

# Integrations

Product Summary

December 10, 2025

# Contents

Setup Considerations: Integrations.....	18
Launch and Manage Integrations.....	24
Launch an Integration.....	24
Cancel an In-Progress Integration.....	25
Relaunch an Integration.....	26
Rerun Integration Document Delivery.....	26
View Integration Events.....	27
Audit Integration Events.....	29
Retrieve Technical Files for Integration Events.....	29
Concept: Mass Actions on Integration Events.....	30
Create Integration Notifications.....	31
Delete Integrations and EIBs.....	33
Concept: Integration Schedules and Weekly Service Updates.....	34
Reference: Integration Message Components and Error Handling.....	35
Reference: Integration Event Statuses.....	37
Example: Schedule Integration for Last Day of Each Calendar Quarter.....	37
Enterprise Interface Builder (EIB).....	39
Setup Considerations: Enterprise Interface Builder.....	39
Concept: Enterprise Interface Builder.....	43
Inbound EIBs.....	44
Steps: Set Up EIBs Using Templates from Web Service Operations.....	44
Set Up Inbound EIB.....	44
Customize EIB Spreadsheet Template.....	48
Generate EIB Spreadsheet Template.....	49
Set Up EIB Spreadsheet.....	50
Set Up Business Process Security for EIB Upload.....	52
Launch EIB Spreadsheet Upload.....	52
Concept: EIB Template Models and Spreadsheet Templates.....	55
Concept: EIB Spreadsheet Data Entry Guidelines.....	56
Concept: Guidelines for Spreadsheets That Launch a Business Process.....	59
Reference: Inbound Transport Protocol Types for EIBs.....	62
Reference: Inbound Integration Transformations for EIBs.....	62
Reference: Inbound Integration Data Sources.....	62
Reference: EIB Upload Reports.....	63
Example: Generate EIB Spreadsheet Template with Data.....	64
FAQ: EIB Spreadsheet Templates.....	65
Outbound EIBs.....	66
Steps: Set Up Outbound EIB.....	66
Set Up Outbound EIB.....	67
Create Web Service Data Source.....	72
Create Security Proxy to Grant Report Access.....	73
Set Up Launch Parameters for Web Service Data Source.....	74
Create HTTPS Transport Protocol.....	77
Create Integration Transformation.....	78
Manage Outbound EIBs with Custom XSLTs.....	79

Set Up Custom Report Transformation.....	80
Set Up Dynamic Filename Definition.....	81
Reference: Outbound Transport Protocol Types for EIBs.....	82
Reference: Outbound Integration Transformations.....	83
Reference: Outbound Integration Data Sources.....	84
<b>EIB General Errors and Guidelines.....</b>	<b>85</b>
View Error Messages for an EIB.....	85
Troubleshooting: Enterprise Interface Builder.....	85
<b>Inbound EIB Template Guidelines and Troubleshooting.....</b>	<b>89</b>
Concept: Inbound EIB Template Guidelines.....	89
Absence Management EIBs.....	89
Benefits Administration EIBs.....	118
Cash Management EIBs.....	142
Compensation EIBs.....	147
Compensation Review EIBs.....	170
Custom Objects EIBs.....	175
Financial Management EIBs.....	179
Human Resources EIBs.....	204
Integrations EIBs.....	282
Learning EIBs.....	295
Payroll EIBs.....	322
Performance Management EIBs.....	364
Recruiting EIBs.....	385
Resource Management EIBs.....	417
Staffing EIBs.....	447
Student Finance EIBs.....	482
Talent EIBs.....	485
Tenant Data Translation EIBs.....	495
Time Tracking EIBs.....	499
Workday Connect EIBs.....	516
<b>Getting Started with Workday Connectors.....</b>	<b>524</b>
Browse Connector Templates.....	524
Concept: Workday Connectors.....	524
Reference: Benefits Connectors Catalog.....	525
Reference: Financials Connectors Catalog.....	525
Reference: HCM Connectors Catalog.....	528
Reference: Student Connectors Catalog.....	530
Reference: Third-Party Payroll Connectors Catalog.....	531
Reference: Workday Payroll Connectors Catalog.....	532
<b>Benefits Connectors.....</b>	<b>533</b>
Setup Considerations: Cloud Connect for Benefits.....	533
Getting Started with Cloud Connect for Benefits.....	536
Concept: Cloud Connect for Benefits.....	536
Concept: Planning a Benefit Provider Integration.....	538
Concept: Cloud Connect for Benefits Integration Templates.....	539
Concept: Cloud Connect for Benefits Field Overrides.....	539
Concept: Inbound Cloud Connect for Benefits Integrations.....	539
Create Benefit Provider Integration.....	540
Steps: Set Up Benefit Provider Integration.....	540
Set Up Attributes and Maps in Benefits Integration.....	541
Set Up Field Overrides in Benefits Integration.....	543
Test and Manage Benefit Provider Integration.....	544

