you edit the ICC dashboard, consider:

Option	Description
Configurable By User	Clear the check box.
Prompt Set	Select <i>Payroll Interface Integration Command Center Prompt Set</i> .
Worklets	Add a row for <i>Payroll Interface Integration Command Center Run Status</i> .
Menu Sections	Add rows with these tasks:

Option	Description
	<ul style="list-style-type: none"> <li>• <i>Manage Payroll Interface Integration Command Center Configurations and Activities</i></li> <li>• <i>Manage Payroll Interface Integration Command Center Data Queue</i></li> <li>• <i>Payroll Interface Integration Command Center Activities Audit Report</i></li> <li>• <i>Payroll Interface Integration Command Center Data Audit Report</i></li> <li>• <i>View Integration System for integration Command Center Queue Populator</i></li> </ul>

3. On the Payroll Interface Integration Command Center dashboard, access the Manage Payroll Interface Integration Command Center Configurations and Activities task.

Note: When you access the Manage Payroll Interface Integration Command Center Configurations and Activities task for the first time, you must enter an integration system user (ISU).

Workday creates the *Payroll Interface Integration Command Center Queue Populator* integration with this ISU.

As you complete the task, consider:

Option	Description
Integration System	Select the <i>Payroll Effective Change Interface</i> integration system that you want to schedule runs through ICC. Stop all existing scheduled batch runs for the integration you select.
Organization	Specify 1 or more payroll interface pay groups for ICC to run for the Integration System you specify. The ICC <i>Queue Populator</i> integration monitors the transactions that you select for the Worker Event Types for these pay groups.
Pay Period Selection Option	<p>When you select:</p> <ul style="list-style-type: none"> <li>• <i>Use Pay Period for Current Date</i>, Workday uses the pay period based on the pay period that the current date lands, regardless of the pay period status in the pay group.</li> <li>• <i>Use Earliest Open Pay Period</i>. Workday uses the earliest pay period with an <i>In Progress</i> status, regardless of whether it has a future date. When no pay periods are in progress, Workday selects the earliest <i>Not Yet Started</i> pay period.</li> </ul>
Prioritize Events	Specify the transactions that you need to monitor in near real-time. ICC sends workers with these transactions for the priority runs. For any event types that you don't include, ICC picks up workers with those transactions during the next batch run.

Option	Description
Start Time	Workday doesn't start batch runs before this time, but could start up to 15 minutes after. Workday waits to start batch runs if a priority run is still in progress.
Enabled	Enable or disable the configuration by selecting the related actions menu of the configuration. Workday selects this check box after you enable the configuration.

4. (Optional) From the related actions menu of the configuration, access the Manage Data Transferring Down Time task.

Set up data transferring downtime.

5. (Optional) Access the Maintain Dashboards task.

Edit the Payroll Interface Integration Command Center dashboard.

In the Prompts section, select a Default Type and Default Value for each dashboard prompt field.

## Configure Data Transferring Activity

### Prerequisites

- Set up the Payroll Interface Integration Command Center dashboard.
- Security: *Set Up: Payroll Interface* domain in the Payroll Interface functional area

### Context

When your third-party system has maintenance windows that prevent you from sending data, you can use the Data Transferring Down Time task from the related actions menu of the configuration to schedule down-time for the integrations to pause and resume.

When you create a data transferring activity to pause priority runs for the configuration, you can:

- Launch an ad hoc run for an integration system that you enabled for the Payroll Interface Integration Command Center dashboard.
- Update the workers' Last Successful Run Date.

### Steps

1. On the Payroll Interface Integration Command Center dashboard, access the Manage Payroll Interface Integration Command Center Configurations and Activities task.
2. From the related actions menu of the configuration, select Data Transferring Down Time > Manage.
3. Click Create.
4. As you select an option for the Data Transferring Activities field, consider:

Option	Description
Batch Runs	Workday won't run batch runs at the specified start time.
Priority Runs	Workday won't run priority runs every 15 minutes.
Queue Activity	Workday won't add queue items to the queue.

## Concept: Payroll Interface Integration Command Center

### Multiple Configurations

The Payroll Interface Integration Command Center dashboard is a central hub, where you can:

- View, set up, and maintain configurations.
- View and manipulate the data queue of prioritized transactions across all ICC configurations
- Manage data-transferring downtimes
- View audit reports
- Get a look into recent integration events

You can create up to 25 configurations using a *Payroll Effective Change Interface* (PECI) integration with multiple pay groups so you can launch each integration simultaneously.

Based on the worker events you prioritize, the integration sends the top 100 workers among all configurations every 15 minutes to the third-party system.

Workday sends the data to the third-party system based on the business process that you set up in the PECI integration system you configured for the Payroll Interface Integration Command Center (ICC).

### View Configuration Status

With ad-hoc and scheduled downtimes, you can check the state of a configuration by accessing the View Configuration as of Date Time report from the related actions menu of the configuration. You can use this report to check the configuration to troubleshoot any questionable behavior. Example: A transaction that you prioritized isn't showing like you expected. You access the View Configuration as of Date Time report and see that another admin paused the queue activity. By checking the configuration, you can see that another admin paused the queue activity. You see that because another admin paused the queue activity, ICC never sent the transaction to the data queue. ICC then picks up the transaction in the later batch run as opposed to a priority run.

### Data Queue Management

Priority Events displays:

- The priority order of queue items across multiple configurations.
- The estimated time until the ICC scheduler launches the next priority event.
- Any currently in-progress priority events.

Batch Events displays any ICC batch events that are in progress.

Data Queue displays the priority order of queue items across multiple configurations. You can remove or override a priority for a worker as well as expand details for a more in-depth look at the priority transactions the worker has.

### Data Transferring Activity Behavior

Queue Activity - ICC monitors the prioritized events, and Workday sends the event to the ICC data queue based on the priority.

Priority Runs Activity - Every 15 minutes, ICC launches the top 100 workers with transactions based on priority from the data queue.

Batch Runs Activity - Batch runs launch based on the option you select for the Schedule Batch Run field on the configuration. The Start Time that you set in the configuration is the minimum start time. ICC runs the next batch 15 minutes after the last priority run. Example: The batch start time is 10:00 AM, but the integration ran the last priority run at 9:55AM. The integration runs the next batch run in the next 15 min at 10:10AM.

## Integration Launch Parameters

You can specify launches and updates when you select 1 of these options on the Integration Command Center Run Type for the *Payroll Effective Change Interface / Payroll Interface Integration Command Center* service:

Option	Description
Batch Run - For Integration Command Center use only	ICC launches primary batch events within 15 minutes of the specified start time for the pay groups associated with the ICC configuration batch run schedule. ICC updates the Pay Group Last Extract Date.
Priority Run - For Integration Command Center use only	ICC launches primary priority events every 15 minutes for the top 100 prioritized workers in theData Queue. ICC updates the Worker Last Successful Run Date when it reports a worker in the output file.
No LSRD Update - Last Successful Run Date will not be updated	The ICC scheduler doesn't use this option. Use this option for nonprimary ad-hoc events when the integration doesn't update the Worker Last Successful Run Date.
LSRD Update - Last Successful Run Date will be updated	The ICC scheduler doesn't use this option. Use this option for nonprimary ad-hoc events when the integration updates the Worker Last Successful Run Date. Set up a data transferring down time to pause priority runs to use this option.

## Last Successful Run Date

Workday updates the last successful run date (LSRD) based on the last priority run or batch run.

Example: Pay Group A has an LSRD of 2023-05-25 12:30pm. On 2023-05-26 at 12:10, 105 workers in Pay Group A have prioritized transactions. On 2023-05-26 at 12:15 ICC sends the top 100 workers with a priority run and gives the workers with changes a Worker LSRD of 2023-05-26 at 12:15.

Example with a 11:30 Scheduled Batch Run	Example with a 12:00 Scheduled Batch Run
On 2023-05-26 at 11:30, ICC has a scheduled batch run for Pay Group A. ICC only looks at the top 100 workers who previously reported changes to their LSRD of 2023-05-26 at 11:15. ICC sends the rest of Pay Group A including the 5 remaining prioritized workers by capturing all changes after the pay group LSRD of 2023-05-25 at 11:30.	On 2023-05-26 at 11:30, ICC sends the remaining 5 prioritized workers in a priority run and adds an LSRD to those workers of 2023-05-26 11:00. At 12:00, ICC runs the scheduled batch run for all of Pay Group A with an LSRD of 2023-05-25 11:30, but only considers transactions after 2023-05-26 11:15 for the 100 workers and 2023-05-26 11:30 for the 5 workers.

## Event-Driven Integration

### Setup Considerations: Event-Driven Integration for Third-Party Payroll

You can use this topic to help make decisions when planning your configuration and use of the *Event-Driven Integration for Third-Party Payroll* service. It explains:

- Why to set it up.
- How it fits into the rest of Workday.
- Downstream impacts and cross-product interactions.

- Security requirements and business process configurations.
- Questions and limitations to consider before implementation.

Refer to detailed task instructions for full configuration details.

## What It Is

You enable the *Event-Driven Integration for Third-Party Payroll* integration service on your Payroll Effective Change Interface (PECI) integration to send information on hires and terminations to your third-party payroll vendor automatically.

## Business Benefits

Event-driven integration for third-party payroll helps improve efficiency and reduce worker-level errors by enabling:

- The third-party payroll vendor to validate received information and return any errors to you.
- You to correct the errors and resubmit the corrections immediately .

## Use Cases

- You need immediate payroll processing information for a termination so you can comply with regulations.
- You need to report new hires to the government on the same day of hire. You enable event-driven integration for third-party payroll to help comply with government regulations.

## Questions to Consider

Do you need immediate information on hires and terminations sent to your third-party payroll vendor?

If you don't need to send this information immediately to your third-party payroll vendor, you can wait for your scheduled PECI integration.

## Recommendations

Test your delivery and retrieval endpoints to help ensure that you can successfully pass data between Workday and your external payroll vendor.

## Requirements

Enable the *Event Driven Integration for Third-Party Payroll* integration service on a PECI integration.

Configure a REST API client to enable your external payroll vendor to update Workday with the processing status of hires and terminations.

To use event-driven integration, you or your external payroll vendor must build 2 endpoints to:

- Deliver the hire and termination information to the external payroll vendor.
- Retrieve the status and errors from the external payroll vendor.

## Limitations

When an event-driven integration is in progress for a worker, the next primary PECI integration doesn't pick up changes for that worker.

To ensure efficient processing, the primary PECI integration can process up to 500 worker events per hour through event-driven integration.

Event-driven integrations don't:

- Process events initiated by Mass Operation Management tasks.
- Pick up future new hires if their hire date is beyond the current period.

## Tenant Setup

Access the Edit Tenant Setup – Security task to select the OAuth 2.0 Clients Enabled check box.

## Security

Configure these domains in the Payroll Interface functional area:

Domain	Consideration
<i>Set Up: Payroll Interface</i> in the Payroll Interface functional area.	<ul style="list-style-type: none"> <li>View the primary integration system associated with your pay group.</li> <li>Configure the integration service and integration attributes on the PECL integration.</li> <li>Create external payroll vendor mapping.</li> <li>Configure event-driven integration steps.</li> <li>Configure a REST API client.</li> </ul>
These domains in the System functional area: <ul style="list-style-type: none"> <li><i>Business Process Administration</i></li> <li><i>Manage: Business Process Definitions</i></li> </ul>	Add the event-driven integration steps to the Hire and Termination business processes.

## Business Processes

To use the integration service, you must configure steps on the Hire or Termination business process to:

- Transmit employee data to third-party payroll.
- Review event-driven integration for third-party payroll.

## Reporting

Report	Description
Maintain Errors from Third-Party Payroll	View and correct errors that your third-party payroll vendor returns for event-driven integrations.
Workers Not Processed by PECL Events	View workers that the event-driven integration didn't process yet because there are in-process or failed event-drive integration steps.

## Integrations

You enable the integration service on a PECL integration.

## Connections and Touchpoints

Workday offers a Touchpoints Kit with resources to help you understand configuration relationships in your tenant. Learn more about the [Workday Touchpoints Kit](#) on Workday Community.

## Steps: Set Up Event-Driven Integration for Third-Party Payroll

### Prerequisites

Successfully configure a *Payroll Effective Change Interface* connector integration for your pay group.

See [Steps: Set Up Payroll Effective Change Interface](#).

Security: Set Up: Payroll Interface domain in the Payroll Interface functional area

## Context

The *Event Driven Integration for Third-Party Payroll* integration service enables you to configure business process steps that send information from Workday to your external payroll vendor automatically. Your payroll vendor validates the information and returns any errors to you. You can then correct the errors and resubmit the corrections immediately, saving time and money.

Example: You hire, rehire, or terminate an employee. Event-driven integration sends that information to your external payroll vendor through the *Hire* or *Termination* business processes. The payroll vendor confirms receiving the information successfully or sends back errors for you to correct.

## Steps

1. Access the Maintain Payroll Integration Systems for Pay Group task.  
Verify that the primary integration system associated with your pay group is a *Payroll Effective Change Interface* connector.
2. From the related action menu on your integration, select Integration System > Configure Integration Services.  
Select the Enabled check box for Payroll Effective Change Interface - Event Driven Integration for Third Party Payroll.
3. From the related action menu on your integration, select Integration System > Configure Integration Attributes.

Configure the external payroll vendor. As you complete the task, consider:

Option	Description
External Payroll Vendor	Select your vendor for event-driven integration. If it's not available, access the Create External Payroll Vendor task to create a vendor and select <i>Event Driven Integration</i> in the Features prompt.
Pay Period Selection Option	Select the pay period to use. Workday automatically populates <i>Use Earliest Open Pay Period</i> .
PGP Public Key	Encrypt the integration payload delivered to your vendor with this key.

4. [Create External Payroll Vendor Mapping](#) on page 1413.

Map your Workday tenants to the target tenant names from your external payroll vendor.

Note: If you've completed the External Payroll Vendor, Environment, and Public Private Key Pairs configuration for local payroll data, you don't need to repeat it for event-driven integration.

Configure the Feature Configuration grid.

Option	Description
Feature	Event Driven Integration
Attribute Configuration	Add rows for the Delivery Endpoint and the Retrieval Endpoint. Enter the endpoint values.

5. Configure event-driven integration steps for the *Hire* and *Termination* business processes for the pay group.

See [Steps: Add Event-Driven Integration for Third-Party Payroll Steps to Business Processes](#) on page 1650.

6. Configure a REST API client.

This configuration enables your external payroll vendor to send the processing status for hires and terminations in the vendor system to Workday.

See [Steps: Set Up API Client for Event-Driven Integration Payroll Vendor Response](#) on page 1649.

## Result

After the *Hire* or *Termination* business process *Completion* step, Workday sends the employee information to your external payroll vendor. The owner of the *Review Event Driven Integration* step receives a successful completion message or notification of errors to correct in *My Tasks*. Correct errors and resend to your external payroll vendor.

## Next Steps

- Access the *Maintain Errors from Third-Party Payroll* report to view and correct errors your external payroll vendor returns for event-driven integrations.
- Access the *Workers Not Processed by PECI Events* report. Use this report to view workers that event-driven integration didn't process yet or with in-process or failed event-driven integration steps.
- Access the *GET* operation on the *eventDrivenIntegrationVendorResponse* REST API for a copy of the vendor response.

### Tasks

[Steps: Set Up Payroll Effective Change Interface](#) on page 1526

[Register API Clients](#)

### Reference

[The Next Level: Third-Party Payroll](#)

## Steps: Set Up API Client for Event-Driven Integration Payroll Vendor Response

### Prerequisites

Successfully configure event-driven integration for a *Payroll Effective Change Interface* integration for your pay group.

See [Steps: Set Up Event-Driven Integration for Third-Party Payroll](#).

Ensure that the security configuration for your Workday tenant has the OAuth 2.0 Clients Enabled option selected.

### Context

You must configure REST API client in Workday before you can use the *Event Driven Integration for Third-Party Payroll* integration service.

Your third-party payroll vendor can send Workday a request with the status of hires and terminations sent through event-driven integration. You configure a REST API client in Workday to receive this request.

### Steps

1. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Set Up: Payroll Interface (Vendor Response for Event-Driven Integration)* domain in the Payroll Interface functional area.

See [Steps: Grant Integration or External Endpoint Access to Workday](#).

2. Register an API client for event-driven integration in Workday and manage the refresh tokens for the integration system user.

Ensure that you configure these settings:

- Select Non-Expiring Refresh Token.
- Ensure that the Disabled check box is clear.
- For Scope (Functional Areas), select Payroll Interface.
- Ensure that all other options and check boxes are clear.

[See Register API Clients for Integrations.](#)

3. From the related action menu on the API client for event-driven integration, select API Client > Manage Refresh Tokens for Integrations.

Ensure that you configure these settings:

- For Workday Account, select the ISU you created.
- For Generate New Refresh Token, select True.

[See Register API Clients for Integrations.](#)

4. Securely send these API client values to your external payroll vendor.

- Client ID.
- Client Secret.
- Refresh Token.

5. Access the View API Clients report.

On the API Clients for Integrations tab, locate these endpoints for the API client for event-driven integration:

- Workday REST API Endpoint.
- Token Endpoint.
- Authorization Endpoint.

Share these endpoints with your external payroll vendor.

#### Related Information

##### Reference

[Asynchronous Third Party Payroll Event Driven Integration](#)

### Steps: Add Event-Driven Integration for Third-Party Payroll Steps to Business Processes

#### Prerequisites

Enable the *Payroll Effective Change Interface - Event Driven Integration for Third Party Payroll* integration service for your PECL integration.

Security: These domains in the System functional area.

- *Set Up: Payroll Interface* in the Payroll Interface functional area.
- *Business Process Administration and Manage: Business Process Definitions*

#### Context

When you add the event-driven integration steps to the *Hire* and *Termination* business processes for a pay group:

- Workday transmits employee data immediately to your external payroll system.
- You create and update hire and termination data in the external payroll system more quickly.

Workday recommends that you avoid configuring business process steps with audited entry conditions. This type of configuration can cause a situation where:

- The primary integration runs after the event completion date.
- Event-driven integration doesn't run because of condition rules.

## Steps

1. From the related action menu on the *Hire* and *Termination* business processes for the pay group, select Business Process > Edit Definition.
2. Add the *Transmit Employee Data to Third Party Payroll* service step to these business processes:
  - *Hire*: Add the service step after the *Assign Pay Group* action step and after the *Completion* step.
  - *Termination*: Add the service step after the *Completion* step.
3. (Optional) Configure the *Transmit Employee Data to Third Party Payroll* service step to skip event-driven integration for future-dated transactions.  
Set up condition rules with the *Is Event Driven Integration Transaction Future Effective* report field.
4. Access the Create Business Process Definition (Default Definition) task to create the default definition required for the integration. As you complete the task, consider:

Option	Description
Business Process Type	Select <i>Review Event Driven Integration for Third Party Payroll</i> .
Business Process Steps	Leave this grid empty.

5. Select Business Process Security Policy > Edit from the related actions menu of *Review Event Driven Integration for Third Party Payroll* business process type.  
Select the security groups that can be assigned in the *Review Event Driven Integration for Third-Party Payroll* step.  
See [Edit Business Process Security Policies](#).
6. For these options, select the security groups to receive the *Review Event Driven Integration for Third Party Payroll* notification in My Tasks. Example: *Payroll Interface Administrator/Partner* security group.
  - *Who Can Start the Business Process*
  - *Who Can Do Actions on Entire Business Process*

Note: You can configure role-based security groups for the *Review Event Driven Integration for Third Party Payroll* business process step based on organization types, such as pay groups. Example: Event-driven integration triggers the *Review Event Driven Integration for Third Party Payroll* step for payroll errors returned by an external payroll vendor. Based on pay group roles such as Payroll Partner:

- Tasks in My Tasks for employees in the German pay group go to the Payroll Partner for the German pay group.
- Tasks in My Tasks for employees in the Australian pay group go to the Payroll Partner for the Australian pay group.

See [Create Role-Based Security Groups](#).

7. Add the *Review Event Driven Integration for Third Party Payroll* action step right after the *Transmit Employee Data to Third Party Payroll* service step.
8. (Optional) Create condition rules to send notifications based on the status of the integration. Use these report fields to retrieve the *Event Driven Integration* status.

Option	Description
Overall Status	Provides the processing status of the employee information in the external payroll system. Example: Create a condition rule with this report field to send a notification when the

Option	Description
	external payroll system returns a <i>Successfully sent to Payroll</i> status for an employee update.
Skip Review	Indicates whether the payroll vendor requests to skip the <i>Review Event Driven Integration for Third-Party Payroll</i> step.  Example: Create a condition rule with this report field to send a notification when Event Driven Integration skips the <i>Review Event Driven Integration for Third-Party Payroll</i> step.
Skip Review Reason	Indicates why the payroll vendor requests to skip the <i>Review Event Driven Integration for Third-Party Payroll</i> step.  Example: Add this report field to the condition rule in the Skip Review example to include a reason for skipping the step, such as Payroll is Locked.

9. Add a notification to the *Hire* or *Termination* business process.

10.(Optional) Add the condition rules to the notification. Set up the notification to trigger:

- On entry into a required step.
- After the *Review Event Driven Integration for Third Party Payroll* step.

11.(Optional) Access the Create Business Process Definition (Default Definition) task to create a default business process definition to send correction and rescind events.

Option	Description
Business Process Type	Select <i>Event Driven Integration Process Event</i> .
Business Process Steps	<ul style="list-style-type: none"> <li>• <i>Transmit Employee Data to Third Party Payroll</i></li> <li>• <i>Review Event Driven Integration for Third Party Payroll</i></li> </ul>

- Mark the initiation step in the business process as a completion step.
- Add the Review step to ensure that event-driven integration displays any errors that occur during a hire or correction.

Note: The event-driven integration only retriggers for corrections made on the top-level Hire event. This retrigger doesn't include corrections made to subprocesses, such as the Propose Compensation Hire business process.

#### Related Information

##### Concepts

[Setup Considerations: Role-Based Security Groups](#)

##### Tasks

[Steps: Configure Business Process Definitions](#)

#### Concept: Event-Driven Integration for Third-Party Payroll

The *Event-Driven Integration for Third-Party Payroll* integration service sends hires and terminations to your third-party payroll vendor instantly instead of through primary *Payroll Effective Change Interface* (PECI) integrations. When you enable this service on your PECI integration, you can:

- Configure business process steps on the *Hire* and *Termination* business processes to send these worker events from Workday to your third-party payroll vendor automatically.
- Send future-dated hires and terminations automatically.
- Send corrections and rescinds for hires and terminations immediately.

Note: Workday also provides event-driven integration support for the *Hire\_Employee* operation in the *Staffing* web service (version 35.2).

When Workday successfully processes any of the configured events, event-driven integration sends the updates to your third-party payroll vendor. Your third-party payroll vendor validates the information and returns any errors to you. You can correct the errors and resubmit the corrections immediately, saving time and money.

When event-driven integration is in progress for a worker, the next primary PECL integration doesn't pick up changes for that worker. When the event-driven integration steps have completed, the primary PECL integration starts picking up changes for the worker.

Example: You hire several employees for a pay group. Workday sends these hires to your third-party payroll vendor when the *Hire* business process is configured with event-driven integration. The third-party payroll vendor reports that the third-party payroll system saved the hires successfully. Before the next primary PECL run, 1 newly hired employee enters a mailing address change in Workday. The next primary PECL integration run for that pay group:

- Detects that the mailing address change for the employee occurred after event-driven integration sent the hire event to the third-party payroll vendor.
- Picks up the mailing address change and sends it to the third-party payroll vendor.

The third-party payroll vendor now has the same hire and mailing address information as Workday.

## Event-Driven Integration Status

These sources can help you understand the status of event-driven integration.

- The configuration of the *Review Event-Driven Integration for Third-Party Payroll* step can display notifications for these situations:
  - Errors extracting a new hire or termination in Workday.
  - Failures during processing in the payroll vendor.
- The Error Report link to the Diagnostic audit of the integration event.

The integration returns the *Vendor\_Response.json* file on the Output Files tab when the *Event-Driven Integration* event completes. The response contains these values from your external payroll vendor.

Field	Value
setLSRD	Indicates whether the integration successfully updated the worker in the third-party payroll system: <ul style="list-style-type: none"> <li>If True, the integration updated the worker. Subsequent integration runs don't send this change.</li> <li>If False, Workday sends the original worker data again during the next integration. The next integration could be an Event-Driven Integration or the next primary PECL integration.</li> </ul>
relaunchable	Indicates whether you can submit the worker data again after making changes.

Field	Value
	<ul style="list-style-type: none"> <li>If True, you can see the Resend to Payroll button in the <i>Review Event Driven Integration for Third Party Payroll</i> business process step.</li> <li>If False, the Resend to Payroll button isn't available in the business process step. You can't resubmit the worker data.</li> </ul>
skipReview	<p>Indicates whether to present the <i>Review Event Driven Integration for Third Party Payroll</i> step for the transaction sent through Event-Driven Integration.</p> <ul style="list-style-type: none"> <li>If True, the integration doesn't present a <i>Review Event Driven Integration for Third Party Payroll</i> step for transactions.</li> <li>If False, the <i>Review Event Driven Integration for Third Party Payroll</i> step displays the payroll messages returned by the vendor.</li> </ul>

## Troubleshooting: Event-Driven Integration for Third-Party Payroll

### No notification when Event-Driven Integration is successful.

Cause: The *Payroll Effective Change Interface* (PECI) integration automatically sends a notification for errors but not for successful integrations.

Solution: Create a notification for successful Event-Driven Integration.

See [Steps: Add Event-Driven Integration for Third-Party Payroll Steps to Business Processes](#) on page 1650.

### Event-Driven Integration doesn't pick up future effective transactions.

Cause: Event-Driven Integration doesn't pick up future transactions when:

- The transaction date is beyond the current period.
- You don't configure the *Number of Additional Pay Periods* integration attribute to include additional periods.

Solution:

#### Steps

Security: *Integration Configure* domain in the Integration functional area.

- From the related actions menu of the *Payroll Effective Change Interface* integration configured for Event-Driven Integration, select *Integration System > Configure Integration Attributes*.
  - Set the *Number of Additional Pay Periods* attribute for the additional pay periods you want.
- Event-Driven Integration picks up future transactions with dates within the additional periods.

### Unable to view Resend to Payroll.

The notification for an *Event-Driven Integration* event contains a *Review Event Driven Integration for Third Party Payroll* step but not a Resend to Payroll button.

Cause	Solution
You try to run multiple <i>Event-Driven Integration</i> events for the same worker at the same time. Example: An <i>Event-Driven Integration for a Hire</i> event is in progress with a <i>Review Event Driven Integration for Third Party Payroll</i> step. While that event is in progress, a <i>Termination</i> event triggers another <i>Event-Driven Integration</i> event. These <i>Event-Driven Integration</i> events are in conflict.	Click the <i>Submit</i> button in the <i>Review Event Driven Integration for Third Party Payroll</i> steps for the worker's <i>Event-Driven Integration</i> events. Clicking this button closes the step but doesn't send any data. After you close the steps, the next primary PECL integration picks up the worker changes.
You try to run conflicting <i>Event-Driven Integration</i> events for a worker. Example: You changed a worker's hire date while a preceding <i>Event-Driven Integration</i> event is in progress for that worker. The preceding event has a <i>Review Event Driven Integration for Third Party Payroll</i> step but no <i>Resend to Payroll</i> button. The hire date change event has a <i>Review Event Driven Integration for Third Party Payroll</i> step with integration errors.	View the instructions in the <i>Review Event Driven Integration for Third Party Payroll</i> step for the second event.
You don't configure <i>Event-Driven Integration</i> to relaunch after correcting errors.	To check the configuration, locate the <i>Relaunchable</i> option in the <i>Vendor_Response.json</i> file, which is on the <i>Output Files</i> tab in the <i>Event-Driven Integration</i> event. When the <i>Relaunchable</i> option has a value of <i>False</i> , the <i>Resend to Payroll</i> button is hidden. Contact your payroll vendor to set the <i>Relaunchable</i> option to <i>True</i> .

### There's a 456 error code.

Solution: Verify that the hire effective date you select for the event-driven integration is within the pay period.

### Event-Driven Integration is skipped when its called using a web service.

Solution: Update your Hire Employee web service request to set *Enable\_Event\_Drive\_Integration\_for\_Third\_Party\_Payroll* to true.

### Troubleshooting: Event-Driven Integration for Hires

#### Event-Driven Integration didn't include new Hire.

You entered a Hire for a new worker but Event-Driven Integration didn't include the Hire event. The next scheduled PECL integration also didn't include the Hire event.

Cause: The notification for the *Event-Driven Integration* event contained a *Review Event-Driven Integration for Third Party Payroll* step for an error in the new Hire. You clicked the *Submit* button instead of the *Resend to Payroll* button. The *Review Event-Driven integration for Third Party Payroll* step closed without sending the correction through Event-Driven Integration.

Solution: If the next scheduled PECL integration hasn't run:

#### Steps

Security: *Worker Data: Historical Staffing Information* domain in the *Staffing* functional area.

1. Correct the error in the worker's Hire event.

2. From the related actions menu on the worker profile, select Worker History > View Worker History. Note the date of the original Hire event.
3. Access the Manage Payroll Integration System for Pay Group task.
4. Set the *Last Successful Run Date* for the worker to the date of the original Hire event.

**Solution:** If the next scheduled PECL integration has run, you can correct the worker's Hire event and send the corrected Hire in an ad hoc PECL integration. The ad hoc PECL automatically updates the worker's *Last Successful Run Date* so the next scheduled PECL doesn't include the Hire.

### Steps

1. Correct the error in the worker's Hire event.

*Integration Build* and *Integration Configure* domains in the Integration functional area.

2. Access the *Payroll Effective Change Interface* integration.
3. From the related actions menu, select Integration System > Configure Integration Services.
4. Enable the *Worker Last Successful Run Date - Launch Parameters* service.

*Integration Event* domain in the Integration functional area.

5. Launch the integration. For the Update Worker Last Successful Run Date launch parameter, select *Determine Value at Runtime*.

### Hire correction sent through Event-Driven Integration fails because a prior event failed.

**Cause:** Event-Driven Integration didn't send a *Hire Correction* event because a prior *Hire* or *Hire Correction* event didn't complete successfully.

**Solution:** Correct the initial *Hire* event, then send the *Hire Correction* event.

### Steps

1. Access the Review Event Driven Integration for Third Party Payroll notification.
2. Review the notification and take the corrective action for the prior *Hire* event.
3. Click Resend to Payroll in the Review Event Driven Integration for Third Party Payroll notification to send the corrected *Hire* event through event-driven integration.
4. Resend the failed *Hire Correction* through event-driven integration.
5. Verify that the *Hire Correction* event correctly updated the third-party system.

### Related Information

#### Tasks

[Steps: Automatically Update Worker Last Successful Run Date for Ad Hoc Integrations](#) on page 1530

[Steps: Manually Update Worker Last Successful Run Date for Ad Hoc Integrations](#) on page 1531

### Troubleshooting: Event-Driven Integration for Terminations

This topic provides strategies for diagnosing and resolving *Event-Driven Integration* problems for *Termination* events.

### Termination correction sent through Event-Driven Integration fails.

**Cause:** The *Termination Correction* event fails because a prior *Termination* or *Termination Correction* event didn't complete successfully.

**Solution:**

### Steps

1. Access the Review Event-Driven Integration for Third-Party Payroll report.  
Configure the *Review Event Driven Integration For Third Party Payroll* business process in the *Payroll Interface* and *Staffing* functional areas.

2. Review the error message and make the necessary correction for the preceding *Termination* or *Termination Correction* event.
3. Click Resend to Payroll in the Review Event Driven Integration For Third Party Payroll report to send the corrected *Termination* or *Termination Correction* event through Event-Driven Integration.
4. After the next batch integration run, verify that your original failed *Termination* or *Termination Correction* event has correctly updated the third-party system.

## Payroll Interface Configurable Output

### Setup Considerations: Payroll Interface Configurable Output

You can use this topic to help make decisions when planning your configuration and use of the *Payroll Interface Configurable Output* integration service. It explains:

- Why to set it up.
- How it fits into the rest of Workday.
- Downstream impacts and cross-product interactions.
- Security requirements and business process configurations.
- Questions and limitations to consider before implementation.

Refer to detailed task instructions for full configuration details.

### What It Is

The Payroll Interface Configurable Output enables you to configure and view a Payroll Effective Change Interface (PECI) output in an Excel file.

### Business Benefits

The Payroll Interface Configurable Output helps you efficiently find information about payroll changes.

### Use Cases

You're a payroll administrator, and you submit payroll for an individual worker or a small group of workers working in nonheadquarter countries. You use this integration service to:

- Find effective payroll changes for workers in an output file format that isn't XML.
- Enter manual changes into third-party payroll systems for small employee populations.

### Questions to Consider

Question	Considerations
How do you want to use the Excel output file?	<p>Use the Excel output file only to review and manually enter payroll data into downstream third-party payroll systems.</p> <p>If you find incorrect data in your Excel output file, make corrections in Workday and rerun the PECI integration.</p>
Do you review payroll data for multiple pay groups?	You can configure the integration to output a separate Excel output file for each pay group.
What kind of data do you want to enter manually into third-party payroll systems?	<p>Determine what data is included in your Excel output file through your layouts and definitions. You can select this data from the PECI integration to include in the Excel workbook:</p> <ul style="list-style-type: none"> <li>• Data sections</li> </ul>

Question	Considerations
	<ul style="list-style-type: none"> <li>• Event types</li> <li>• Fields</li> </ul>
When should you use only a PECL integration?	If you want to review payroll data for more than 5,000 workers, use a PECL integration to create an XML output file.

## Recommendations

To help avoid truncated or invalid labels in your Excel workbook, create a label for your payroll interface configurable output layout:

- With less than 31 characters.
- Without these characters: : \ / ? \* [ or ].

To help ensure that Workday creates an output file for each pay group in your PECL integration:

- Create a separate Payroll Interface Configurable Output integration system for each pay group that you want to include in your Excel output file.
- Use the name of the pay group as the Input Document tag.

## Requirements

- Configure a Payroll Effective Change Interface (PECI) integration for your pay group.
- Enable the Payroll Interface Configurable Output integration service on the PECL integration.

## Limitations

The Payroll Interface Configurable Output functionality doesn't support:

- Creating an Excel output for more than 5,000 workers.
- Configuring field overrides.

## Tenant Setup

No impact.

## Security

Domain	Considerations
<ul style="list-style-type: none"> <li>• <i>Set Up: Payroll - Pay Group Specific</i> domain in the Core Payroll functional area</li> <li>• <i>Set Up: Payroll Interface</i> domain in the Payroll Interface functional area</li> </ul>	Create layouts and definitions for the Excel output file.
These domains in the Integration functional area: <ul style="list-style-type: none"> <li>• <i>Integration Build</i></li> <li>• <i>Integration Configure</i></li> <li>• <i>Integration Event</i></li> <li>• <i>Integration Process</i></li> </ul>	<ul style="list-style-type: none"> <li>• Enable the integration service on your PECL integration.</li> <li>• Configure integration attributes.</li> <li>• Create a payroll configurable output integration system.</li> <li>• Launch a PECL integration.</li> </ul>
• <i>Reports: Pay Calculation Results for Pay Group (Results) - CAN</i> in the CAN Payroll functional area.	Access the Excel output file.

Domain	Considerations
<ul style="list-style-type: none"> <li>• <i>Reports: Pay Calculation Results for Pay Group (Results) - FRA</i> in the FRA Payroll functional area.</li> <li>• <i>Reports: Pay Calculation Results for Pay Group (Results) - UK</i> in the UK Payroll functional area.</li> <li>• <i>Reports: Pay Calculation Results for Pay Group (Results) - USA</i> in the USA Payroll functional area.</li> </ul>	

## Business Processes

To launch your Payroll Interface Configurable Output integration sequentially, add an integration step to the business process definition of your PECL integration.

## Reporting

No impact.

## Integrations

You use the PECL integration to create an output with effective payroll changes.

## Connections and Touchpoints

Workday offers a Touchpoints Kit with resources to help you understand configuration relationships in your tenant. Learn more about the [Workday Touchpoints Kit](#) on Workday Community.

## Steps: Set Up Payroll Interface Configurable Output

### Prerequisites

Configure a *Payroll Effective Change Interface* (PECI) integration for your pay group.

See [Steps: Set Up Payroll Effective Change Interface](#).

### Context

You can use the *Payroll Interface Configurable Output* integration service to create an Excel output of effective payroll changes from your PECL integration.

You can use the Excel output file to:

- Find effective payroll changes about workers.
- Enter manual changes into third-party payroll systems.

When you have multiple pay groups in your PECL integration, you can create a separate Excel output for each pay group.

### Steps

1. [Set Up Payroll Effective Change Interface Integration Services](#) on page 1532.

Enable the *Payroll Interface Configurable Output* integration service on your PECL integration.

2. [Create a Payroll Interface Configurable Output Layout](#) on page 1660.

3. [Create a Payroll Interface Configurable Output Definition](#) on page 1662.

4. [Create Integration System](#) on page 1967.
  - a. Create a *Payroll Interface Configurable Output* integration system. When you have multiple pay groups, create a separate integration system for each pay group that you want to create an Excel output for.
  - b. In the New using Template prompt, select *Payroll Interface Configurable Output*.
  - c. To name your output Excel files, enable the *Filename Sequence Generator* integration service.
5. From the related actions menu of your *Payroll Interface Configurable Output* integration, select Integration System > Configure Integration Attributes.
  - a. For the Input Document Tags attribute, select a document tag that matches the pay group in your PECL integration. When you have multiple pay groups, select an input document tag for each pay group.
  - b. For the Output Definition attribute, select the definition you created.
  - c. Security: *Integration Configure* domain in the Integration functional area.
6. [Create Integration \(Step\)](#).
  - a. Create an integration step to launch the *Payroll Interface Configurable Output* integration system when you launch the PECL integration.
  - b. From the related actions menu on your PECL integration, select Business Process > Edit Definition.
  - c. Add an integration step on the business process definition after your *Fire Integration* service step.
  - d. Click Configure Integration System.
  - e. From the Integration System prompt, select the *Payroll Interface Configurable Output* integration system that you created.
  - f. From the At the Run As User prompt, select the integration system user (ISU) that matches your PECL integration.
7. [Launch an Integration](#) on page 24.

Run your PECL integration.

## Next Steps

You can now download your Excel output file from the PECL integration event.

[Related Information](#)

### Tasks

[Set Up Integration Sequence Generators](#) on page 1969

### Examples

[2023R1 What's New Post: Payroll Interface Configurable Output](#)

## Create a Payroll Interface Configurable Output Layout

### Prerequisites

- Enable the Payroll Interface Configurable Output integration service on a Payroll Effective Change Interface (PECI) integration system.
- From the related actions menu of your PECL integration, select Integration System > Configure Integration Field Attributes. Select the Include in Output check box for the data sections and fields you want to include in your Excel workbook.
- Security: *Set Up: Payroll Interface* domain in the Payroll Interface functional area.

## Context

You can create a payroll interface configurable output layout to configure what data the integration includes in the sheets of your Excel output. You can repeat these steps for each sheet you want to add to the workbook.

## Steps

1. Access the Create Payroll Interface Configurable Output Layout task.
2. As you complete the header, consider:

Option	Description
Name	Displays the name of the layout seen in Workday.
Description	Displays the description seen in Workday.
Integration System	Informs the layout grid which data sections and fields populate the Excel output file.
Label	Displays the name of the sheet in the Excel workbook.
Event Type	Defines which event types are in the Excel workbook.  Example: You can create separate sheets in your workbook for HIR and TERM.

3. Add a Data Section row. As you complete the grid, consider:

Option	Description
Data Section	Displays the data sections from the PECL integration system that you enabled to include in output.
Field	Displays the fields from the PECL integration system that you enabled to include in output.
Column Label	Displays the name of the column on the Excel sheet.
Transformation Options	Maps internal data in Workday to external data in your Excel workbook.  If you don't create or select a transformation option, the data in your Excel file will match what you normally see in a PECL output.  If you create a transformation, the external value displays in the cells of the Excel workbook.  Example: To display 1 as Yes and 0 as No in your Excel workbook, enter: <ul style="list-style-type: none"> <li>• <i>No</i> in the Default Value field.</li> <li>• <i>1</i> in the Internal Value field.</li> <li>• <i>Yes</i> in the External Value field.</li> </ul>

## Create a Payroll Interface Configurable Output Definition

### Prerequisites

- Enable the Payroll Interface Configurable Output integration service on a Payroll Effective Change Interface (PECI) integration system.
- From the related actions menu of your PECI integration, select Integration System > Configure Integration Field Attributes. Select the Include in Output check box for the data sections and fields you want to include in your Excel workbook.
- Security: *Set Up: Payroll Interface* domain in the Payroll Interface functional area.

### Context

You can create a payroll interface configurable output definition to configure how your Excel output displays data. The definition also configures key fields, which are fields that are output for all effective changes.

Example: You configure *Employee ID* as a key field on your definition. When you download your Excel workbook, the employee ID of each worker is on every effective change row.

### Steps

- Access the Create Payroll Interface Configurable Output Definition task.
- As you complete the header, consider:

Option	Description
Name	Displays the name of the definition seen in Workday.
Description	Displays the description seen in Workday.