Set Up Test Environment for Benefits Integration.....	544
Include Payroll Balances in Benefits Integration.....	545
Change Benefit Provider Integration Maps.....	546
Launch and Troubleshoot Benefit Provider Integration.....	547
Steps: Schedule, Launch, and Troubleshoot Benefit Provider Integration.....	547
Concept: Benefits Integration Launch Parameters.....	547
Concept: Benefit Integration Error Reporting.....	553
Reference: Integration Status Reports.....	554
FAQ: Benefit Provider Integration Common Issues.....	554
Open Enrollment Integration Tasks.....	557
Concept: Open Enrollment Integration Checklist.....	557
Link Benefit Plans to Integration Systems.....	559
COBRA Integration.....	559
Set Up Event-Based Change Files.....	559
Concept: COBRA Integration.....	560
Ended Coverage Reporting.....	562
Steps: Report Ended Coverage Once.....	562
Concept: Ended Coverage Options.....	563
Workday Benefits Connector.....	565
Concept: Workday Benefits Connector.....	565
Steps: Set Up the Workday Benefits Connector V2 Integration.....	567
Set Up Benefits Connector V2 Integration Services.....	568
Set Up Benefits Connector V2 Attributes and Maps.....	570
Concept: Benefits Connector Workflow.....	571
Concept: Benefits Connector V2 Change Detection.....	572
Concept: Benefits Connector V2 Data Validation and Error Handling.....	573
Reference: Benefits Connector Data Sections.....	574
Reference: Benefits Connector V2 Audit Files.....	575
FAQ: Benefits Connector.....	577
Workday Benefits Connector (V1).....	577
<b>Data Initialization Service (DIS) Integration.....</b>	<b>586</b>
Concept: Data Initialization Service (DIS).....	586
Steps: Set Up Data Initialization Service (DIS) Integration.....	587
Set Up Integration Data Initialization Service.....	588
Set Up Sub-Document for Data Initialization Service (DIS).....	593
<b>Document Transformation Connector.....</b>	<b>594</b>
Steps: Set Up Document Transformation Connector.....	594
Reference: Arithmetic Attributes for Document Transformation.....	596
Reference: Comma-Separated Value (CSV) Attributes for Document Transformation.....	600
Reference: Date/Time Attributes for Document Transformation.....	602
Reference: Fixed-Length Formatting Attributes for Document Transformation.....	603
Reference: Grouped Attributes for Document Transformation.....	605
Reference: Integration Value Attributes for Document Transformation.....	606
Reference: Number Formatting Attributes for Document Transformation.....	611
Reference: Text Insertion and Removal Attributes for Document Transformation.....	613
Reference: Truncation Attributes for Document Transformation.....	615
Reference: Validation Attributes for Document Transformation.....	617
Reference: Document Transformation Sample Use Case.....	621
Concept: Document Transformation Connector.....	623
Concept: Document Transformation and Validation.....	624