- On the Included Output Layouts tab, select the layout you want to include on your Excel output file.
- On the Key Fields tab, add a Data Section row. As you complete the grid, consider:

Option	Description
Data Section	Displays the data sections available as key field identifiers.
Field	Displays the fields available as key field identifiers.
Column Label	Displays the name of the column on the Excel sheet.
Transformation Options	<p>Maps internal data in Workday to external data in your Excel workbook.</p> <p>If you don't create or select a transformation option, the data in your Excel file will match what you normally see in a PECI output.</p> <p>If you create a transformation, the external value displays in the cells of the Excel workbook.</p> <p>Example: To display 1 as Yes and 0 as No in your Excel workbook, enter:</p> <ul style="list-style-type: none"> <li>No in the Default Value field.</li> <li>1 in the Internal Value field.</li> </ul>

Option	Description
	<ul style="list-style-type: none"> <li>• Yes in the External Value field.</li> </ul>

## Third-Party Payroll Errors Collaboration

### Steps: Set Up Third-Party Payroll Errors

#### Prerequisites

Configure a *Payroll Effective Change Interface* integration with the *Override Integration Event* field attribute disabled.

Your third-party payroll vendor must use the operation *Put\_Integration\_Event\_Error\_Message\_Set* in the *Payroll\_Interface* web service to make payroll errors available for reporting. This operation also applies for PECL integrations configured with the *Event-Driven Integration for Third Party Payroll* service.

Create endpoints for third-party payroll vendor access. Use the Workday SOAP API.

#### Context

To resolve payroll errors reported in *Payroll Effective Change Interface* and *Event-Driven Integration for Third-Party Payroll* integrations, you can:

- Set up security groups authorized to resolve the payroll errors.
- Define any reasons and statuses that you want to use for tracking the payroll errors.
- Assign the payroll errors returned by an integration for resolution.

#### Steps

1. [Edit Domain Security Policies](#).

Grant these security groups access to these domains.

Domain	Roles
<i>Set Up: Payroll Interface</i> domain in the Payroll Interface functional area.	<p>Required by:</p> <ul style="list-style-type: none"> <li>• <i>Payroll Interface: Put Integration Event Error Message Set</i> web service.</li> <li>• Maintain Global Payroll Statuses task and the View Global Payroll Statuses report.</li> <li>• Maintain Global Payroll Reasons task and the View Global Payroll Reasons report.</li> </ul>
<i>Manage: External Payroll Errors</i> domain in the Payroll Interface functional area.	Roles who review and assign third-party payroll errors for resolution. Example: Payroll Administrators or Integration Specialists.
<i>Process: External Payroll Errors</i> domain in the Payroll Interface functional area.	Roles who review and resolve third-party payroll errors. Example: Human Resource or Compensation Partners/Specialists.

2. Access the Maintain Global Payroll Statuses task.

On the External Payroll Feature prompt, select *Third-Party Payroll Errors*.

Review and modify the statuses you want to use for resolving the payroll errors. You can map your statuses with these Workday statuses.

- *Complete*.
- *In Progress*.
- *Not Yet Started*. This status is the default status for third-party payroll errors. You can select another status as the default.

Note:

- You can associate more than 1 of your statuses with a Workday status.
- You can't delete a status that's in use.

Security: *Set Up: Payroll Interface* domain in the Payroll Interface functional area.

3. Access the Maintain Global Payroll Reasons task.

On the External Payroll Feature prompt, select *Third-Party Payroll Errors*.

Create reasons for tracking third-party payroll error resolutions.

Note: You can't delete a reason that's in use.

Security: *Set Up: Payroll Interface* domain in the Payroll Interface functional area.

4. Access the Configure Global Payroll Notifications task.

Add a row for each notification for roles with access to the *Manage: External Payroll Errors* domain. This notification indicates that payroll errors are available for integration events.

- Select the *Third-Party Payroll Errors* feature.
- Select the pay group.
- Select the groups that contain Payroll Administrators or Integration Specialists who manage the error assignments.

Security: *Set Up: Payroll Interface* domain in the Payroll Interface functional area.

## Result

Roles authorized to review and assign third-party payroll errors for resolution can access these reports after an integration run. These reports indicate if *Payroll Effective Change Interface* and *Event-Driven Integration for Third-Party Payroll* integrations returned errors.

- Access the Third-Party Payroll Errors report to check for specific errors.
- Access the External Payroll Response for Integration Events report to check if:
  - An integration reported any errors.
  - An integration was successful and didn't report any errors.
  - An integration didn't return any results.

## Next Steps

Assign third-party payroll errors to roles authorized to resolve errors.

**Related Information**

**Reference**

[Workday Community: API Authentication Methods](#)

## Assign Third-Party Payroll Errors

### Prerequisites

Have a *Payroll Effective Change Interface* or *Event-Driven Integration for Third-Party Payroll* integration that returned payroll errors.

Security: *Manage: External Payroll Errors* domain in the Payroll Interface functional area.

### Context

You can view and assign payroll errors to roles authorized to resolve them.

### Steps

1. Access the Maintain Errors from Third-Party Payroll task.
2. Select the pay groups that have payroll errors you want to assign.

You can select the payroll errors you want to assign by:

- Severity level of the errors.
- Workers.
- The sent on date for the integration event. You can report payroll errors for a specific date or a range of dates.

3. (Optional) Change the values in the Status and Reason columns for the payroll errors you want to assign.
  4. Select the payroll errors you want to assign.
- Integrations can return payroll errors related to workers or setup errors. Example for setup error: Cost Center is invalid.
5. Click Assign Selected.
  6. For the selected errors, you can enter:

Option	Description
Assigned To	<p>You can assign errors to members of security groups configured with access to the <i>Process: External Payroll Errors</i> domain.</p> <p>You can assign an error to 1 or more members of the authorized security groups.</p> <p>Assignees must have security access to the worker whose data is in error.</p>
Due Date	<p>Specify the date for resolving the item.</p> <p>Assignees can filter items in the My Assigned Third Party Payroll Errors task by due date to identify errors that are past due.</p>
Status	<p>The default status is <i>Not Yet Started</i>. You can select a different status.</p> <p>The assignee can change this status to indicate progress for resolving the item.</p>
Comment	Enter any instructions to the assignee.

7. Click OK.

## Result

Assignees receive a *Third-Party Payroll Errors: Assigned to me* notification with access to their newly assigned errors.

## Next Steps

Access the Maintain Errors from Third-Party Payroll task to add or change assignments.

From their *Third-Party Payroll Errors: Assigned to me* notification, assignees can click Newly Assigned Third-Party Payroll Errors or All My Assigned Errors to view their assigned payroll errors.

### Review Assigned Third-Party Payroll Errors

#### Prerequisites

Security: *Process: External Payroll Errors* domain in the Payroll Interface functional area.

#### Context

Review and resolve third-party payroll errors assigned to you.

#### Steps

1. Access the *Third-Party Payroll Errors: Assigned to me* notification.
2. Click Newly Assigned Third-Party Payroll Errors.
3. In the grid, click Review to review and update an error.

Note: Click All My Assigned Items to review all errors currently assigned to you.

4. As you update the error, consider:

Option	Description
Status	Select the current status for the error.
Reason	Select the cause for the error.
Approved by	Select the approver for the error resolution.
Comment	Add any information the approver or other assignees need to know.

Note: The History and Comments tabs display the updates and additional information for an error.

## Next Steps

You can access the My Assigned Third-Party Payroll Errors report to view and update all of your assigned errors.

Payroll administrators or integration specialists authorized to the *Manage: External Payroll Errors* domain can access:

- The Maintain Errors from Third-Party Payroll task to view the payroll error updates.
- The Third-Party Payroll Errors report to view error statuses.

## Global Payroll Reconciliation

### Setup Considerations: Global Payroll Reconciliation

You can use this topic to help make decisions when planning your configuration and use of the *Global Payroll Reconciliation* integration. It explains:

- Why to set it up.
- How it fits into the rest of Workday.
- Downstream impacts and cross-product interactions.
- Security requirements and business process configurations.
- Questions and limitations to consider before implementation.

Refer to detailed task instructions for full configuration details.

## What It Is

The *Global Payroll Reconciliation* integration:

- Enables you to compare and reconcile worker payroll data between Workday and third-party payroll systems.
- Provides the options for launching the reconciliation.

This integration automatically includes:

- All active workers in a pay period.
- All terminated workers in the pay period.
- All terminated workers with a pay through date within or after the period.

## Business Benefits

The *Global Payroll Reconciliation* integration helps you save time and ensure accuracy in payroll processing and payment.

## Use Cases

You can:

- Run this integration for multiple pay groups and multiple times during a pay period. Example: You schedule the integration to run before your payroll processing and help you identify any problems to fix before running payroll.
- Include terminated employees in this integration when you need to reconcile home addresses to send tax forms at the end of the year.

## Questions to Consider

Questions	Considerations
When do you want to run the <i>Global Payroll Reconciliation</i> integration?	<p>Consider that timing can affect the worker payroll data extracted from Workday and your third-party payroll system and the subsequent comparison.</p> <p>Workday might extract data at certain dates and times when the third-party payroll system isn't able to. Data also might be updated constantly through:</p> <ul style="list-style-type: none"> <li>• The <i>Payroll Effective Change</i> (PECI) integration or <i>Event-Driven Integration for Third-Party Payroll</i> integration service.</li> <li>• Manual entry in the third-party payroll system</li> </ul>
What fields in my <i>Payroll Effective Change Interface</i> (PECI) integration can I reconcile with this integration?	<p>Workday supports the fields in these PECI data sections for global payroll reconciliation:</p> <ul style="list-style-type: none"> <li>• Worker Status</li> <li>• Personal – Legal Name</li> </ul>

Questions	Considerations
	<ul style="list-style-type: none"> <li>• Person Communication – Address</li> <li>• Person Identification – National Identifier</li> <li>• Position – Organization</li> <li>• Compensation – Summary in Annualized Frequency</li> <li>• Payment Election</li> <li>• Employee Contract</li> <li>• Payroll Input Earnings and Deductions</li> <li>• Compensation One Time Payment</li> <li>• Payroll One Time Payment</li> </ul>
<p>Does your third-party payroll vendor support Global Payroll Reconciliation?</p>	<p>For a third-party payroll vendor other than ADP GlobalView, you or your vendor need to build these 3 REST endpoints to be able to support Global Payroll Reconciliation:</p> <ul style="list-style-type: none"> <li>• An initiating endpoint to send reconciliation parameters from Workday to the vendor.</li> <li>• A retrieval endpoint where Workday picks up data from the vendor.</li> <li>• A schema endpoint for fields the vendor supports for reconciliation.</li> </ul> <p>For more information, see <a href="#">Concept: Global Payroll Reconciliation REST APIs</a> on page 1682.</p>

## Recommendations

To help avoid decreased performance, only include terminated employees when necessary.

Disable the Transaction Log service on the PECL integration system that you use for reconciliation. When you enable the service, Workday reconciles a smaller population than expected against the full population from the third-party system.

## Requirements

Have or create a PECL integration that:

- Is in production.
- You configured with the fields you want to reconcile.

Create endpoints for third-party payroll vendor access.

Set up a pay group code that matches the pay group or company in your third-party system. Workday uses this code to map Workday external pay groups to external third-party pay groups or companies. Without this code, Workday can't communicate to the third-party system for which pay group to compare against.

## Limitations

You:

- Can't reconcile workers that you terminated more than 5 years ago from the current period.
- Can only set a case sensitivity option for either all fields or individual fields. Applying both options makes the fields case-sensitive.

Workday ignores leading zeros when matching the employee IDs. Example: The Workday employee ID 123 matches the vendor employee ID 000123.

Global Payroll Reconciliation doesn't support retro changes effective in a prior period changes and future-dated changes effective in a future period.

### Tenant Setup

No impact.

### Security

Domains	Considerations
<i>Manage Global Payroll Reconciliation in the Payroll Interface functional area</i>	Enables users to access the All Global Payroll Reconciliation Items report and view all assigned reconciliation items.
<i>Process: Global Payroll Reconciliation in the Payroll Interface functional area</i>	Enables users to access the My Assigned Global Payroll Reconciliation Items report and view their assigned reconciliation items.
<i>Set Up: Maintain Payroll Interface in the Payroll Interface functional area</i>	Enables users to access the View Global Payroll Reconciliation Results report and view discrepancies in worker payroll data.
<i>View: Maintain Payroll Interface in the Payroll Interface functional area</i>	Enables the payroll administrator assigning reconciliation items to access the View Global Payroll Reconciliation Results report.
<i>View: Global Payroll Reconciliation in the Payroll Interface functional area</i>	Enables assignees to access the View Global Payroll Reconciliation Results report.

### Business Processes

No impact.

### Reporting

Reports	Considerations
All Global Payroll Reconciliation Items	Displays the reconciliation items that a payroll administrator has assigned for resolution.
My Assigned Global Payroll Reconciliation Items	Displays assigned reconciliation items for assignees.
View Global Payroll Reconciliation Results	Displays the reconciliation items assigned to an assignee for resolution. Example: An assignee is a benefits administrator or a human resources administrator.

### Integrations

Integration Templates	Considerations
<i>Payroll Effective Change Interface</i>	Enables you to select the fields that you want to reconcile and the options for performing the worker payroll data comparison.
<i>Document Transformation</i>	Enables you to transform the data used in the global payroll reconciliation comparison.

Integration Templates	Considerations
	Example: You configure a <i>Document Transformation</i> integration system with rules to set a truncation for the length of a cost center data.

## Connections and Touchpoints

Workday offers a Touchpoints Kit with resources to help you understand configuration relationships in your tenant. Learn more about the [Workday Touchpoints Kit](#) on Workday Community.

## Steps: Set Up Global Payroll Reconciliation

### Prerequisites

- Create a *Payroll Effective Change Interface* integration that you can configure with the fields you want to reconcile.  
Note: The *Payroll Effective Change Interface* integration must be in production.
- Create endpoints for third-party payroll vendor access. For a third-party payroll vendor other than ADP GlobalView, you or your vendor need to build these 3 REST endpoints:
  - An initiating endpoint to send reconciliation parameters from Workday to the vendor.
  - A retrieval endpoint where Workday picks up data from the vendor.
  - A schema endpoint for fields the vendor supports for reconciliation.

For more information, see [Concept: Global Payroll Reconciliation REST APIs](#) on page 1682.

### Context

You can configure a *Global Payroll Reconciliation* integration to provide options for reconciling worker data in:

- A *Payroll Effective Change Interface* integration.
- Your third-party payroll system.

### Steps

1. (Optional) Access the Create External Payroll Vendor task.

If you're using a third-party payroll system other than ADP GlobalView, create the vendor in Workday.

On the Features prompt, select *Global Payroll Reconciliation*.

Security: *Set Up: Payroll Interface* domain in the Payroll Interface functional area.

2. [Create External Payroll Vendor Mapping](#) on page 1413.

Map each Workday environment that you use for global payroll reconciliation to your external payroll vendor.

If you create an external payroll vendor instead of selecting an available vendor:

- Select the *Global Payroll Reconciliation* feature.
- Enter values from your external payroll vendor for the endpoint attributes and these additional attributes:
  - *Maximum Number of Polling Requests*.
  - *Polling Frequency (ms)*.
  - *Vendor Date Format*.

3. [Create Integration System](#) on page 1967.  
Select *Global Payroll Reconciliation* on the New Using Template prompt.
4. From the related actions menu on your *Global Payroll Reconciliation* integration, select Integration System > Configure Integration Attributes.

As you complete the task, consider:

Option	Description
Allowable Difference Due to Rounding	Workday reconciles numeric values using the <i>Allowable Difference Due to Rounding</i> amount. This amount applies if you select the <i>Allow Rounding Difference</i> option for a numeric field in the <i>Payroll Effective Change Interface</i> integration.
Number of Years to Include Terminated Employees	Workday reconciles data for workers terminated within the specified number of years. You can select a value from 1 to 5.
Exclude Terminated Workers with a Pay Through Date in the Future	Workday reconciles payroll data. The <i>Global Payroll Reconciliation</i> integration excludes terminated workers that have a pay through date in a current or future period when their termination is in a prior period.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

5. [Set Up Information to Reconcile](#) on page 1674.

Select the information in the *Payroll Effective Change Interface* integration system to reconcile with your third-party payroll system.

6. (Optional) Configure the steps in the *Payroll Effective Change Interface* integration business process. Ensure steps won't cause unexpected results when you launch the *Global Payroll Reconciliation* integration.

Example: The business process for your *Payroll Effective Change Interface* integration system includes a step for document delivery. If you don't want to receive certain documents when running the reconciliation integration, set up a condition rule not to deliver those documents.

Note: The Initiating Integration Template report field indicates the template used to create an integration. You can use this field in a condition rule to initiate a business process step, based on the type of integration template.

Security: *Manage: Business Process Definitions* domain in the System functional area.

7. [Edit Business Process Security Policies](#).

Add security groups to receive global payroll reconciliation notifications in the Who Can Do Action Steps in the Business Process section.

8. [Edit Business Processes](#).

Add this step on the *Global Payroll Reconciliation* business process:

Order	Type	Specify	Group
Add after the initiating step.	Select Action.	Select <i>Global Payroll Reconciliation Notification</i> .	Select the security groups that receive reconciliation notifications.  <i>Global Payroll Reconciliation</i> business process

Order	Type	Specify	Group
			<p>notifications only supports:</p> <ul style="list-style-type: none"> <li>• Unconstrained groups.</li> <li>• Pay-group based security groups, such as payroll partner.</li> </ul>

9. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

- *Integration Process* domain in the Integration functional area.
- *Set Up: Payroll Interface* domain in the Payroll Interface functional area.

Note: The *Payroll Effective Change Interface* integration that you configure for reconciliation also requires access to this domain.

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

10. [Edit Domain Security Policies](#).

To view reconciliation results:

- In the Report/Task Permissions section, grant the security groups that receive notifications *View* access to the *View: Maintain Payroll Interface* domain.
- In the Integration Permissions section, grant the security group for the Workday account on the *Payroll Effective Change Interface* integration system *Put* access to the *Set Up: Payroll Interface* domain.

11. [Activate Pending Security Policy Changes](#).

12. (Optional) Create a *Document Transformation* integration system.

Configure this integration system with rules to transform data used in the reconciliation comparison.

- Create a sequence generator for filenames of the transformed output data files.
- Configure these integration attributes.

<i>Input Document Tags</i>	Select <i>Reconciliation</i> or an <i>Output Document Tags</i> value on the <i>Payroll Effective Change Interface</i> integration system.
<i>Output Document Tags</i>	Select a tag different from the <i>Output Document Tags</i> value on the <i>Payroll Effective Change Interface</i> integration system.
<i>Carry Forward Input Tags</i>	Required for integrations used with global payroll reconciliation.
<i>Multiple Input Documents</i>	Required for integrations used with global payroll reconciliation.

See [Steps: Set Up Document Transformation Connector](#) on page 594.

### 13. Launch an Integration on page 24.

Launch the *Global Payroll Reconciliation* integration system.

- Select the Pay Groups for reconciliation.
- Select the *Payroll Effective Change Interface* integration system you configured for reconciliation.
- Select the *Document Transformation* integration system if you want to transform data used in the reconciliation comparison.
- Select the *Include Terminated Employees* option if you need to reconcile data for terminated employees. This option includes employees terminated before the start date of the pay period that you're reconciling. The default value is 2 years unless you select the *Number of Years to Include Terminated Employees* attribute.

## Result

Access the View Global Payroll Reconciliation Results report to view these discrepancies:

- Employees missing in either Workday or the third-party payroll system.
- Employees with discrepancies in fields configured as Errors.
- Employees with discrepancies in fields configured as Informational.

## Next Steps

Administer the discrepancies identified in the reconciliation results for resolution.

Related Information

### Tasks

[Steps: Set Up Global Payroll Reconciliation Administration](#) on page 1673

### [Steps: Set Up Global Payroll Reconciliation Administration](#)

### Prerequisites

Have the *Global Payroll Reconciliation* integration results for the *Payroll Effective Change Interface* integration configured with the fields you want to reconcile.

### Context

To resolve discrepancies identified in a *Global Payroll Reconciliation* integration, you can:

- Set up security groups authorized to resolve discrepancies.
- Define any reasons and statuses you want to use for tracking discrepancies.
- Assign discrepancies identified in the *Global Payroll Reconciliation* integration output for resolution.

### Steps

1. [Edit Domain Security Policies](#).

Grant these security groups *View* and *Modify* access to these domains.

Domain	Roles
<i>Manage: Global Payroll Reconciliation</i> domain in the Payroll Interface functional area	Administrators who configure <i>Global Payroll Reconciliation</i> tasks and assign reconciliation items for resolution.
<i>Process: Global Payroll Reconciliation</i> domain in the Payroll Interface functional area.	Human resource or compensation specialists who can review and resolve reconciliation discrepancies.

Domain	Roles
<i>View: Global Payroll Reconciliation domain in the Payroll Interface functional area.</i>	Workday users who can view reconciliation results.

2. Access the Maintain Global Payroll Statuses task.

On the External Payroll Feature prompt, select *Global Payroll Reconciliation*.

Associate statuses you want to use for resolving reconciliation items with these Workday statuses.

- *Complete*.
- *Ignore*.
- *In Progress*.
- *Not Yet Started*.

Note:

- You can associate more than 1 status with a Workday status.
- You can't delete a status that's in use.

Security: *Set Up: Global Payroll Reconciliation* domain in the Payroll Interface functional area.

3. Access the Maintain Global Payroll Reasons task.

On the External Payroll Feature prompt, select *Global Payroll Reconciliation*.

Create reasons to use for resolving reconciliation items.

Note: You can't delete a reason that's in use.

Security: *Set Up: Global Payroll Reconciliation* domain in the Payroll Interface functional area.

4. [Assign Global Payroll Reconciliation Items](#) on page 1676.

## Result

Access the All Global Payroll Reconciliation Items report to see the status of assigned reconciliation items.

## Set Up Information to Reconcile

### Prerequisites

Security: *Integration Configure* domain in the Integration functional area.

### Context

You can set up information in your *Payroll Effective Change Interface* integration system that you want to reconcile.

- Select fields and select how you want Workday to reconcile them.
- You can also include data for terminated employees in the reconciliation.

## Steps

1. Access the *Payroll Effective Change Interface* integration system you use for reconciliation.
2. From the related actions menu, select Integration System > Configure Integration Field Attributes.
3. Select the options in the More Options column for the fields that you want to reconcile.

Note:

- The More Options column is available for data sections and fields included in the integration output.
- The default options are *Daily*, *Exact Match*, and *Error*. Workday applies the *Exact Match* option automatically to compare individual fields.

4. As you complete the More Options column, consider:

Option	Description
Daily or Period End Date	<p>Select <i>Daily</i> for fields where the exact date of the change might impact payroll calculations, such as Compensation Data Section fields.</p> <p>Select <i>Period End Date</i> for fields that don't impact payroll calculation even if you use the value at the end date. Examples are Business Title and Last Name.</p>
Exact Match or At Least One Match	<p>When you select:</p> <ul style="list-style-type: none"> <li>• <i>Exact Match</i>, a discrepancy occurs if any data in an instance of the section doesn't match.</li> <li>• <i>At Least One Match</i>, a discrepancy occurs if no instances match.</li> </ul> <p>This option applies to sections that have multiple instances, such as the Person Communication &gt; Address, Person Identification &gt; National Identifier, and Position Data &gt; Organization sections.</p>
Error or Informational	<p>This selection determines where discrepancies display in the reconciliation results.</p> <p>Workday recommends that you select:</p> <ul style="list-style-type: none"> <li>• <i>Error</i> for fields that can affect a worker's pay, such as Compensation Data Section fields.</li> <li>• <i>Informational</i> for fields that don't affect the worker's pay, such as Related Person Communication Data Section fields.</li> </ul>
Allow Rounding Difference	<p>Select to reconcile numeric field values using the <i>Allowable Difference Due to Rounding</i> attribute. You set an amount for this attribute in the <i>Global Payroll Reconciliation</i> integration system.</p> <p>Example: You select the <i>Allow Rounding Difference</i> option for the <i>Total Base Pay</i> attribute. The <i>Allowable Difference Due to Rounding</i> attribute value is 0.5. The <i>Total Base Pay</i> amount for an employee in Workday is 65,195.00. If the <i>Total Base Pay</i> amount in the third-party payroll system for this employee is:</p> <ul style="list-style-type: none"> <li>• 65,196.00, the reconciliation results display this discrepancy as an error.</li> <li>• 65,195.25, the reconciliation results don't report this difference.</li> </ul>
Ignore Space and Special Characters	<p>Select this option to remove any spaces and special characters in alphanumeric values so the reconciliation results don't include them as</p>

Option	Description
	discrepancies. Special characters are: - !#\$%&()'*,.-./;=>?@[]^_`{}~
Override Case Sensitivity Setting of Integration Attribute	Select this option to change how the <i>Global Payroll Reconciliation</i> integration handles differences in capitalization for a field. <ul style="list-style-type: none"> <li>If you select the <i>Ignore Case Sensitivity in Characters Comparison</i> integration attribute, selecting this option includes differences as discrepancies.</li> <li>If you don't select the <i>Ignore Case Sensitivity in Characters Comparison</i> integration attribute, selecting this option excludes differences as discrepancies.</li> </ul>

5. From the related actions menu of the *Payroll Effective Change Interface* integration, select Integration System > Configure Integration Field Overrides.
6. In the Field Details column, select options in the More Options prompt for the field override values you want to reconcile.
7. (Optional) From the related actions menu of the *Payroll Effective Change Interface* integration, select Integration System > Configure Integration Services.
8. (Optional) Enable the Payroll Effective Change Interface - Include Sections Configuration Service.
9. (Optional) From the related actions menu of the *Payroll Effective Change Interface* integration, select Integration System > Configure Integration Attributes.
- 10.(Optional) As you complete this task, consider:

Option	Description
Include Position Data Section	Select Post Termination (Secondary).
Include Compensation Data Section	Select As of Termination Date (Secondary).
Include Compensation Plans Data Section	Select As of Termination Date (Secondary).

Note:

- These selections include terminated employee data as of the date of termination.
- Workday includes terminated employee data for all processing with your *Payroll Effective Change Interface* integration system, not only for reconciliation processing.

## Next Steps

Complete the setup of the *Global Payroll Reconciliation* integration.

## Assign Global Payroll Reconciliation Items

### Prerequisites

- Have *Global Payroll Reconciliation* integration results that contain reconciliation items you need to assign for resolution.
- Manage: *Global Payroll Reconciliation* domain in the Payroll Interface functional area.

### Context

You can assign reconciliation items to members of security groups configured to resolve discrepancies.

## Steps

1. Access the *Global Payroll Reconciliation* results for an integration event and select the Administer Reconciliation Items button.
2. Select the pay groups with reconciliation items you want to assign.
3. (Optional) Exclude reconciliation items that you don't need to assign.

Select the reconciliation items you don't need to assign and set the Status to *Ignore*. Assigning the *Ignore* status enables you to exclude these discrepancies from the reconciliation reports, making it easier to work with the discrepancies you need to assign.

You can also set the Reason and Comment values for the selected reconciliation items.

4. Select the reconciliation items to assign.
5. As you complete an assignment, consider:

Option	Description
Assigned To	<p>You can assign items to members of security groups configured with access to the <i>Process: Global Payroll Reconciliation</i> domain.</p> <p>You can assign an item to 1 or more members of the security groups.</p>
Due Date	<p>Specify the date for resolving the item.</p> <p>You can filter items in the All Global Payroll Reconciliation Items report by due date to identify any items that are past due.</p>
Status	<p>Select the initial <i>Global Payroll Reconciliation</i> status for the assigned item.</p> <p>The assignee can change this status to indicate progress for resolving the item.</p>

## Result

All assignees receive a *Reconciliation: Assigned Items* notification for new assignments to review and resolve.

## Next Steps

Access the All Global Payroll Reconciliation Items report to view and track all reconciliation items you've assigned.

Access the Administer Global Payroll Reconciliation Items task to change or add assignments.

Assignees can access the My Assigned Global Payroll Reconciliation Items report to view all of their assigned items.

## Review Assigned Reconciliation Items

### Prerequisites

Security: *Process: Global Payroll Reconciliation* domain in the Payroll Interface functional area.

### Context

Review and resolve reconciliation items an administrator assigned to you from a *Global Payroll Reconciliation* integration event.

## Steps

1. Access the *Reconciliation: Assigned Items* notification you receive when you're assigned a reconciliation item to review.
2. Click the Newly Assigned Global Payroll Reconciliation Items button.
3. Click the Review button to resolve a reconciliation item.

Note: You can click the All Assigned Items button to view all of your reconciliation items.

4. As you complete the Update Global Payroll Reconciliation Item task, consider:

Option	Description
Status	Select the current status for the reconciliation discrepancy.
Reason	Select the cause for the discrepancy.
Comment	Add any information the approver or other assignee needs to know.

## Next Steps

You can access the My Assigned Global Payroll Reconciliation Items report to view all of your assigned items.

### Concept: Global Payroll Reconciliation

Global payroll reconciliation enables you to configure the worker data you want to compare between Workday and supported third-party payroll systems. The result from this comparison identifies discrepancies between the worker data.

The *Include Terminated Employees* launch parameter enables you to increase the population of terminated workers reconciled for the pay group. This option includes all workers terminated within 2 years from the pay period start date. You can configure the *Number of Years to Include Terminated Employees* integration attribute to change the number of years to include terminated workers from 1 to 5 years.

You can configure the *Exclude Terminated Workers with a Pay Through Date in the Future* integration attribute to exclude terminated workers that have a pay through date in a current or future period when their termination is in a prior period.

For Global Payroll Reconciliation runs with multiple pay groups, Workday uses the Last Successful Load Date for each pay group when evaluating discrepancies.

The reconciliation results display:

- The number of reconciliation runs for a pay group and pay period. You can drill down on the number of runs to see detailed information for that run.
- The number of occurrences for each discrepancy.
- The most recent assignee for discrepancies.

### Administering Discrepancies

You can configure the statuses you want to use for tracking discrepancies. You can use statuses you assign to the Workday statuses *Complete* and *Ignore* to hide those discrepancies in the reconciliation results. The results then display the discrepancies that you need to assign or that are in progress.

You can configure the security groups authorized to resolve discrepancies.

You can select multiple discrepancies to:

- Assign to 1 or more assignees. Workday assigns a discrepancy only to assignees that have security authorization to the worker with the discrepancy.

- Change the status or reason or add a comment for selected discrepancies. You can also notify the assignees about these changes.

### Troubleshooting: Global Payroll Reconciliation Configuration

- The pay group that you're running for doesn't have an organization code. on page 1679
- The host name is invalid. on page 1679
- Endpoints are missing for the custom third-party payroll vendor. on page 1679

#### The pay group that you're running for doesn't have an organization code.

Cause: You haven't set up the pay group code for the pay group.

Solution:

##### Steps

Security: Set Up: Payroll Interface domain in Payroll Interface functional area.

1. Access the View Pay Group report and select the pay group that you're running Global Payroll Reconciliation for.
2. From the related actions menu of the pay group, select Organization > Edit Name/Code.
3. Enter a code that matches the pay group or company in the third-party system.

#### The host name is invalid.

Cause: You haven't set up the third-party payroll tenant name provided by your vendor and the key pair.

Solution: See [Create External Payroll Vendor Mapping](#) on page 1413.

#### Endpoints are missing for the custom third-party payroll vendor.

Cause: You didn't map 1 or more endpoints for the custom third-party payroll vendor.

Solution:

##### Steps

Security: Security Administration domain in the System functional area.

1. Access the Edit External Payroll Vendor Mapping task.
2. In the Feature Configuration section, specify these attributes:
  - Initiating Endpoint
  - Retrieval Endpoint
  - Schema Endpoint
  - Maximum Number of Polling Requests
  - Polling Frequency (ms)
  - Vendor Date Format

Include full URLs with protocol, hostname, and path. Example: https://<customhostname.com>/<api>

### Troubleshooting: Global Payroll Reconciliation Results

- Results are missing terminated workers from prior periods. on page 1680
- Results include terminated workers in a current period that have a prior period termination. on page 1681
- Workday displays reconciliation differences in data sections for a terminated employee. on page 1681
- Results display discrepancies that are only case-sensitive. on page 1681

- Workers are listed in the Employees in Vendor Payroll System Not in Workday section even though the workers exist in Workday. on page 1682

### **Results are missing terminated workers from prior periods.**

Cause: 1 or both of these conditions could be the cause of this issue:

- You didn't enable the Include Terminated Employees launch parameter.
- The termination date is past the look back period that you specified for the Number of Years to Include Terminated Employees integration attribute.

Cause	Solution
The termination date is past the look back period that you specified for the Number of Years to Include Terminated Employees integration attribute.	<p>Prerequisites: These domains in the Integration functional area:</p> <ul style="list-style-type: none"> <li><i>Integration Build</i></li> <li><i>Integration Configure</i></li> <li><i>Integration Event</i></li> </ul> <ol style="list-style-type: none"> <li>From the related actions menu on your <i>Global Payroll Reconciliation</i> integration, select <i>Integration System Configure Integration Attributes</i>.</li> <li>Specify the number of years for Workday to reconcile data for terminations on the Number of Years to Include Terminated Employees integration attribute. You can't reconcile workers that you terminated more than 5 years ago from the current period.</li> </ol>
You didn't enable the Include Terminated Employees launch parameter.	<p>Prerequisites: These domains in the Integration functional area:</p> <ul style="list-style-type: none"> <li><i>Integration Build</i></li> <li><i>Integration Configure</i></li> <li><i>Integration Event</i></li> </ul> <ol style="list-style-type: none"> <li>Access the Launch / Schedule Integration task and select your <i>Global Payroll Reconciliation</i> integration system.</li> <li>Select the Include Terminated Employees check box.</li> </ol>

Solution:

### **Steps**

Security: These domains in the Integration functional area:

- Integration Build*
- Integration Configure*
- Integration Event*

- From the related actions menu on your *Global Payroll Reconciliation* integration, select *Integration System > Configure Integration Attributes*.

2. Specify the number of years for Workday to reconcile data for terminations with the Number of Years to Include Terminated Employees integration attribute.  
Note: Workday automatically sets the number of years to 2, but you can specify up to 5 years.
3. Access the Launch / Schedule Integration task and select your *Global Payroll Reconciliation* integration system.
4. Select the Include Terminated Employees check box.

### **Results include terminated workers in a current period that have a prior period termination.**

Cause: You enabled the Include Terminated Employees launch parameter.

Note: This issue can also happen when the pay through date for the worker is in the current or a future period. *Global Payroll Reconciliation* always reconciles terminated workers with a prior period termination and a pay through date that is current or in the future.

Solution:

#### **Steps**

Security: These domains in the Integration functional area:

- *Integration Build*
  - *Integration Configure*
  - *Integration Debug*
1. Access the Launch / Schedule Integration task and select your *Global Payroll Reconciliation* integration system.
  2. Clear the Include Terminated Employees check box.

### **Workday displays reconciliation differences in data sections for a terminated employee.**

There are reconciliation differences in 1 or more of these data sections for a terminated employee:

- Compensation
- Compensation Plans
- Position

Cause: You have to configure the integration to report effective changes on or after the termination date in these data sections:

- Compensation
- Compensation Plans
- Position

Solution:

#### **Steps**

Security: *Integration Configure* domain in the Integration functional area.

1. From the related actions menu on your *Global Payroll Reconciliation* integration, select Integration System > Configure Integration Attributes.
2. Select the *Post Termination (Secondary)* option for the Include Position Data Section integration attribute.
3. Select the *As Of Termination Date (Secondary)* option for these integration attributes:
  - Include Compensation Data Section
  - Include Compensation Plans Data Section

### **Results display discrepancies that are only case-sensitive.**

**Cause:** The *Global Payroll Reconciliation* integration reports differences when the text is the same but the capitalization is different. You can either set a case sensitivity option for:

- All fields.
- Individual fields.

**Solution:** Set a case sensitivity option for all fields.

### Steps

**Security:** *Integration Configure* domain in the Integration functional area.

1. From the related actions menu of the *Payroll Effective Change Interface* integration you use for Global Payroll Reconciliation, select Integration System > Configure Integration Field Attributes.
2. Enable the Ignore Case Sensitivity in Characters Comparison integration attribute.

**Solution:** Set a case sensitivity option for individual fields.

### Steps

**Security:** *Integration Configure* domain in the Integration functional area.

1. From the related actions menu of the *Payroll Effective Change Interface* integration you use for Global Payroll Reconciliation, select Integration System > Configure Integration Field Attributes.
2. On the More Options column for the fields, enable the Override Case Sensitivity Setting of Integration Attribute option and select the *Ignore Case Sensitivity in Characters Comparison* integration attribute.

**Workers are listed in the Employees in Vendor Payroll System Not in Workday section even though the workers exist in Workday.**

The View Global Payroll Reconciliation Results report shows workers in the Employees in Vendor Payroll System Not in Workday section even though the workers exist in Workday.

Cause	Solution
You have the Transaction Log Service enabled.	On the related actions menu of the integration, select Integration System > Configure Integration Services, and disable the Transaction Log Service.
You didn't assign the worker to the pay group before the last successful run date.	<ol style="list-style-type: none"> <li>1. Access the Messages tab of the reconciliation integration event.</li> <li>2. Access the <i>InitialVendorCalloutResponse&lt;pay group name&gt;.json</i> file in <i>MessageAudit_VendorCallout.zip</i> to confirm you assigned the worker to the pay group before the last successful load date.</li> </ol>
The employee ID is different from what is in Workday and the vendor files.	Resolve the employee ID in either of the systems based on your business requirements.

### Concept: Global Payroll Reconciliation REST APIs

For a third-party payroll system to be able to support Global Payroll Reconciliation (GPR), they must build 3 REST API endpoints to generate a data file in the accepted schema file format. Global Payroll Reconciliation (GPR) uses the *Payroll Effective Change Interface* (PECI) integration XML output document provided by Workday and the schema data file to make data comparisons.

Workday can communicate with the third-party payroll systems system, when the third-party payroll vendor uses these 3 REST APIs they built:

- [Concept: Global Payroll Reconciliation Initiating API](#) on page 1684 - sends the reconciliation parameters to the third-party payroll system.
- [Concept: Global Payroll Reconciliation Retrieval API](#) on page 1686 - retrieves the third-party system's data.
- [Concept: Global Payroll Reconciliation Schema API](#) on page 1687 - identifies which PECI fields the third-party system supports for reconciliation.

For secure communication, we recommend you use all these APIs with JWT authentication.

### **PECI Output File and Vendor Data File**

Setup the vendor data file to be similar to the PECI output file for Global Payroll Reconciliation.

On the PECI output file, the standard PECI fields have a “peci:” prefix and the custom field overrides have the “ptdf:” XML prefix. The vendor data file needs these same prefixes. For a sample, see [Reference: Sample Output XML](#) on page 1691.

Include the `//Worker_Summary/Employee_ID` element for all workers in the PECI extract in order for the comparison to function properly in the vendor data file. For a sample, see [Reference: Sample Output XML](#) on page 1691.

We recommend you include these elements for all workers to help the reconciliation results reviewer easily identify the worker incase the reviewer can't find the worker in Workday:

- `//Worker_Status/Hire_Date`
- `//Personal/Legal_Name/First_Name`
- `//Personal/Legal_Name/Last_Name`

We also recommend you include these corresponding child elements with their parent elements so the comparison can more intuitively display any differences in the reconciliation results:

- `Usage_Type` child element with `//Person_Communication/Address`.
- `Organization_Type` child element with `//Position/Organization`.
- `National_ID_Type` child element with `//Person_Identification/National_Identifier`.

Similar to Workday's PECI output, anytime the worker has a change to any of the fields on any given date in the period, the vendor data output file needs to include an `Effective_Change` element with the `Effective_Moment` as the date of change for fields that have a daily comparison, such as compensation one-time payment.

GPR removes leading zeroes in the employee ID so employees can be compared between the 2 systems. However, when the employee ID is shown in the reconciliation results, it preserves the leading zeroes.

Only include terminated workers in the vendor data file if they are terminated within the reconciliation period. Additionally, when you enable the include terminated workers launch parameter to increase the scope of terminated employees, you can configure the `Number of Years to Include Terminated Employees` integration attribute to change the number of years to include terminated workers from 1 to 5 years. Workday sends the `includeTerminatedWorkersAsOfDate` field in the initial third-party system request.

You can configure the `Exclude Terminated Workers with a Pay Through Date in the Future` integration attribute to exclude terminated workers that have a pay through date in a current or future period when their termination is in a prior period. Workday sends the `excludeTerminatedWorkersFuturePTD` field in the initial third-party system request.

GPR doesn't compare the XML attributes and `Derived_Event_Code` elements; therefore, you don't have to provide this information in the vendor data output file.

GPR doesn't support retro changes effective in a prior period changes and future-dated changes effective in a future period.

## Vendor Mapping Configuration

The third-party payroll vendor must provide these values to input on the Create External Payroll Vendor Mapping task:

- Initiating Endpoint
- Retrieval Endpoint
- Maximum Number of Polling Requests - The third party payroll system specifies these in the Retrieval API.
- Polling Frequency (ms) - The third party payroll system specifies these in the Retrieval API.
- Schema Endpoint
- Vendor Date Format - The third-party payroll system must specify all dates in the format set here in the REST APIs.

## Concept: Global Payroll Reconciliation Initiating API

The Initiating (POST) API enables Workday to:

- Communicate to the third-party payroll system for what reconciliation you are running for, such as pay group or period.
- Kick off the data extraction in the third-party system.

### Request

#### Header

- Authorization: JWT Token (JWT claims: iss, aud, exp, iat, jti)  
Note: The JWT expiration is 60 seconds.
- Content-Type: application/json

#### Body

```
{
    "startDate": "PERIOD START DATE",
    "endDate": "PERIOD END DATE",
    "payGroup": "PAY GROUP CODE",
    "membersInclude": {
        "employeeId": [ "EMPLOYEE WORKDAY ID 1", "EMPLOYEE WORKDAY ID 2" ]
    },
    "membersExclude": {
        "employeeId": []
    },
    "includeTerminatedWorkersAsOfDate": "LOWER BOUND FOR TERMINATION DATES",
    "schema": "BASE 64-ENCODED SCHEMA CONTAINING ONLY THE FIELDS CONFIGURED FOR RECONCILIATION",
    "excludeTerminatedWorkersFuturePTD": "BOOLEAN"
}
```

Format the startDate and endDate fields based on the Vendor Date Format attribute you configured in the Create External Payroll Vendor Mapping or Edit ExternalPayroll Vendor Mapping tasks.

Specify the value for the payGroup field based on the pay group code for the pay group. If you haven't configured this in Workday, the reconciliation API request will fail. To configure the pay group code, access the Edit Organization Name / Code task for the pay group and enter a value in the Code field.

If you don't specify members in the membersInclude field, the API sends an empty array in the body.

## Response

Header

HTTP Response Status

Body

Continue Reconciliation (HTTP status code 200):

```
{
  "skipReconciliation": "",
  "skipReconciliationReason": "",
  "id": "PROCESS ID ASSIGNED TO RECONCILIATION REQUEST BY THE VENDOR, ALSO REFERRED TO AS VENDOR PROCESS ID",
  "lastSuccessfulLoadDate": "YYYY-MM-ddTHH:MM:SS",
  "estimatedDuration": "TIME TO WAIT (NUMBER IN SECONDS)"
}
```

The lastSuccessfulLoadDate = Datetime the data was last synced between the 2 systems. Use the format yyyy-MM-ddTHH:MM:SS, not the format you specified on the Vendor Date Format attribute.

Skip Reconciliation (HTTP status code 200):

```
{
  "skipReconciliation": "true",
  "skipReconciliationReason": "REASON FOR SKIPPING RECONCILIATION; TO BE DISPLAYED TO USER",
  "id": "",
  "lastSuccessfulLoadDate": "",
  "estimatedDuration": ""
}
```

This response allows the third-party system to display a specific message in the reconciliation results viewer when the system can't run the reconciliation request. Building this response isn't required; the system can return a non-successful HTTP response status and Workday shows a generic error message in the reconciliation results viewer.

Error (Non-successful HTTP response status):

```
{
  "errors": [
    {
      "code": "RECONCILIATION_FAILED"
    }
  ]
}
```

```

        {
            "message": "ERROR MESSAGE"
        }
    ]
}

```

404, 408, and 500 HTTP response statuses are distinctly noted in Workday but will still show the same error message in the inbox item as the other HTTP error response status codes.

### **Concept: Global Payroll Reconciliation Retrieval API**

The Retrieval (GET) API enables Workday to poll the third-party payroll system to see if its data extraction is complete. When the data extraction is complete, this API retrieves the vendor data in pages. Each page has a set number of workers, based on the query parameter pageSize. This data is base-64 encoded in the response body.

### **First Call Request**

The first call to this API is to check if the third-party system is ready with the output. Make this first request after you extract the Workday PECI output file and the third-party system's estimated extract time has elapsed. You can specify the third-party's estimated extract time in the response of the Initiating API in the estimatedDuration field.

#### Query Parameters

id: Vendor process ID

#### Header

- Authorization: JWT Token (JWT claims: iss, aud, exp, iat, jti)
   
Note: The JWT expiration is 60 seconds.
- Content-Type: application/json

### **First Call Response**

#### Header

#### HTTP Response Status

#### Body

First call (HTTP status code 200):

```

{
    "status": "STATUS OF VENDOR EXTRACTION",
    "employeeCount": "NUMBER OF EMPLOYEES IN VENDOR DATA FILE",
    "data": ""
}

```

To continue with reconciliation, the status must be "Completed". This status is case-sensitive.

This API polls every minute up to 10 times to get a Completed response.

### **Subsequent Call Request**

Subsequent call requests retrieve third-party system paginated data files.

#### Query Parameters

- id: Vendor process ID

- `pageNumber`: Workday starts at page 1
- `pageSize`: You only need to provide this query parameter on the first subsequent call. This specifies how many employees the API returns per page. Workday dynamically determines the page size based on the `employeeCount` field returned in the first API call. If the number is less than 500, the `pageSize` is equal to the `employeeCount` field. Otherwise, the default is set to 500.

#### Header

- `Authorization`: JWT Token (JWT claims: iss, aud, exp, iat, jti)
- `Content-Type`: application/json

#### Subsequent Call Response

Successful response (HTTP status code 200):

```
{
  "status": "STATUS OF VENDOR EXTRACTION",
  "employeeCount": "",
  "data": "BASE-64 ENCODED VENDOR DATA FILE (XML)"
}
```

For a sample of the XML vendor data file, see [Reference: Sample Output XML](#) on page 1691.

Error (non-successful HTTP response status) follows the same error response format in the Initiating API. See [Concept: Global Payroll Reconciliation Initiating API](#) on page 1684 .

#### Concept: Global Payroll Reconciliation Schema API

The schema API enables Workday to determine what fields the third-party payroll system supports for reconciliation. If you configure fields in Workday for reconciliation but the fields aren't in the third-party system schema, the API won't compare the fields and reports them in the reconciliation results viewer in the Unsupported Fields list.

Additionally, the schema API supports whitelisting. If the third-party system has a restriction on a set of values, Workday only compares the whitelisted items. If the third-party payroll vendor doesn't provide a list, the API compares all the values. See the `Organization_Type` element in the [Reference: Sample Output XML](#) on page 1691 for an example. This data should be base-64 encoded. Each worker should have a base snapshot, such as an `Effective_Change` element for the first day of the pay period. Every `Effective_Change` element consists of all the elements specified in the Schema API in addition to the `Effective_Moment` element, with some exceptions described in [Reference: Global Payroll Reconciliation and PECI Data Sections](#) on page 1688. If a value does not exist for the field, the element should be an empty element.

#### Request

Only call this API when the third-party system PECI extract has been successfully and completely retrieved.

#### Header

- `Authorization`: JWT Token (JWT claims: iss, aud, exp, iat, jti)
- Note: The JWT expiration is 60 seconds.
- `Content-Type`: application/json

#### Query Parameters

`id`: Vendor process ID

**Response**

## Header

## HTTP Response Status

## Body

Successful response (HTTP status code 200):

```
{
  "xsd" : "BASE-64 ENCODED VENDOR SCHEMA"
}
```

See [Reference: Sample Output XML](#) on page 1691 for an example of what should go in the “xsd” field and how you should structure the schema. The HTTP response status should be 200.

Error (Non-successful HTTP response status) follows the error response format in the Initiating API.

See [Concept: Global Payroll Reconciliation Initiating API](#) on page 1684 .

**Reference: Global Payroll Reconciliation and PECI Data Sections**

Review the behavior for each of these *Payroll Effective Change Interface* (PECI) integration field attributes for Global Payroll Reconciliation.

Data Sections	Notes
Worker Status Data Section	The API outputs all the fields you configure in this data section in each Effective_Change element.
Recruiting Information	
Personal Data Data Section	The API outputs all the fields you configure in this data section in each Effective_Change element.
Personal Data By Country Section	
Person Communication Data Section	The API outputs all the fields you configure in this data section in each Effective_Change element. However, the API outputs the latest e-mail address and phone number regardless of the effective moment.
Person Identification Data Section	The API outputs all the fields you configure in this data section in each Effective_Change element.
Related Person Data Section	The API outputs all the fields you configure in this data section in each Effective_Change element.
Related Person Communication Data Section	The API outputs all the fields you configure in

Data Sections	Notes	
	this data section in each Effective_Change element. However, the API outputs the latest e-mail address and phone number regardless of the effective moment.	
Related Person Identification Data Section	The API outputs all the fields you configure in this data section in each Effective_Change element.	
Education Data Section	The API outputs all the fields you configure in this data section in each Effective_Change element.	
Position Data Section	The API outputs all the fields you configure in this data section in each Effective_Change element.	
Compensation Data Section	The API outputs all the fields you configure in this data section in each Effective_Change element. The API only reports compensation changes in the pay group they occurred in.	
Compensation Plans Data Section	The API outputs all the fields you configure in this data section in each Effective_Change element.	
Payment Election Data Section	The API outputs all the fields you configure in this data section in each Effective_Change element.	
Employee Contract Data Section	The API only outputs the Employee_Contract element on the date it is effective. If the End_Date has a value and is before the Effective_Moment of the Effective_Change element, the API doesn't output the Employee_Contract element.	
Collective Agreement Data Section	The API only outputs the Collective_Agreement element on the date it is effective. If the End_Date has a value and is before the Effective_Moment of the Effective_Change element, the API doesn't output the Collective_Agreement element.	

Data Sections	Notes	
Leave of Absence Data Section	The API only outputs the Leave_of_Absence element on the date it is effective. If the Leave_End_Date has a value and is before the Effective_Moment of the Effective_Change element, the API doesn't output the Leave_of_Absence element. In the case of pay group transfers, the API reports LOA and RFL events only in the pay group it occurred in.	
Benefit Elections Data Section		
Benefits Earnings and Deductions	If you don't configure the Amount field, leave it empty, or specify zero, the API doesn't output the entire Benefits_Earnings_and_Deductions element for the particular earning or deduction. Otherwise, the API outputs it in each Effective_Change element.	
Compensation Earnings and Deductions	If you don't configure the Amount field, leave it empty, or specify zero, the API doesn't output the entire Compensation_Earnings_and_Deductions element for the particular earning or deduction. Otherwise, the API outputs it in each Effective_Change element.	
Work Schedule Calendar Section		
Time Off Earnings and Deductions	The API only outputs the Time_Off_Earnings_and_Deductions element on the date it is effective. In the case of pay group transfers, the API reports this section only in the pay group it occurred in. The API won't output the Time_Off_Earnings_and_Deductions element if all of the Time_Off_Entry and Grouped_Time_Off_Entry child elements have a value of zero in the Units element.	

Data Sections	Notes
Time Tracking	The API only outputs the Time_Tracking element on the date it is effective.
Payroll Input Earnings and Deductions	If the End_Date has a value and is before the Effective_Moment of the Effective_Change element, the API doesn't output the particular earning or deduction for the Payroll_Input_Earnings_and_Deductions element.
Compensation One Time Payment	The API only outputs the Compensation_One_Time_Payment element on the date it is effective.
Payroll One Time Payment	The API only outputs the Payroll_One_Time_Payment element on the date it is effective.
Costing Allocation Data Section	The API only outputs the Costing_Allocation element on the date it is effective. If the Allocation_End_Date has a value and is before the Effective_Moment of the Effective_Change element, the API doesn't output the Costing_Allocation element.
Union Member Data Section	
Additional Information	
Transaction Log	

### Reference: Sample Output XML

Base-64 encode the response when sending the data with the Retrieval subsequent call response.

## Payroll Interface Connector

### Steps: Set Up Workday Payroll Interface

#### Prerequisites

We recommend that you use Workday Professional Services or a Workday Consulting partner when implementing Payroll Interface. If you implement Payroll Interface without assistance, ensure that a member of your team attends a Workday Integration training class. Ensure that you read the Payroll Interface documentation.

## Steps

1. Set up a payroll organization.

See [Steps: Establish Third-Party Payroll Organization](#) on page 1392.

2. Create and assign pay groups for third-party payroll.

See [Steps: Create and Assign Third-Party Payroll Pay Groups](#) on page 1396.

3. Define external payroll earnings and deductions.

See [Steps: Define Third-Party Payroll Earnings and Deductions](#) on page 1403.

4. Create a third-party payroll integration.

See [Steps: Create Third-Party Payroll Integration](#) on page 1700.

## Steps: Create Third-Party Payroll Integration

### Context

Create an integration system that sends employee data to an external payroll provider. These steps apply to Workday Payroll Interface and Workday Payroll Effective Change Interface.

### Steps

1. [Steps: Set Up Payroll Integration System](#) on page 1701.

2. [Select Fields for Payroll Extract](#) on page 1704.

3. [Configure Payroll Interface Attributes and Maps](#) on page 1705.

4. [Set Up Integration Delivery](#) on page 1952.

Before you configure integration delivery options, enable the *PI Delivery Service* integration service.

5. (Optional) [Set Up Integration Sequence Generators](#) on page 1969.

To create output files with unique filenames, configure the sequence generator. Enable the integration services for the file types you want to generate filenames:

- Integration output file: *PI Filename*
- Data Changes Audit: *PI Data Changes Audit Filename*
- Diagnostic Audit: *PI Diagnostic Audit Filename*

6. (Optional) [Add Custom Fields to Payroll Integration](#) on page 1715.

7. (Optional) Set up a document transformation to modify the output file before you send it to an external provider.

See [Steps: Set Up Document Transformation Connector](#) on page 594.

8. Access the Maintain Functional Areas task.

Select the Enabled check box for the USA Payroll functional area for your tenant. Do this step to view payroll extract files.

Security: *Security Configuration* domain in the System functional area.

9. [Launch or Schedule Payroll Integration](#) on page 1717.

Generate a payroll extract for external processing.

#### Tasks

[Steps: Set Up Workday Payroll Interface](#) on page 1699

## Steps: Set Up Payroll Integration System

### Context

Create an integration system that extracts and sends data to an external payroll provider.

### Steps

1. Access the Create Integration System task.
2. Give the integration a meaningful System Name. Record this name; you use it when you launch the integration.
3. Click the New using Template prompt, then select Cloud Connect for Third Party Payroll > Payroll Interface.
4. In the Integration Services grid, select the Enabled check box for each integration service that you want to activate. The integration services provide categories of data or configuration options for the output file.

Note: The integration requires these services:

- *Payroll Interface*
- *PI Launch Parameters*
- *Payroll Effective Change Interface - Summary DIS*

The *Transaction Log Service* isn't enabled by default, but the integration requires the service for change detection processing.

Option	Description
PI Members Launch Parameters	Provides additional launch parameters to the Launch/Schedule Integration task that enables you to select individual Pay Group members for inclusion in Payroll Interface. You typically enable this service only for an integration that processes ad hoc payroll runs.
PI Change Detection Launch Parameters	Provides additional launch parameters to the Launch/Schedule Integration task for ad hoc payroll integration events. You typically enable this service only for an integration that processes ad hoc payroll runs.
PI Full Extract With No Diff Launch Parameter	Provides additional launch parameters to the Launch/Schedule Integration task. The parameters enable you to extract all active and terminated employees assigned to a pay group as of the Current Date Entry Time and Pay Period End Date, regardless of whether they've changed. Enable this parameter to generate output that initially populates the external system. These output files don't include earnings and deductions.
PI Personal Data Section Fields	Provides employee personal data and contact information.
PI Status Data Section Fields	Provides employment status and service dates.

Option	Description
PI Position Data Section Fields	Provides job profile data, salary and base compensation elements, and organization membership data.
PI Compensation Data Section Fields	Provides worker compensation data.
PI Allowance Plan Data Section Fields	Provides data for worker allowance plans.
PI Commission Plan Data Section Fields	Provides data for worker commission plans.
PI Period Salary Plan Data Section	Provides data for worker period salary plans.
PI Unit Salary Plan Data Section Fields	Provides data for worker unit salary plans.
PI Salary and Hourly Plan Data Section Fields	Provides data for worker salary and hourly plans.
PI Contract Section Fields	Provides employment contract data.
PI Collective Agreement Section Fields	Provides collective agreement data.
PI Job History Section Fields	Provides data about employee job history.
PI Education Section Fields	Provides employee education data.
PI Leave of Absence Section Fields	Provides leave of absence data.
PI Earnings and Deductions Section Fields	Provides earnings and deductions configured for compensation elements and benefit plans, plus any external payroll input that spans more than 1 pay period.
PI T1 Tax Section Fields	Provides tax elections for Canadian employees.
PI W4 Tax Section Fields	Provides federal tax elections for U.S. employees.
PI Identifiers Section Fields	Provides identification numbers by type.
PI Payment Elections Section Fields	Provides employee direct deposit information.
PI Pay Data Section Fields	Provides earnings and deductions configured for one-time payments from compensation, plus any external payroll input that has start and end dates within the current pay period.
PI Paid Time Off Section Fields	Provides Paid Time Off (PTO) data, including position ID, PTO type, pay period start and end dates, and paid and unpaid hours taken during the pay period.
PI Time Off Correction Section Fields	Provides Time Off correction data.
PI Related Person Data Section Fields	Provides personal data and contact information for related persons.
PI Related Person Identifier Data Section Fields	Provides identification numbers by type for related persons.
PI Cost Allocations Section Fields	Provides percentages for cost center allocation.

Option	Description
Time Tracking Data	Provides time tracking data.
Time Tracking Correction Data	Provides time tracking correction data.
Transaction Log Service	Provides a record of event-based changes to employee data that are relevant to payroll integrations. Don't enable this service in integrations that generate full extracts.
PI Delivery Service	Provides file transport and encryption options for the output file.
PI Filename	Provides unique filenames for integration output documents by using the Workday sequence generator.
PI Data Changes Audit Filename	Enables your integration system to generate a unique, sequenced filename for the Data Changes Audit each time it runs. If selected, you must configure the integration sequence generator for your integration system.
PI Diagnostic Audit Filename	Enables your integration system to generate a unique, sequenced filename for the Diagnostic Audit each time it runs. If selected, you must configure the integration sequence generator for your integration system.

5. Grant the integration system user *Get* and *Put* access to these domains:

- *Payroll Interface*
- *Person Data: Birth Place*
- *Person Data: Citizenship Status*
- *Person Data: Disabilities*
- *Person Data: Ethnicity*
- *Person Data: Gender*
- *Person Data: ID Information*
- *Person Data: Marital Status*
- *Person Data: Military Status*
- *Person Data: Nationalities*
- *Person Data: Personal Data*
- *Person Data: Religion*
- *View: External Pay Groups*
- *Worker Data: Benefit Elections*
- *Worker Data: Compensation*
- *Worker Data: Payees*
- *Worker Data: Skills and Experience*
- *Manage: Organization Update Integration*
- *Manage: Organization Integration*

Configure unconstrained access to the *Person Data: Personal Data* domain for the integration. This domain access prevents empty values in the integration results for any country that the ISU isn't configured to access.

See: [Steps: Grant Integration or External Endpoint Access to Workday](#)

6. Configure the integration service for the transaction log:
  - a) As a related action on the integration system, select Integration System > Configure Integration Transaction Log.
  - b) Click Subscribe to all Transaction Types except and select the transactions to exclude from payroll interface processing. Typically, payroll providers only need information about staffing events and employee changes that have a payroll effect. These changes include changes to earnings and deductions, payment elections, and certain types of personal data.

## Next Steps

Select the individual fields to include in each data section, then configure the output file and map values in your tenant to the external system.

Related Information

### Tasks

[Steps: Create Third-Party Payroll Integration](#) on page 1700

## Select Fields for Payroll Extract

### Prerequisites

Security: *Integration Build* domain in Integration functional area.

Integration services manage the employee data available for output in a payroll integration. Enable the integration services that manage the fields using the related action Integration System > Configure Integration Services.

### Context

Field attributes control the data elements included in output files. When the integration runs, Workday:

- Searches for changes to the selected fields.
- Validates that the required fields are in the output file.
- Truncates values that exceed the maximum field length.
- Reports errors in the audit files.

If the required fields are missing, the *Payee Validation* attribute determines whether employees are included in output files.

### Steps

1. Access the View Integration System task.
2. Select the related action Integration System > Configure Integration Field Attributes.
3. In Field Configuration:
  - To include a field in the output file, select **Include in Output**.
  - If a field must contain a value, select **Required Field**.
  - If a field length is limited, specify the **Maximum Length**.

The *Operation* field is required in Position Data, T1 Tax, W4 Tax, Identifiers, and Payment Elections. *Operation* indicates whether a row is new, changed, or deleted.

## Configure Payroll Interface Attributes and Maps

### Prerequisites

Security: *Integration Build* domain in *Integration* functional area.

### Context

After you create a payroll integration system and select output fields, configure the integration attributes and maps for the output file.

Integration attributes define various processing options for the output file:

- File format.
- Retention period for audit files.
- Data validation rules.
- Always include data, or include only when changes occur.

Integration maps control how Workday maps values to the external payroll system. Only a subset of data elements requires an integration map. Workday maps data according to these rules:

- If an integration map has at least 1 row of data, Workday uses the map to convert your tenant values to external values. If you don't define a tenant value in the map, Workday uses the default value of the map. If the default value is blank, Workday issues an error or a warning message and the external value is empty.
- If an integration map is empty, Workday uses reference IDs in the output file. In the View Integration System report, click the Integration Maps tab to see which reference ID corresponds to each map. The only exception is the Region map, which uses the Workday region name instead of a reference ID. If a value in your tenant has no reference ID, Workday issues an error or a warning message and the external value is empty.

### Steps

1. Access the View Integration System report.
2. As a related action, select Integration System > Configure Integration Attributes.
3. Specify values for the attributes in the Integration Attributes grid:
  - For attributes without default values, add a row and specify a Value.
  - For attributes whose default values you want to change, select the Override Template Values check box and specify a new Value.
  - Optionally, use the Restricted to Environment field to specify that a value applies to a particular environment.

This table doesn't list the attributes that control when each data section displays in a Payroll Interface extract. These attributes automatically populate to *Include only when changed*. Change the setting to *Always* for data sections that you want to include in every Payroll Interface extract.

As you complete this task, consider:

Option	Description
Output Format	Specify the file format for integration output files (XML or CSV). The default value is XML.
Version	Select the version number for the output file. The initial version number matches the current Workday version number. In future releases, you must upgrade to a later version if you need new functionality or if the Get_Payees web service changes. If not, upgrading is optional.

Option	Description
Document Retention Policy	The default value is 30 days, but you can change the retention period to 60, 90, 120, or 180 days.
Date Format	The default value is [Y0001]-[M01]-[D01], but you can specify any date format supported by XSLT.
Date Time Format	The default value is [Y0001]-[M01]-[D01]T[H01]:[m01]:[s01], but you can specify any date time format supported by XSLT.
Required Field Validation	<p>When you export data, the integration applies additional validation rules to identify errors that might occur:</p> <ul style="list-style-type: none"> <li>• <i>(Default value) Include</i>: includes employees in the output file even if data errors exist; reports warnings.</li> <li>• <i>Omit - Report Warning</i>: excludes employees from the output file when data errors occur and reports a warning.</li> <li>• <i>Abort</i>: prevents delivery of an output file that contains errors.</li> </ul>
Max Field Length Validation	<p>When you export data, the integration applies validation rules for maximum field length to employee data to identify errors that might occur:</p> <ul style="list-style-type: none"> <li>• <i>Include</i>: truncates the affected employee invalid fields and includes them in the extract.</li> <li>• <i>Omit - Report Warning</i>: excludes the employee from the extract and adds warning messages to the event.</li> <li>• <i>Abort</i>: prevents delivery of an output file that contains errors.</li> </ul>
Payroll Company Organization Type	Identifies the organization type for payroll organizations. Use this attribute only if you include a pay group in multiple organizations.
Include Prior Values	Includes the prior values of data elements that have changed. Only available if output file format is XML.
Output Document Tags	Specify document tags to apply to each integration output file.
Audit Document Tags	Specify document tags to apply to the DataChangesAudit.html and DiagnosticAudit.html files. This attribute also enables you to deliver these files to the same location as the integration output file. Enable the PI Delivery Service integration service to use this attribute.

Option	Description
Extract All Payee Data	Extracts all Configured Data Section Fields with annotations on the modified field or records for employees that have identified changes. Doesn't extract deleted data from sections with an Operation field. If you enable Extract All Payee Data, you can't use the Transaction Log Service.
Period Look Ahead All Effective Lookup	<p>Specifies if an all effective lookup for a pay period should include workers whose status:</p> <ul style="list-style-type: none"> <li>Is specified in the integration attribute <i>Period Look Ahead Payee Status</i>.</li> <li>Was set within X number of days after the pay period end date. X is specified in the integration attribute <i>Period Look Ahead Days</i>.</li> </ul> <p>An all effective lookup includes the data changes performed in the past that became effective in the pay period.</p> <p>Enabling <i>Period Look Ahead All Effective Lookup</i> might cause over reporting of worker with the specified status. Over reporting includes reporting a worker:</p> <ul style="list-style-type: none"> <li>During an incremental update within the look ahead period.</li> <li>During an all effective update within the look ahead period.</li> <li>When the specified status for the worker becomes effective.</li> </ul> <p>Example: You set a look ahead period to 90 days and to identify workers with a terminated status. If you terminate Worker A effective 90 days after the period end date, then the integration includes Worker A in the output file:</p> <ul style="list-style-type: none"> <li>During an incremental update, because the termination date is within the look ahead period and you entered the termination since the last successful execution date time.</li> <li>During the all effective update for the subsequent monthly pay period that is within the 90-day look ahead period.</li> <li>When the termination becomes effective for the pay period included in the termination date.</li> </ul> <p>The integration doesn't apply the period look ahead in an all effective execution when you disable <i>Period Look Ahead All Effective Lookup</i>.</p> <p>The integration includes the staffing events of TERM and PCO based on when you configure</p>

Option	Description
	this attribute even if you haven't configured the transaction log service for these event types. This doesn't represent a restriction of what types of transaction the integration considers for look ahead functionality.
Period Look Ahead Days	Defines the number of whole days after the current pay period end date to detect payee changes that are effective in the next pay period. If the payee status matches 1 status in the <i>Period Look Ahead Payee Status</i> attribute, then the payee is extracted in the current pay period, plus changes that are effective in the next pay period.
Period Look Ahead Payee Status	Defines a set of Payee Status values used to select Payees for Period Look Ahead consideration. Use this attribute with the <i>Period Look Ahead Days</i> attribute.
Include Earnings and Deductions Section	Specifies if the integration always includes this data section in the output, or only when one of the values has changed. Default value is <i>Include only when changed</i> . Also enable the applicable integration service for this data section.
Calculate Benefits as of Pay Check Date	Calculates benefit earnings and deductions based on the pay check date instead of the period end date. This option gives you control over benefit calculations when an employee pay period crosses benefit plan years.  You don't select this option, the Use Coverage From Plan Year End check box in the Maintain Benefit Coverage Types task specifies whether year-end calculations use benefits in effect at the beginning or end of the pay period.
Include Identifiers section	Specifies if the integration always includes this data section in the output, or only when one of the values has changed. Default value is <i>Include only when changed</i> .  Also enable the applicable integration service for this data section.  The integration only includes identifiers in the output file for which there's an entry in the Identifier Type integration map. The integration only includes in the output file identifiers of a type listed in the Identifier Type integration map.
National ID Required	Select this check box to require at least one national identifier in the output file. When the integration runs, Workday will generate an

Option	Description
	error or warning message if a national identifier is missing.
Include Leave of Absence section	<p>Specifies if the integration always includes this data section in the output, or only when one of the values has changed. Default value is <i>Include only when changed</i>.</p> <p>Also enable the applicable integration service for this data section.</p>
Include only leave that affects payroll	Automatically populates to <i>Yes</i> . Select <i>No</i> to include all leave of absence data, regardless of payroll effect.
Include Paid Time Off section	<p>Specifies if the integration always includes this data section in the output, or only when one of the values has changed. Default value is <i>Include only when changed</i>.</p> <p>Also enable the applicable integration service for this data section.</p>
Include Pay Data section	<p>Specifies if the integration always includes this data section in the output, or only when one of the values has changed. Default value is <i>Include only when changed</i>.</p> <p>Also enable the applicable integration service for this data section.</p>
Include Payment Elections section	<p>Specifies if the integration always includes this data section in the output, or only when one of the values has changed. Default value is <i>Include only when changed</i>.</p> <p>Also enable the applicable integration service for this data section.</p>
Payment Election Rule for Regular Payments	Select the payment election rules that apply to regular payments. If you select payment election fields for output, then also select this attribute, otherwise the output values will be empty.
Payment Election Type	Select the Payment Election Types for Payment Distributions. The output file will include only Payment Distributions matching one of these payment election types.
Include Personal Data section	<p>Specifies if the integration always includes this data section in the output, or only when one of the values has changed. Default value is <i>Include only when changed</i>.</p> <p>Also enable the applicable integration service for this data section.</p>

Option	Description
Use Preferred Name when present	The output file uses Legal Name by default. Select the check box to use Preferred Name instead of Legal Name.
Use Address in Local Script	Select to include local address fields in the integration output file. If not selected, the output file includes default Western address fields.
First Address Type	Indicates the type of First Address ( <i>Home</i> or <i>Work</i> ).
First Address Usage	<p>In combination with the First Address Type attribute, indicates the address used as the First Address in the output file:</p> <ul style="list-style-type: none"> <li>If the First Address Usage Type doesn't exist for the selected First Address Type, then the output file doesn't include a First Address for the worker.</li> <li>If you don't configure the First Address Usage Type for the selected First Address Type, then the output file includes the primary address of the selected First Address Type.</li> <li>Example: You configured the integration system to select a First Address Type of <i>Home</i>, but you didn't configure the First Address Usage Type. The output file then includes the primary home address of the worker.</li> <li>You can select only 1 usage type. If you select multiple usage types, Workday uses only 1 of the selected First Address Usage Types.</li> </ul>
Second Address Type	Indicates the type of Second Address ( <i>Home</i> or <i>Work</i> ).
Second Address Usage	<p>In combination with the Second Address Type attribute, indicates the address used as the Second Address in the output file:</p> <ul style="list-style-type: none"> <li>If the Second Address Usage Type doesn't exist for the selected Second Address Type, then the output file for the worker doesn't include any Second Address.</li> <li>If you don't configure the Second Address Usage Type for the selected Second Address Type, then the output file includes the primary address of the selected Second Address Type.</li> <li>Example: You configured the integration system to select a Second Address Type of <i>Home</i>. You also didn't configure the Second Address Usage Type. The</li> </ul>

Option	Description
	<p>output file includes the primary home address of the worker.</p> <ul style="list-style-type: none"> <li>You can select only 1 usage type. If you select multiple usage types, Workday uses only one of the selected Second Address Usage Types.</li> </ul>
Communications Usage Type for Phone	<p>Select the usage type for the phone number in the output file. Use this attribute if you select phone number fields for output, otherwise the output values will be empty.</p>
Phone Number Parsing	<p>Specifies whether phone numbers are output as <i>Parsed</i> or <i>Unparsed</i>. Set this attribute to <i>Unparsed</i> to output phone numbers exactly as users enter them in Workday.</p>
Phone Number Format	<p>Specifies the format in which phone numbers are output.</p>
Communications Usage Type for First Email Address	<p>Select the usage type for the first email address in the output file. Use this attribute if you select email fields for output, otherwise the output values will be empty.</p>
Communications Usage Type for Second Email Address	<p>Select the usage type for the second email address in the output file. Use this attribute if you select email fields for output, otherwise the output values will be empty.</p>
Name Type for Maiden Name	<p>Select the type of name to use for the maiden name fields in the output file.</p>
Include Position Data section	<p>Specifies if the integration always includes this data section in the output, or only when one of the values has changed. Default value is <i>Include only when changed</i>.</p> <p>Also enable the applicable integration service for this data section.</p>
Return Only Primary Position	<p>Select to report changes only for:</p> <ul style="list-style-type: none"> <li>Primary positions within the same pay group.</li> <li>Former primary positions within the same pay group up to 12 months in the past.</li> </ul> <p>If you don't select the attribute, the output file includes all position data for employees who have multiple jobs.</p>
Job Classification Group for Job Classification One, Two, and Three	<p>Specify which type of job classification group to include in the output file. Example: US Worker Compensation. When you configure the integration maps, you map a value in your tenant for this group type.</p>

Option	Description
Organization Type for Organization One, Two, Three, Four, and Five	Specify which type of organization to include in the output file. Example: Cost Center or Region. When you configure the integration maps, you map a value in your tenant for this organization type.
Organization Default Value Type	<p>Defines the default value for Organizations that aren't mapped using the <i>Organization</i> integration map. This attribute overrides the default value defined for the <i>Organization</i> integration map.</p> <p>Workday returns a warning message when you run the integration for either of these situations:</p> <ul style="list-style-type: none"> <li>• You don't map all Organization values.</li> <li>• You define a default Organization on the <i>Organization</i> integration map and you don't enable this attribute.</li> </ul>
Organization Type for ORG Event	This organization type generates an organization change staffing event (ORG) when an employee changes organizations but doesn't change pay groups.
Include Contract section	<p>Specifies if the integration always includes this data section in the output, or only when one of the values has changed. Default value is <i>Include only when changed</i>.</p> <p>Also enable the applicable integration service for this data section.</p>
Enable Employee Contracts for Terminated and Rehired Employees	If you select this attribute, the integration includes employee contracts for terminated and rehired employees. If not selected, it removes employee contracts when an employee is terminated and adds them when rehired.
Include Job History section	<p>Specifies if the integration always includes this data section in the output, or only when one of the values has changed. Default value is <i>Include only when changed</i>.</p> <p>Also enable the applicable integration service for this data section.</p>
Include Education section	<p>Specifies if the integration always includes this data section in the output, or only when one of the values has changed. Default value is <i>Include only when changed</i>.</p> <p>Also enable the applicable integration service for this data section.</p>
Include Status Data section	Specifies if the integration always includes this data section in the output, or only when one

Option	Description
	<p>of the values has changed. Default value is <i>Include only when changed</i>.</p> <p>Also enable the applicable integration service for this data section.</p>
Include T1 Tax section	<p>Specifies if the integration always includes this data section in the output, or only when one of the values has changed. Default value is <i>Include only when changed</i>.</p> <p>Also enable the applicable integration service for this data section.</p>
Include W4 Tax section	<p>Specifies if the integration always includes this data section in the output, or only when one of the values has changed. Default value is <i>Include only when changed</i>.</p> <p>Also enable the applicable integration service for this data section.</p>
Include Related Person Data section	<p>Specifies if the integration always includes this data section in the output, or only when one of the values has changed. Default value is <i>Include only when changed</i>.</p> <p>Also enable the applicable integration service for this data section.</p>
Related Person ID Type	<p>Select the ID type to use for Related Person ID in the Related Person data section. If selected, the Related Person ID field can be empty due to the related person not having the type of ID specified. If not specified, the integration system includes the Related Person WID in the Related Person ID field.</p>
Include Related Person Identifier Data section	<p>Specifies if the integration always includes this data section in the output, or only when one of the values has changed. Default value is <i>Include only when changed</i>.</p> <p>Also enable the applicable integration service for this data section.</p>
Include Cost Allocations section	<p>Specifies if the integration always includes this data section in the output, or only when one of the values has changed. Default value is <i>Include only when changed</i>.</p> <p>Also enable the applicable integration service for this data section.</p>
Worktag Type for Costing Worktag One	<p>Specifies what type of worktag to include for cost allocations. Select either <i>Cost Center</i> or <i>Region</i>. If you want to include both worktag types, configure both worktag attributes.</p>
Worktag Type for Costing Worktag Two	<p>Specifies what type of worktag to include for cost allocations. Select either <i>Cost Center</i> or</p>

Option	Description
	<i>Region.</i> If you want to include both worktag types, configure both worktag attributes.
Include Additional Information Section	<p>Specifies if the integration always includes this data section in the output, or only when one of the values has changed. Default value is <i>Include only when changed</i>.</p> <p>Also enable the applicable integration service for this data section.</p>
Primary Payroll Integration	<p>Specifies if this integration system is for scheduled payroll runs (Primary) or for ad hoc payroll runs. If selected, Workday uses the pay period status to determine the changed detection method used, and updates the pay period status after successful completion.</p>
Pay Group Transfer Staffing Event Precedence	<p>When configured, pay group transfer staffing events (PCI/PCO/PGI/PGO) take precedence over leave staffing events (LOA/RFL) in the output file. When not configured, leave staffing events take precedence over pay group staffing events.</p>
Countries which Require Extended Address Type	<p>Specifies countries where you must use extended addresses. If selected, basic addresses in the selected countries aren't valid for payees.</p>
Restrict Addresses to These Countries	<p>Specifies valid countries for addresses in the integration output file. If selected, addresses that aren't in 1 of the selected countries isn't valid.</p>
Payroll Country	<p>Specifies country of residence for payees paid through this integration system. This attribute is for reporting purposes only; it doesn't affect integration behavior.</p>
Country Code	<p>Specifies country code in integration output file.</p>
Payroll Vendor	<p>Select payroll vendor for this integration system. This attribute is for reporting purposes only.</p>
Payroll Vendor, if Other selected	<p>If your external payroll vendor for the integration isn't available for selection in the <i>Payroll Vendor</i> attribute:</p> <ul style="list-style-type: none"> <li>• Select the value <i>Other</i> in the <i>Payroll Vendor</i> attribute.</li> <li>• Add the name of your vendor in this integration attribute.</li> </ul> <p>Contact Workday Support if you want to add your external payroll vendor to the <i>Payroll Vendor</i> attribute permanently.</p>

Option	Description
Include Time Tracking Data Section	Specifies if the integration always includes this data section in the output, or only when one of the values has changed. Default value is <i>Include only when changed</i> . Also enable the applicable integration service for this data section.
Time Tracking Reporting Interval	Specify if the time tracking data for each position is per-day or per-pay period.
Include Compensation Data Section	Specifies if the integration always includes this data section in the output, or only when one of the values has changed. Default value is <i>Include only when changed</i> . Also enable the applicable integration service for this data section.
Suppress Worker Messages Audit	If selected, Workday doesn't generate details for each worker in the Messages Audit report. Select this option only if you're running Payroll Interface for many workers and need improved performance.
Suppress Audit Files	If selected, Workday doesn't generate the Data Changes and Diagnostic Audit files when you run the integration. Select this option only if you're running Payroll Interface for many workers and need improved performance.

4. Save your changes, then as a related action, select Integration System > Configure Integration Maps.
5. In the Integration Maps grid, specify output file values for data in your tenant:
  - a) Add a row for each value in your tenant, select the Internal Value, and enter the External Value for the output file.
  - b) (Optional) Provide a Default Value for any data elements with values that aren't mapped.

Example: Your organization has *Hourly* and *Salary* pay rate types. In the *Pay Rate Type* map, define external values for the *Hourly* and *Salary* rate types. Create a Default Value of *Other* for any unmapped pay rate types.

Define mappings for the data elements that you include in the output file. Example: If the Personal Data Section only includes Gender and Marital Status, specify values in those maps and leave the other maps in the section empty. Also, if the output file doesn't contain the W4 Tax section, leave the *Payroll Marital Status* map empty. The Configure Integration Field Attributes task displays which maps correspond to each field.

#### Related Information

##### Tasks

[Steps: Create Third-Party Payroll Integration](#) on page 1700

#### Add Custom Fields to Payroll Integration

#### Prerequisites

Security: *Integration Build Custom Services* domain in *Integration* functional area.

## Context

Add custom fields to a payroll integration. You can use calculated fields or report fields to incorporate additional data elements into payroll extracts.

## Steps

1. Create an integration field override service and define custom fields:
  - a) Access the Create Integration Field Override Service task.
  - b) Set a Name. Example: *Payroll Interface Custom Fields*.
  - c) Click the Business Object prompt and select the data source for the custom fields. Example: *Employee*.
  - d) For each custom field, add a row to the Fields grid, enter the field Name, and optionally provide a Description.
2. Access the View Integration System report.
3. Enable the custom integration service:
  - a) As a related action, select Integration System > Configure Integration Services.
  - b) In the Custom Integration Services grid, add a row.
  - c) From the Integration Service prompt, select *Integration Generic Service (Audited)* then *Integration Field Override Service (Audited)*, and select the custom integration service you created in step 1.
4. Configure the custom fields:
  - a) As a related action on the integration system, select Integration System > Configure Integration Field Overrides.
  - b) For each field in the grid, click the Override External Field prompt and select the report field or calculated field.

The Override External Field prompt lists fields for the Business Object.
5. To map the custom field values to external values, create and configure one or more integration maps:
  - a) As a related action, select Integration System > Maintain Integration Maps.
  - b) For each field that requires a map, specify a map Name in this format: ADD-<FieldName>. The ADD prefix indicates that the map is for the Additional Data section, and the <FieldName> identifies the field that requires you to map.
  - c) Specify the Internal Value Type and External Value Type for each map. You can create an Enumeration with a list of valid values or select a report field at the Data Type prompt.
  - d) Save the maps.
  - e) As a related action, select Integration System > Configure Integration Maps, then go to the bottom of the grid to view the custom maps.
  - f) Add a row for each tenant value, select the Internal Value, and enter the External Value for the output file.

## Result

Workday groups custom fields into a record called ADD that displays on a separate line in the output file. By default, Workday includes custom fields in output files only when field values change. To include always custom fields in output files, change the setting of the integration attribute *Include Additional Information Sections*. Custom fields have no other integration attributes or maps to configure.

## Example

Payroll output files must include Federal and State Employer Identification Numbers. Create a field override service called *Additional Tax Data*, select the *Employee* business object, and define fields called *FEIN* and *State EIN*. View the payroll integration system and enable the *Additional Tax Data* integration

service. Then, configure the custom fields by selecting Worker Tax Elections > Federal Withholding FEIN and Worker Tax Elections > State EIN as field overrides.

## Next Steps

To add or change fields in an integration field override service, use 1 of these methods:

- In the View Integration System report, select Integration Field Override Service > Edit as a related action in the Custom Integration Services grid.
- Access the Edit Integration Field Override Service task.

### Tasks

Steps: [Create Third-Party Payroll Integration](#) on page 1700

## Launch or Schedule Payroll Integration

### Prerequisites

Security: *Integration Build* domain in *Integration* functional area.

Condition	Action
Running a Primary Payroll Interface integration for the first time in production.	Set the Created Date Time using the Maintain Payroll Integration Systems for Pay Group task. Set the Created Date Time value for the Last Extract Created section to the pay period beginning. Otherwise, Workday sets the date to the day before the payroll run date.
Running External Payroll Results Inbound a subsequent time, for the same Pay Groups and Pay Periods, due to errors in the previous integration run.	Delete the results from the previous payroll integration run using the Delete by Batch ID task. Otherwise, Workday generates duplicate results.

### Context

Extract Workday payroll data and send the data to an external payroll endpoint.

### Steps

1. Access the Launch / Schedule Integration task.
2. Select the Integration.  
You can't select or schedule an integration system that contains *Critical* errors.
3. To run an integration immediately, select the Organization. You can select the organization or subordinate organizations that you're a member of or in which you have an organization role.

Option	Description
Owning Organization	Displays if the Integration Process Event for this integration is associated with a specific organization.
Organization By Type	Displays if the Integration Process Event for this integration has no associated organization.

If you're running the integration in the future, Workday ignores the Organization value and determines the organization context, if any, based on the Integration Process Event.

4. Select an integration Run Frequency:

Option	Description
Run Now	Run immediately after you click OK.
Run Once in the Future	Run at the specified date and time.
Daily Recurrence	Run every x number of days on the specified day (or every weekday) at the specified time.
Weekly Recurrence	Run every x number of weeks on the specified day at the specified time.
Monthly Recurrence	Run in the specified months (or every month) on the specified day of the month or week.
Dependent	Run when a specified Workday event status completes, fails, or aborts.

5. (Optional) Enter a Request Name field. Default is Integration Name.

Request name is displayed in the Process Monitor and Scheduled Future Processes reports.

6. Specify values for the launch parameters on the Integration Criteria tab:

Parameter	Value Type	Value
Pay Group	Specify Value	<p>Select pay groups to:</p> <ul style="list-style-type: none"> <li>Extract pay period data for all pay group members.</li> <li>Extract member data based on Basic Staffing Transaction Log Types.</li> </ul> <p><i>Pay Group Availability Date</i> must be on or before the <i>Pay Period Start Date</i>, otherwise the integration fails.</p> <p>To extract data for a subset of pay group members, leave the parameter blank and select the Pay Group Members.</p> <p>If you select multiple pay groups, Workday combines the member data for all pay groups into 1 output file. Each pay group has a separate header record, followed by the member data.</p> <ul style="list-style-type: none"> <li><i>Use Earliest Open Pay Period</i>. Selects the first open pay period based on the pay group period schedule and period calculation status.</li> <li><i>Use Pay Period for Current Date</i>. Selects the pay period for the current date.</li> </ul>
Pay Period Selection Option	Specify Value	
Pay Group Members (only available when you enable the PI Members Launch Parameters integration service).	Specify Value	<p>To extract data for all pay group members, leave this field blank and select the Pay Group. If you select a Pay Group, and also select some of the pay group members, Workday includes all members of the Pay Group.</p> <p>Use a separate integration system to create a payroll extract for a specific set of employees. This action ensures that the Last Successful Run value for the next regular payroll extract isn't affected. To copy the current integration system, select Clone as a related action.</p>

Parameter	Value Type	Value
Exclude Members/ Only Include Members (only available when you enable the PI Members Launch Parameters integration service).	<i>Specify Value</i>	<ul style="list-style-type: none"> <li><i>Exclude specified members</i> ignores any Pay Group members selected in the Pay Group Members prompt.</li> <li><i>Only include specified members</i> ignores any Pay Group Members not selected in the Pay Group Members prompt.</li> </ul>
Last Successful Run (only available when you enable the PI Change Detection Launch Parameters integration service).	<i>Specify Value or Determine Value at Runtime</i>	<p>Specify the start date and time for the payroll extract process to search for changes:</p> <ul style="list-style-type: none"> <li>To enter a specific date and time if you're launching manually, set the Value Type to <i>Specify Value</i>. Enter the last date and time that the integration ran for the selected pay group.</li> <li>To have Workday calculate the value when a scheduled integration runs, set the Value Type to <i>Determine Value at Runtime</i>. Select the <i>Integration</i> category and then select a date field. Example: <i>As Of Entry Date/Time of Last Completed Integration Event</i>. Don't use <i>Datetime of Last Successful Integration Event (Don't Use)</i> as a launch parameter.</li> </ul>
Basic Staffing Transaction Log Types (only available when you enable the PI Change Detection Launch Parameters integration service).	<i>Specify Value</i>	<p>Default is the last time the integration successfully completed.</p> <p>To extract pay group member data for specific staffing events, select the transaction types.</p> <p>Leave blank to extract all payroll changes for the specified pay group and pay period.</p>

Parameter	Value Type	Value
Change Detection (only available when you enable the PI Change Detection Launch Parameters integration service).	Specify Value	<p>Specify how to search for changes to payroll data:</p> <ul style="list-style-type: none"> <li>Automatically select appropriate behavior based on date of last successful run. If the last successful run date was before the current period start date, Workday includes all changes effective within the current pay period regardless of when someone enters the changes. Workday also includes changes completed since the last successful run and effective within the current or prior pay period. If the last successful run date was after the current period start date, this option only includes changes entered after the last successful run. This option isn't valid when you create an extract for a pay period after the period end date.</li> <li>Include all changes effective in the pay period. Workday includes all changes effective within the current pay period regardless of when someone enters the changes. Workday also includes changes completed since the last successful run and effective within the current or prior pay period. Use this option when you run the first integration of the pay period or if you only create a single extract per pay period.</li> <li>Include only changes entered since the last successful run. Selects only changes to employee data that occurred after the last successful run and are effective in the current pay period or a previous pay period. Select this method for incremental runs during the pay period, but not the first run.</li> </ul> <p>If you enable the <i>Full Extract</i> integration attribute, then all data are extracted. Otherwise, Workday extracts only data changes. If you configured the integration for a full extract, the change detection method determines which changes Workday highlights in audit reports; doesn't affect the output file.</p>

7. To schedule an integration run, complete the Schedule tab:

Run Frequency	Criteria
Run Once in the Future	Specify a Start Date, Start Time, and Time Zone.
Daily Recurrence	<ul style="list-style-type: none"> <li>Select a Recurrence Type. If you select Recurs Every x Day(s), enter a number between 1 and 366.</li> <li>Specify a Start Time and Time Zone.</li> <li>Specify a Start Date and an End Date.</li> </ul>
Weekly Recurrence	<ul style="list-style-type: none"> <li>In the Recurs Every x Week(s) field, enter a number between 1 and 52.</li> <li>Select one or more Day(s) of the Week. If Recurs Every x Week(s) is greater than 1, you can select only 1 day.</li> <li>Specify a Start Time and Time Zone.</li> <li>Specify a Start Date and an End Date.</li> </ul>

Run Frequency	Criteria
<i>Monthly Recurrence</i>	<ul style="list-style-type: none"> <li>Select one or more Month(s) to schedule each recurrence.</li> <li>Select the Recurrence Type and then specify which Day(s) of the Month or Day of the Week.</li> <li>Specify a Start Time and Time Zone.</li> <li>Specify a Start Date and an End Date.</li> </ul>
<i>Dependent</i>	<p>Select the Dependency event type that triggers this integration.</p> <p>Use the Trigger on Status field to specify what event statuses will trigger this integration.</p>

The Start Date is 12:01 A.M. on the first possible day that a process could be scheduled. The End Date is 11:59 P.M. on the last possible day that a recurrence could be scheduled and must be greater than or equal to the Start Date. You can't specify an End Date after December 31 of the next year. A schedule created on 3/1/11 can't have an End Date after 12/31/12.

## Result

The payroll integration runs. Check the status in the Process Monitor report. View details about a scheduled integration in the Scheduled Future Processes report.

Workday attaches audit reports to the integration event. If you enabled the integration delivery service, Workday sends the output file to the specified endpoint.

### Concept: Payroll Interface Workflow

The *Workday Payroll Interface* integration enables you to connect with a third-party payroll vendor to send payroll data.

When you launch a Primary Payroll Interface integration, you specify:

- Pay group.
- Pay period.

When you launch a non-Primary or ad hoc Payroll Interface integration, you also specify:

- Date and time of the last successful run.
- Change detection method.
- (Optional) Specific Staffing transactions.
- (Optional) Pay group members.

You can use a transaction log to track event changes to employee data to send to your payroll provider. This service is optional.

When you configure this service, Workday only includes employees with transaction log entries within the specified time period. If you don't use a transaction log, Workday includes all employees in the specified pay group. You can use the integration launch parameters to further filter payees.

The payroll extract includes employees who transferred into or out of a pay group during the pay period.

#### Workday:

- Selects employees.
- Checks for field changes to employee data.
- Generates a payroll extract for the changes.

Workday uses these rules to create a payroll extract:

- Find employees who are members of the pay group at the start or end of the pay period. The payroll extract includes employees who transferred in or out of the pay group during the pay period.
- If you configure the transaction log:
  - Select employees who have transaction log events that are effective in the prior and current pay periods.
  - Exclude events with effective dates in future pay periods.
- Compare data for the selected employees at the beginning and end of the pay period.
- Identify field data changes.
- Determine if the changed data is included in the integration output. Examples:
  - Personal data.
  - Position and status data.
  - Earnings and deductions.
- Include employees who have data changes.
- Exclude employees who have no data changes or changes that don't affect data.
- Send earnings and deductions when they start, when the amounts change, and when they end.
- Provide data for staffing events based on the event type:
  - New hires = all data.
  - Transfers into pay companies or pay groups = all data.
  - Terminations = changed data.
  - Leave of absence and return from leave = changed data.
  - Transfers out of pay companies or pay groups = all data as of 1 day before the transfer.

##### Concepts

[Concept: Workday Payroll Interfaces](#) on page 1496

#### Concept: Payroll Interface Change Detection

You can select 1 of these change detection methods when running a Payroll Interface Integration:

Include all changes effective in the pay period.

Select this method when you launch the first integration in a pay period. The payroll extract includes all changes to employee data that are effective in the current pay period, regardless of when you enter the changes in Workday.

Include only changes entered since the last successful run.

Select this method when you launch an incremental integration after the first run of a pay period. The payroll extract includes only those changes that you enter in Workday after the date of the last successful run and are effective in the current pay period or a prior pay period.

Automatically select appropriate behavior based on date of last successful run.

You can select this method only for payroll extracts that you create before the pay period end date. For payroll extracts after a period ends, you must

explicitly select the change detection method. When you select this method, Workday compares the date of the last successful run to the pay period start date. When the last successful run was:

- If the last successful run was after the current period start date, the default method is *Include only changes that were entered since the last successful run.*
- After the current period start date, Workday uses the *Include only changes that were entered since the last successful run* method.

## Primary and Non-Primary Integrations

The Primary Integration updates the pay group. When you run it the first time for a period, Workday updates the period status to *In Progress*. Designate the primary payroll integration and disable the PI launch parameter:PI Change Detection Launch Parameters and PI Members Launch Parameters.

Create Primary payroll integration systems for scheduled runs; create non-Primary payroll integration systems for ad hoc/error resolution runs.

A Primary payroll integration can process multiple pay groups, but a pay group must be processed by only one Primary payroll integration.

- Use the *Primary* integration for scheduled payroll interface runs. It performs change detection automatically; it includes all effective changes for pay periods whose status is *Not Yet Started*, and only changes since the last successful run when the pay period status is *In Progress*.

The integration automatically updates the last successful run date and if needed, the pay period date. The integration processes:

- All effective records when the period status is *Not Yet Started*
- Incremental changes only when the period status is *In Progress*.

For ad hoc or error resolution runs only, enable these integration services on a Primary Integration:

- *PI Change Detection Launch Parameters*
- *PI Members Launch Parameters*

Note: On the Note, suggest: After the last payroll run for a pay group and pay period combination, you must manually set the pay period status to *Complete*.

- Use *Non-Primary* integrations for unscheduled payroll runs. Example: After correcting an error. It doesn't update pay group or pay period status. When you disable the *PI Change Detection Launch Parameters* integration service, the change detection works differently for different versions:

Version	Pay Period Status as of Last Successful Run Date	Changes Detected for the Period
22 and later	<i>Not Yet Started.</i>	<i>All Effective</i>
22 and later	<i>Any status except Not Yet Started.</i>	<i>Incremental</i>

Version	Pay Period Status as of Last Successful Run Date	Changes Detected for the Period
21 and earlier	Any status.	<i>All Effective</i>

When you set up a new pay group and payroll calendar and run a payroll extract for the first time:

- When the pay period begins in the future, the interface uses the current entry date as the last successful date and time.
- When the pay period start date is earlier than now, the interface uses the pay period start date as the last successful date and time.

## Payroll Extract Dates

Workday determines which changes payroll integrations to include in an extract based on the:

- last successful run date
- pay period start date
- event entry date
- event effective date

If there are events missing from a payroll extract, check the change detection mode and the effective dates of the event.

This diagram displays how dates affect event selection:

## Change Detection Timeline

This timeline displays a series of transactions for the same employee over a two-month period:

Example: In your company, employees have monthly pay frequencies, and you use automatic change detection to schedule twice-monthly payroll integrations. You hire an employee in March with an effective date of 04-18, and the employee submits an address change on 04-20. The payroll integrations return these results:

Payroll Integration Date	Default Change Detection	Changes Included in Payroll Extract
03-15: First run	All changes effective in the pay period.	No changes included because the hire event isn't effective in the current pay period.
03-31: Incremental run	Only changes entered since last successful run.	No changes included because there are no events after the last successful run.
04-15: First run	All changes effective in the pay period.	Hire event included because it's effective in the current pay period.
04-30: Incremental run	Only changes entered since last successful run.	Address change included because you entered it after the last successful run and it's effective in the current pay period.

### Concepts

[Concept: Payroll Interface Workflow](#) on page 1721

## Concept: Multiple Positions in Payroll Interface

You can include payroll information for multiple positions in Payroll Interface. You can include the positions in integrations for the same or different Pay Groups, which enable you to pay workers separately for each position. Workday enables you to assign positions to pay groups.

Workers with multiple positions can have a position in a more than 1 Pay Group. Each position is paid by Workday Payroll (if it's the primary position) or Payroll Interface. You can use a different currency for each position. Assign earnings and deductions at the Worker or Position level.

You can use multiple positions to pay employees on international assignment. You can:

- Establish a second position for the international assignment.
- Maintain the worker primary position during and after the international assignment.
- Include Domestic for the International Assignment Type field in the output file for employees with international assignments that transfer domestically.

When a worker is on international assignment, you can pay a portion of their total compensation to their primary home country position. This feature enables a worker to continue to receive home country benefits. Dependents who stay in the home country might need those benefits. You can also use multiple positions to pay the worker for an additional position in the local currency.

Note: Ensure that your payroll provider supports multiple jobs before you set up Payroll Interface for multiple jobs.

## Using Payroll Interface with Workday Payroll

When paying workers with multiple positions, you can pay each position with a different payroll system. You can use both Workday Payroll and Payroll Interface to pay workers with multiple positions; however, not all combinations are available. This table lists each combination of primary and additional position pay options.

Primary Position Paid By	Additional Position Paid By	Supported?
Workday Payroll	Workday Payroll	Yes, however, Workday Payroll can only process payroll for the same Company and the same Pay Group.
Workday Payroll	Payroll Interface	Yes
Payroll Interface	Payroll Interface	Yes
Payroll Interface	Workday Payroll	No

## Switching Primary Jobs for Workers with Multiple Positions

If *both* jobs are in the same external Pay Group, and are paid through Payroll Interface, switch a worker's primary using the Switch Primary Job task.

## Switching Primary Jobs for International Assignments

You can change a worker's primary position that's assigned to an external pay group with an international assignment that's assigned to an external pay group.

Payroll Interface doesn't support payroll processing for a worker whose primary job is:

- Assigned to an external pay group that changes to an international assignment that's assigned to a Workday pay group.
- Assigned to a Workday pay group that changes to an international assignment that's assigned to an external pay group.
- Assigned to an external pay group that changes to an international assignment that doesn't belong to a pay group.

- Not assigned to a pay group and changes to an international assignment that's assigned to an external pay group.

## **Earnings and Deductions with Multiple Positions**

Earnings and deductions can exist at the worker level or the position level. You can designate one or more earnings and deductions as position based. To designate the earnings and deductions, use the Maintain External Payroll Earnings and Maintain External Payroll Deductions tasks.

Workday resolves earnings and deductions differently depending on whether they're position-based:

- Worker level (nonposition based) earnings and deductions have a single resolution for each worker. Workday returns these earnings and deductions with the worker primary position.
- Position-based earnings and deductions resolve separately for each position. Therefore, a worker could have multiple resolved earnings. Example: Base pay.

### **Example: Two Positions in Same Pay Group**

When paying a worker who has 2 positions in the same Pay Group, Workday Payroll and Payroll Interface generates payroll using these methods:

- Workday Payroll. Workday pays both positions in the same check. Workday displays payroll results based on the position.
- Payroll Interface. Payroll results include all worker level data. Examples: Personal data and payment elections. Position level payroll results include a Position reference for each position. Examples: Compensation and job details.

### **Example: Two Positions in Separate Pay Groups**

When paying a worker who has 2 positions in separate Pay Groups, Workday Payroll and Payroll Interface generates payroll using these methods:

- Workday Payroll. If Payroll Interface pays the additional position, Workday pays the Primary position. If Workday pays the Primary position, Workday Payroll can't pay an additional position.
- Payroll Interface. Payroll results include all worker level data. Examples: Personal data and payment elections. Payroll results also include position level payroll results, but only for the positions in the Pay Group. If Payroll Interface pays a Primary position, payroll results also return worker level data that might also be position level results.

#### **Tasks**

[Steps: Set Up Workday Payroll Interface](#) on page 1699

[Steps: Establish Third-Party Payroll Organization](#) on page 1392

#### **Concept: Pay Data Integration with Workday Payroll Interface**

Pay data is payroll data that is only valid for a single pay period or payroll run. Examples:

- One-time payments.
- Payroll adjustments.
- Time off taken.

Pay data doesn't include payroll-related HR data that spans multiple pay periods, such as:

- Personal information.
- Employment information.
- Compensation.
- Regular earnings and deductions.

## Pay Data Integration Setup

External payroll providers handle pay data differently than HR data. Some providers receive both types of data in the same integration file. Most providers require separate files for pay data.

You can:

- Create an integration system based on the Payroll Interface integration template.
- Clone your existing payroll integration system and modify it for pay data.

Workday uses the same payroll organization and pay groups for payroll and pay data, whether or not you create separate integration systems. No additional setup is needed other than maintaining external payroll earnings and deductions. Payroll and pay data integrations use the same launch parameters. Separate integration systems can have different schedules.

## Time-Off Taken

Time-off data includes both paid and unpaid time-off. You can configure time-off with or without offset periods for payroll processing when you create or edit the time-off. Pay data integrations send approved time-off based on employee self-service entries; no additional time-off data entry is required.

To configure time-off data:

1. [Create Time Off Types](#)

Define time-off types.

2. [Manage External Payroll Earnings](#) on page 1403 and [Manage External Payroll Deductions](#) on page 1406

Set up external payroll earnings and deductions for time-off:

- If you reduce base pay by paid time-off, set up paid time-off as an earning.
- If you don't reduce base pay by paid time-off, set up paid time-off as a deduction.
- Set up unpaid time-off as a deduction.

## Payroll Adjustments

Payroll adjustments are one-time adjustments to earnings or deductions. Examples: Adjustments to regular compensation, employee benefit costs, taxable benefits, flex credits, general deductions, one-time payments, and bonuses.

You can configure payroll adjustments by using:

- [Manage External Payroll Earnings](#) on page 1403 and [Manage External Payroll Deductions](#) on page 1406 to set up external payroll earnings or deductions for adjustments.
- [Manage External Payroll Input for Worker](#) on page 1410 to maintain external payroll input for workers.

### Concepts

[Concept: Workday Payroll Interfaces](#) on page 1496

## Reference: Staffing Events in Payroll Interface Extracts

Payroll Interface extracts include a staffing event when the effective date occurs in the pay period that the integration is processing. Workday reports staffing events in the status record of the output file.

## Staffing Event Types

Based on the staffing event code, Workday uses these event dates and returns information in these sections:

Staffing Event Code	Definition	Status Event Date	Data Included
HIR	New hire into a pay group, or termination rescinded.	Hire date	All employee sections.
TRM	No longer employed.	Termination date	All employee sections.
LOA	On unpaid leave of absence.	First day of leave	Status, Position, Earnings and Deductions, and any other sections with changes.
ORG	Change organization but don't change pay group.	Date of position change	Personal, Position, Compensation, Earnings and Deductions, plus any other sections with changes.
RFL	Return from unpaid leave of absence.	First day back at work	Status section plus any other sections with changes.
PCI	Transfer into this pay group from a pay group in a different payroll company.  For payees with multiple positions, this code applies only to the first position transferred.	Date of pay group reassignment	All employee sections.
PCO	Transfer out of this pay group to a pay group in a different payroll company.  For payees with multiple positions, this code applies only to the last position transferred.  Includes outbound transfers to a pay group in a different payroll company.	Date of pay group reassignment	All employee sections.
PGO	Transfer out of this pay group to another pay group in the same payroll company.	Date of pay group reassignment	Status section.

Payroll integrations only include leave of absence events for a worker primary position. Workday reports the leave start date and estimated return date:

- Single leave: Uses the Leave Start Date and Estimated Leave End Date.

- Multiple concurrent leaves: Uses the Leave Start Date and Estimated Leave End Date for both leaves.
- Multiple overlapping or nested leaves: Uses the Leave Start Date of the earliest leave and the Estimated Leave End Date of the latest leave.
- Multiple contiguous leaves: Uses the Leave Start Date of
  - Either the first leave or the leave in effect at the time of reporting.
  - And, the Estimated Leave End Date of either the first leave or the leave in effect at the time of reporting.

## Staffing Event Selection Process

These changes to employee status produce a staffing event:

Previous Status	Present Status			
	Active	On Unpaid Leave	On Paid Leave	Terminated
Not Yet Hired	HIR	HIR	HIR	TRM
Active		LOA		TRM
On Unpaid Leave	RFL		RFL	TRM
On Paid Leave		LOA		TRM
Terminated	HIR	HIR	HIR	

Example: When you terminate an active employee, the employee record has a staffing event code of TRM in the payroll extract. When you place an active employee on unpaid leave, the record has a staffing event code of LOA. An employee who has returned from unpaid leave has a staffing event code of RFL.

If the integration runs once at the period end, an employee you hire and terminate in the same period has a staffing event code of TRM.

For other staff changes not included in the table, Workday compares current and past values for the for the employee pay group and payroll company. Workday reports any change in value as a transfer event with a status code of PCI, PCO, PGI, or PGO.

We recommend that you run payroll integrations to isolate staffing events for the same employee in the same pay period. Workday Payroll Interface captures net changes to employee status from the period beginning to end. Depending on the change detection method that you select at launch, the payroll extract might omit intermediate changes that occur during a pay period.

## Reference: Data Sections for Payroll Interface

You enable integration services for each data section. Each data section has an integration attribute that specifies whether to:

- Always include the section.
- Include the section only when changes occur.

If you include a section when changes occur, the section data varies:

- In sections that contain a single record, the payroll extract includes all section data when 1 field changes.
- In sections that contain multiple records, the payroll extract includes all section records when 1 field changes. Exceptions: Earnings and Deductions, Pay Data, and Paid Time Off sections. In those sections, the payroll extract includes only the record that changed.

For workers paid in more than 1 position, some sections contain worker level data. Others contain position-specific data. For each position data section, Workday returns data for positions that are part of that Pay Group. For sections that contain position data, Payroll Interface includes a position reference.

Some sections have an *Operation* field that indicates if a row is new, changed, or deleted. *Operation* codes are ADD, REMOVE, MODIFY, and NONE.

Section Fields	Description	Fields
Header	<p>Every output file has a header section. If you include multiple pay groups in an integration run, the output file contains 1 header for each pay group, followed by member records for the pay group. The version number of the output file matches the Workday version number.</p> <p><i>Updated From</i> and <i>Updated Through</i> are the start date and end date for changes in the output file.</p> <p><i>All Effective</i> indicates that the file includes all changes effective in the pay period. If you don't this field, the integration includes only changes entered between the <i>Updated From</i> and <i>Updated Through</i> dates.</p>	<ul style="list-style-type: none"> <li>• Version</li> <li>• Payroll Company</li> <li>• Pay Group</li> <li>• Period Start Date</li> <li>• Period End Date</li> <li>• Updated From</li> <li>• Updated Through</li> <li>• All Effective</li> </ul>

Section Fields	Description	Fields
Personal Data	<p>This section includes worker level data. It has a single record.</p> <p>The integration bases name fields on Legal Name. To use Preferred Name, configure the <i>Use Preferred Name when present</i> integration attribute.</p> <p>If you include maiden name fields in the output file, specify a value for the <i>Name Type for Maiden Name</i> integration attribute.</p> <p><i>Title</i> is the name Prefix and <i>Social Suffix</i> is the name Suffix.</p> <p><i>Country of Birth</i> is a 2-digit country code.</p> <p>You can include 2 addresses in the output file. To specify the type of addresses to include, configure the <i>Communications Usage Type for First Address</i> and <i>Communications Usage Type for Second Address</i> integration attributes.</p> <p>You can include a single phone number in the output file with separate phone number fields, such as:</p> <ul style="list-style-type: none"> <li>• <i>International Phone Code</i></li> <li>• <i>Area Code</i></li> <li>• <i>Phone Number</i></li> <li>• <i>Phone Extension</i></li> </ul> <p>Alternatively, you can include a single field with <i>Formatted Phone Number</i>. To specify the type of phone number, configure the <i>Communications Usage Type for Phone</i> integration attribute.</p> <p><i>First Address Lines 3 to 9</i> are for international address components.</p> <p>The <i>Disability Data</i> output depends on how you configure the file type (XML or CSV) for the integration output files. If a worker has multiple disabilities, the integration includes all disabilities in XML output files. It only includes the first disability in CSV output files.</p> <p>If a worker has multiple citizenship statuses, the integration only includes the first citizenship status in the output file.</p> <p>Note: Grant the Integration System User role Get access to the <i>Person Data: Personal Data</i> security domain and all its subdomains or this data section won't correctly return personal data.</p>	<ul style="list-style-type: none"> <li>• First Name</li> <li>• Middle Name</li> <li>• Last Name</li> <li>• Secondary Last Name</li> <li>• Full Legal Name</li> <li>• Title</li> <li>• Surname</li> <li>• Social Suffix</li> <li>• Name in Local Script</li> <li>• First Name in Local Script</li> <li>• First Name in Local Script 2</li> <li>• Middle Name in Local Script</li> <li>• Last Name in Local Script</li> <li>• Last Name in Local Script 2</li> <li>• Secondary Last Name in Local Script</li> <li>• Country for Name</li> <li>• Maiden First Name</li> <li>• Maiden Middle Name</li> <li>• Maiden Last Name</li> <li>• Maiden Secondary Last Name</li> <li>• Maiden Title</li> <li>• Maiden Surname</li> <li>• Maiden Social Suffix</li> <li>• Maiden Name in Local Script</li> <li>• Maiden First Name in Local Script</li> <li>• Maiden Middle Name in Local Script</li> <li>• Maiden Last Name in Local Script</li> <li>• Maiden Secondary Last Name in Local Script</li> <li>• Country for Maiden Name</li> <li>• Tertiary Last Name</li> <li>• Gender</li> <li>• Birth Date</li> <li>• Date of Death</li> <li>• Country of Birth</li> <li>• Region of Birth</li> <li>• City of Birth</li> <li>• Marital Status</li> <li>• Marital Status Date</li> <li>• Religion</li> <li>• Disability</li> <li>• Disability Status Date</li> <li>• Disability Data /</li> <li>• Disability Data / Operation</li> <li>• Disability Data / Disability</li> <li>• Disability Data / Disability Status Date</li> <li>• First Submunicipality 2</li> <li>• Workday Proprietary and Confidential</li> <li>• Disability Data / Disability</li> </ul>

Section Fields	Description	Fields
Personal Data by Country	<p>This data section contains personal information by country for a worker's non-primary position, such as an additional job or international assignment. The data section includes a repeating element if there's more than 1 non-primary position and repeats per country. Workday only includes the Personal Data by Country section in the output file if you enable the PI Personal Data By Country Data Section Fields integration service.</p> <p>Note: Grant the Integration System User role Get access to the <i>Person Data: Personal Data</i> security domain and all its subdomains or this data section won't correctly return personal data.</p>	<ul style="list-style-type: none"> <li>• Country</li> <li>• Hispanic or Latino</li> <li>• Hispanic or Latino Visual Survey</li> <li>• Marital Status Date</li> <li>• Disability</li> <li>• Disability Status Date</li> <li>• Disability Data /</li> <li>• Disability Data / Operation</li> <li>• Disability Data / Disability</li> <li>• Disability Data / Disability Status Date</li> <li>• Disability Data / Disability Date Known</li> <li>• Disability Data / Disability End Date</li> <li>• Disability Data / Disability Grade</li> <li>• Disability Data / Disability Degree</li> <li>• Disability Data / Disability Remaining Capacity</li> <li>• Disability Data / Disability Certification Authority</li> <li>• Disability Data / Disability Certified At</li> <li>• Disability Data / Disability Certification ID</li> <li>• Disability Data / Disability Certification Basis</li> <li>• Disability Data / Disability Severity Recognition Date</li> <li>• Disability Data / Disability FTE Toward Quota</li> <li>• Disability Data / Disability Work Restrictions</li> <li>• Disability Data / Disability Accommodations Requested</li> <li>• Disability Data / Disability Accommodations Provided</li> <li>• Disability Data / Disability Rehabilitation Requested</li> <li>• Disability Data / Disability Rehabilitation Provided</li> <li>• Disability Data / Note</li> <li>• Disability Data / Disability Status</li> <li>• Ethnicity</li> <li>• Gender</li> <li>• Marital Status</li> <li>• Religion</li> </ul>

Section Fields	Description	Fields
Status Data	<p>This data section contains position-specific data. It has a single record.</p> <p>The <i>Payroll Company</i> and <i>Pay Group</i> fields contain organization codes. When an employee transfers out of a pay group, the fields identify the new payroll company and pay group. If you configure the <i>Include Prior Values</i> integration attribute, the payroll extract also identifies the prior payroll company and pay group.</p> <p><i>Staffing Event</i> codes are:</p> <ul style="list-style-type: none"> <li>• HIR (hire).</li> <li>• TRM (termination).</li> <li>• LOA (leave of absence).</li> <li>• RFL (return from leave).</li> <li>• PCI (payroll company in).</li> <li>• PCO (payroll company out).</li> <li>• PGI (pay group in).</li> <li>• PGO (pay group out).</li> </ul> <p><i>Employee Status</i> codes are:</p> <ul style="list-style-type: none"> <li>• Active.</li> <li>• Terminated.</li> <li>• On Leave.</li> <li>• On Paid Leave.</li> <li>• Not Yet Hired.</li> </ul> <p>These fields support Record of Employment (ROE) reporting for Canada:</p> <ul style="list-style-type: none"> <li>• <i>Last Date for Which Paid</i></li> <li>• <i>Expected Return Date</i></li> <li>• <i>Not Returning</i></li> <li>• <i>Return Unknown</i></li> </ul> <p>You can specify data for these fields with the <i>Termination</i> business process and include the data in the integration output file to help you meet country requirements:</p> <ul style="list-style-type: none"> <li>• <i>Notice Period Start Date</i></li> <li>• <i>Agreement Signature Date</i></li> <li>• <i>Dismissal Process Start Date</i></li> </ul>	<ul style="list-style-type: none"> <li>• Payroll Company</li> <li>• Pay Group</li> <li>• Staffing Event</li> <li>• Staffing Event Date</li> <li>• Employee Status</li> <li>• Active</li> <li>• Active Status Date</li> <li>• Hire Date</li> <li>• Original Hire Date</li> <li>• Hire Reason</li> <li>• End Employment Date</li> <li>• Continuous Service Date</li> <li>• First Day of Work</li> <li>• Expected Retirement Date</li> <li>• Seniority Date</li> <li>• Severance Date</li> <li>• Retirement Date</li> <li>• Benefits Service Date</li> <li>• Company Service Date</li> <li>• Time Off Service Date</li> <li>• Vesting Date</li> <li>• Terminated</li> <li>• Termination Date</li> <li>• Pay Through Date</li> <li>• Resignation Date</li> <li>• Primary Termination Reason</li> <li>• Primary Termination Category</li> <li>• Secondary Termination Reason</li> <li>• Local Termination Reason</li> <li>• Not Eligible for Hire</li> <li>• Regrettable Termination</li> <li>• Termination Last Day of Work</li> <li>• Probation Start Date</li> <li>• Probation End Date</li> <li>• Date Entered Workforce</li> <li>• Pay Group Assignment Date</li> <li>• Last Date for Which Paid</li> <li>• Expected Date of Return</li> <li>• Not Returning</li> <li>• Return Unknown</li> <li>• Notice Period Start Date</li> <li>• Agreement Signature Date</li> <li>• Dismissal Process Start Date</li> </ul>

Section Fields	Description	Fields
Position Data	<p>Contains position-specific data and can have multiple records.</p> <p>If an employee has multiple jobs, Workday doesn't aggregate work hours or compensation for all jobs. Establish the pay group assignment and maintain all payroll data on a worker primary job. To ensure that payroll extracts include details only for the primary job, you configure the <i>Return Only Primary Position</i> integration attribute.</p> <p><i>Effective Date</i> is the effective date for the most recent change to position data.</p> <p><i>Compensation Effective Date</i> is the effective date for the most recent compensation change. Depending on your configuration, a change to position or compensation data might not affect the contents of the payroll extract. However, these effective dates reflect the date of the most recent change in Workday. The payroll extract won't include the Position Data section if:</p> <ul style="list-style-type: none"> <li>• You set the <i>Include Position Data section</i> integration attribute to <i>Include only when changed</i>.</li> <li>• Only the effective dates change.</li> </ul> <p><i>Total Annual Base Pay</i> is the annual compensation number. <i>Total Bay Pay</i> is based on <i>Base Pay Frequency</i>, which is the same frequency as the pay period.</p> <p>A position can have job classifications based on job classification groups. You can include up to 3 references in the output file. To specify the job classification type, configure the integration attributes.</p> <p>An employee can belong to different organizations. You can include up to 5 organization references in the output file. To specify the organization type, configure the integration attributes.</p> <p><i>Supervisor ID</i> is the employee ID of the immediate supervisor. You can include the supervisor status. Example: <i>On Leave</i>.</p>	<ul style="list-style-type: none"> <li>• Operation</li> <li>• Position ID</li> <li>• Effective Date</li> <li>• Primary Job</li> <li>• Business Title</li> <li>• Worker Type</li> <li>• Position Time Type</li> <li>• Job Exempt</li> <li>• Scheduled Weekly Hours</li> <li>• Default Weekly Hours</li> <li>• Pay Cycle Hours</li> <li>• Full Time Equivalent Percentage</li> <li>• Paid FTE</li> <li>• Working FTE</li> <li>• Pay Rate Type</li> <li>• Compensation Effective Date</li> <li>• Compensation Grade</li> <li>• Compensation Change Reason</li> <li>• Total Annual Base Pay</li> <li>• Total Base Pay</li> <li>• Base Pay Currency</li> <li>• Base Pay Frequency</li> <li>• Job Classification (One to Three)</li> <li>• Organization (One to Five)</li> <li>• Company Insider</li> <li>• Work Shift</li> <li>• Work Hours Profile</li> <li>• Workers Compensation Code</li> <li>• Job Profile</li> <li>• Management Level</li> <li>• Job Category</li> <li>• Job Family</li> <li>• Business Site</li> <li>• Business Site Name</li> <li>• Business Site Address Type</li> <li>• Business Site Address Effective Date</li> <li>• Business Site Address Line (1 to 9)</li> <li>• Business Site Municipality</li> <li>• Business Site Submunicipality</li> <li>• Business Site Submunicipality 2</li> <li>• Business Site Address Line (1 to 9) Local</li> <li>• Business Site Municipality Local</li> <li>• Business Site Submunicipality Local</li> <li>• Business Site Submunicipality 2 Local</li> </ul> <p>Workday Proprietary and Confidential</p>

Section Fields	Description	Fields
Compensation Data	<p>Contains position-specific compensation data.</p> <p>The <i>Compensation Summary Data</i> attribute doesn't send data, but enables the field attributes with the same attribute prefix. Example: To use the <i>Summarization Format</i>, <i>Total Base Pay</i>, and <i>Primary Compensation Basis</i> field attributes, enable <i>Compensation Summary Data</i>.</p>	<ul style="list-style-type: none"> <li>• Operation</li> <li>• Position ID</li> <li>• Compensation Effective Date</li> <li>• Compensation Grade</li> <li>• Compensation Change Reason</li> <li>• Compensation Summary Data /</li> <li>• Compensation Summary Data / Operation</li> <li>• Compensation Summary Data / Summarization Format</li> <li>• Compensation Summary Data / Total Base Pay</li> <li>• Compensation Summary Data / Total Salary and Allowance</li> <li>• Compensation Summary Data / Primary Compensation Basis</li> <li>• Compensation Summary Data / Currency</li> <li>• Compensation Summary Data / Frequency</li> <li>• Operation</li> <li>• Position ID</li> <li>• Compensation Plan</li> <li>• Percentage</li> <li>• Unit</li> <li>• Number of Units</li> <li>• Per Unit Amount</li> <li>• Amount</li> <li>• Prorated Amount</li> <li>• Currency</li> <li>• Frequency</li> <li>• Start Date</li> <li>• Operation</li> <li>• Position ID</li> <li>• Compensation Plan</li> <li>• Target Amount</li> <li>• Currency</li> <li>• Frequency</li> <li>• Draw Amount</li> <li>• Draw Frequency</li> <li>• Draw Duration</li> <li>• Recoverable</li> <li>• Start Date</li> </ul>
Allowance Plan Data	Contains information about worker allowance plans and can have multiple records.	
Commission Plan Data	Contains information about worker commission plans and can have multiple records.	

Section Fields	Description	Fields
Period Salary Plans Data	Contains information about worker period salary plans and can have multiple records.	<ul style="list-style-type: none"> <li>• Operation</li> <li>• Position ID</li> <li>• Compensation Plan</li> <li>• Currency</li> <li>• Frequency</li> <li>• Period Multiplier</li> <li>• Start Date</li> </ul>
Unit Salary Plan Data	Contains information about worker unit salary plans and can have multiple records.	<ul style="list-style-type: none"> <li>• Operation</li> <li>• Compensation Plan</li> <li>• Unit</li> <li>• Number of Units</li> <li>• Per Unit Amount</li> <li>• Currency</li> <li>• Frequency</li> <li>• Start Date</li> </ul>
Salary and Hourly Plan Data	Contains worker salary or hourly plan information can have multiple records.	<ul style="list-style-type: none"> <li>• Operation</li> <li>• Position ID</li> <li>• Compensation Plan</li> <li>• Amount</li> <li>• Currency</li> <li>• Frequency</li> <li>• Start Date</li> </ul>
Contract	<p>Contains worker level data and can have multiple records.</p> <p>An employee can only have 1 contract in effect at a time. This section can include contracts from the past or contracts that become effective in the future.</p>	<ul style="list-style-type: none"> <li>• Operation</li> <li>• Contract ID</li> <li>• Contract Type</li> <li>• Position ID</li> <li>• Start Date</li> <li>• End Date</li> <li>• Contract Status</li> <li>• Description</li> <li>• Contract Reason</li> <li>• Collective Agreement</li> <li>• Minimum Weekly Hours</li> <li>• Maximum Weekly Hours</li> <li>• Operation</li> <li>• Effective Date</li> <li>• Position ID</li> <li>• Collective Agreement</li> <li>• Collective Agreement Factor /</li> <li>• Collective Agreement Factor / Factor</li> <li>• Collective Agreement Factor / Option</li> </ul>
Collective Agreement	<p>Contains position-specific Collective Agreement data and can have multiple records.</p> <p>The <i>Collective Agreement</i> attribute doesn't send data. It enables the field attributes with the same attribute prefix. Example: To use the <i>Factor</i> and <i>Option</i> field attributes, enable <i>Collective Agreement</i>.</p>	

Section Fields	Description	Fields
Job History	<p>Contains worker level data and can have multiple records.</p> <p>Includes external job history in the employee Skills and Experience. Payroll extracts include job history records.</p>	<ul style="list-style-type: none"> <li>• Operation</li> <li>• Job History ID</li> <li>• Job Title</li> <li>• Company</li> <li>• Start Date</li> <li>• End Date</li> <li>• Responsibilities and Achievements</li> <li>• Location</li> <li>• Reference</li> <li>• Contact Information</li> <li>• Operation</li> <li>• Education ID</li> <li>• Education Institution</li> <li>• Institution Type</li> <li>• Degree Type</li> <li>• Field of Study</li> <li>• Location</li> <li>• Grade Average</li> <li>• Last Year Attended</li> <li>• Is Highest Level of Education</li> </ul>
Education	<p>This section contains worker-level data and can have multiple records.</p> <p>Workday determines the value of <i>Is Highest Level of Education</i> based on the settings on the Maintain Degrees task. If a worker has multiple degrees, Workday selects the degree with the latest completion date. If the ranking or the latest completion date isn't available, Workday selects the degree with the latest entry date.</p>	

Section Fields	Description	Fields
Leave of Absence	<p>This section contains position-specific data and can have multiple records. An employee can be on multiple different types of leave at the same time. Payroll integrations don't include leave of absence data for multiple jobs. If an employee is on multiple leaves of absence for their primary position, this section has multiple records.</p> <p>If you only require information on leave that affects payroll, configure the <i>Include only leave that affects payroll</i> integration attribute.</p> <p><i>Employee Status, Staffing Event, and Staffing Event Date</i> fields in the Status Data section indicate whether an employee is on leave. If you need additional information about leave, enable the Leave of Absence section.</p> <p>The integration sets the <i>On Leave</i> field as of the last day of the pay period. Indicates that an employee is on leave only if they are on leave on the last day of the period.</p> <p>A payroll extract includes all leave that overlaps the current pay period. Includes leave that ends during the pay period. Doesn't include leave that ended before the current period or that starts after the current period. If you modify a leave that ended before the period, the first integration after the modification includes an entry for the leave.</p>	<ul style="list-style-type: none"> <li>• Operation</li> <li>• Leave Request Event ID</li> <li>• Leave Return Event ID</li> <li>• Position ID</li> <li>• On Leave</li> <li>• Leave Start Date</li> <li>• Estimated Leave End Date</li> <li>• Leave End Date</li> <li>• First Day of Work</li> <li>• Leave Last Day of Work</li> <li>• Leave of Absence Type</li> <li>• Benefits Effect</li> <li>• Payroll Effect</li> <li>• Paid Time Off Accrual Effect</li> <li>• Continuous Service Accrual Effect</li> <li>• Stock Vesting Effect</li> <li>• Leave Reason</li> <li>• Last Date for Which Paid</li> <li>• Expected Due Date</li> <li>• Child Birth Date</li> <li>• Stillbirth or Baby Deceased</li> <li>• Date Baby Arrived Home From Hospital</li> <li>• Adoption Placement Date</li> <li>• Adoption Notification Date</li> <li>• Date Child Entered Country</li> <li>• Multiple Child Indicator</li> <li>• Number of Babies or Adopted Children</li> <li>• Number of Previous Births</li> <li>• Number of Previous Maternity Leaves</li> <li>• Number of Child Dependents</li> <li>• Single Parent Indicator</li> <li>• Age of Dependent</li> <li>• Work Related</li> <li>• Dependent Detail</li> <li>• Stop Payment Date</li> <li>• Social Security Disability Code</li> <li>• Location During Leave</li> <li>• Caesarean Section Birth</li> <li>• Leave Percentage</li> <li>• Week of Confinement</li> <li>• Leave Entitlement Override</li> <li>• Date of Recall</li> </ul>

Section Fields	Description	Fields
<b>Earnings and Deductions</b>	<p>This section contains position-specific data and can have multiple records.</p> <p>A payroll extract includes an earning or deduction in the first pay period in which it applies.</p> <p><i>First Day No Longer Applies</i> is the day after the end date for an earning or deduction. A payroll extract includes the field only for the pay period in which an earning or deduction no longer applies. A value in this field instructs the payroll provider to stop applying the earning or deduction.</p> <p>If the end date is equal to the pay period end date, an earning or deduction applies to the pay period. The payroll extract for the next pay period includes the earning or deduction. The <i>First Day No Longer Applies</i> field is equal to the period first day.</p> <p>After a payroll extract includes an earning or deduction, extracts for subsequent pay period don't include the earning or deduction unless:</p> <ul style="list-style-type: none"> <li>• The amount changes.</li> <li>• The earning or deduction ends.</li> </ul> <p>To include all earnings and deductions in payroll extracts, set the <i>Include Earnings and Deductions section</i> integration attribute to <i>Always</i>.</p> <p>To include coverage values for GTL coverage, set up an earning code with a <i>GTL</i> worktag. Set up the worktag in the Coverage Amount field.</p> <p>By default, the value of the <i>Frequency</i> field matches the pay group frequency. You can override this value by using the Override Frequency setting in the Maintain External Payroll Earnings or Deductions tasks.</p> <p>If you select the <i>Calculate Benefits as of Pay Check Date</i> integration attribute, Workday moves up the start date for benefit deductions that begin:</p> <ul style="list-style-type: none"> <li>• After the pay period end date</li> <li>• Before the payment date.</li> </ul> <p>The payroll extract reports the deduction as starting within the pay period. When the deduction ends, the <i>First Day No Longer Applies</i> date also moves up so that the payroll provider has the same number of deductions.</p> <p>If the benefits plan year doesn't end on the last day of a pay period, use the Maintain Benefit Coverage Types task to take deductions at:</p> <ul style="list-style-type: none"> <li>• The old rate.</li> <li>• The new rate.</li> </ul>	<ul style="list-style-type: none"> <li>• Operation</li> <li>• Position ID</li> <li>• Code Name</li> <li>• Code</li> <li>• Earning or Deduction</li> <li>• Start Date</li> <li>• First Day No Longer Applies</li> <li>• Amount</li> <li>• Compensation Effective Date</li> <li>• Prorated Amount</li> <li>• Coverage Amount</li> <li>• Goal Amount</li> <li>• Percentage</li> <li>• Rate</li> <li>• Unit</li> <li>• Unit Type</li> <li>• Frequency</li> <li>• Currency</li> <li>• Cost Center</li> </ul>

Section Fields	Description	Fields
T1 Tax	<p>This section contains worker level data. This section has a single record.</p> <p>If multiple values are available in Workday, the payroll extract has the values for the last day of the pay period.</p> <p>A change in <i>Effective Date</i> isn't significant for change detection. The payroll extract doesn't include the T1 Tax section if:</p> <ul style="list-style-type: none"> <li>• You set the <i>Include T1 Tax section</i> integration attribute to <i>Include only when changed</i>.</li> <li>• Only the <i>Effective Date</i> changes.</li> </ul>	<ul style="list-style-type: none"> <li>• Operation</li> <li>• Effective Date</li> <li>• Creation Date Time</li> <li>• Basic Personal Amount</li> <li>• Child Amount</li> <li>• Age Amount</li> <li>• Pension Income Amount</li> <li>• Education Amount</li> <li>• Disability Amount</li> <li>• Spouse Amount</li> <li>• Dependent Amount</li> <li>• Caregiver Amount</li> <li>• Infirm Dependents Amount</li> <li>• Amount Transferred from Spouse</li> <li>• Amount Transferred from Dependents</li> <li>• Total Claim Amount</li> <li>• More than 1 Employer</li> <li>• Total Income Less than Claim Amount</li> <li>• Addition Amount</li> <li>• Prescribed Zone Amount</li> <li>• ESS Electronic Signature Confirmation</li> <li>• Currency</li> <li>• Operation</li> <li>• Effective Date</li> <li>• Creation Date Time</li> <li>• Number of Allowances</li> <li>• Additional Amount</li> <li>• Exempt</li> <li>• Nonresident Alien</li> <li>• Last Name Differs from SS</li> <li>• ESS Electronic Signature</li> <li>• Lock in Letter</li> <li>• Payroll Marital Status</li> <li>• Currency</li> <li>• Multiple Jobs or Spouse Works</li> <li>• Total Dependent Amount</li> <li>• Other Income</li> <li>• Deductions</li> </ul>
W4 Tax	<p>This section contains worker level data and has a single record.</p> <p>If multiple values are available in Workday, the payroll extract has the values on the last day of the pay period.</p> <p>The integration doesn't consider a change in <i>Effective Date</i> for change detection. The payroll extract doesn't include the W4 Tax section if:</p> <ul style="list-style-type: none"> <li>• If you set the <i>Include W4 Tax section</i> integration attribute to <i>Include only when changed</i>.</li> <li>• Only the <i>Effective Date</i> changes.</li> </ul>	

Section Fields	Description	Fields
Identifiers	<p>This section contains worker level data and can have multiple records. Payroll extracts only include identifiers in the <i>Identifier Type</i> or <i>National ID Type</i> integration maps.</p>	<ul style="list-style-type: none"> <li>• Operation</li> <li>• Identifier Type</li> <li>• Identifier Value</li> <li>• Country</li> <li>• Issued Date</li> <li>• Expiration Date</li> <li>• Verification Date</li> <li>• Authority</li> <li>• License Class</li> <li>• Issued by Organization</li> <li>• Description</li> <li>• Series</li> <li>• Issuing Agency</li> <li>• Operation</li> <li>• Payment Election Rule</li> <li>• Payment Type</li> <li>• Order</li> <li>• Country</li> <li>• Currency</li> <li>• Bank Account Nickname</li> <li>• Bank Account Name</li> <li>• Account Number</li> <li>• Roll Number</li> <li>• Account Type</li> <li>• Bank Name</li> <li>• IBAN</li> <li>• Bank ID Number</li> <li>• BIC</li> <li>• Branch Name</li> <li>• Branch ID Number</li> <li>• Check Digit</li> <li>• Distribution Amount</li> <li>• Distribution Percentage</li> <li>• Distribution Balance</li> </ul>
Payment Elections	<p>This section contains worker level data and can have multiple records.</p> <p>The integration populates <i>Country</i> and <i>Currency</i> with the values from the Workday Bank Account.</p> <p>The integration populates only 1 of these values:</p> <ul style="list-style-type: none"> <li>• <i>Distribution Amount</i></li> <li>• <i>Distribution Percentage</i></li> <li>• <i>Distribution Balance</i></li> </ul> <p>The value depends on whether the individual payment election is an amount, a percentage, or a balance.</p> <p>To select payment elections in the output file, configure the <i>Payment Election Rule for Regular Payments</i> integration attribute. To identify the direct deposit payment elections, configure the <i>Payment Election Type for Direct Deposit</i> integration attribute.</p>	

Section Fields	Description	Fields
Pay Data	<p>This section contains position-specific data and can have multiple records.</p> <p>When a payroll integration includes all changes effective within a pay period, the payroll extract includes all one-time payments and adjustments for that period. Otherwise, the payroll extract includes the values entered after the last successful run. If the amount of a one-time payment changes, Workday compares the previous value to the current value and reports the difference in the output file. If the date of a one-time payment changes, Workday removes the existing payment and creates a new payment. The output file contains 2 entries:</p> <ul style="list-style-type: none"> <li>• An entry with a negative value for the canceled payment.</li> <li>• An entry with a positive value for the new payment.</li> </ul> <p>Workday adds payment values together and includes a single one-time payment in the output file if:</p> <ul style="list-style-type: none"> <li>• A worker has multiple one-time payments with the same code in the same period.</li> <li>• The Version attribute is 20 or lower.</li> </ul> <p>Workday includes a separate &lt;pi:Pay_Data&gt; element for each payment if:</p> <ul style="list-style-type: none"> <li>• A worker has multiple one-time payments with the same code in the same period.</li> <li>• The Version attribute is 21 or higher.</li> </ul>	<ul style="list-style-type: none"> <li>• Position ID</li> <li>• Pay Data ID</li> <li>• Pay Reason</li> <li>• Code Name</li> <li>• Code</li> <li>• Earning or Deduction</li> <li>• Date</li> <li>• Amount</li> <li>• Percentage</li> <li>• Rate</li> <li>• Unit</li> <li>• Unit Type</li> <li>• Currency</li> <li>• Cost Center</li> <li>• Worktag /</li> <li>• Worktag / Worktag Type</li> <li>• Worktag / Worktag Code</li> </ul>

Section Fields	Description	Fields
Paid Time Off	<p>This section contains position-specific data and can have multiple records.</p> <p>Payroll extracts can include paid and unpaid time off.</p> <p>When a payroll integration includes all changes effective within a pay period, the payroll extract includes the total number of hours approved for the pay period. Otherwise, the payroll extract includes only the incremental hours approved for the pay period since the last successful run.</p> <p>Payroll extracts report backdated changes to hours as incremental values. These values can be either positive or negative numbers.</p> <p>If a worker has multiple entries for time off with the same code in the same period, Workday adds the values together. Workday then reports the total value in the output file.</p> <p>The <i>Start Date</i> and <i>End Date</i> are the start and end dates for the pay period in which the time off was taken. Typically, these dates match the start and end date of the pay period for which the integration creates the payroll extract. The integration reports any backdated changes separately within this section and reflects the start date and end date for a prior pay period.</p> <p>Payroll integrations don't include paid time off for multiple jobs. Payroll Interface only supports time off taken for a worker's primary position.</p>	<ul style="list-style-type: none"> <li>• Position ID</li> <li>• Code Name</li> <li>• Code</li> <li>• Start Date</li> <li>• End Date</li> <li>• Time Off Type</li> <li>• Paid Hours</li> <li>• Unpaid Hours</li> <li>• Time Off Date</li> <li>• Quantity</li> <li>• Unit of Time</li> </ul>
Time Off Correction	<p>This section contains worker-level data. Corrections include:</p> <ul style="list-style-type: none"> <li>• Time offs entered for pay periods before the processing pay period.</li> <li>• Time offs that are effective in pay periods before the processing pay period.</li> </ul>	<ul style="list-style-type: none"> <li>• Position ID</li> <li>• Code Name</li> <li>• Code</li> <li>• Time Off Type</li> <li>• Time Off Date</li> <li>• Quantity</li> <li>• Unit of Time</li> </ul>

Section Fields	Description	Fields
Related Person Data	<p>This section contains worker-level data and can have multiple records.</p> <p>The same integration attributes that apply to the Personal Data section also apply to this section:</p> <ul style="list-style-type: none"> <li>• <i>Use Preferred Name when present</i></li> <li>• <i>Name Type for Maiden Name</i></li> <li>• <i>Communications Usage Type for First Address</i></li> <li>• <i>Communications Usage Type for Second Address</i></li> <li>• <i>Communications Usage Type for Phone</i></li> <li>• <i>Communications Usage Type for First Email Address</i></li> <li>• <i>Communications Usage Type for Second Email Address</i></li> </ul> <p><i>Related Person ID</i> is a unique identifier. Workday uses this identifier to relate entries in this section to entries in the Related Person Identifiers section. Don't use this ID as an identifier in external payroll systems.</p> <p>If a related person has multiple citizenships, the integration only includes the first citizenship in the output file.</p>	<ul style="list-style-type: none"> <li>• Operation</li> <li>• Related Person ID</li> <li>• Relationship Type</li> <li>• First Name</li> <li>• Middle Name</li> <li>• Last Name</li> <li>• Secondary Last Name</li> <li>• Full Legal Name</li> <li>• Title</li> <li>• Surname</li> <li>• Social Suffix</li> <li>• Name in Local Script</li> <li>• First Name in Local Script</li> <li>• First Name in Local Script 2</li> <li>• Middle Name in Local Script</li> <li>• Last Name in Local Script</li> <li>• Last Name in Local Script 2</li> <li>• Secondary Last Name in Local Script</li> <li>• Country for Name</li> <li>• Gender</li> <li>• Birth Date</li> <li>• Date of Death</li> <li>• Country of Birth</li> <li>• Region of Birth</li> <li>• City of Birth</li> <li>• Citizenship</li> <li>• Nationality</li> <li>• Tobacco Use</li> <li>• Full-Time Student</li> <li>• Disability</li> <li>• First Address Type</li> <li>• First Address Effective Date</li> <li>• First Address Line (1 to 9)</li> <li>• First Municipality</li> <li>• First Submunicipality 2</li> <li>• First Submunicipality</li> <li>• First Address Line (1 to 3) Local</li> <li>• First Subregion 2</li> <li>• First Address Line (4 to 9) Local</li> <li>• First Municipality Local</li> <li>• First Submunicipality Local</li> <li>• First Submunicipality 2 Local</li> <li>• First Region</li> <li>• First Subregion</li> <li>• First Postal Code</li> <li>• First Country</li> <li>• Second Address Type</li> <li>• Second Address Effective Date</li> <li>• <del>Workday Proprietary and Confidential</del></li> <li>• Second Address Line (1 to 4)</li> </ul>

Section Fields	Description	Fields
Related Person Identifier Data	<p>This section contains worker-level data and can have multiple records.</p> <p>Payroll extracts include only identifiers listed in the <i>Identifier Type</i> or <i>National ID Type</i> integration maps.</p> <p>The <i>National ID Required</i> integration attribute doesn't apply to this section.</p>	<ul style="list-style-type: none"> <li>• Operation</li> <li>• Related Person ID</li> <li>• Identifier Type</li> <li>• Identifier Value</li> <li>• Country</li> <li>• Issued Date</li> <li>• Expiration Date</li> <li>• Verification Date</li> <li>• Authority</li> <li>• License Class</li> <li>• Issued by Organization</li> <li>• Description</li> <li>• Series</li> <li>• Issuing Agency</li> <li>• Operation</li> <li>• Level</li> <li>• Costing worktag One</li> <li>• Costing Worktag Two</li> <li>• Position ID</li> <li>• Earning Code</li> <li>• Allocation Percentage</li> <li>• Allocation Start Date</li> <li>• Allocation End Date</li> </ul>
Cost Allocations	<p>This section contains position-specific data and can have multiple records.</p> <p>Cost allocations are available for 1 or more worktag types. Configure the integration attributes to identify how to include the worktags in the extract. Payroll extracts include only cost allocations in effect on the last day of the pay period.</p> <p>Payroll integrations include only allocations assigned to workers, workers' positions (filled positions), and position restrictions (unfilled positions). The integration doesn't support earning cost allocations.</p>	
Time Tracking Data	<p>This section contains position-specific data and can have multiple records.</p> <p>The integration can generate time tracking data per time period or per day. Use the Time Tracking Reporting Interval integration attribute to specify per-day or per-period reporting.</p> <p>Workday recommends that you create a separate, non-primary integration to generate time tracking data.</p>	<ul style="list-style-type: none"> <li>• Operation</li> <li>• Time Tracking Start Date</li> <li>• Time Tracking End Date</li> <li>• Code Name</li> <li>• Code</li> <li>• Position ID</li> <li>• Quantity</li> <li>• Override Rate</li> <li>• Currency Code</li> <li>• Daily Reporting</li> <li>• Pay Period Reporting</li> <li>• Daily Summary Start Date</li> <li>• Worktag</li> <li>• Worktag Type</li> </ul>

Section Fields	Description	Fields
Time Tracking Correction Data	<p>This section contains position-specific data and can have multiple records.</p> <p>The integration can generate time tracking data per time period or per day. Use the <i>Time Tracking Reporting Interval</i> integration attribute to specify per-day or per-period reporting.</p> <p>We recommend that you create a separate, non-primary integration to generate time tracking data.</p>	<ul style="list-style-type: none"> <li>• Code Name</li> <li>• Code</li> <li>• Position ID</li> <li>• Quantity</li> <li>• Override Rate</li> <li>• Time Tracking Correction Date</li> <li>• Worktag</li> <li>• Worktag Type</li> </ul>

#### Reference: Payroll Interface Connector Versions

The table lists significant changes to the Payroll Interface connector by version attribute. The version attribute has no relation to the Workday Release number.

Version Attribute	Changes
13	Pay data XML is always output with header data, even if the integration processes no payees. For versions 12 and earlier, when the integration processes no payees, no output is attached to the event.
13	Formats Earnings and Deductions percent value as 0.00 rounded.
14	All sections are output, except for PGO, then the integration sends only the status section. For PCO, the integration sends all data.
14	When the rate type for the payee is hourly, the integration uses Hourly Frequency for Summary Data.
14	Earnings and Deductions section is available.
14	For PCO, returns data as of the transfer date.
16	All sections are output, except for PGO, then the integration sends Status and Earnings and Deductions sections. For PCO, the integration sends all data as of the transfer date.
16	PCO events send Additional Information.
16	If the Date Format integration attribute is blank, it automatically populates to YYYY-MM-DD. In versions 15 and earlier, the attribute must be blank and the output set to XML for this default.
16	If the Date Time Format integration attribute is blank, it automatically populates to YYYY-MM-DDTHH:mm:ss. In versions 15 and earlier, the attribute must be blank and the output set to XML for this default.
16	<p>The integration automatically includes Earnings and Deductions (E&amp;D) for transfers except:</p> <ul style="list-style-type: none"> <li>• If it adds E&amp;D during a transfer with an End Date within the current period. It doesn't include these E&amp;D to avoid double reporting.</li> <li>• If it deletes or effectively ends E&amp;D, it only includes them if the current transaction is a transfer out.</li> <li>• For all remaining types of E&amp;D, it only includes them if the current transfer is a transfer in.</li> </ul> <p>For versions 15 and earlier, the integration automatically includes Earnings and Deductions for transfers.</p>
17	Output schema file contains a Document Retention Policy element.

Version Attribute	Changes
18	Multiple fields are available. Example: Ethnicity, Citizenship Status, and Contract Reason.
18	XSD output file is available.
20	The extract includes the Boolean XML element, Contains Corrections or Rescinds.
20	The Leave of Absence data section contains an OPERATION value.
20	The integration output includes a Corrections and Rescinds HTML file.
20	Corrections and Rescinds includes One Time Payment data.
20	Output includes Costing Allocation End Date only if that date is before the end date of the processing period. For versions 19 and earlier, the integration always includes the Costing Allocation End Date.
21	Output doesn't aggregate Pay Data, and also includes the correcting payments for prior periods. For versions 20 and earlier, Pay Data is aggregated by Earnings and Deductions code, date, currency, and position ID.
21	Added Full Extract With No Diff launch parameter as an integration service. Output schema file contains a Full Extract With No Diff element.
21	Doesn't output Leave End Date and First Day of Work (plus correction data) until they become effective in the period.
22	If you disable the change detection service for a nonprimary integration, it evaluates the current period status as of the last successful run moment.
23	Contract data section is available.
24	When the integration processes the position of a payee, it includes compensation data only if it exists on the position. Compensation data includes effective date, total base pay, annual base pay, and compensation data sections.
24	Updates Address line data to support extended addresses. Use this field if you're dealing with extended addresses but don't require Address line 1 to N.
25	If you configure the field attribute for Related Person Type to Dependent ID, the Related Persons Identifiers data section uses the Dependent ID for the Person ID field. Both sections, Related Person and Identifier, will have matching Person IDs.

### Reference: Payee Data Validation and Error Handling

Workday Payroll Interface enables you to apply validation rules to employee data. When employees fail the validation because of missing required fields, Workday processes the integration based on the *Payee Validation* integration attribute.

Setting	Description
Include	<p>When validation errors occur, includes an employee in a payroll extract. Workday continues to process the integration and report errors as warnings.</p> <p>Select this option if your payroll provider can process payroll extracts that contain some invalid data.</p> <p>The payroll administrator can fix the imported data and you can apply the same changes to the data in Workday.</p>
Omit	When validation errors occur, excludes an employee from a payroll extract. Workday continues to process the integration and report errors.

Setting	Description
	Select this option if your payroll provider rejects payroll extracts that contain invalid data.  The invalid or missing data for 1 employee does not stop payroll processing for a pay group. You can fix the employee data in Workday and generate a supplemental payroll extract using the Pay Group Members integration launch parameter.
Abort	If data validation fails for an employee, stops integration processing, and a critical severity message is reported.  Use when a payroll provider can process a single payroll extract per pay period. You can fix the employee data in Workday and recreate the payroll extract.

To view integration messages, use these reports:

Report	Description
Process Monitor	Integrations that are currently running or completed. To view message details, use the links in the Errors & Warnings column.
Integration Events	Launch date and time, user who launched the integration, event status, and event response message.
Integration Messages	Summary and message details for integration events.
Process Monitor	Shows integrations that are currently running or completed. To view message details, use links in the Errors & Warnings column.

## FAQ: Time Tracking Entries for Payroll Interface

### Why Didn't the Integration Report a Time Tracking Entry?

Reasoning	Details
The integration reports on top of the stack.	The integration looks at the time tracking entries for the position and pay group combination at the pay period end date to evaluate the set of changes. When you change a pay group for a worker midperiod, the integration doesn't report

Reasoning	Details
	time entries for the prior position in the prior pay group.
The time tracking entry was approved after a completed termination.	<p>The integration doesn't report time entries that are approved after a termination, including the day after the termination effective date.</p> <p>Example: A worker enters these time tracking entries:</p> <ul style="list-style-type: none"> <li>• September 25 at 12:00 pm.</li> <li>• September 26 at 12:00 pm.</li> </ul> <p>The manager approves both of these time entries.</p> <p>A termination for the worker is entered on September 26 at 1:30pm, with an effective date for September 29. The worker enters another time tracking entry on September 26 at 2:00 pm.</p> <p>The integration:</p> <ul style="list-style-type: none"> <li>• Reports the first and second time tracking entries because they occur before the completed termination entry.</li> <li>• Doesn't report the third time tracking entry because it occurred after the completed termination entry.</li> </ul> <p>If the termination was effective:</p> <ul style="list-style-type: none"> <li>• September 30, the integration would report the third time tracking entry on September 26 at 2:00 pm because the integration includes entries until October 1.</li> <li>• October 5, the integration wouldn't report any time entries entered after 1:30 pm on September 26 for the October period.</li> </ul>

### Why Didn't the Integration Report a Deleted Time Tracking Entry?

Reasoning	Details
The manager hasn't approved the time entry.	<p>For the integration to report time tracking entries, the manager must:</p> <ul style="list-style-type: none"> <li>• Approve the time entries.</li> <li>• Reapprove deleted time entries that the manager previously approved.</li> </ul>
The net effect doesn't change after the user deleted the time tracking entry.	<p>Example: A worker submits a time tracking entry of 8 hours. The manager approves the time entry. Then the worker deletes the same 8-hour entry, and the manager reapproves the deletion. Both of these transactions are within the entry range of the integration event, which has a net result of no change. The sequence is 0 -&gt; 8 -&gt; 0, so the net change is 0 -&gt; 0.</p>

## Troubleshooting: Payroll Interface

- [The integration didn't include workers in the output file. on page 1750](#)
- [The integration didn't report a benefit deduction or compensation plan in the Earnings and Deductions data section. on page 1750](#)
- [The integration isn't returning data such as Marital Status, Gender, Social Security Number. on page 1751](#)
- [The integration isn't returning the retirement deduction. on page 1751](#)
- [You mapped the external earnings and deductions correctly, but the integration isn't reporting the amounts. on page 1751](#)
- [The integration is reporting deduction codes and amounts in the Earnings and Deductions section for workers that aren't in the benefit plan. on page 1752](#)
- [The integration didn't report a one-time payment for a worker. on page 1752](#)
- [The integration didn't report a time tracking entry. on page 1752](#)
- [The integration is reporting a one-time payment twice after rescinding a termination. on page 1753](#)

### **The integration didn't include workers in the output file.**

Cause: There could be several reasons why integration didn't include the worker in the output file.

Solution:

#### **Steps**

Security:

- *Background Process Management* domain in the Tenant Non-Configurable functional area.
  - *Integration Build and Integration Configure* domains in the Integration functional area.
1. From the related actions menu of the integration event, select Background Process > View Output Files. Check the *DiagnosticAudit.html* file to see if it lists the worker. When the integration lists a missing employee in this file, there's an explanation of why they weren't in the payroll extract. If it doesn't list the employee, then the web service didn't return the worker.
  2. If the worker isn't in the diagnostic audit file, check the entry moment and effective date of the change. Compare them with the dates and times in the Extract Summary section of the Data Changes Audit report. The change must meet 1 of these conditions for the web service to output a worker:
    - Entered after the Updated From time and before the Updated To time.
    - Effective on or after the pay period start date and on or before the pay period end date.
  3. If these conditions are true, check to see if you enabled the Transaction Log Service. When you have this integration service enabled, the integration only returns an employee when they have a transaction log entry that meets the conditions listed in step 2 and the integration is subscribed to that type of event.

Note: If you configured everything correctly and the integration doesn't return the worker, Workday might not be generating the required transaction log entry. Disabling the Transaction Log Service on the integration might fix the issue of missing transaction log entries but can have a significant negative impact on performance.

### **The integration didn't report a benefit deduction or compensation plan in the Earnings and Deductions data section.**

Cause: You haven't associated the benefits and compensation elements with an external earnings or deductions code.

Solution:

### Steps

Security: *Set Up: Payroll Interface* domain in *Payroll Interface* functional area.

1. On either the Maintain External Payroll Earnings or Maintain External Payroll Deductions task, check that you added the correct:
  - Benefit Tag and Benefit Plan.
  - Compensation Element.

See:

- [Manage External Payroll Earnings](#) on page 1403
  - [Manage External Payroll Deductions](#) on page 1406
2. If you configured the correct Benefit tag, Benefit Plan, and Compensation Element, make sure that the benefit or compensation change:
    - Is effective-dated.
    - Has an entry date before the date of the transaction.

### The integration isn't returning data such as Marital Status, Gender, Social Security Number.

Cause: The system user running the integration doesn't have sufficient security privileges to get access to this data with the *Get\_Payees* web service.

Solution:

### Steps

- Security:
    - *Security Configuration* and *Security Administration* domains in the System functional area.
    - *Integration Security* domain in the Integration functional area.
    - *Set Up: Payroll Interface* domain in *Payroll Interface* functional area.
1. Grant the integration system user *Get* and *Put* access to the *Worker Data: Payees* domain.
  2. Configure unconstrained access to the *Person Data: Personal Data* domain for the integration. This domain access prevents empty values in the integration results for any country that you haven't configured the ISU to access.

See:[Steps: Grant Integration or External Endpoint Access to Workday](#).

### The integration isn't returning the retirement deduction.

Cause: You configured the external deduction to use the *Employee Cost (posttax)* benefit tag on the deduction definition and not the *Employee Cost (pretax)* benefit tag.

Solution:

### Steps

Security: *Set Up: Payroll Interface* domain in *Payroll Interface* functional area.

1. Access the Maintain External Payroll Deductions task.
2. Select *Employee Cost (pretax)* for the Benefit Tags.

**You mapped the external earnings and deductions correctly, but the integration isn't reporting the amounts.**

Cause: The currency of the pay group doesn't match the currency of the associated plan, such as the compensation plan. There are also currency conversion rates in the tenant that are either zero or you didn't specify.

Solution:

### Steps

Security: *Set Up: Currency (Compensation functional area)* domain in the Core Compensation area.

1. Access the Currency Rates as of Date report to verify you've configured the correct currency conversion for the associated plan.
2. Access the Maintain Currency Conversion Rates task to edit the currency exchange rate.  
See: [Maintain Currency Conversion Rates](#).

### The integration is reporting deduction codes and amounts in the Earnings and Deductions section for workers that aren't in the benefit plan.

Cause: You didn't enable the First Day No Longer Applies field. Then the benefit admin closed out an Evidence of Insurability (EOI) for workers from past years and the integration readded the ended benefit plan. The First Day No Longer Applies field ensures that the plan that the integration reports has already ended. This day is after the end date for an earning or deduction.

Solution:

### Steps

Security: *Integration Configure* domain in the Integration functional area.

1. From the related actions menu on your integration, select Integration System > Configure Integration Field Attributes.
2. Select the Include in Output check box for the First Day No Longer Applies field.

Note: Ensure any document transformation integrations or down-stream systems acknowledge the First Day No Longer Applies field.

### The integration didn't report a one-time payment for a worker.

Cause: This issue could occur because either:

- You enabled the Transaction Log service and the Subscribe to all Business Process Types except option.
- The one-time payment event isn't in the date range that you're running the integration for.

Solution:

### Steps

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

1. On the integrations related action menu, select Integration System > Configure Integration Transaction Log.
2. Select Subscribe to all Transaction Types except.

### The integration didn't report a time tracking entry.

Cause	Solution
You didn't set up external payroll earning codes before processing time tracking entries related to those codes.	<p>Security: <i>Set Up: Payroll Interface</i> domain in Payroll Interface functional area.</p> <ol style="list-style-type: none"> <li>1. Access the Maintain External Payroll Earnings task and select the Pay Group.</li> </ol>

Cause	Solution
	<p>2. Specify a unique earning Name and Code.</p>
You didn't map a time calculation tag that's associated with the time tracking entry to an external earning.	<p>Security: <i>Set Up: Payroll Interface</i> domain in Payroll Interface functional area.</p> <ol style="list-style-type: none"> <li>Access the Maintain External Payroll Earnings task and select the Pay Group.</li> <li>Assign the same Time Calculation Tags from the time tracking entry on the same row for the earning.</li> </ol>
The time tracking entry is for an international assignment position and you didn't enable Position Setup Options on the Edit Tenant Setup - HCM task.	<ol style="list-style-type: none"> <li>Access the Edit Tenant Setup - HCM task.</li> </ol> <p>Security: <i>Set Up: Tenant Setup - HCM</i> domain in System functional area.</p> <ol style="list-style-type: none"> <li>Enable the Position Setup Options option and select <i>Multiple Jobs</i>.</li> <li>Access the Assign Pay Group task to assign the pay group for the international assignment position.</li> </ol> <p>Security: <i>Manage: Service Center</i> domain in System functional area.</p> <ol style="list-style-type: none"> <li>Access the Maintain External Payroll Earnings task and select the Position Based option for the external earnings code for the pay group.</li> </ol> <p>Security: <i>Set Up: Payroll Interface</i> domain in Payroll Interface functional area.</p>

### The integration is reporting a one-time payment twice after rescinding a termination.

Cause: You didn't enable these field attributes in the Status Data section of your *Payroll Interface* integration:

- Staffing Event
- Hire Date
- Active Status Date

Solution:

#### Steps

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

1. On the integrations related action menu, select Integration System > Configure Integration Attributes and enable the Include Status Data section integration attribute.
2. On the integrations related action menu, select Integration System > Configure Integration Field Attributes and select Include in Output for these field attributes in the PICOF Status Data Section Fields Document section:
  - Staffing Event
  - Hire Date
  - Active Status Date

## Local Payroll Data

### Steps: Set Up Local Payroll Data

#### Prerequisites

Note: We plan to retire the Local Payroll Data feature. Workday recommends that you:

- Review your current business processes.
- Confirm with your external payroll vendor that they support this feature.
- Complete the necessary configurations to start using the Additional Payroll Data feature.

See [Steps: Set Up Additional Payroll Data](#) on page 1419.

Your third-party payroll vendor must build the REST APIs for the landing page and field data that Workday displays and sends to the external payroll system.

#### Context

Send local payroll data from Workday to a third-party payroll vendor.

- The third-party payroll vendor sends a description of the local payroll data to Workday.
- Workday displays widgets for entering and modifying the data.
- Workday then sends the new and modified local payroll data to the third-party payroll vendor.

#### Steps

1. Access the Create External Payroll Vendor task.

If you're using a third-party payroll vendor that isn't in Workday, create the vendor. Select the Local Payroll Data feature.

Security: *Set Up: Payroll Interface* domain in the *Payroll Interface* functional area.

2. [Create External Payroll Vendor Mapping](#) on page 1413.

Map your Workday tenants to the target tenant names from your external vendor.

3. [Maintain Pay Group Vendor Associations](#) on page 1414.

Select the pay groups to associate with the vendor for local payroll data.

4. (Optional) [Steps: Set Up Profiles and Profile Groups](#).

Add the Local Payroll Data report for your vendor to profile group Pay for Worker Profile. The report is visible only to Payroll Administrators and Payroll Partners.

## 5. (Optional) Steps: Configure Business Process Definitions.

Add an *Action* step to these business processes:

- *Add Additional Job*
- *Assign Pay Group*
- *Change Job*
- *Edit Position*
- *Hire*
- *Start International Assignment*

Enter Action for the Type column, and Maintain Local Payroll Data for the Specify column. Add this step after the completion step on the business process.

For *Hire*, you must ensure that Workday outputs new employees to the third-party payroll vendor before the *Maintain Local Payroll Data* step. Run the certified payroll integration before this step to output the new employees.

If you configure the *Assign Pay Group* business process as part of the *Hire* business process and you add the *Maintain Local Payroll Data* step on both business processes:

- The *Hire* business process executes the *Maintain Local Payroll Data* step.
- The *Assign Pay Group* business process skips the *Maintain Local Payroll Data* step.

## Next Steps

**Security:** *Worker Data: Payroll Interface (Local Payroll Data)* in the *Payroll Interface* functional area. Local payroll data isn't available through employee self-service. To enable access to local payroll data, configure workers into one of these security groups.

- Roles - Pay Group
- Roles - Supervisory
- Roles - Location Hierarchy
- Unconstrained Groups

Payroll Interface Administrator or Payroll Interface Partner enters local payroll data in Workday by one of these methods:

- Select Payroll Interface > Maintain Local Payroll Data from the related actions menu of a worker.
- If configured, enter the data from the Local Payroll Data report for your vendor on the *Pay* tab of the worker profile.
- If configured, as the business process executes.

For a new worker, you must run the certified payroll integration to create the worker in the third-party payroll system.

If you remove an External Payroll Site Vendor Mapping or Pay Group Vendor Association:

- You can't access Maintain Local Payroll Data from the related actions menu of a worker.
- You can't access Local Payroll Data for your vendor from the worker profile.
- Business processes skip the Maintain Local Payroll Data step.

## Concept: Local Payroll Data

Workday enables you to enter local payroll data and immediately pass it to a third-party payroll vendor without leaving Workday. Based on data requirements provided by the payroll vendor:

- Workday displays pages for you to enter and modify a worker's local payroll data. The local payroll data displays in Workday in the third-party payroll vendor format.
- Workday sends the new and changed local payroll data directly to the third-party payroll vendor. The third-party payroll system saves the local payroll data that you entered in Workday. None of the data persists in Workday.

Local payroll data supports:

- Payroll administrators for data entry. Employees currently can't enter local payroll data through employee self-service.
- Employees who belong to third-party pay groups. An employee must also exist in both Workday and the third-party payroll system. The employee's ID must be the same in both systems.

The third-party payroll vendor controls:

- Validations performed during data entry.
- Names of fields and options.

This integration depends on the availability of the third-party APIs and data.

Workday authenticates and controls worker access to local payroll data through the Maintain Local Payroll Data task. The local payroll vendor authorizes and controls the local payroll data displayed in Workday.

For new workers, you must run a certified payroll integration before entering local payroll data.

## Worker Effective Change Interface

### Setup Considerations: Worker Effective Change Interface

You can use this topic to help make decisions when planning your configuration and use of the *Worker Effective Change Interface* integration (WECl).

It explains:

- Why to set it up.
- How it fits into the rest of Workday.
- Downstream impacts and cross-product interactions.
- Security requirements and business process configurations.
- Questions and limitations to consider before implementation.

Refer to detailed task instructions for full configuration details.

### What It Is

WECl is a full-stack integration. It transmits worker changes for each worker based on organization and includes the effective date and data entry date for each change.

### Business Benefits

The *Worker Effective Change Interface* enables you to:

- Capture personal, job, or position data and changes within Workday HCM, including contingent worker data.
- Capture staffing events and data changes in the effective range.
- Configure required data elements and custom fields for the external system.
- Format and validate data to conform to the requirements of the external system.
- Transfer only those changes relevant to the external system.
- Review the Worker Data Changes Audit output file to see exactly what data the integration captured, selected, and sent to the external system.

- Perform additional transformations to the output file. Deliver the output XML file to an external system.
- Create full snapshots of employee data to help with initial implementation or enable system resynchronization.
- Transmit worker data with the Data Initialization Service (DIS) rather than a web service, providing better performance of data transmissions.

## Use Cases

You can use WECI for applications that require full effective stack worker changes, such as:

- Data warehouses.
- Data hubs.

## Questions to Consider

Question	Considerations
What level of data details does your vendor require?	Consider WECI if your vendor requires all effective changes within a range with a full-stack integration.  If your vendor requires a top-of-stack integration, a comparison to the last run integration, consider the <i>Core Connector: Worker</i> integration.
Do you have a data warehouse that you need to transmit worker data to from Workday?	You can configure WECI to run up to once a day.  If you enable the Effective Stack Sync Service, you can configure WECI to run as frequently as 4 times a day or every 6 hours.
How many workers do you need to process?	WECI supports processing up to 500,000 workers with the option to include contingent workers. If you don't process 500,000 workers, the integration includes all workers in your tenant.  To reduce the population size for an integration run, use the Restrict Results By Orgs launch parameter. You can restrict results by supervisory organization or by company hierarchy. When you use this launch parameter, WECI doesn't capture previously terminated workers.
Do you need to transmit retroactive changes?	WECI reports retroactive transactions entered in the current entry date range for a prior effective date range, as well as retroactive non-effective dated changes.
Do you need transmit indirect changes?	You can transmit indirect changes when you disable the transaction log. Example: The integration reports a change to a cost center name.
Do you need to transmit payroll data to a third-party payroll vendor?	You can use the <i>Payroll Effective Changes Interface</i> integration to transmit payroll data to a third-party payroll vendor for the same workers. You can run both PECI and WECI integrations in parallel.

## Recommendations

Workday strongly recommends that you engage Workday Professional Services or a Workday certified implementation partner to build a WECI integration.

WECI integrations run on grid. Grid is a shared resource in your Workday tenant. If you're scheduling multiple integrations on grid, Workday recommends that you stagger your integration schedule.

To ensure that indirect changes get captured in the integration output, we recommend you turn off the transaction log.

## Requirements

WECI requires grid. You can have grid enabled for only 1 active tenant per environment at a time.  
Example: Implementation or Implementation Preview.

Perform upfront analysis of the data requirements with your third-party vendor or your data warehouse system.

## Limitations

The WECI integration doesn't capture time off or time tracking data.

You can't define eligibility criteria when running the WECI integration, such as eligibility criteria based on managers.

You can't have more than 1 WECI integration on a business process.

You can't use WECI for future change detection past 403 days outside the effective date range.

## Tenant Setup

Contact Customer Care to set up your tenant for grid.

## Security

WECI requires an associated *Integration System User* (ISU) account. ISUs enable you to give integrations security access to only the domains needed to run the integration. The ISU requires *Get* and *Put* access to the domains that secure the integration data sources.

Consider the security authorization that you want to grant for these actions.

Domain	Considerations
These domains in the Integration functional area: <ul style="list-style-type: none"> <li>• <i>Integration Build</i></li> <li>• <i>Integration Configure</i></li> </ul>	Create the WECI integration.
These domains in the Integration functional area: <ul style="list-style-type: none"> <li>• <i>Integration Build</i></li> <li>• <i>Integration Configure</i></li> <li>• <i>Integration Debug</i></li> </ul>	Launch the WECI integration.
<i>Integration Build</i> in the Integration functional area.	View the launched WECI integration.
<i>Set Up: Payroll Interface</i> in the Payroll Interface functional area.	View the WECI integration data changes and diagnostic audit files.

## Business Processes

WECI sends event codes when the related business process finishes the *Completed* step, such as a:

- HIR event code with the *Hire* business process.
- TERM event code with the *Termination* business process.

## Connections and Touchpoints

Workday offers a Touchpoints Kit with resources to help you understand configuration relationships in your tenant. Learn more about the [Workday Touchpoints Kit](#) on Workday Community.

## Steps: Set Up Worker Effective Change Interface

### Prerequisites

Contact Customer Care to set up your tenant for grid.

When you implement *Worker Effective Change Interface* (WECl), Workday recommends that you engage:

- Workday Professional Services
- A Workday Consulting Partner

Professional Services or a Consulting Partner can best assist you to deploy this connector.

Note: To avoid performance issues, Workday strongly recommends you set custom organization membership rules to semidynamic. If you require dynamic membership rules, we strongly recommend you enable the Enable Dynamic Membership Rule Evaluation Optimization check box on the Edit Tenant Setup - HCM task.

### Context

*Worker Effective Change Interface* is a full-stack integration that you can use to transmit each worker data change. You can set up the integration to send worker details based on organizations, such as corrections, rescinds, and indirect changes to:

- Third-party systems
- Data hubs
- Data warehouses

You can use this integration to help track transactions such as HCM data.

The integration includes the effective date and the data entry date for each change. The Worker Effective Change Interface isn't a solution for near real-time integrations or frequent runs because the integration events are resource-intensive.

### Steps

1. Access the Create Integration System task and select *Worker Effective Change Interface* on the New using Template prompt.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

2. (Optional) Enable any of these integration services:

Option	Description
Include Sections Configuration Service	Include a data section even if the integration detects no change for that section.
Transaction Log Service	Tracks event changes to employee data. When configuring the transaction log section by selecting Integration System > Configure Integration Transaction Log, select the Workday transactions that you want the integration to monitor for changes. When you

Option	Description
	<p>enable the Subscribe to all Business Process Types except option, the integration doesn't output any Transaction Log that is an Event Lite Type.</p> <p>Note: Workday recommends that you select Subscribe to all Transaction Types except and specify transaction types that you don't need. If in doubt, don't filter out a transaction type.</p>
Integration Document Retention	Control how long to retain files generated by the integration.
Filename Sequence Generator	Apply a unique name to each integration file.
Effective Stack - Expanded Effective Changes	<p>Enables the integration to include expanded data change details for the same effective date, even if the sum of changes results in a net zero change. Example: You terminate a worker on 12/1/2020 and then rehire the same worker into the same position on 12/1/2020. When you have this attribute:</p> <ul style="list-style-type: none"> <li>• Disabled, the integration doesn't detect a change.</li> <li>• Enabled, the integration reports 2 effective changes.</li> </ul> <p>Enable all fields on the Transaction Log data section when enabling this option. The transaction logs display what transaction created the effective change and what kind of transaction, such as a rescind or correction transaction.</p> <p>You can enable this option if you need to trace transaction events. This option doesn't support entry data roll up configurations.</p> <p>When running an all effective integration, the integration collapses changes that aren't within the entry range but are both:</p> <ul style="list-style-type: none"> <li>• Effective within the effective range.</li> <li>• Have the same effective date.</li> </ul>

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

- Grant the integration system user *Get* and *Put* access to the *Payroll Interface* domain.

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

All field attributes are accessible after you've configured this domain.

- [Configure Worker Effective Change Interface Integration Attributes and Maps](#) on page 1762.
- [Select and Set Up Connector Output Fields](#) on page 1977.
- (Optional) [Add Custom Fields to Connector Output](#) on page 1978.

Worker Effective Change Interface already supports integration field overrides, so select *Integration System > Configure Integration Field Overrides* and follow the directions from step 5 in [Add Custom Fields to Connector Output](#) on page 1978.

7. (Optional) [Test Worker Effective Change Interface Field Overrides](#) on page 1767.
8. (Optional) Configure population eligibility on the [Configure Integration Population Eligibility](#) task off of the related action menu of the integration. Workday doesn't apply web service contextual security, but you can ensure data security based on eligibility configuration.
9. [Set Up Integration Delivery](#) on page 1952.
10. [Set Up Integration Sequence Generators](#) on page 1969 if you enabled the *Filename Sequence Generator* integration service.
11. Create a transformation that converts integration output files into the format required by the external endpoint.  
See [Steps: Set Up Document Transformation Connector](#) on page 594.
12. [Launch an Integration](#) on page 24.

If you set a value for **Restrict Results By Orgs**, the integration runs only for the active workers with primary jobs in those organizations; the integration won't report workers with only non-primary jobs in those organizations. If you don't set a value, the integration runs for all workers in your tenant, active and terminated. The integration won't run if the total number of workers in the organizations you've selected exceeds 500,000. To reduce the population size for an integration run, use the **Restrict Results By Orgs** launch parameter. You can restrict results by supervisory organization or by company hierarchy.

## Next Steps

You can cancel a Worker Effective Change Interface integration run while its Integration Event Trigger child process is in a state of *Processing*. Access the Process Monitor report and find the integration event. Select [Background Process > Abort](#) as a related action on the process. Workday updates the status of the child process accordingly. Workday also changes the status of the integration event to *Failed*. Workday adds a new integration message to the integration event that states that Workday canceled the integration.

[Setting Up Grid for a Tenant](#)

## Steps: Set Up Frequent Integration Runs for Worker Effective Change Interface

### Prerequisites

Set up a Worker Effective Change Interface integration.

### Context

You can set up Worker Effective Change Interface to run more frequently than the typical once-daily recommendation. This one-time setup enables you to refresh internal data warehouses as frequently as every 6 hours.

## Steps

1. From the related actions menu of the integration, select Integration System > Configure Integration Services and then:
  - a. Enable the Transaction Log integration service and click OK.
  - b. Enable the Worker Effective Change Interface – Effective Stack Sync integration service and click OK.
2. Access the Maintain Worker Effective Change Integration System task.  
Security: *Set Up: Payroll Interface* domain in the Payroll Interface functional area.
3. Enter the last successful run date in these fields:
  - Created Date Time
  - Created Date Time for Additional Run

This action is a one-time setup. Workday automatically increments the Created Date Time for Additional Run field based on your integration run frequency. You can manually adjust the time in this field to reflect an earlier LSRD. If you do so, you must then delete the worker-level LSRD for each worker that the integration previously picked up. To delete the LSRD, run the Delete by Batch ID task.

4. [Launch an Integration](#) on page 24.

While using the Effective Stack Sync Service with the Primary Run launch parameter enabled, you can run the integration as frequently as 4 times a day or every 6 hours.

## Result

The integration evaluates the *Created Date Time for Additional Run* field to ensure that duplicates don't display in the output files. The final run of the day detects any indirect and unreported changes not included in the daily integration runs.

## Example

A worker's manager changes, but because it's an indirect change the integration doesn't include that change in the output files. The final daily synchronization run detects the indirect change and includes it in the output files.

## Configure Worker Effective Change Interface Integration Attributes and Maps

### Prerequisites

Security: *Integration Configure* domain in the integration functional area.

### Context

Configure the Worker Effective Change Interface integration system by:

- Enabling optional attributes.
- Mapping internal values to different external values in the output file.

## Steps

1. From the related actions menu on your integration, select Integration System > Configure Integration Attributes. As you complete the task, consider:

Option	Description
Output Document Tags	Specify the document tags the integration appends to the output file. Examples: <i>ADP</i> , <i>Testing</i> , <i>PI Output EDI</i> .

Option	Description
Audit Document Tags	Specify the audit tags the integration appends to the output files DataChangesAudit.html and DiagnosticAudit.html. The integration sets these files as <i>deliverable</i> .
Suppress Worker Message Audits For Job Size	When the job size is greater than 5,000 workers, the integration automatically uses the <i>Always Exclude</i> message audits option. You can override the automatic suppression of message audits by setting this attribute to <i>Always Include</i> .
Suppress Audit Reports For Job Size	When the job size is greater than 30,000 workers, the integration automatically sets the <i>Always Exclude</i> audit reports option. You can override the automatic suppression of audit reports by setting this attribute to <i>Always Include</i> .
Required Field Validation	<p>Select how the integration handles employees who fail 1 or more Required Field validations.</p> <ul style="list-style-type: none"> <li>For Exclude, the integration reports an error and excludes the employee from the output file.</li> <li>For Include, the integration reports a warning and includes the employee in the output file.</li> </ul> <p>If you don't configure this attribute, the integration uses the Exclude option.</p>
Max Length Field Validation	<p>Select how the integration handles employees who have any field data exceeding the maximum length configured for the field.</p> <ul style="list-style-type: none"> <li>For Include, the integration reports a warning, truncates the data, and includes the employee in the output file.</li> <li>For Exclude, the integration reports an error and excludes the employee from the output file.</li> </ul> <p>If you don't configure this attribute, the integration uses the Include option.</p>
Country Code Type or Name	Specify the type of country code or name that the integration includes in the output file. By default, the integration outputs the ISO 3166-1 Alpha 2 code.
Country Region Type or Name	<p>Specify the country region ISO code or name for the integration to output.</p> <p>If you don't enable this attribute, the integration outputs the country region reference ID.</p>
Address Usage Types	Specify the address usage type that the integration includes in the output file. The

Option	Description
	integration uses this attribute with the <i>Address Usage</i> attribute.
Address Usage	<p>Specify the address usage that the integration includes in the output file. The integration uses this attribute with the <i>Address Usage Type</i> attribute. The integration includes the primary address for the <i>Address Usage Types</i> in the output file when either:</p> <ul style="list-style-type: none"> <li>• You don't specify an address usage.</li> <li>• A worker doesn't have an address with the address usages you specified for each of the selected <i>Address Usage Types</i>.</li> </ul>
Phone Usage Type	Specify the phone usage type for the primary phone numbers that the integration includes in the output file.
Phone Number Parsing	Specify if you want parsed phone numbers in the integration output file. If you don't specify, the integration includes unparsed phone numbers.
Phone Number Format	Specify the phone number format. Examples: <i>E164 Formatted</i> , <i>National Formatted</i> .
Email Usage Type	Specify the primary email for the email usage type.
Additional Name Types	Specify the additional name types to include in the output file. If you don't configure this attribute, the integration doesn't include additional name types. It only includes additional names with 1 of the types in the output file.
Roll Up Entry Dated Changes	<p>Specify the sections that the integration displays entry-dated changes for the <i>Hire</i> event. Configure this attribute even if a business process other than <i>Hire</i> enters that data.</p> <p>When you enable the Effective Stack - Expanded Effective Changes service, the integration doesn't support entry dated roll-up changes; the integration includes all transactions in the output.</p>
Return Only Primary Position	<p>Select to return only the primary position for each employee. If you don't enable the attribute, the output file includes all position data for employees who have multiple jobs.</p> <p>Note: When the prior primary position and the new primary position end on the same day, the integration includes both the prior and new position.</p>

Option	Description
Organization Type for Organization	Specify the organization type. The integration only includes organizations with a matching organization type in the output file.
Organizations Role for Position	Specify organization roles for the integration to include assigned roles in the output file. The integration only includes assigned roles with the matching organization roles that you specified.
Future Change Detection	Specify up to 403 additional days to process future effective dated transactions for primary integration runs.  The integration run includes changes with future effective dates that are within the current processing effective range.
Report Post Termination Compensation	Select to report post termination compensation details for employees in the Compensation and Compensation Plans section.
Effective Date for Currency Conversion	If you don't configure this attribute, the integration uses <i>Effective Date From</i> .
Return End Date in Current Processing Effective Range	Specify the end date for integration to send for the selected data sections in the current processing effective range. If you don't select anything, the integration sends the end date when its effective.
Worker Type for Integration Run	Specify the type of workers to include in the integration run. If you don't configure this attribute, the integration includes employees and contingent workers. This filter doesn't apply for an integration run with the ad hoc Workers to Include/Exclude launch parameter.
Include Personal Data Section	When set to <i>Always</i> , the integration includes the Personal Data section, even if it detects no changes in the section. When not set, it only includes the data sections in which it detects changes.
Include Person Communication Data Section	When set to <i>Always</i> , the integration includes the Person Communication Data section, even if it detects no changes in the section. When not set, it only includes the data sections in which it detects changes.
Include Worker Status Data Section	When set to <i>Always</i> , the integration includes the Worker Status Data section, even if it detects no changes in that section. When not set, it only includes the data sections in which it detects changes.
Include Person Identification Data Section	When set to <i>Always</i> , the integration includes the Person Identification Data section, even if it detects no changes in the section. When not

Option	Description
	set, it only includes the data sections in which it detects changes.
Include Additional Data Section	When set to <i>Always</i> , the integration includes the Additional Data section, even if it detects no changes in the section. When not set, it only includes the data sections in which it detects changes.
Include Position Data Section	When set to <i>Always</i> , the integration includes the Position Data section, even if it detects no changes in that section. When set to <i>Job Change Reason Only (Secondary)</i> , the integration includes this section even when that's the only change. When not set, it only includes the data sections in which it detects changes.
Include Compensation Data Section	When set to <i>Always</i> , the integration includes the Compensation Data section, even if it detects no changes in that section. When set to <i>Compensation Change Reason Only (Secondary)</i> , the integration includes this section with the compensation change reason even when that's the only change. When not set, it only includes the data sections in which it detects changes.
Include Compensation Plans Data Section	When set to <i>Always</i> , the integration includes the Compensation Plans Data section, even if it detects no changes in that section. When not set, it only includes the data sections in which it detects changes.
Include Payment Election Data Section	When set to <i>Always</i> , the integration includes the Payment Election Data section, even if it detects no changes in that section. When not set, it only includes the data sections in which it detects changes.
Document Retention Policy	Specify the number of days the integration output file is available to view.
Payment Election Rules	Specify the Payment Election Rules. The integration only includes Payment Elections matching 1 of these rules in the output file.
Exclude Amount Field for Percentage Based Plans	<p>Enable this option and select 1 or both Compensation Plans subsections to exclude percentage-based amounts in the output:</p> <ul style="list-style-type: none"> <li>• <i>Allowance Plans</i></li> <li>• <i>Bonus Plans</i></li> </ul> <p>This option can help integration performance for the Compensation Plans data section when the integration runs for workers with percent-based bonus or allowance plan changes where</p>

Option	Description
	you don't need the integration to calculate the amount field.

2. From the related actions menu on the integration system, select Integration System > Configure Integration Maps.
3. On the Integration Maps grid, add a row for each tenant value. Select the Internal Value and enter the External Value for the output file.
4. (Optional) Provide a Default Value for data elements with values that aren't mapped.

## Test Worker Effective Change Interface Field Overrides

### Prerequisites

Security: These domains in the System functional area:

- *Custom Report Creation*
- *Manage: All Custom Reports*

### Context

When creating field overrides for Worker Effective Change Interface integration (WECl), test the calculated field in a report before adding it to the integration. This ensures the values that the integration returns are correct and the performance isn't greatly affected. Test all production scenarios, such as bulk import or organization changes as these can affect performance depending on the report fields you use in the calculated field. Make sure that the value of the calculated field changes with the worker event when you expect it.

Note: If the calculated field has more than 8 levels in the hierarchy, you might see a performance impact. Ensure that you test all scenarios, including mass updates, if you're using calculated fields with multiple conditions.

### Steps

1. Access the Create Custom Report task and select these values:

Field	Value
Report Type	<i>Advanced</i>
Data Source	<i>Indexed All Workers</i>

2. On the Columns tab, select the calculated field you want to test on the Field column.
3. On the Filter tab, add a row on the Filter on Instances grid and configure a worker filter condition. Example: Set the filter to prompt for an employee ID so the report only runs for that worker with these values:

Field	Value
And/Or	<i>And</i>
Field	<i>Employee ID</i>
Operator	<i>equal to</i>
Comparison Type	<i>Prompt the user for the value</i>
Comparison Value	<i>Default Prompt</i>

4. On the Prompts tab, select these values for the Runtime Date Prompts:

Field	Value
Effective Date	<i>Prompt for effective as of date</i>
Entry Date	<i>Prompt for entry date and time</i>

- Run the report and test the effective and entry date of the event during runtime.

Example: A worker event has an effective date of 2020-10-13 and an entry date of 2020-10-20T09:30. You run the report with an effective date of 2020-10-13 and entry date of 2020-10-20T09:25. You then run the report a second time with an effective date of 2020-10-13 and entry date of 2020-10-20T09:35. This tests if the calculated field value changes with the value of the event. If the value doesn't change, then the WECI integration probably won't pick up the change. Conduct a similar test by changing the effective date using 2020-10-12 and 2020-10-12 while keeping the same entry date of 2020-10-20T09:35. This ensures the integration reports the proper effective date for when the change takes effect.

## Concept: Worker Effective Change Interface

With the *Worker Effective Change Interface* (WECI) integration, you can:

- Capture all personal, job, or position data within Workday HCM.
- Capture all staffing events and data changes in the effective range.
- Configure required data elements and custom fields for the external system.
- Format and validate data to conform to the requirements of the external system.
- Transfer only those changes relevant to the external system.
- Run a Worker Data Changes Audit to see exactly what data the integration captured, selected, and sent to the external system.
- Perform additional transformations to the output file. Deliver the output XML file to an external system.
- Create full snapshots of employee data to help with initial implementation or enable system resynchronization.

Note: When the integration generates the schema and output files for field overrides, it might not correctly describe where the integration reports the `isAdded`, `isUpdated`, or `isDeleted` annotations when there's field overrides nested in other field overrides, such as a nested document structure for field overrides.

To run *Worker Effective Change Interface* integrations, configure your tenant for the grid functionality. The grid functionality is a shared resource in your Workday tenant. If you're scheduling multiple integrations on grid, Workday recommends that you stagger your integration schedule.

To help prevent a *Worker Effective Change Interface* integration from timing out, we limit the data for each worker to 100 megabytes. When workers exceed the limit, the integration skips these workers and continues processing. The integration then completes with errors and indicates the skipped workers.

When scheduling multiple integrations to run in parallel, consider:

- The job size, or number of workers in the organization you're processing.
- The number of integrations you run at the same time. Example: If the maximum size of your organization is 5,000 workers, you can run 4 integrations in parallel. If the maximum size of your organization is 12,000 workers, you can run 2 integrations in parallel.

Integrations that process 12,000 or more workers require additional considerations. Workday recommends that you work with Workday Professional Services or a Workday certified implementation partner to establish your resource strategy.

*Worker Effective Change Interface* supports 2 types of Change Detection:

- Include all changes in the effective date range* outputs all changes and events that are effective within the date range, regardless of entry date.
- Include only changes entered since the last successful run* outputs changes entered in Workday since the last successful run and effective within the specified date range.

## Primary Run

Use the Primary Run parameter for your regularly scheduled integration runs. As the run completes, it uses the last successful run date for the next integration run. Primary Run uses *Include all changes in the effective date range* as the type for Change Detection. It uses the last successful run date to the time that you launch the integration as the effective range for the integration run.

Note: After the initial primary run, any subsequent primary runs only include changes in effect after the last successful run date.

The last successful run date is associated with the combination of organizations that you enter in the Restrict Results By Orgs launch parameter for a Primary Run. Example: You enter organizations A and B, then launch a primary run. The integration sets the last successful run date for the next time that combination of organizations does a primary run. If you later launch a primary run for organization A only, that earlier successful run date doesn't apply.

To set the last extract dates for the primary run, access the Maintain Worker Effective Change Integration Systems task. The Maintain Worker Effective Change Integration Systems doesn't update the Last Successful Run Date for primary integration runs that complete with errors. Each row in the task corresponds to the combinations of organizations that you entered in Restrict Results By Orgs when you ran the integration.

For primary runs:

- Effective and entry date ranges automatically use the last extract date.
- From Effective Date is set to the last successful event entry date +1 day. Effective Date is set to the current date.
- The Restrict Results By Orgs parameter is optional. The integration won't run if the total number of workers in the organizations you've selected exceeds 500,000.
- The integration ignores all other launch parameters if you select Primary Run for the integration run.
- Workday provides the batch IDs that you must delete to avoid sending duplicate information downstream.

## Ad Hoc Run

If you don't select Primary Run, you launch an ad hoc run. Enter values to specify a range from which to capture the worker changes. Use an ad hoc run for unscheduled integration runs. For an ad hoc run, enter these launch parameters:

- From Effective Date
- From As Of Entry Moment
- Effective Date
- As Of Entry Moment
- Change Detection

Note: Effective moment is when the transaction is effective. Entry moment is when it was entered in the UI. Entry dated changes might have the same values.

An ad hoc integration run doesn't affect the last successful primary extract date.

During ad hoc runs, the integration reports entry-dated transactions regardless if the entry moment is within the effective range or not.

When WEI is processing a:

- Prior period, it sets the effective date to the last date of the period and the time to 23:59:59.999.
- Future period, it sets the effective date to the first date of the period and the time to 00:00:00.000.

## Full Snapshot Run

The Full Snapshot launch parameter sends the downstream system with all the worker information as of their current state in Workday.

When running a full snapshot, disable Transaction Log Service with the Configure Integration Services task. If you don't disable Transaction Log Service, Workday won't include any workers in the extract.

Related Information

**Reference**

[Setting Up Grid for a Tenant](#)

## Reference: Staffing Events in Worker Effective Change Interface Extracts

Workday reports the staffing events in the status record of the output file. The integration extracts includes effective dated changes when the effective date occurs in the specified effective range. For noneffective dated changes, the next time you run the integration, the integration sets the Effective Date to the Entry Date.

The *Worker Effective Change Interface* sends a HIR event when the *Hire* business process finishes the *Completed* step in the process. If there's an HIR event code, sections can have prior values or the integration can annotate the sections with isAdded during the *hire* event. Handle HIR or XFR-IN event codes as net-new hires or a rebase of an existing record.

Depending on the transactions you enter for a worker, you might see a combination of staffing events in the extract. Example:

Correction Use Case	Staffing Event Codes with Expanded Effective Changes Service Off (Default Setup)	Staffing Event Codes with Expanded Effective Changes Service Enabled
You correct a hire date to an earlier effective date.	HIR and DTA	HIR-C
You correct a hire date to a future effective date.	HIR-R and HIR	HIR-R and HIR
You correct a termination date to an earlier effective date.	TERM-C and DTA	TERM-C
You correct a termination date to a future effective date.	TERM-R and TERM	TERM-R and TERM

For rescinded staffing events, the information in the status section matches the status of the original event.

The integration doesn't include these events in the output file, if you don't enable the Leave of Absence data section:

- CONT-LOA
- LOA
- LOA-C
- LOA-R
- RFL
- RFL-R

To avoid missing data, ensure you evaluate event details when you transform the extract file. The details indicate if the event was an addition or a deletion.

When you enable the Effective Stack - Expanded Effective Changes service, the integration:

- Includes the HIR-C event when you correct a hire date to an earlier effective date.
- Doesn't include the CONT-LOA event code.

Staffing Event Code	Definition	Status Event Date	Data Sections Included
HIR	Worker hired or rehired upon completion of hire business process.	Hire date.	All data as of hire date.
HIR-C	Correction to the hire event. Correcting the hire date by moving it to an earlier effective date generates this event.	Hire date.	Status section.
HIR-R	Rescinded hire transaction.	Hire date.	Worker Status
DTA	Data change.	Effective date of data changes.	Changed sections only.
TERM	No longer employed. Employee status changed from active to terminated.	Termination date.	Personal, Person Communication, Worker Status, Position, Compensation, Compensation Plans
TERM-C	Corrected termination event. Correcting the termination event by moving it to an earlier effective date generates this event. The status changes from active to terminated.	Termination date.	Worker Status
TERM-R	Rescinded the termination event. Correcting the termination date by moving it to a future effective date generates this event. The status changes from terminated to active.	Termination date.	Worker Status, Person Communication, Position, Compensation, Compensation Plans
XFR	Worker transferred into supervisory organization you don't specify anything for the Restrict Results By Orgs launch parameter. Enter <i>Supervisory</i> in the <i>Organization Type for Organization</i> attribute. Otherwise, the integration won't generate XFR staffing events.	Organization event date. Position	

Staffing Event Code	Definition	Status Event Date	Data Sections Included
XFR-IN	Worker transferred into a supervisory organization for the specified Restrict Results By Orgs launch parameter. Enter <i>Supervisory</i> in the <i>Organization Type for Organization</i> attribute. Otherwise, the integration won't generate XFR-IN staffing events.	Organization event date.	Position
XFR-OUT	Worker transferred out of a supervisory organization for the specified Restrict Results By Orgs launch parameter. Enter <i>Supervisory</i> in the <i>Organization Type for Organization</i> attribute. Otherwise, the integration won't generate XFR-OUT staffing events.	Organization event date.	Position
LOA	Leave of absence. The integration won't report 2 simultaneous LOA's for the same worker without an RFL between them. The integration only reports an LOA when the worker goes on their first leave. If the worker is still on leave and you add a second leave, the integration reports a DTA code.	Leave start date.	Worker Status and Leave of Absence
LOA-R	Rescinded leave of absence.	Leave start date.	Worker Status and Leave of Absence
LOA-C	Correction to leave end date or type of leave of absence.	Leave end date.	Worker Status and Leave of Absence
RFL	Return from leave of absence.	Leave end date.	Worker Status and Leave of Absence
RFL-R	Correction to end date of leave of absence.	First day back at work.	Status and Leave of Absence sections.

Staffing Event Code	Definition	Status Event Date	Data Sections Included
CONT-LOA	Continuous leave of absence. A worker returns from leave and immediately goes on leave again. The leave must be back-to-back and can be any type of leave. Example: a worker returns from parental leave on the 15th and goes on personal leave on the 16th.	Same date as the original leave start date.	Leave of Absence.

## Reference: Data Sections for Worker Effective Change Interface

You can configure these integration field attributes for data you want to include in the Worker Effective Change Interface output files.

Note: When you configure integration field attributes, you must select the parent field attribute for the field. Example: You select the Include in Output check box for all the fields in the Personal Data Section. Also select the Include in Output check box for the Personal Data Section in the Effective Stack Worker folder for the integration to output that data.

Worker Effective Stack Data Sections	Fields	Notes
Worker Summary	<ul style="list-style-type: none"> <li>• WID</li> <li>• Name</li> <li>• Employee ID</li> </ul>	

Worker Effective Stack Fields Data Sections	Notes

Payment Election	<ul style="list-style-type: none"> <li>• Payment Election Rule</li> <li>• Order</li> <li>• Payment Type</li> <li>• Country</li> <li>• Currency</li> <li>• Bank Account Nickname</li> <li>• Bank Account Name</li> <li>• Account Number</li> <li>• Roll Number</li> <li>• Account Type</li> <li>• Bank Name</li> <li>• IBAN</li> <li>• Bank ID</li> <li>• BIC</li> <li>• Branch Name</li> <li>• Branch ID</li> <li>• Check Digit</li> <li>• Distribution Amount</li> <li>• Distribution Percentage</li> <li>• Distribution Balance</li> </ul>	
Collective Agreement	<ul style="list-style-type: none"> <li>• Start Date</li> <li>• End Date</li> <li>• Position ID</li> <li>• Collective Agreement</li> <li>• Collective Agreement Factor</li> </ul>	
Collective Agreement / Collective Agreement Factor	<ul style="list-style-type: none"> <li>• Factor</li> <li>• Option</li> </ul>	
Costing Allocation	<ul style="list-style-type: none"> <li>• Order</li> <li>• Level</li> <li>• Position ID</li> <li>• Allocation Percentage</li> <li>• Costing Worktag</li> <li>• Allocation Start Date</li> <li>• Allocation End Date</li> </ul>	
Costing Allocation / Costing Worktag	<ul style="list-style-type: none"> <li>• Worktag Dimension</li> <li>• Worktag Code</li> <li>• Worktag Name</li> </ul>	
Union Member	<ul style="list-style-type: none"> <li>• Union</li> <li>• Seniority Date</li> <li>• Membership</li> </ul>	

Worker Effective Stack Data Sections	Fields	Notes
Union Member / Membership Additional Information Transaction Log	<ul style="list-style-type: none"> <li>Start Date</li> <li>End Date</li> <li>Position ID</li> <li>Membership Type</li> <li>Notes</li> <li>Instance ID</li> <li>Instance ID</li> <li>Transaction Type</li> <li>Transaction Effective Moment</li> <li>Transaction Entry Moment</li> <li>Transaction Effective Moment in Initiator Time Zone</li> <li>Initiator Employee ID</li> <li>Initiator Full Display Name</li> <li>Is Corrected Event</li> <li>Is Corrected To</li> <li>Is Rescinded Event</li> <li>Original Event</li> <li>Overall Parent Event</li> </ul>	<p>To display in the Transaction Log:</p> <ul style="list-style-type: none"> <li>The effective moment of the change must match the entry moment.</li> <li>The change must have a corresponding business process change.</li> <li>The change must be a direct change.</li> </ul> <p>Changes that won't display in the Transaction Log include:</p> <ul style="list-style-type: none"> <li>Entry-dated changes and changes that don't have effective dates.</li> <li>Changes that don't have a corresponding business process change, such as changes to job profiles.</li> <li>Indirect changes, such as cost center changes.</li> </ul> <p>The integration only reports indirect changes for a worker when you enable the transaction log and the worker also has a direct change. Example: A manager of a worker your processing was terminated and the worker doesn't have any direct changes. Since the worker only has an indirect change, there isn't a transaction log for the worker.</p> <p>The Transaction Effective Moment in Initiator Time Zone field displays the entry moment of a data change in the time zone associated with your tenant time zone. When your tenant time zone is in Pacific Daylight Time (PDT), the field doesn't display in the output. When you override the tenant time zone and use the Transaction Log data section, we recommend that you configure this field.</p> <p>Note: Enable the Original Event field to include the Transaction Entry Moment, Transaction Effective Moment, and Transaction Effective Moment in Initiator Time Zone fields in the output.</p> <p>When you enable the Overall Parent Event field attribute, the integration returns the WID of the overall parent event relationship so you can synchronize data when there's a correction or rescind on the sub process business process. If there isn't a parent event, then both the original event WID and parent event WID are the same.</p>

## Troubleshooting: Performance Issues in WECI

This topic provides strategies for diagnosing and resolving these Worker Effective Change Interface (WECI) integration problems:

- Your integration is referencing a poor performing report field. on page 1797
- Your integration is referencing the Is Manager report field. on page 1798
- Your integration is referencing the Terminated (based on report date) report field. on page 1799
- Your integration is referencing dynamic rules but you don't have Dynamic Membership Rule Evaluation Optimization enabled. on page 1635
- Your integration is referencing the Job Classifications - Job Profile report field. on page 1636

### **Your integration is referencing a poor performing report field.**

Cause: You configured 1 or more of these report fields in a calculated field that you used as a field override in WECI:

- Worker Events Completed
- Staffing History – All
- Staffing History – Approved
- Worker History

Solution: Create a calculated field that prompts for the *Worker* business process. Use this calculated field where the integration references the report field. Then apply the parameter and field override assignments so the integration can determine the prompt value during run time to achieve the best performance.

### **Steps**

1. Access the Create Calculated Field task.

Enter these values:

Option	Description
Field Name	Worker Business Process Prompt
Business Object	<i>Global</i>
Function	<i>Prompt for Value</i>
Field Type	<i>Multi-Instance</i>
Business Object	<i>Worker Business Process</i>
Required check box	Select

Security: *Custom Field Management* domain in the System functional area.

2. Access the View Calculated Field report.

Select the poor performing calculated field from the Calculated Field prompt.

On the Where Used tab, find where the integration references the poor performing calculated field.

Security: *Custom Report Creation* and *Custom Field Management* domains in the System functional area.

3. On your integration, replace the poor performing calculated field with the *Worker Business Process Prompt* calculated field.

4. Select Integration System > Configure Integration Field Overrides from the related actions menu of the integration system.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

5. To enter the parameter and field override assignments, navigate to 1 of these integration documents:

- Worker Status Data Section
- Personal Data Section
- Person Communication Data Section
- Additional Information

6. Add a new row on the Parameters grid with these values:

Option	Description
Name	Worker History
Data Type	<i>Worker Event History with Filter Parameters</i> (on the <i>Worker</i> business object)
Value Type	<i>Determine Value at Runtime</i>
Value	<i>Worker Event History with Filter Parameters</i>

7. Fill out the Transaction Types field on the External Parameter Assignment(s) section on the Parameters grid and click OK.
8. Select Integration System > Configure Integration Field Overrides from the related actions menu of the integration system again.

Navigate to the same integration document where you applied the field overrides and external parameter assignments.

On the Extended Fields grid, add a new row with *Worker Business Process Prompt* as the Value.

In the External Parameter Assignment(s) section of the Extended Fields grid, select these values:

Option	Description
Value Type	<i>Document Parameter</i>
Value	<i>Worker History</i>

### Your integration is referencing the Is Manager report field.

Cause: You configured the Is Manager report field in a calculated field that you used as a field override in WECI.

Solution: For the best performance, use the Role field in the Effective Stack Worker / Position Data Section / Assigned Role data section to identify if the worker is a manager after processing the integration.

### Steps

1. Access the View Calculated Field report.

Select the poor performing calculated field from the Calculated Field prompt.

On the Where Used tab, find where the integration references the poor performing calculated field.

Security: *Custom Report Creation* and *Custom Field Management* domains in the System functional area.

2. On your integration, remove the poor performing calculated field.

3. Select Integration System > Configure Integration Field Overrides from the related actions menu of the integration system.

Use the Role field in the Effective Stack Worker / Position Data Section / Assigned Role data section to identify if the worker is a manager after processing the integration.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

### Your integration is referencing the Terminated (based on report date) report field.

Cause: You configured the Terminated (based on report date) report field in a calculated field that you used as a field override in WECI.

Solution: To avoid excluding workers, use the Terminated report field instead.

#### Steps

1. Access the Edit Calculated Field task.  
Select the calculated field from the Calculated Field prompt.  
Security: *Custom Field Management* domain in the System functional area.
2. Replace any references of the Terminated (based on report date) report field with the Terminated report field.

### Your integration is referencing dynamic rules but you don't have Dynamic Membership Rule Evaluation Optimization enabled.

Cause: You have dynamic rules set up for your integration but haven't selected the Enable Dynamic Membership Rule Evaluation Optimization check box.

Solution:

#### Steps

1. Access the Edit Tenant Setup - HCM task.  
Security: *Set Up: Tenant Setup - HCM* domain in the System functional area.
2. Select the Enable Dynamic Membership Rule Evaluation Optimization check box under the Payroll Interface section.

### Your integration is referencing the Job Classifications - Job Profile report field.

Cause: You configured the Job Classifications - Job Profile report field in a calculated field that you used as a field override in WECI.

Solution:

#### Steps

1. Access the Create Calculated Field task.  
Security: *Custom Field Management* domain in the System functional area.
2. Enter these values:
 

Option	Description
Field Name	Worker Job Classifications
Business Object	<i>Position and Job - All Staffing Models</i>
Function	<i>Look up related value</i>
Lookup field	<i>Job Profile</i>
Return Value	<i>Job Classifications</i>
3. Access the View Calculated Field report, and select the poor performing calculated field on the Calculated Field prompt.  
Security: *Custom Report Creation* and *Custom Field Management* domains in the System functional area.
4. On the Where Used tab, find where the integration is referencing the poor performing calculated field.

5. Select Integration System > Configure Integration Field Overrides from the related actions menu of the integration system.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
6. Replace the poor performing calculated field with the Worker Job Classifications calculated field.

## External Payroll Documents and Results

### Callback for External Payroll

#### Steps: Set Up Callback for External Payroll

##### Prerequisites

Have an integration system security group with Get and Put access to these domains in these functional areas:

Domains	Functional Area
<i>Background Process Management</i>	Tenant Non-Configurable
<ul style="list-style-type: none"> <li>• <i>Set Up: Payroll</i></li> <li>• <i>Set Up: Payroll - Pay Group Specific</i></li> </ul>	Core Payroll
<ul style="list-style-type: none"> <li>• <i>Payroll Interface</i></li> <li>• <i>Set Up: Payroll Interface</i></li> </ul>	Payroll Interface

See [Create Integration System Security Groups](#).

Workday recommends that you confirm with your external payroll vendor that they support the Callback feature.

##### Context

The Callback feature enables you to send a callback message to your external payroll vendor when Workday completes an import of data from external payroll documents or external payroll results.

You can set up the Callback feature for these web services:

- *Import External Payroll Document*
- *Import External Payroll Results*

##### Steps

1. Access the Create Integration System User task.
  - a) From the related actions menu of the ISU you created, select Security Profile > Assign Integration System Security Groups.
  - b) From the Integration System Security Group to Assign prompt, select a security group with Get and Put access to these domains in these functional areas:

Domains	Functional Area
<i>Background Process Management</i>	Tenant Non-Configurable
<ul style="list-style-type: none"> <li>• <i>Set Up: Payroll</i></li> </ul>	Core Payroll

Domains	Functional Area
• <i>Set Up: Payroll - Pay Group Specific</i>	
• <i>Payroll Interface</i> • <i>Set Up: Payroll Interface</i>	Payroll Interface

The integration system user (ISU) you create can only be used for the Callback feature.

Security: *Integration Security* domain in the Integration functional area.

## 2. Create External Payroll Vendor Mapping on page 1413.

On the Feature Configuration grid, select:

- *Callback* from the Feature prompt.
- *Integration System User* from the Attribute prompt.
- The ISU that you created for the Call back feature from the Value prompt.

### Result

When your external payroll documents or external payroll results finish importing, Workday notifies your third-party payroll vendor with a callback message.

## External Payroll Documents

### Setup Considerations: External Payroll Documents

You can use this topic to help make decisions when planning your configuration and use of *External Payroll Documents* integration. It explains:

- Why to set it up.
- How it fits into the rest of Workday.
- Downstream impacts and cross-product interactions.
- Security requirements and business process configurations.
- Questions and limitations to consider before implementation.

Refer to detailed task instructions for full configuration details.

### What It Is

You can use *External Payroll Documents* integrations to import payslips, tax documents, and other payroll documents from your external payroll system into Workday.

### Business Benefits

Importing external payroll documents makes it easier for your workers and administrators to view all of their payroll documents in Workday. With this integration, you have the flexibility to define the types of external payroll documents you want to import.

### Use Cases

You can use this feature to import into Workday payslips and tax documents generated by an external vendor. You can also use this feature to import other types of payroll documents that you define. Example: Garnishment letters.

## Questions to Consider

Questions	Considerations
What external payroll documents other than payslips and tax documents do you need to import into Workday?	You can use the Maintain External Payroll Document Types task to define the additional types of payroll documents you want to import.
Who needs to view the external payroll documents within Workday?	Workday provides security domains that you can configure to grant workers access to view their external payroll documents. Workday provides other security domains that you can configure to grant administrators access to workers' external payroll documents.
How do you want employees to acknowledge payroll documents?	You can use the <i>Review External Payroll Document</i> business process to request worker reviews of external payroll documents. Example: You request workers sign their payslips each month to meet compliance requirements.
Where does Workday display the external payroll documents?	You can configure Workday to display the external payroll documents on the worker profile: <ul style="list-style-type: none"> <li>In the External Payslips grid on the Payslips tab.</li> <li>In the External Tax Documents grid on the Tax Documents tab .</li> <li>In the Other External Payroll Documents grid on the Additional Documents tab.</li> </ul>
What is the policy of your organization for retaining payroll documents?	Uploaded external payroll documents remain in Workday until you remove them.
How many external payslips do you want to print?	You can print individual external payslips from the Payslips for Worker report or the Payslips section of the worker's profile.  You can also use the Edit Tenant Setup - HCM task to enable printing multiple external payslips for administrators and employee self-service.

## Recommendations

You can configure Integration Sequence Generators for the *External Payroll Documents* integration. This configuration enables you to use the Delete by Batch ID task to remove uploaded external payroll documents.

You can configure an Integration System User (ISU) for the integration.

You can define tax documents and other payroll documents that you want to import from your external payroll vendor. Example: Garnishment letters.

If you import tax documents from countries other than the United States, you can use Tax Document Version 2. This version provides additional fields in the .CSV manifest file for identifying international tax documents.

You can use the Configure Profile Group task to add imported external payslips, tax documents, and other payroll documents on the Pay for worker profile. Workers can then view their imported external payroll documents within Workday.

## Requirements

You configure manifest files for the external payroll documents that you want to import. You create a separate .CSV manifest file for each type of external payroll document. A single manifest file in .XML format can contain all types of external payroll documents.

You import all types of external payroll documents in a single archive file.

Every payslip must have a check number.

The integration requires an organization. Set the *Organization Identifier Type* to Reference ID or provide the organization code for the organization.

These functional areas enable the ISU that's associated with the integration to launch the *Import External Payroll Document* web service.

## Limitations

You can upload payslips up to 7 years before the end date of the current pay period.

- You can upload a combined total of 1000 uploaded external tax documents and other external payroll documents for each worker.
- You can upload up to 199,999 documents for each batch ID.
- An individual attachment file, such as PDF file, can't exceed 2.5 MB.
- Multiple attachment files must be in a ZIP file.
- A manifest file or archive ZIP file can't exceed 30 MB.

If you import your external payroll documents through a different method such as a retrieval service or a web service, different size limits may apply to your files. See [Reference: Integrations and Web Service Limits](#).

## Tenant Setup

Ensure that your tenant configuration supports the file extensions of the payroll documents you want to import.

## Security

Domains	Considerations
These domains in the Integration functional area: <ul style="list-style-type: none"> <li>• <i>Integration Event</i></li> <li>• <i>Payroll Interface</i></li> <li>• <i>Set Up: Payroll Interface</i></li> </ul>	The ISU requires these domains.
The <i>Access Payroll Country (Segmented)</i> domain in the Core Payroll, Implementation, and Payroll Interface functional areas.	The ISU requires this domain when you're using: <ul style="list-style-type: none"> <li>• Version 2 of the <i>External Payroll Documents</i> integration.</li> <li>• Version 37.0 or higher of the <i>Import External Payroll Document</i> web service.</li> </ul>
These domains in the Payroll Interface functional area: <ul style="list-style-type: none"> <li>• <i>View: Maintain Payroll Interface</i></li> <li>• <i>Worker Data: Payroll Interface (External Payroll Documents)</i></li> </ul>	Payroll administrators with security enabled for these domains can view employee external payslips, external tax documents, and other external payroll documents in Workday.
These domains in the Payroll Interface functional area:	Employees with security enabled for these domains can view their external payslips, external

Domains	Considerations
<ul style="list-style-type: none"> <li>• <i>Self Service: Payroll Interface</i></li> <li>• <i>Self Service: Payroll Interface (External Payroll Documents)</i></li> </ul>	tax documents, and other external payroll documents in Workday.

## Business Processes

To use the *External Payroll Documents* integration, you must configure a business process with a *Document Retrieval* step. This step imports the external payroll documents from the external payroll vendor SFTP server or through the *Import External Payroll Document* web service.

The *Review External Payroll Documents* business process enables you to request worker reviews of external payroll documents.

## Reporting Items

Workday provides these reporting items for *External Payroll Documents* integrations.

Reports	Considerations
All External Payroll Documents	<p>Create custom reports on external payslips, external tax documents, and other external payroll documents uploaded to Workday.</p> <p>You can filter the report by worker, organization, and batch ID.</p>
Audit Report	<p>View the number of external payroll documents imported successfully and any invalid external payroll documents included in the manifest files.</p>
External Payslips	<p>Create custom reports on external payslips uploaded to Workday.</p> <p>You can filter the report by worker, organization, pay period, and date range.</p>
External Tax Documents	<p>Create custom reports on external tax documents uploaded to Workday.</p> <p>You can filter the report by worker, organization, document type, and country.</p>
Find External Payroll Documents	<p>Search for external payroll documents imported into Workday. The report provides these prompts for searching payslips, tax documents, and other external payroll documents:</p> <ul style="list-style-type: none"> <li>• Batch ID, document categories, organizations, and workers.</li> <li>• For payslips, prompts include pay periods and date range.</li> <li>• For tax documents and other payroll documents, prompts include document types, years, countries, and issued date range.</li> <li>• Other payroll documents also include prompts for the date that you received the documents.</li> </ul>

Reports	Considerations
Other External Payroll Documents	Create custom reports on other external payroll documents uploaded to Workday. You can filter the report by worker, organization, document type, and country.
Payslips for Worker	View external payslips imported for a selected worker.

## Integrations

Integrations or Web Services	Considerations
<i>External Payroll Documents</i>	You can use this integration template to create an integration.
<i>Import External Payroll Document</i>	You can use this web service to import external payroll documents into Workday. When you access the Register API Client for Integrations task to register an API client, select these functional areas from the Scope (Functional Areas) prompt: <ul style="list-style-type: none"><li>• <i>Integration</i></li><li>• <i>Payroll Interface</i></li><li>• <i>Tenant Non-Configurable</i></li></ul>

### Related Information

#### Tasks

[Register API Clients for Integrations](#)

#### Examples

[Reference: Integrations and Web Service Limits](#)

### Steps: Set Up External Payroll Documents Integration

#### Prerequisites

See [Setup Considerations: External Payroll Documents](#) on page 1801.

#### Context

You can create a single integration based on the *External Payroll Documents* integration template to import these external payroll documents into Workday:

- External payslips. Importing these documents is an alternative to an *Import External Payslips* integration.
- External tax documents.
- Other payroll documents.

The integration can import:

- Archive files in ZIP format that contain the external payroll documents you want to import.
- Manifest files in the Workday-defined XML or CSV format that contain the necessary details and file paths for the documents in the archive files.

See [Reference: External Payroll Documents File Schema](#).

You must upload both manifest files and their corresponding archive files together to import the external payroll documents successfully.

You can reach out to your third-party payroll vendor to include the appropriate mime type in your external payroll document file. If the appropriate mime type isn't included, then Workday downloads the file automatically.

## Steps

1. [Create Integration System](#) on page 1967.

Select *External Payroll Documents* on the New Using Template prompt.

2. From the related actions menu on your *External Payroll Documents* integration, select **Integration System > Configure Integration Attributes**.

Note:

- The default *Input Date Format* is yyyy-MM-dd. You can specify another format that conforms to Java's SimpleDateFormat for the dates present in the input file.
- The default *Organization Identifier Type* is Organization Code.
- The default *Tax Document Version* is 1. Select 2 to use the CSV manifest file version that has additional fields for tax documents.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

3. From the related actions menu on your *External Payroll Documents* integration, select **Integration System > Configure Integration Services**.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

4. (Optional) From the related actions menu on your *External Payroll Documents* integration, select **Integration System > Configure Integration Maps**.

As you complete this task, consider:

Option	Description
Organizations	Use to map organizations in Workday to organizations in your third-party vendor system.
Run Category	Use only if an integration has both: <ul style="list-style-type: none"> <li>• Workday Payroll pay groups.</li> <li>• <i>Payslip Version</i> integration attribute set to 2.</li> </ul>

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

5. (Optional) [Set Up Integration Sequence Generators](#) on page 1969.

Enable and configure the *External Payroll Documents Sequence Generator* service to generate a batch ID for each group of uploaded external payroll documents.

6. [Create Integration Business Process](#) on page 1950.

As you complete this task, consider:

Option	Description
Business Process Type	Select None of the Above.
Business Process Steps	Add a step before the <i>Fire Integration</i> step. <ul style="list-style-type: none"> <li>• For Type, select <i>Service</i>.</li> <li>• For Specify, select <i>Document Retrieval</i>.</li> </ul>

**7. Set Up Integration Retrieval** on page 1957.

Add entries for *XML* and *CSV* in the File Name/Pattern prompt.

- An XML file can contain all document categories.
- The integration requires a separate CSV file for each document category (payslips, tax documents, other payroll documents).

**8. Create an Integration System User (ISU)** and grant the ISU *Get* and *Put* access to these domains in the Integration functional area:

- *Integration Event*
- *Payroll Interface*
- *Set Up: Payroll Interface*

Also grant the ISU access to the *Access Payroll Country (Segmented)* domain in the Core Payroll, Implementation, and Payroll Interface functional areas when you use:

- Version 2 of the *External Payroll Documents* integration.
- Version 37.0 or higher of the *Import External Payroll Document* web service.

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

**9. Assign the ISU to the integration.**

- From the related actions menu, select Workday Account > Edit.
- Click Workday Account. Select Integration System Users and select the ISU that you created.
- (Optional) In the Global Preferences area, select a locale and display language.

These settings control the language that Workday uses for the integration data. If left blank, Workday uses the default locale and display language.

Security: *Integration Security* in the Integration functional area.

**10. Edit Domain Security Policies.**

Configure security policies for these domains in the Payroll Interface functional area.

- These domains enable payroll administrators to view external payroll documents for workers:
  - *View: Maintain Payroll Interface*
  - *Worker Data: Payroll Interface (External Payroll Documents)*
- These domains enable workers to view their own external payroll documents:
  - *Self-Service: Payroll Interface*
  - *Self-Service: Payroll Interface (External Payroll Documents)*

**11. Set Up Self-Service for External Payroll Documents** on page 1808.

**12. Launch an Integration** on page 24.

## Result

If you didn't specify a Display Date, Workday immediately displays the external payroll documents.

External payroll documents display by year. If the documents are in the same year, Workday displays the documents in the order they were uploaded.

Workers and administrators can view these external payroll documents.

External Payroll Documents	Workers	Administrators
Payslips	From the My Payslips task. From the Pay profile group of the worker profiles on the Payslips tab in the External Payslips grid.	From the Pay profile group of the worker profile on the Payslips tab in the External Payslips grid.

External Payroll Documents	Workers	Administrators
Tax Documents	From the My Tax Documents task. From the Pay profile group of the worker profile on the Tax Documents tab in the External Tax Documents grid.	From the Pay profile group of the worker profile on the Tax Documents tab in the External Tax Documents grid.
Other External Payroll Documents	From the My Other External Documents task. From the Pay profile group of the worker profile on the Additional Documents tab in the Other External Documents grid.	From the Pay profile group of the worker profile on the Additional Documents tab in the Other External Documents grid.

## Next Steps

Workers and administrators can use these reports to view external payroll documents.

Role	Reports
Workers	<a href="#">My Payslips</a> <a href="#">External Payslips - Gross and Net History</a> <a href="#">External Payslips - Recent Payslips</a> <a href="#">My Tax Documents</a> <a href="#">My Other External Payroll Documents</a>
Administrators	<a href="#">Payslips for Worker</a> <a href="#">Other External Payroll Documents for Worker</a> <a href="#">Find External Payroll Documents</a>

## Set Up Self-Service for External Payroll Documents

### Prerequisites

Security: *Set Up: System* domain in the System functional area.

### Context

You can set up access in Workday to these external payroll documents:

- External payslips.
- External tax documents.
- Other external payroll documents. Example: Garnishment letters, social insurance documents.

### Steps

1. Access the Configure Profile Group task.
2. Select the profile group *Pay for Worker Profile*.

3. Add a row in the grid for each type of external payroll document you import:

- Payslips.
- Tax documents.
- Additional documents.

## Result

The Pay tab of the worker profile can now display uploaded external payroll documents.

## Set Up External Payroll Document Types

### Prerequisites

Security: *Set Up: Payroll Interface* domain in the Payroll Interface functional area.

### Context

You can create document types for tax documents and other payroll documents you want to import into Workday from your third-party payroll system. Example: Create a T4 external payroll document type for Canada to import those Canadian tax documents into Workday.

If an integration or the web service imports an external payroll document without a predefined document type, Workday automatically creates a new document type for that document. Workday ignores spaces and hyphens in filenames when creating a document type.

### Steps

1. Access the Maintain External Payroll Document Types task.
2. As you complete the Tax Document Types section, consider:

Option	Description
Name	You can change the name of a tax document type, but the combination of name and country must be unique.  Note: When you change the name of a tax document type, any existing document with the same document type and country combination displays the new name.
Country	Select the country where the tax document type applies.
Show to Employee	Select to enable employees to see tax documents of this type.  Workday automatically selects this option for tax document types created by integrations or web services.
Show Comments to Employee	Select to enable employees to see any additional information for the type of tax document.  Workday doesn't automatically select this option for tax document types created by integrations or web services.
In Use	Workday sets this option when an integration or web service imports a document of this type.

Option	Description
	You can't delete tax document types that are in use.

3. As you complete the Other Document Types section, consider:

Option	Description
Name	You can change the names of other document types, but the combination of name and country must be unique.
Country	Select the country where the other document type applies.
Show to Employee	Select to enable employees to see documents of this type. Workday doesn't automatically select this option for other payroll document types created by integrations or web services.
Show Comments to Employee	Select to enable employees to see any additional information for the type of document. Workday doesn't automatically select this option for other payroll document types created by integrations or web services.
In Use	Workday sets this option when an integration or web service imports a document of this type. You can't delete other payroll document types that are in use.

## Next Steps

Import external payroll documents into Workday.

## Set Up Contextual Security for External Payroll Documents

### Prerequisites

Configure domain security policies for external payroll documents. See [Steps: Set Up External Payroll Documents Integration](#).

Security: *Set Up: Tenant Setup - HCM* in the System functional area.

### Context

You can set up contextual security for external payroll documents to help limit the access of constrained role-based security groups to workers' documents. This feature helps ensure that only roles assigned to the same pay group or organization as the external payroll documents can access them.

Workday only supports:

- Pay group-based roles for external payslips.
- Organization-based roles for external tax documents and other external payroll documents.

### Steps

1. Access the Edit Tenant Setup - HCM task.

2. In the Payroll Interface section, select the Restrict Constrained Security Groups Access to External Payroll Documents check box.

## Result

After you select the check box, Workday contextually secures the external payroll documents so that only roles assigned to the same pay group or organization can access them:

External Payroll Document Type	Secured By
External payslips	The pay group associated with the external payslip.
External tax documents	The organization associated with the external tax document.  If you don't provide an organization for an external tax document, roles that have access to any organizations of the worker can access that document.
Other external payroll documents	The organization associated with the external payroll document.

## Example

You have:

- Configured domain security policies for external payroll documents.
- Enabled the Restrict Constrained Security Groups Access to External Payroll Documents check box.

Kayla, a payroll partner for Third Party - Australia, goes to review worker Robert's payslips. Robert has:

- 3 payslips for the Third Party - Singapore pay group.
- 2 payslips for the Third Party - Australia pay group.

Because you set up contextual security, Kayla:

- Can only view Robert's Australia payslips.
- Can't view Robert's Singapore payslips.

## Upload Individual External Payroll Documents

### Prerequisites

Security:

- For third-party payroll customers: *Worker Data: Payroll Interface (External Payroll Documents)* domain in the Payroll Interface functional area.
- For Workday Payroll customers: *Reports: Pay Calculation Results for Worker (External Payroll Documents)* domain in the Core Payroll functional area.

### Context

You can use the Upload External Payroll Documents for a Worker task to upload externally generated payroll documents for individual workers into Workday. This task helps you upload external payroll documents outside of your scheduled integration.

Example: You set up your *External Payroll Documents* integration so that the integration automatically uploads payslips. In the latest integration run, 2 payslips failed to upload. You don't want to run your integration again, so you use the Upload External Payroll Documents for a Worker task to upload the 2 failed payslips manually.

## Steps

1. Access the Upload External Payroll Documents for a Worker task.
2. As you complete the task, consider:

Option	Description
~Worker~	Select the worker for whom you want to import external payroll documents.
Document Category	Select the type of document that you want to import. You can select only 1 type.

3. As you complete this task to upload payslips, consider:

Option	Description
Pay Group	Select the Workday Reference ID for the pay group.
Run Category	For a Workday Payroll pay group with multiple run categories, select the run category for determining the pay period for the uploaded payslips.
Period	Select the pay period for attaching the uploaded payslip.
Payment Date	Enter the payment date for the uploaded payslip.
Check Number	Enter the number of the check for the payment associated with the payslip.
Gross Amount	(Optional) Enter the gross payment amount for the payslip.
Net Amount	(Optional) Enter the net payment amount for the payslip.
Currency	(Optional) Enter the currency code for the pay amounts.
Display Date	Enter the date to display when you view the payslip details in Workday.
File Name	Enter the filename for the uploaded payslip file.

4. As you complete this task to upload tax documents, consider:

Option	Description
Organization	Enter the name of the organization for which the tax document is issued.
Serial ID	Enter the serial ID of the document in string format. Applies only to Tax Document Version 2.

Option	Description
Year	Enter the year for the tax document in date format.
Tax Form	Select the type of tax document or create a new one.
Region	Select the region for which the tax document is issued. Applies only to Tax Document Version 2.
Form Classification	Select the type of form that you're uploading. Applies only to Tax Document Version 2.
Issued Frequency	Select the scheduled release of the tax document. Applies only to Tax Document Version 2.
Issued Date	Enter the date that the tax document was issued.
Comments	Use this field for any additional information that you require for the document. Applies only to Tax Document Version 2.
Display Date	Enter the date to display when you view the tax document details in Workday.
File Name	Enter the filename for the uploaded tax document.

5. As you complete this task to upload other payroll documents, consider:

Option	Description
Organization	Enter the name of the organization for which the document is issued.
Serial ID	Enter the serial ID of the document in string format.
Document Type	Select the type of document or create a new one.
Year	Enter the year for the document in date format.
Issued Date	Enter the date that the document was issued.
Issued By	Enter the external entity that issued the document. Example: The IRS issues a federal tax levy garnishment.
Received Date	Enter the date that the document was received.
Comment	Use this field for any additional information that you require for the document.
Display Date	Enter the date to display when you view the document details in Workday.
File Name	Enter the filename for the uploaded document.

6. In the Attachment section, add the external payroll files you want to upload for the worker.

## Steps: Print Multiple External Payslips

### Context

Workday enables you to print multiple externally uploaded payslips for a worker. You can select:

- Files in these formats: \*.pdf, \*.jpeg., \*.png.
- Payslips that have period end dates within 7 years of the current period end date.

You must select 2 or more payslips. You can only select payslips that haven't been purged.

You can also enable employee self-service access to the Print Multiple External Payslips button on:

- The My Payslips report.
- Pay > Payslips.
- View Profile > Pay > Payslips.

### Steps

1. Take 1 of these actions to import external payslips:
  - Set up the external payroll documents integration or the import external payslips integration.  
See [Steps: Set Up External Payroll Documents Integration](#) and [Steps: Set Up Import External Payslips Integration](#).
  - [Upload Individual External Payroll Documents](#)
2. On the Edit Tenant Setup - HCM task, enable 1 or both of these options:
  - Enable Print Multiple Payslips for Administrators  
*Security: Worker Data: Payroll Interface (External Payroll Documents)*
  - Enable Print Multiple Payslips for Self-Service  
*Security: Self-Service: Payroll Interface and Self-Service: Payroll Interface (External Payroll Documents)*
3. As an administrator, access 1 of these options and select the Print Multiple External Payslips button:
  - The Payslips tab of a worker profile.
  - The Payslips for Worker report.

As you complete the task, consider:

Option	Description
Worker	You can search for payslips for the worker or select a different worker.
Payment From Date	Select the beginning of the date range from which to retrieve payslips.
Payment To Date	Select the end of the date range. For faster processing, select the narrowest date range that meets your needs.

4. Select the payslips you want to print.
5. (Optional) Select Notify Me Later to have the results sent to My Reports.

### Result

Workday generates a PDF showing the selected payslips in chronological order.

## Steps: Set Up External Payroll Document Reviews

### Prerequisites

- Review setup considerations for external payroll documents.
- Security: *Business Process Administration* or *Manage: Business Process Definitions* domain in the System functional area.

### Context

You can set up the *Review External Payroll Document* business process to send external payslips, tax documents, and other payroll documents to workers to review and acknowledge or sign using 1 of these eSignature features:

- Adobe Sign
- DocuSign
- Workday e-signature

You can include multiple acknowledgements or signatures on each external payroll document, allowing you to request approvals from other relevant users. Examples: HR administrator, manager.

Note: DocuSign doesn't support documents with these filename extensions: .bmp, .PDF. It does support the .pdf filename extension.

### Steps

1. Configure the *Review External Payroll Document* business process.
  - a) You need to create a document to add to the *Review Documents* step on the business process definition. This document enables Workday to provide the external payroll document for the worker to review.  
Access the Create Document task to configure a document that you need to add to the business process definition. Complete the task, selecting the *External Payroll Document* category and the External Payroll Document for Review report field.  
See [Add Documents to Workday](#).
  - b) Configure the *Review External Payroll Document* business process definition to include a *Review Documents* action step.  
See [Steps: Configure Business Process Definitions](#).
  - c) On the row for the *Review Documents* step, click Configure Document Review. Select the document you created and configure your signature options.  
See [Concept: Review Documents Step](#).
  - d) (Optional) To include a Don't Accept option for workers completing document reviews, configure a Redirect action on the business process definition.  
See [Configure Redirect on Business Process Steps](#).
  - e) Configure the security policy for the *Review External Payroll Document* business process.  
Assign any relevant security groups to the initiate and review actions. Examples: Employee as Self, Payroll Administrator.  
See [Edit Business Process Security Policies](#).

2. Create custom reports to enable you to request external payroll document reviews from multiple workers and to schedule future review requests. When Workday executes the custom report, it initiates the *Review External Payroll Document* business process.

- a) Create a custom report for each kind of external payroll document you want to schedule for review. Example: External payslips.

When you create the report, Workday recommends you:

- Select the *Advanced* report type.
- Clear the Optimized for Performance check box.

Select the appropriate data source for the report:

- All External Payroll Documents
- External Payslips
- External Tax Documents
- Other External Payroll Documents

On the Columns tab, add at least 1 field on the grid (Example: Worker) to enable you to continue creating the report. It doesn't matter which fields you select on the Columns tab, as the report also picks up the fields from the data source you select.

You can use the Review External Payroll Document for Worker Event report field as a filter on your custom reports to ensure workers don't receive multiple review requests for the same document. Note: You can't use the report field as a filter when you've selected the Optimized for Performance check box on the Create Custom Report task.

See [Create Custom Reports](#).

- b) Access the Initiate External Payroll Document Review task. Select your custom report and desired run frequency. Examples: *Run Now*, *Monthly Recurrence*. Define the report parameters and click OK.

When you complete the task, Workday schedules execution of the report and initiation of the business process. When you use the Review External Payroll Document for Worker Event report field on your report, you can't request reviews of documents that you generated before configuring the *Review External Payroll Document* business process.

See [Concept: Workday Scheduled Processes](#).

- 3. (Optional) Access the Request Worker Review of External Payroll Document task when you want to initiate the *Review External Payroll Document* business process to send 1 document to 1 worker for ad hoc review.

## Result

Workday routes the document review request to the worker as a My Tasks notification. Reviewed external payroll documents display on the Pay profile group of the worker profile.

## Next Steps

You can use the Scheduled Future Processes report to manage scheduled background processes. Example: You want to change the recurrence schedule from *Monthly Recurrence* to *Custom Recurrence*.

You can create custom reports using the External Payroll Document for Review report field to:

- Track the status of external payroll document reviews.
- Verify which workers have or are scheduled to receive review requests.

When you delete an unsigned external payroll document using 1 of these tasks, Workday also deletes the signed version of the document:

- Delete by Batch ID
- Delete External Payroll Documents
- Mass Delete External Payroll Documents

You can purge reviewed external payroll documents using the Purge Person Data report.

[Concept: Business Processes](#)

### Tasks

[Set Up Adobe Sign](#)

[Set Up DocuSign](#)

## Steps: Configure Alerts for External Payroll Documents

### Prerequisites

- Set up an external payroll documents integration or upload external payroll documents. See [Steps: Set Up External Payroll Documents Integration](#) and [Upload Individual External Payroll Documents](#).
- Security: *Notification Alerts* domain in the System functional area.

### Context

You can use a custom report to configure alerts to notify workers when external payroll documents have been uploaded. You can include a task in the notification message that recipients can access to view the external payroll document, or configure the attachment to display as a link in the body of the notification.

### Steps

1. [Create Custom Reports](#).

As you complete the task:

- Select 1 of these data sources:
  - External Payslips.
  - External Tax Documents.
  - Other External Payroll Documents.
- On the Columns tab, add any report fields that may provide useful information for workers in the alert. You must add at least 1 report field. Examples: Attachment, pay period.

2. Access the Configure Alert task. See [Configure and View Alerts](#).

As you complete the task, consider:

Option	Description
Run Frequency	Select your preferred frequency. Examples: Run Now to send an alert immediately, or Monthly Recurrence to match a monthly pay frequency.
Report Parameters	You must define a value for all report parameters.
Include Task	(Optional) Select a task or report that you want workers to have access to in the alert. Examples: My Payslips, My Tax Documents, My Other External Payroll Documents.
Recipients	Select the <i>Employee As Self</i> security group on the Groups prompt. You don't need to add anything on the Recipients prompt.
Body	Add rows for any text or fields you want to display in the Details grid of the Body section,

Option	Description
	such as the fields you added on the custom report.

## Result

- Workday displays the alert in the Process Monitor report as an Alert Job process.
- Workers receive notification alerts when they have new external payroll documents.

## Related Information

### Concepts

[Concept: Alerts](#)

### Concept: External Payroll Documents

You can use an *External Payroll Documents* integration to upload these external payroll document types into Workday:

- External payslips for employee's current and prior pay groups. Importing these documents is an alternative to an *Import External Payslips* integration.
- External tax documents. Example: To import Canadian tax documents into Workday, create a T4 external payroll document type.
- Other payroll documents. You can define additional external payroll documents to import and grant access to in Workday. Example: You can upload a garnishment letter you received for an employee.

You also have the flexibility to upload these external payroll documents through the *Import External Payroll Document* web service. You can use the Upload External Payroll Documents for a Worker task to import documents for an individual worker manually.

You can upload payslips up to 7 years before the current pay period end date. You can upload 1000 external tax documents and other payroll documents for each worker. The 1000 maximum applies to the combined number of external tax documents and other payroll documents. When a worker has 1000 uploaded documents, you need to remove some documents before you can upload new documents.

Uploaded external payroll documents remain in Workday until you remove them. External payslips are available to view up to 7 years from the end date of the current pay period. External tax documents and other external payroll documents are available to view until removed.

You can upload external payroll documents for terminated employees and enable access within Workday. When you purge data for terminated employees, the purge includes any external payroll documents in Workday.

When you configure the *Review External Payroll Document* business process, you can request workers to review or sign external payroll documents, such as payslips.

## Removal

Workday provides these options for removing external payroll documents:

- Use the Delete by Batch ID task. The *Delete External Payroll Document* option removes all external payroll documents associated with the selected batch ID.
- Use the integration or web service to delete documents that match these key fields:
  - *Delete\_External\_Payroll\_Document* parameter.
  - *Delete* option set to True for CSV and XML files.
- Use the Delete External Payslips task to remove uploaded payslips.
- Use the Delete External Payroll Documents task to remove external payslips, external tax documents, and other external payroll documents.
- Use the Mass Delete External Payroll Documents task to mass delete external payslips, external tax documents, and other external payroll documents by organization within a specified criteria. You

- can access the Process Monitor report with necessary security configurations to find historical mass delete runs.
- Administrators can use the Find External Payroll Documents report to delete individual external payroll documents. Select the related action External Payroll Document > Delete on the document that you want to delete.

Workday only returns external payroll documents for deletion if they're related to the organization you selected from the Organizations prompt on the:

- Delete External Payroll Document task
- Find External Payroll Documents report
- Mass Delete External Payroll Documents task

### **Reference: External Payroll Documents File Schema**

#### **File Descriptions**

The *External Payroll Documents* integration supports CSV or XML format for manifest files. Manifest files contain the data for payslips, tax documents, and other external payroll documents.

- You can use 1 CSV manifest file to upload external payroll documents for a single document category. Example: 1 manifest CSV file for external payslips, 1 manifest CSV file for external tax documents, and 1 manifest CSV file for other external payroll documents.
- Note: The header for the CSV file format is case-sensitive.
- A single XML manifest file can contain data for all document categories: external payslips, external tax documents, and other external payroll documents.

Archive ZIP files contain the PDF attachment files for the external payroll documents.

#### **CSV File Format**

The CSV file input supports a single Document\_Category field value for the type of external payroll documents included. Document\_Category values are:

- External payslips = payslip.
- External tax documents = tax.
- Other external documents = other.

File format for payslips:

- Document\_Category
- Batch\_ID
- Delete
- Worker\_ID
- Pay\_Group
- Run\_Category
- Period\_End\_Date
- Payment\_Date
- Check\_Number
- Gross\_Amount
- Net\_Amount
- Currency
- Display\_Date
- File\_Name

File format for tax documents:

- Document\_Category

- Batch\_ID
- Delete
- Worker\_ID
- Organization
- Serial\_ID
- Year
- Tax\_Form
- Country
- Region
- Form\_Classification
- Issued\_Frequency
- Issued\_Date
- Comments
- Display\_Date
- File\_Name

File format for other external payroll documents:

- Document\_Category
- Batch\_ID
- Delete
- Worker\_ID
- Organization
- Serial\_ID
- Document\_Type
- Country
- Year
- Issued\_Date
- Issued\_By
- Received\_Date
- Comments
- Display\_Date
- File\_Name

## XML Elements and Schema

The XML schema for external payroll documents manifest files includes these elements.

Element	Level	Details and Validations
External_Payroll_Documents	1	Top level of the document.
Document_Category	2	Required for external payslips. Value = payslip. Container for these level 3 elements for a single external payslip.
Batch_ID	3	Must be in <i>string</i> format.
Delete	3	Must be in <i>boolean</i> format.
Worker_ID	3	Required; key field. Must be in <i>string</i> format.
Pay_Group	3	Required; key field. Must be in <i>string</i> format.

Element	Level	Details and Validations
Run_Category	3	Required if integration attribute Payslip Version = 2; key field. Must be in <i>string</i> format.
Period_End_Date	3	Required; key field. Must be in <i>date</i> format.
Payment_Date	3	Required; key field. Must be in <i>date</i> format.
Check_Number	3	Required; key field. Required; key field. Must be in <i>string</i> format.
Gross_Amount	3	Must be in <i>string</i> format.
Net_Amount	3	Must be in <i>string</i> format.
Currency	3	Must be in <i>string</i> format.
Display_Date	3	Must be in <i>date</i> format.
File_Name	3	Required only for new records. Must be in <i>string</i> format.
Document_Category	2	Required for external tax documents. Value = tax. Contains all elements for a single external tax document.
Batch_ID	3	Must be in <i>string</i> format.
Delete	3	Must be in <i>boolean</i> format.
Worker_ID	3	Required; key field. Must be in <i>string</i> format.
Organization	3	Key field. Must be in <i>string</i> format.
Serial_ID	3	Key field. Must be in <i>string</i> format. Only applies when the Tax Document Version integration attribute = 2.
Year	3	Required; key field. Must be in <i>date</i> format.
Tax_Form	3	Required; key field. Must be in <i>string</i> format.
Country	3	Required; key field. Must be in <i>string</i> format.
Region	3	Key field. Must be in <i>string</i> format. Only applies when the Tax Document Version integration attribute = 2.
Form_Classification	3	Key field. Must be in <i>string</i> format. Only applies when

Element	Level	Details and Validations
		the Tax Document Version integration attribute = 2.
Issued_Frequency	3	Key field. Must be in <i>string</i> format. Only applies when the Tax Document Version integration attribute = 2.
Issued_Date	3	Must be in <i>date</i> format.
Comments	3	Must be in <i>string</i> format. Only applies when the Tax Document Version integration attribute = 2.
Display_Date	3	Must be in <i>date</i> format.
File_Name	3	Required only for new records. Must be in <i>string</i> format.
Document_Category	2	Required for other external documents. Value = other. Contains all elements for a single other external document.
Batch_ID	3	Must be in <i>string</i> format.
Delete	3	Must be in <i>boolean</i> format.
Worker_ID	3	Required; key field. Must be in <i>string</i> format.
Organization	3	Required; key field. Must be in <i>string</i> format.
Serial_ID	3	Required; key field. Must be in <i>string</i> format.
Document_Type	3	Required; key field. Must be in <i>string</i> format.
Country	3	Required; key field. Must be in <i>string</i> format.
Year	3	Must be in <i>string</i> format.
Issued_Date	3	Must be in <i>date</i> format.
Issued_By	3	Must be in <i>string</i> format.
Received_Date	3	Must be in <i>date</i> format.
Comments	3	Must be in <i>string</i> format.
Display_Date	3	Must be in <i>date</i> format.
File_Name	3	Required only for new records. Must be in <i>string</i> format.

This schema applies when the Tax Version integration attribute is set to 1.

## Reference: External Payroll Documents Comparison

Compare these features for importing:

- External payslips.
- External tax documents.
- Other external payroll documents.

	Import External Payslips	REST APIs for Payslips and Tax Documents	External Payroll Documents
Method	Integration template.	External payslip and external tax documents REST APIs.	<i>External Payroll Documents integration or the Import External</i>

	Import External Payslips	REST APIs for Payslips and Tax Documents	External Payroll Documents
			<i>Payroll Document</i> web service.
Set up in Workday	Create integration system for importing and retaining payslip files.  Configure the file formatting for the imported payslips.	Associate third-party payroll vendor, pay group, and payroll vendor REST APIs with <i>External Payslips</i> and <i>External Tax Documents</i> features.	Create integration system for importing external payslips, external tax documents, and other external payroll documents.
Requirements for third-party payroll vendor	Provide FTP server endpoint for storing external payslips in the desired format.	Provide REST APIs for accessing payslips.	Provide FTP server endpoint for retrieving external payroll documents or make a web service request to upload external payroll documents.
Storage	In Workday.	In the third-party payroll vendor system.	In Workday.
Availability	Available up to 7 years from the end date of the current pay period.	No availability restrictions in Workday.	Payslips are available up to 7 years from the end date of the current pay period. No current limits for tax documents and other external documents.
File size	Can't exceed 600K.	No limit in Workday.	An attachment can't exceed 1MB. Standard limits for web service.
Maintenance	Delete External Payslips task.	Not available in Workday.	<ul style="list-style-type: none"> <li>• Delete and Update through the web service and integration.</li> <li>• Delete by Batch ID task.</li> <li>• Delete External Payslips task.</li> </ul>

## External Payroll Results Inbound Integration

### Steps: Set Up External Payroll Results Inbound Integration

#### Prerequisites

Set up an external FTP server that your external payroll provider and your integration system can access.

Note: Alternatively, you can attach the external payroll results manually when launching the integration.

For the external payroll results you want to upload, create these pay components:

- External Payroll Earnings.

- External Payroll Deductions.

## Context

The external payroll system provides payroll results in CSV or XML format.

The *External Payroll Results Inbound* integration imports the payroll results into Workday.

## Steps

1. [Create Integration System](#) on page 1967.

Select *External Payroll Results Inbound* from the New Using Template prompt.

2. From the related actions menu on your *External Payroll Results Inbound* integration, select Integration System > Configure Integration Attributes.

As you complete the task, consider:

Option	Description
Include Web Service Requests in Message Audit	Includes web service requests in the message audit file. Include web service requests to verify that the information sent to the <i>Import Payroll External Results</i> web service operation. Use carefully, as this information can significantly increase the size of the message audit file.
Version	1
CSV Contains Header	Ignore the first line of the CSV file because it contains the column headers.
Input File Format	Incoming file format: CSV, or XML.
Input Date Format	Use Java simple date format ( <code>java.text.SimpleDateFormat</code> ) to specify the format of all the dates in the input file. The default format is <code>yyyy-MM-dd</code> .
Input File Tag	Identifies the External Payroll Result data file. Use this attribute when the business process has multiple attachments with different file types. If you enter multiple tags, the matching file must have all the listed tags. If empty, the integration processes files tagged as <i>Retrieved</i> .
Document Retention Policy	Days to keep imported files. The default value is 30 days.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

3. (Optional) Select Integration System > Configure Integration Maps.

Map external earning, deduction, and pay group values to the Workday values.

Note:

- You don't need to map earning, deduction, or pay group values if the codes match in Workday and in your external payroll system.
- The integration doesn't return an external payroll earning or deduction that has different values for the Code and External Payroll Code fields.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

4. (Optional) Select Integration System > Configure Integration Sequence Generators. Specify the format of the batch ID that you want Workday to generate for each group of inbound payroll results.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
5. [Set Up Integration Retrieval](#) on page 1957.
6. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:
  - *Integration Event* domain in the Integration functional area.
  - *Set Up: Payroll Interface* domain in the Payroll Interface functional area.
  - *View: External Pay Groups* domain in the Payroll Interface functional area.

With *View: External Pay Groups* domain, the integration only processes data for the pay groups that the ISU has been given access to.

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

7. Assign the ISU to the integration.
  - a) From the related actions menu, select Workday Account > Edit.
  - b) Click Workday Account. Select Integration System Users and select the ISU you created.
  - c) (Optional) In the Global Preferences area, select a locale and display language.  
These settings control the language that Workday uses for the integration data. If left blank, Workday uses the default locale and display language.
8. (Optional) [Set Up External Pay Component Groups](#) on page 1828.  
Create groups that you want to use to report on imported external payroll earnings and deductions.
9. [Launch an Integration](#) on page 24.

## Next Steps

Enable self-service for external payroll results so that your employees, their managers, or both, can view the external payroll results.

You can use the External Payroll Result Lines for Pay Component Segments report data source to set up segment-based security. This security enables managers and employees to view external payroll earnings and deductions.

You can add these worklets to the Pay dashboard so employees can access their third-party payroll information:

- External Pay Results – Recent Pay
- External Pay Results – Compare My Periods

You can access the Delete by Batch ID task to manually remove external payroll results. This task removes all results that are related to the same batch ID.

Related Information

### Tasks

[Steps: Enable Self-Service for External Payroll Results](#) on page 1829

[Steps: Set Up Dashboards and Landing Pages](#)

## Set Up External Pay Component Groups

### Prerequisites

Set up the external payroll earnings and deductions you want to assign to external pay component groups.

Security: *Set Up: Payroll Interface* domain in the Payroll Interface functional area.

## Context

Create groups of external payroll earnings and deductions to use for reporting purposes. An external pay component group can contain both earnings and deductions.

An external pay component group enables you to display different pay components as a single item in reports. You can drill down on a group to view the individual pay components.

## Steps

1. Access the Create External Pay Component Group task.
2. As you complete the task, consider:

Option	Description
Code	Enter an alphanumeric identifier.
Pay Component Usage	Select the types of pay components that the group includes. A group can contain both external payroll earnings and external payroll deductions.

## Next Steps

Assign external payroll earnings and deductions to your groups.

Related Information

### Tasks

[Manage External Payroll Earnings](#) on page 1403

[Manage External Payroll Deductions](#) on page 1406

## Steps: Enable Self-Service for External Payroll Results

### Prerequisites

Set up and successfully run an External Payroll Results Inbound Integration in order to have results to display.

## Context

Enable self-service for external payroll results so that your employees, their manager, or both, can view the external payroll results that you've imported into your tenant. These results display in the worker profile on the Pay tab.

## Steps

1. Access the domain *Self-Service: Payroll Interface (External Payroll Results)*. From the related-actions menu access Domain > Edit Domain Security Policy Permissions.
2. Add *Employee As Self, Manager*, or both, to Report/Task Permissions.
3. (Optional) Set up segment-based security groups for workers and managers to view earnings and deductions on workers' external payroll results.

The *External Payroll Result Lines for Pay Component Segments* report data source supports segment-based security for earnings and deductions.

See [Create Segment-Based Security Groups](#).

4. Access Activate Pending Security Policy Changes to confirm the changes.
5. Access Configure Profile Group for the Profile Group, *Pay for Worker Profile*, and add the report, *External Results*.

## Result

External Results now display on the Pay tab on the worker profile.

### Concept: External Payroll Results Inbound Integration

You can create an integration based on the *External Payroll Results Inbound* integration template to import data from an external payroll endpoint into Workday. You can then use and report on the imported payroll data.

### File Format for Inbound Payroll Interface Data

The integration imports data in XML or CSV format. Each row represents 1 payroll result line. You can import up to 100 different earnings and deductions for each payroll result. Group all lines for a payroll result together in the file.

### Integration Process Flow

You can generate external payroll results files from the payroll results provided by the external payroll vendor and save them in a secure location. You configure this location in the Document Retrieval of the integration.

When you launch the integration, the integration retrieves the files according to the Document Retrieval configuration on the Integration Process Event and processes each row (payroll result line).

When all of the key values in the current row match the values in the previous row, the integration adds the current row to the current payroll result line. Otherwise, the integration saves the current row and creates a new payroll result line.

The integration removes result lines with errors and returns error messages to the integration event. You can correct and resubmit the erroneous result lines manually.

The integration imports valid records and applies a batch ID to the records in the integration run. If you don't provide a batch ID in the CSV or XML file, the integration generates a single batch ID for all records in the integration run using the configured sequence generator.

### Key Values for a Payroll Result

The integration identifies a payroll result by comparing these key values for a row:

- Employee\_ID
- Position\_ID
- Company\_ID
- Pay\_Group
- Payment\_Date
- Period\_End\_Date
- Check\_Number

### Derived Values

When you don't supply values for these optional columns, Workday derives a value:

Empty Value	Derived Value
Position_ID	If the employee has: <ul style="list-style-type: none"> <li>• A single position, we use that position.</li> <li>• Multiple positions, we use the position in the pay group.</li> </ul>

Empty Value	Derived Value
	<ul style="list-style-type: none"> <li>Multiple positions in the pay group, we use the one with the earlier start date.</li> </ul>
Company_ID	If the employee has: <ul style="list-style-type: none"> <li>A single position, we find the pay group for that position and use the company associated with the pay group.</li> <li>Multiple positions, we use the given pay group and use the company associated with that pay group.</li> </ul>
Pay_Group_Currency_ID	We use the default currency for the country associated with the pay group.
Company_Currency_ID	We use the default currency for the company.

## Errors

When any row has key fields identical to another row, the integration doesn't import either of the external payroll results. The integration displays the duplicate entry on the data audit file and all error lines in the error output file. The error file is in the integration output.

The integration only reports up to 200,000 errors.

## Reports for Inbound Payroll Data

Workday provides these standard reports to view uploaded payroll results. You can copy and modify these reports. Unless you provide a date, Workday uses the run date of the report for the currency conversion rate.

- View External Payroll Results
- External Payroll Results for Workers
- External Payroll Results Variant by Worker
- External Payroll Results Variant by Pay Component
- External Payroll Results Average Cost for Pay Component
- External Payroll Results Summary by Pay Component Group

You can use these report data sources to create custom reports.

- External Payroll Result Lines
- External Payroll Result Lines for Organization, Worker, Period, and Date Range
- External Payroll Result Lines for Pay Component Segments

Groups secured to the *View: External Payroll Results - Restricted* domain can have this type of access.  
Example: Finance team reporting on external payroll pay components.

## Removal

Workday provides these options for removing external payroll results:

- Use the Delete by Batch ID task. The *Delete External Payroll Result* option removes all external payroll results associated with the selected batch ID.
- Use the integration or web service to delete results that match these key fields:
  - Delete\_External\_Payroll\_Result* parameter.
  - Delete* option set to True for CSV and XML files.

## Reference: External Payroll Results Inbound File Schema

Import file is in CSV (Comma-Separated Value) or XML format.

### CSV File Description

Configure your external payroll endpoint to generate CSV files with these fields. Supply a value for the required fields; other fields are optional. For a complete description of each field, see the XML Elements section.

- Batch\_ID
- Pay\_Group
- Period\_End\_Date
- Pay\_Group\_Currency\_ID
- Delete\_Result
- Employee\_ID
- Position\_ID
- Company\_ID
- Company\_Currency\_ID
- Payment\_Date
- Check\_Number
- Gross\_Amount
- Net\_Amount
- Code
- Earning\_or\_Deduction
- Recorded\_Currency\_ID
- Amount
- Hours
- Rate
- Amount\_in\_Company\_Currency
- Amount\_in\_Pay\_Group\_Currency

All dates must use the same format. The default format is *yyyy-MM-dd*. To specify a different format, configure the integration attribute Input Date Format.

### XML Elements

The XML schema for inbound payroll interface data includes these elements.

Column Name	Description and Notes
Batch_ID	
Pay_Group	(Required) Workday Reference ID for the Pay Group, or the external Pay Group code. If you use the external code, you configure the integration to map the external Pay Group code to a Workday Pay Group.
Period_End_Date	(Required) Pay Period end date.
Pay_Group_Currency_ID	
Delete_Result	Set to 1 to delete the uploaded result (YES) or set to 0 (zero) to keep the uploaded result (NO). If empty, keep the result (NO).
Employee_ID	(Required) Employee identifier.
Position_ID	
Company_ID	
Company_Currency_ID	
Payment_Date	(Required)
Check_Number	(Required) Number of the check.

Column Name	Description and Notes
Gross_Amount	
Net_Amount	
Code	(Required) Code from external payroll endpoint. The integration maps the code to a Workday Pay Component worktag.
Earning_or_Deduction	(Required) If the pay component is an earning or deduction, E or D.
Recorded_Currency_ID	
Amount	Pay amount in the Pay Group currency. Ensure that each Pay Group has a <i>Country</i> value.
Hours	Number of hours worked.
Rate	
Amount_in_Company_Currency	
Amount_in_Pay_Group_Currency

## Troubleshooting: External Payroll Results Inbound Integration

### The External Payroll Results Inbound integration completed with errors.

Cause:

Cause	Solution
The worker in the pay group isn't valid with the selected: <ul style="list-style-type: none"> <li>• Period end date</li> <li>• Payment date</li> <li>• Check number</li> </ul>	Security: These domains in the Staffing functional area: <ul style="list-style-type: none"> <li>• <i>Self-Service: Historical Staffing Information</i></li> <li>• <i>Worker Data: Historical Staffing Information</i></li> </ul> <ol style="list-style-type: none"> <li>1. From the worker profile, select the related actionWorker History &gt; View Worker History.</li> <li>2. Verify that the worker is in the pay group during the pay period you selected for the integration.</li> </ol>
There are invalid or empty pay component codes in one of the external payroll result lines.	Security: <i>Set Up: Payroll Interface</i> domain in the Payroll Interface functional area. <ol style="list-style-type: none"> <li>1. Access your input file to verify that the correct pay component codes have been added.</li> <li>2. (Optional) To view and maintain pay component codes in Workday, access 1 of these tasks:<ul style="list-style-type: none"> <li>• Maintain External Payroll Earnings</li> <li>• Maintain External Payroll Deductions</li> </ul></li> </ol>

### The External Payroll Results Inbound integration failed.

Cause: The Integration System User (ISU) can't access these tasks:

- View External Pay Groups
- View External Pay Results

Solution: Security: These domains in the System functional area:

- *Security Configuration*

- *Security Activation*

## Steps

1. Access the Domain Security Policies for Functional Area report.  
From the Functional Area prompt, select *Payroll Interface* or *Core Payroll*.  
Select the Set Up: Payroll Interface or Set Up: Payroll - Pay Group Specific security policy.  
Click *Edit Permissions*.  
Select the Get or Put check box to grant the security groups access to the integration and report or task securable actions.
2. Access the Activate Pending Security Policy Changes task.  
Select the *Confirm* check box to activate your changes.

## Global Payroll Results

### Steps: Set Up Global Payroll Results

#### Context

You can include payroll results from both Workday and your third-party payroll vendor in Global Payroll Results reports. These reports provide comprehensive payroll data to help you analyze your global payroll costs.

To view data from the Global Payroll Results reports, you must tie constrained security groups to a pay component segment.

## Steps

1. Set up and launch an *External Payroll Results* integration to import third-party payroll results into Workday for use in the reports.  
See [Steps: Set Up External Payroll Results Inbound Integration](#) on page 1826.
2. Access the Maintain Global Payroll Reporting Groups task.  
Create global payroll reporting groups to associate comparable Workday pay earnings or deductions and third-party pay earnings or deductions. These reporting groups enable you to include both Workday and third-party payroll results in Global Payroll Results reports.
  - Enter a Name for the reporting group. You can also enter an alphanumeric identifier for the group in the Code field.
  - Select the Workday and external Pay Components and Pay Component Groups you want to include in the group.

#### Security:

- *Set Up: Payroll (Calculations - Payroll Specific)* domain in the Core Payroll functional area.
- *Set Up: Payroll Interface* domain in the Payroll Interface functional area.

## Next Steps

Access the Global Payroll Results report you want to use and select options for the results you want to include. The reports include Workday and comparable third-party payroll earnings and deductions based on the Global Payroll Reporting Groups you select.

Workday converts all payroll amounts in the Global Payroll Results reports to the currency you specify. If you don't specify a Currency Conversion Date, Workday uses the conversion rate on the date you run the report.

## Reference: Global Payroll Results Reports

Workday provides reports that give you different views of your global payroll results. These reports also are enabled as worklets you can add to the Pay Cycle Command Center dashboard.

### Security:

- *Reports: Pay Calculation Results for Pay Group (Results)* domain in the Core Payroll functional area.
- *View: External Payroll Results* domain in the Payroll Interface functional area.

Report	Description
View Global Payroll Results	Provides a comprehensive view of Workday and external payroll results for the organizations or employees you select.
Global Payroll Results Number of ~Employees~ by Pay Group	Provides the number of employees who have external or Workday payroll results for a specified period.
Global Payroll Results Average Cost for Pay Component	Calculates the average cost per employee by pay component over time.
Global Payroll Results Variant by Pay Component	Compares the values of pay components for 2 specified pay periods for employees in the selected pay groups.
Global Payroll Results Variant by Worker	Compares the values of pay components for 2 specified pay periods for each employee in the selected pay groups.

## Import External Payslips Integration

### Steps: Set Up Import External Payslips Integration

#### Prerequisites

Enable access to the external FTP server where your external payroll vendor endpoint loads payslip files.

#### Context

You can set up an integration to retrieve external payslip files for selected pay groups and import the files into Workday. Each external payslip must have a unique combination of worker, pay group, pay period end date, payment date, and check number. You can import external payslips up to 5 years before the end date of the current pay period.

Imported external payslips are stored in Workday after you upload them through the:

- *External Payroll Documents* integration or web service.
- *Import External Payslips* integration.

You can import external payslips for employee's current and prior pay groups. Employees in the selected pay groups and administrators can view the imported external payslips in Workday. The external payslips remain available up to 7 years from the end date of the current pay period.

#### You can't import:

- An individual file attachment greater than 600 KB.
- A manifest file or an archive ZIP file greater than 1 GB.

You can reach out to your third-party payroll vendor to include the appropriate mime type in your attachment file. If the appropriate mime type isn't included, then Workday downloads the attachment automatically.

## Steps

1. [Create Integration System](#) on page 1967.  
Select *Import External Payslips* from the New Using Template prompt.
2. As a related action on your integration system, select [Integration System > Configure Integration Services](#).

Enable 1 or more of these optional integration services:

Option	Description
Import External Payslips Document Retrieval	Retrieve the external payslip files.  Workday recommends that you enable this service. Otherwise, the integration won't retrieve the external payslips.
Integration Document Retention	Preserve imported payslip files.
Import External Payslips - Invalid Manifest Records File Name	Use a sequence generator to apply a custom-formatted, unique filename to the manifest file for invalid payslips.
Import External Payslips - Invalid Archive Records File Name	Use a sequence generator to apply a custom-formatted, unique filename to the archive file containing invalid payslip PDFs.

Security: these domains in the Integration functional area:

- *Integration Build*
  - *Integration Configure*
3. As a related action on your integration, select [Integration System > Configure Integration Attributes](#).  
As you complete this task, consider:
    - When you enable *CSV Contains Header*, the first line of a CSV manifest file must be a header row.
    - Select the *Work ID Type* that identifies workers in the manifest file. Example: Employee ID.
    - The *Pay Group Default ID Type* identifies the default value in the manifest files. The integration uses this value when the integration mapping doesn't have a *Pay Group ID Type* value. Example: Organization Reference ID.

Option	Description
<i>CSV Contains Header</i>	Indicates that the first line of a CSV manifest file must be a header row.
<i>Work ID Type</i>	Displays the identifier for workers in the manifest file.  Example: Employee ID.
<i>Pay Group Default ID Type</i>	Identifies the default value in the manifest files. The integration uses this value when the integration mapping doesn't have a <i>Pay Group ID Type</i> value.

Option	Description
	Example: Organization Reference ID.

Security: these domains in the Integration functional area.

- *Integration Build*
- *Integration Configure*

4. From the related actions menu on your integration, select **Integration System > Configure Integration Maps**.

Map each external pay group to a corresponding Workday pay group.

Security: These domains in the Integration functional area.

- *Integration Build*
- *Integration Configure*

5. (Optional) [Set Up Integration Sequence Generators](#) on page 1969.

Configure an integration sequence generator for these services, when enabled.

- *Import External Payslips - Invalid Manifest Records File Name*
- *Import External Payslips - Invalid Archive Records File Name*

6. [Create Integration Business Process](#) on page 1950.

For the Business Process Type, select *None of the Above*.

Add a *Document Retrieval Service* step before the *Fire Integration* step.

7. [Set Up Integration Retrieval](#) on page 1957.

Enter these values in the File Name/Pattern prompt.

- *XML*
- *ZIP*

8. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains in the Integration functional area:

- *Integration Event*.
- *Set Up: Payroll Interface*.
- *View: External Pay Groups*.
- *Payroll Interface*.

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

9. [Edit Domain Security Policies](#)

Grant *Get* and *Put* access for the integration to these security domains.

- *All Background Processes* in the System functional area.
- *Integration Event* in the Integration functional area.
- *Set Up: Payroll Interface* in the Payroll Interface functional area.

Configure security policies for these domains in the Payroll Interface domain.

- *Self-Service: Payroll Interface* enables workers to view their own payslips.
- *View: Maintain Payroll Interface* enables payroll administrators to view payslips for workers.

10. [Launch an Integration](#) on page 24.

## Result

If you didn't specify a Display Date, Workday immediately displays the external payslips.

Workers can view their payslips on the:

- My Payslips task.

- Pay profile group of the worker profile on the Payslips tab.

Payroll administrators can view worker payslips on the Payslips for Worker task.

#### Related Information

##### Concepts

[Setup Considerations: External Payroll Documents](#) on page 1801

##### Reference

[Reference: External Payroll Documents Comparison](#) on page 1825

[Reference: Import External Payslips Files](#)

#### File Descriptions

Manifest files are CSV or XML files containing employee payslip data. Archive files are PDF files, each containing an image of a payslip. Compressed archive files are ZIP files that can contain multiple PDF files.

#### CSV File Format

For manifest data in CSV format, ensure that your external payroll endpoint generates a CSV file with these values:

Column Name	Description and Notes
Worker	Worker identifier.
Pay_Group	Either the Workday Reference ID for the Pay Group or the external Pay Group code. If you use the external Pay Group code, you configure the integration to map the external Pay Group code to a Workday Pay Group.
Pay_Period_End_Date	Date of the Pay Period.
Payment_Date	Date of the payment.
Net_Amount	Net pay amount. This column displays only if the external payroll vendor provides a value for the worker. If a worker has multiple net pay amount rows and only 1 row has a value, the other net pay amount rows will be empty.
Gross_Amount	Gross pay amount. This column displays only if the external payroll vendor provides a value for the worker. If a worker has multiple gross pay amount rows and only 1 row has a value, the other gross pay amount rows will be empty.
Currency	Currency code for the pay amounts. Example: USD.
Check_Number	Number of the check.
Display_Date	Date when the worker can view payslip details in Workday. The payslip details become visible at midnight on this date in the worker's time zone.
File_Name	Filename of the payslip PDF archive file.

Note: If the integration attribute *CSV Contains Header* is enabled, ensure the column names in the CSV header row match the column names in the preceding table.

#### XML File Format

For manifest data in XML format, ensure that your external payroll endpoint generates an XML file with these values:

Element	Description
External_Payslip	Top-level element. Contains all other payslip elements.
Worker	Worker identifier. XSD <i>string</i> format.
Pay_Group	Either the Workday Reference ID for the Pay Group or the external Pay Group code. If you use the external Pay Group code, you map the external Pay Group code to a Workday Pay Group. XSD <i>string</i> format.
Pay_Period_End_Date	Date of the Pay Period. XSD <i>date</i> format.
Payment_Date	Date of the payment. XSD <i>date</i> format.

Element	Description
Net_Amount	Net pay amount. XSD <i>decimal</i> format.
Gross_Amount	Gross pay amount. XSD <i>decimal</i> format.
Currency	Currency code for the pay amounts. Example: USD. XSD <i>NCName</i> currency code format.
Check_Number	Number of the check. XSD <i>string</i> format.
Display_Date	Date when the worker can view payslip details in Workday. The payslip details become visible at midnight on this date in the worker's time zone. XSD <i>date</i> format.
File_Name	Filename of the payslip PDF archive file. XSD <i>string</i> format.

## XML Schema

The XML schema for the integration is:

```

<?xml version="1.0" encoding="UTF-8"?>
<xss:schema xmlns:xss="http://www.w3.org/2001/XMLSchema"
  elementFormDefault="qualified" targetNamespace="urn:com.workday/extps"
  xmlns:extps="urn:com.workday/extps">

  <xss:element name="External_Payslips" nillable="true">
    <xss:complexType>
      <xss:sequence>
        <xss:element maxOccurs="unbounded" minOccurs="0"
        ref="extps:External_Payslip" />
      </xss:sequence>
    </xss:complexType>
  </xss:element>

  <xss:element name="External_Payslip">
    <xss:complexType>
      <xss:sequence>
        <xss:element ref="extps:Worker" />
        <xss:element ref="extps:Pay_Group" />
        <xss:element ref="extps:Pay_Period_End_Date" />
        <xss:element ref="extps:Payment_Date" />
        <xss:element ref="extps:Net_Amount" />
        <xss:element ref="extps:Gross_Amount" />

  <xss:element name="Pay_Period_End_Date" type="extps:dateWithTimeZone" />
  <xss:element name="Payment_Date" type="extps:dateWithTimeZone" />
  <xss:element name="Net_Amount" type="xs:decimal" />
  <xss:element name="Gross_Amount" type="xs:decimal" />
  <xss:element name="Currency" type="xs:NCName" />
  <xss:element name="Check_Number" type="extps:nonEmptyString" />
  <xss:element name="Display_Date" type="extps:dateWithTimeZone"
  nillable="true"/>
  <xss:element name="File_Name" type="extps:archiveFileString" />

  <xss:simpleType name="dateWithTimeZone">
    <xss:restriction base="xs:date">
      <xss:pattern value=".+[:Z].*"/>
    </xss:restriction>
  </xss:simpleType>

```

```

<xs:simpleType name="nonEmptyString">
  <xs:restriction base="xs:string">
    <xs:minLength value="1"/>
  </xs:restriction>
</xs:simpleType>

<xs:simpleType name="archiveFileString">
  <xs:restriction base="extps:nonEmptyString">
    <xs:minLength value="1"/>
    <xs:pattern value=".*\.\pdf" />
  </xs:restriction>
</xs:simpleType>
</xs:schema>

```

## Manifest File Validation

Ensure that your manifest file is valid:

- Display\_Date, Net\_Amount, and Gross\_Amount can be empty.  
Note: Workday doesn't display the Gross\_Amount and Net\_Amount columns on payslips if all records for a worker have empty or zero values in the column.
- Date fields require time zones. Example time zones: -03:00, Z. Example date with time zone: 2014-11-25-03:00.
- Pay\_Group is a valid active Payroll Interface Pay Group.
- File\_Name is unique in the manifest file for each integration run. A manifest record is considered invalid from the first manifest record with the same filename.
- File\_Name specifies an archive file (a PDF file with the extension .pdf) that exists in the compressed archive file (the ZIP file).
- Any archive file not referenced by a manifest record is sent to the invalid archive file.
- Any archive file referenced by a manifest record that failed a validation test is sent to the invalid archive file.
- CSV files have the extension .csv. The integration only reads .csv manifest files when you configure the integration to read CSV files.
- When using CSV files, and the integration attribute CSV Contains Header is enabled, ensure the column names in the CSV header row are correct. The column names are Worker, Pay\_Group, Pay\_Period\_End\_Date, Payment\_Date, Net\_Amount, Gross\_Amount, Currency, Check\_Number, Display\_Date, and File\_Name.
- XML files have the extension .xml. The integration only reads .xml manifest files when you configure the integration to read XML files.
- Compressed archive files are ZIP files and have the extension .zip. The integration only reads .zip files for the compressed archive files.
- Manifest files must be located outside of ZIP files.
- PDF files have the extension .pdf, and are placed in a compressed archive file.
- PDF file size is below the limit for each payslip.
- Combination of Worker, Pay\_Group, Pay\_Period\_End\_Date, Payment\_Date, and Check\_Number uniquely identify an external payslip. The combination is unique for all manifest records for each integration run, and unique for all external payslips per tenant. A manifest record is considered invalid from the first manifest record having the same combination.
- Worker is valid and has a position currently assigned to the specified Pay\_Group as of the Pay\_Period\_End\_Date.
- Pay\_Period\_End\_Date is within 1 year of the current year. Example: For 2014, a pay period end date of 2012 or earlier is invalid.
- Pay\_Period\_End\_Date is valid for the Pay Group.

The integration generates a data audit file, which contains details for the imported files. The integration also returns any invalid manifest records and invalid archive records files. You can use these files to correct failed records that couldn't be imported.

After 5 unsuccessful attempts to import a manifest file, Workday considers all records in that file invalid and writes those records to the invalid manifest file. The data audit file differentiates records that have errors from records that exceeded the maximum number of import attempts.

## External Payslips REST API

### Setup Considerations: External Payslips REST API

You can use this topic to help make decisions when planning your configuration and use of External Payslips REST API. It explains:

- Why to set them up.
- How they fit into the rest of Workday.
- Downstream impacts and cross-product interactions.
- Security requirements and business process configurations.
- Questions and limitations to consider before implementation.

Refer to detailed task instructions for full configuration details.

### What They Are

Workday accesses a REST API managed by an external payroll vendor to retrieve external payslips for the pay groups mapped to that vendor for the feature.

### Business Benefits

With External Payslips REST API, you can help save time and improve efficiency by reducing the need to sign into your external payroll vendor's system.

### Use Cases

You can enable workers or payroll administrators to access payslips from an external payroll vendor within Workday.

### Questions to Consider

Question	Consideration
What type of external payroll vendor will you use for this feature?	If your external payroll vendor is: <ul style="list-style-type: none"> <li>• Provided by Workday, then the vendor is already available to select when you create your mapping.</li> <li>• Customer defined, then you must:               <ul style="list-style-type: none"> <li>• Create the external payroll vendor in Workday.</li> <li>• Collaborate with the external payroll vendor to configure the retrieval endpoint in the Create External Payroll Vendor Mapping task.</li> </ul> </li> </ul>
How does Workday retrieve external payslips through REST API?	After you associate a pay group with your external payroll vendor, Workday calls all REST APIs configured to retrieve external payslips from pay groups for a worker's past and current positions.

Question	Consideration
	If a worker has multiple positions in different pay groups, at least 1 of the pay groups must have a REST API configured for that access.  The external payroll vendor configuration of the REST API determines if Workday can return any external payslips for the worker. Example: The external payroll vendor might configure the REST API not to return payslips for workers who transferred out of a pay group or terminated workers.
Do you need to view multiple types of payslips?	You can enable historical external payslips if you want to display both external payslips retrieved through REST API and imported payslips retrieved through these integrations: <ul style="list-style-type: none"><li>• <i>External Payroll Documents</i></li><li>• <i>Import External Payslips</i></li></ul>
How can you ensure that workers can access their external payslips?	You can use proxy functionality to verify that a worker has access to external payslips. See <a href="#">Manage Proxy Access</a> .

## Recommendations

Test to determine the situations when the REST API returns external payslips.

## Requirements

Build REST APIs for Workday to access the payslips in an external payroll system.

## Limitations

Workday doesn't store external payslips after retrieving them from external vendors through REST API.

When you enable a pay group for External Payslips REST API access, Workday automatically excludes payslips uploaded for that pay group through these integrations:

- *Import External Payslips*
- *External Payroll Documents*

## Tenant Setup

Map your:

- Third-party pay group to the external payroll vendor through the Maintain Pay Group Vendor Associations task.
- Tenants to the external payroll vendor through the Create External Payroll Vendor Mapping task.

## Security

Configure these domains in the Payroll Interface functional area:

Domain	Description
<i>Self-Service: Payroll Interface</i>	Enables workers to view their own payslips.

Domain	Description
<i>View: Maintain Payroll Interface</i>	Enables payroll administrators to view payslips for workers.

## Business Processes

No impact.

## Reporting

No impact.

## Integrations

- *External Payroll Documents*
- *Import External Payslips*

## Connections and Touchpoints

Workday offers a Touchpoints Kit with resources to help you understand configuration relationships in your tenant. Learn more about the [Workday Touchpoints Kit](#) on Workday Community.

## Steps: Set Up External Payslips REST API

### Prerequisites

You or your third-party payroll vendor must build the REST APIs for Workday to access the payslips in an external payroll system.

### Context

In Workday, you can associate your payroll vendor with REST APIs configured to enable access to external payslips. You can also associate the vendor with pay groups that have payslips in the third-party system. This association enables workers or administrators to view payslips in the external payroll system directly from Workday. Workers and administrators can retrieve payslips without signing in separately to the external payroll system. When retrieving and displaying these payslips, Workday doesn't store or persist the documents in Workday.

### Steps

1. (Optional) Access the Create External Payroll Vendor task.

If you're using a third-party payroll vendor that isn't in Workday, create the vendor. From the Features prompt, select *REST API External Payslips*.

Security: *Set Up: Payroll Interface* in the Payroll Interface functional area.

2. [Create External Payroll Vendor Mapping](#) on page 1413.

Map each Workday environment that you use for external payslips to your external payroll vendor.

Enter these values:

Option	Description
Public Private Key Pairs	From the Key Pair prompt, select the key pair to use for authentication with the third-party vendor.

Option	Description
Feature Configuration	<p>From the Feature prompt, select <i>REST API External Payslips</i>.</p> <p>From the Attribute prompt, select <i>Retrieval Endpoint</i> to access payslips in the external payroll system. In the Value field, enter the REST APIs you or your payroll vendor built.</p> <p>Example: <a href="https://test.endpoint.com/payslips">https://test.endpoint.com/payslips</a></p>
	Select to access payslips in the external payroll system.

### 3. [Maintain Pay Group Vendor Associations](#) on page 1414.

From the Feature prompt, select *REST API External Payslips*.

### 4. [Edit Domain Security Policies](#).

Configure security policies for these domains in the Payroll Interface functional area:

- *Self-Service: Payroll Interface*
- *View: Maintain Payroll Interface*

5. (Optional) Access the [Configure External Payroll Vendor Mapping](#) task and configure the Attachment Endpoint attribute if it doesn't have the same host name as the Retrieval Endpoint attribute. Contact your vendor for the Attachment Endpoint host name details. If the host names don't match and you don't configure the Attachment Endpoint attribute, you may not be able to access external payslip attachments.

### 6. (Optional) [Manage Proxy Access](#).

Provide administrators with proxy access so they can verify that workers have access to their external payslips.

## Result

Workers can view their payslips on the:

- My Payslips task.
- Pay profile group of the worker profile on the Payslips tab.

Payroll administrators can:

- Access worker payslips on the:
  - Payslips for Worker task.
  - Pay profile group of the worker profile on the Payslips tab.
- Verify a worker has access to payslips by starting a proxy session as the worker.

## Related Information

### Tasks

[Set Up Historical External Payslips](#) on page 1846

### Reference

[Workday Community: Expected Vendor Response Documentation for External Payslips](#)

[Reference: External Payroll Documents Comparison](#) on page 1825

## Set Up Historical External Payslips

### Prerequisites

Enable REST API External Payslips for the pay group that you want to set up historical external payslips for.

Security: *Set Up: Payroll Interface* domain in the Payroll Interface functional area.

### Context

You can set up historical external payslips to help maintain historical payslips. When you enable this feature:

- Workday displays imported external payslips and REST API external payslips in separate grids on the Payslips tab of workers' profiles.
- You can configure the type of payslip that displays in the Historical External Payslips grid.

Workday recommends using this feature if you want to display both imported and REST API external payslips for the same pay group.

Example: You currently use imported external payslips, but your new vendor only supports REST API external payslips. You enable this feature for historical imported payslips when setting up the REST API Payslips feature. From the Payslips tab on their profiles, workers are able to access both the:

- REST API external payslips in the External Payslips grid
- Imported external payslips in the Historical External Payslips grid.

For workers with multiple positions, Workday:

- Uses the pay group of the worker's primary position to configure historical external payslips.
- Doesn't display the Historical Payslips grid if there are no available historical payslips, even if you set up the feature.

### Steps

1. Access the Maintain Pay Group Vendor Associations task.
2. Click the Edit button in the Edit Pay Group Vendor Association column for the pay group that you want to enable the feature for.
3. From the Historical External Payslips prompt, select the type of payslip you want to display in the Historical External Payslip grid.

### Next Steps

You can now review historical payslips on Workday delivered payslip reports.

### Reference: External Payslips Access Through REST APIs

Worker access to external payslips in Workday depends on the external payroll vendor configuration for the worker's pay groups.

These comparisons apply to a worker with a single position who transfers from pay group A to pay group B. These comparisons have both pay groups mapped to the same external payroll vendor.

Maintain Pay Group Association Configuration	External Payslip Access in Workday
The customer has configured external payslips access for pay group A. The customer hasn't configured payslips access for pay group B.	Workday makes an API call for external payslips returned by the external payroll vendor. The worker can view external payslips for pay group A if the external payroll vendor returns payslip data for that worker.

Maintain Pay Group Association Configuration	External Payslip Access in Workday
The customer previously configured external payslips for pay group A but removed the configuration for that pay group. The customer hasn't configured payslips access for pay group B.	Workday doesn't make an API call for external payslips because there's no configuration for either pay group A or pay group B. The worker can't view external payslips from the external payroll vendor.
The customer removed the previous external payslips configuration for pay group A. The customer has configured external payslips access for pay group B.	Workday makes an API call for external payslips. The worker's access to external payslips for pay group A depends on the external payroll vendor implementation. If the vendor provides the external payslips for pay group A, the worker can view payslips for both pay group A and pay group B.

## External Tax Documents REST API

### Steps: Set Up External Tax Documents REST API

#### Prerequisites

You or your payroll vendor needs to build the REST endpoint for Workday to access the tax documents in the third-party payroll system.

#### Context

You can enable workers or payroll administrators to access tax documents in an external payroll system directly in Workday. This access eliminates the need to sign in separately to the external payroll system to retrieve tax documents. When retrieving and displaying these external tax documents, Workday doesn't store or persist the documents in Workday.

You map the Workday environment where you enable access to the tax documents to the external payroll system where you retrieve the tax documents.

#### Steps

- Access the Create External Payroll Vendor task.

Set up your third-party payroll system as a vendor in Workday. In the Features prompt, select *REST API External Tax Documents*.

*Security: Set Up: Payroll Interface* in the Payroll Interface functional area.

- Create External Payroll Vendor Mapping on page 1413.

As you complete the task, consider:

Option	Description
External Payroll Vendor	Select the vendor you created using the Create External Payroll Vendor task.
Public Private Key Pairs	Select or create the key pair to use for authenticating with the third-party vendor, and select the Active check box.
Feature Configuration	Specify the Retrieval Endpoint attribute to access tax documents in the external system. Enter the endpoint you or your payroll vendor created.

Option	Description
	Example: <a href="https://test.endpoint.com/taxdocuments">https://test.endpoint.com/taxdocuments</a>

3. [Maintain Pay Group Vendor Associations](#) on page 1414.

Associate the pay group with the vendor and External Tax Documents REST API feature.

4. [Edit Domain Security Policies](#).

Configure security policies for these domains in the Payroll Interface functional area:

- *Self-Service: Payroll Interface (External Tax Documents)* enables workers access to their own external tax documents.
- *Self-Service: Payroll Interface (External Year End Tax Documents)* enables terminated workers access to their external tax documents for the previous year.
- *Worker Data: Payroll Interface (External Tax Documents)* enables payroll administrators to access external tax documents for workers.

5. (Optional) Access the [Configure External Payroll Vendor Mapping](#) task and configure the Attachment Endpoint attribute if it doesn't have the same host name as the Retrieval Endpoint attribute. Contact your vendor for the Attachment Endpoint host name. If the host names don't match and you don't configure the Attachment Endpoint attribute, you may not be able to access external tax document attachments.

6. (Optional) [Manage Proxy Access](#).

Provide administrators with proxy access so they can verify that workers have access to their external tax documents.

## Result

Workers can access their tax documents:

- On the External Tax Documents section on the Tax Documents report of the Pay profile group of their worker profile.
- In the External Tax Documents section on the My Tax Documents task.

Payroll administrators can access tax documents:

- On the External Tax Documents section on the Tax Documents report of the Pay profile group of a worker's profile.
- From the related actions menu of a worker profile, select Payroll > Tax Documents.

## Workday Payroll Connectors

### ADP Check Print Integration

#### Steps: Set Up ADP Check Print Integration

##### Prerequisites

- Configure the *Outsourced Payment Release Event* business process.
- Ensure that each Location has a Usage Type of *Shipping*.

## Context

You can create an integration to send check printing data to ADP.

Note: If you need to create a new integration system to replace one that uses the ADP Check Print Template (DO NOT USE) template, you can save time by using the Migrate Check Print Integration Configuration for Data Initialization Service task.

## Steps

1. [Maintain Payment Election Rules](#).

If you set the Max Number of Elections to a number greater than 8, the integration fails. ADP defines this limit.

2. [Define Payslips](#).

Verify that you've configured the correct Label to the corresponding Payslip Group in the Sections grid:

Payslip Group	Label
Absence Plans	Absence Plans
Earnings	Earnings
Employee Taxes	Employee Taxes
Employer Paid Benefits	Employer Paid Benefits
Earnings or Deductions	Pre-tax Deductions
Deductions	Post Tax Deductions
Subject or Taxable Wages	Taxable Wages

3. [Create Integration System](#) on page 1967.

Enter *ADP Check Print (Enhanced Performance)* in the New Using Template field.

4. (Optional) To enable 1 or more integration services, from the related actions menu of your ADP Check Print integration, select Integration System > Configure Integration Services. Workday displays all integration services, including required services that you can't edit.

Option	Description
ADP Check Print - FedEx Label File	Enables you to send a FedEx payer account number, service codes, and Saturday delivery preferences to ADP.
ADP Check Print - UPS Label File	Enables you to send a UPS account number, service type, Saturday delivery preferences, and other configuration data to ADP.
ADP Check Print Label File Field Override Service	Enables you to add field override data to mailing labels generated by ADP.
Enable Message Auditing	Select if you want to enable generation of integration audit files.
DIS - Performance Log	Enables Workday to generate performance logs.
ADP Check Print Bank Name	Select to include the bank name for an outsourced bank account.

5. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

- *Integration Event*
- *Process: Payroll Settlement*

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

6. From the related actions menu of your ADP Check Print integration, select Integration System > Configure Integration Attributes.

Security: *Integration Configure* domain in the Integration functional area.

7. From the related actions menu of the integration system, select Integration System > Configure Integration Maps.

The Location WRAP FedEx Map must have a unique External Value for each location. The External Value must correspond to the Wrap Number override.

Security: *Integration Configure* domain in the Integration functional area.

8. From the related actions menu of your integration system, select Integration System > Configure Integration Field Overrides.

To override a company's name for Minnesota state requirements if the name is different from the company's legal registered name:

- a. Select Payment Group Data > Payment Data > Outgoing Party and Bank Data > Originating Party Data > ADP Alternate Company Name and Address.
- b. In the Field Overrides section, configure a field override for DBA Name.

Note: The Distribution Code field override must return FX for both locations, or return value ZZ.

The Wrap Number field override must return a unique value for each location.

When you configure the same field override differently in both of these ADP Data sections, Workday uses the Payment Group Data configuration in the integration output:

- Payslip\_Data / Payroll Remittance Worker Data / Payroll Worker Data / ADP Data
- Payslip\_Data / Payment Group Data / ADP Data

Security: *Integration Configure* domain in the Integration functional area.

9. To configure fields and field overrides to include or exclude from the integration output, select Integration System > Configure Integration Field Attributes from the related actions menu of your integration system.

Note: When you include the YTD Taken field, it replaces the Reduced field on payslips.

Security: *Integration Configure* domain in the Integration functional area.

[10. Set Up Banking for ADP Check Print Integration on page 1850](#).

11. Access the *Payment Release Event* business process that launches the integration.

Add an integration step that refers to the integration system.

#### Related Information

##### Reference

[Reference: Settlement Business Processes](#)

## Set Up Banking for ADP Check Print Integration

### Prerequisites

Create an *ADP Check Print* integration. See: [Steps: Set Up ADP Check Print Integration on page 1848](#).

Security: *Set Up: Bank Entity* domains in the Banking and Settlement functional area.

## Context

The *ADP Check Print* integration uses the Workday banking and settlement infrastructure. To ensure the integration system receives the correct payroll data, configure an outsourced bank provider and a bank account so Workday can route payments to the outsourced provider.

## Steps

1. Access the Create Outsourced Bank Provider task.
2. As you complete the task, consider:

Option	Description
Outsourced Bank Provider Name	Enter a name to use when referring to the outsourced vendor.
Integration System	Select the <i>ADP Check Print</i> integration system that you created.
Cut Off Time	Enter the cutoff time for including payments from this account in an electronic payment file. This field is informational only.
Maximum Payments per Group	Specify the maximum number of payments that you want to include in a single payment group originating from this account. If a file exceeds this number, Workday automatically separates the payments into multiple groups.

3. Access the Create Bank Account task.
  - a) In the Bank Account Type field, select *Bank Account* to have ADP issue checks drawn from your bank account.
4. Enter the details of your bank account. See: [..../..../financial-management/cash/banking-setup/dan1370796986851.dita](#).
5. Add a row on the Settlement Setup grid.
  - a) Select a Payment Type.
  - b) In the Technical Integration column, enter the Integration System and the Outsourced Provider that you created.

## Concept: ADP Check Print Integration

The ADP Check Print integration enables you to outsource Full Service Direct Deposits (FSDD) and printing of payroll checks, payroll advice slips, and mail label files to ADP. The integration can create checks drawn on your outsourced bank. You can configure the integration to provide additional data to enable ADP to send checks using Federal Express, United Parcel Service (UPS), or postal service

For improved performance, enter the *Payslip Printing Option* integration attribute to filter output to:

- *Checks Only*.
- *Checks and Advices*.
- *Checks and Advices and Payments*.

This integration supports ADP Check Print, FSDD, and ADP Check.

## Data Generated by ADP Check Print Integration

The ADP payslip format provides a standard set of sections to display earnings, deductions, gross and net wages, taxes, and other information. ADP checks display these types of information:

- Employee ID, name, and address

- Company name and address
- Pay period information, check date, and check number
- Employee marital status
- Exemptions and allowances
- Earnings and deductions (including garnishments, if you configure your tenant to track them)
- PTO balance
- Pre- and post-tax deductions
- Employer-paid benefits
- Direct deposit summary

The ADP mail label file format provides data used by Federal Express, United Parcel Service, and domestic and international postal services.

Note: You can override fields for earnings and deductions. The template-level field overrides are applied consistently across all checks that you generate with the template.

### Integration Process Flow

When configured, the ADP Check Print integration launches and runs using this process:

1. The Settlement process calls a bank routing rule.
2. The bank routing rule ties payments for a specified pay group to a bank account.
3. The bank account specifies the outsourced bank provider to use to generate checks.
4. The outsourced bank provider specifies the ADP Check Print integration system to use.
5. The ADP Check Print integration produces an output file and posts it to an FTP server controlled by ADP.
6. ADP prints payroll paychecks and payroll advice slips based on your configuration options and mails them to your workers.

### Integration Audit Files

Every time the integration runs, Workday generates these files:

- The *Data Changes Audit* is a readable version of the integration output file.
- The *Diagnostic Audit* is designed to help you troubleshoot integration errors.

You can find these files in the Reports and Other Output Files section of the Integration Event for each integration run.

Note: Because Workday includes actual data in the Data Change Audit file, you can secure this file separately. Example: if administrators can't have access to the data.

### Mass Prenote Files

You can generate a Mass Prenote file for ADP using this integration:

- Only generate this file immediately after the *first* payroll run.
- Rerun the integration manually for the same payroll run with these launch parameters:
  - Run Frequency: *Run Now*
  - Payment Message ID: (leave empty)
  - Outsourced Payment Group Id: Payment Group ID.
  - Pre-Note Run: select this option.

### Reference: ADP Check Print Integration Data Sections

Before you build an ADP Check Print integration, familiarize yourself with each data section. Understand which fields are available for output and how the configuration options affect integration behavior.