<b>Financials Connectors.....</b>	<b>626</b>
Accounting Journal Connector.....	626
Steps: Set Up Accounting Journal Connector.....	626
Concept: Accounting Journal Connector.....	628
Reference: Accounting Journal Connector CSV File Format.....	629
Reference: Accounting Journal Connector XML Schema.....	646
Ad Hoc Bank Transaction Connector.....	687
Steps: Set Up Ad Hoc Bank Transaction Connector.....	687
Concept: Ad Hoc Bank Transaction Connector.....	688
Reference: Ad Hoc Bank Transaction Connector XML Schema.....	689
Reference: Ad Hoc Bank Transaction Connector CSV File Format.....	715
Bank Fee Analysis Connectors.....	721
Steps: Set Up Bank Fee Statement Connectors.....	721
Concept: Bank Fee Statement Connectors.....	722
Reference: Bank Fee Statement Connectors XML Schema.....	723
Bank Statement Import Integrations.....	734
Steps: Set Up Bank Statement Load Integration.....	734
Concept: Bank Statement Load Integrations.....	735
Reference: Bank Statements Connector XML Schema.....	736
Credit Card Integrations.....	741
Steps: Set Up Integration for Credit Cards and Transactions.....	741
Concept: Credit Card and Card Transaction Integrations.....	743
Concept: MasterCard CDF3 15.01 Credit Card Transaction Integration.....	744
Concept: Visa Commercial Format 4.4 (VCF 4) Credit Card Transaction Integration.....	746
Reference: Credit Card Formats Supported for Expense Integrations.....	747
Currency Exchange Rate Connector.....	747
Steps: Set Up Integration to Import Currency Exchange Rates into Workday.....	747
Concept: Currency Exchange Rate Connector.....	748
Reference: Currency Exchange Rate Connector File Schema.....	749
Customer Lockbox Integration.....	752
Steps: Set Up Customer Payment Lockbox Integration.....	752
Concept: Customer Payment Lockbox Integration.....	753
Reference: Customer Payment Lockbox Integration File Format.....	757
DAS2 Integration.....	761
Steps: Set Up DAS2 Integration.....	761
Concept: DAS2 Integration.....	763
EBICS Integrations.....	764
Steps: Set Up EBICS.....	764
Create EBICS Contract.....	765
EDI Supplier Integrations.....	767
Steps: Set Up Integration to Import EDI 810 Supplier Invoices.....	767
Steps: Set Up Integration to Export EDI 850 Purchase Orders.....	770
Steps: Set Up Integration to Import EDI 855 Purchase Order Acknowledgments.....	774
Steps: Set Up Integration to Import EDI 856 Advance Ship Notices.....	776
Steps: Configure the Procure-to-Pay Integrations Work Area.....	778
Concept: EDI Supplier Integrations.....	779
Concept: EDI Connector Pre and Postprocessor Common Use Cases.....	780
Reference: EDI Connector Pre and Postprocessor Common Use Cases.....	780
Reference: Valid Element Codes for Inbound EDI 810 Files.....	782
Reference: Valid Element Codes for Outbound EDI 850 Files.....	787
Reference: Valid Element Codes for EDI 855 Purchase Order Acknowledgment Files.....	795
Reference: Valid Element Codes for Inbound EDI 856 Files.....	800
Reference: Purchase Order Invoice cXML Schema.....	806
Reference: Purchase Order Invoice with Negative Amounts cXML Schema.....	815

Reference: Purchase Order Issue cXML Schema.....	817
Troubleshooting: EDI Integrations Complete with Warnings or Errors.....	822
Electronic Invoice Connector.....	824
Steps: Set Up Electronic Invoice Connector.....	824
Steps: Configure UBL Version 2.1 Electronic Customer Invoice Integration Service Map.....	825
Steps: Configure cXML Electronic Customer Invoice Template.....	831
Steps: Automate Electronic Invoice Document Delivery for cXML.....	833
Concept: Electronic Invoice Connector.....	835
Reference: Electronic Invoice Connector XML Schema.....	840
Electronic Payment Integrations.....	849
Steps: Set Up Bank Integrations for Settlement Processing.....	849
Steps: Set Up Electronic Filing 1099 Integration.....	851
Steps: Set Up 1099 Electronic Filing Run Event Business Process.....	852
Convert Payment Integrations.....	853
Concept: Electronic Payments.....	853
ELSTER Integrations.....	854
Steps: Generate ELSTER Tax Declaration XML.....	854
Reference: Default Mappings for German ELSTER Periodic VAT Return Integrations.....	855
FEC Integration.....	858
Steps: Set Up FEC Integration.....	858
Concept: FEC Integration.....	859
Financial Journal Lines Outbound Connector.....	860
Steps: Set Up Financial Journal Lines Outbound Connector.....	860
Reference: Financial Journal Lines Outbound Connector XML Schema.....	861
Financial Management Connector for Salesforce.....	869
Steps: Set Up Financial Management Connector for Salesforce.....	869
Set Up Salesforce Tenant for Financial Management Connector for Salesforce.....	871
Concept: Financial Management Connector for Salesforce.....	872
GoBD Integration.....	873
Steps: Set Up GoBD Integration.....	873
Concept: GoBD Integration.....	874
Inventory Label Data Integrations.....	874
Steps: Set Up Integrations for Inventory Label Data.....	874
Concept: Inventory Label Data Integrations.....	877
Reference: Inventory Label Data Integration Data Sections.....	878
Payment Connector.....	883
Steps: Set Up Payment Connector Integration.....	883
Concept: Payment Connector.....	884
Reference: Payment Connector Integration Data Sections.....	885
Payments Inbound Integrations.....	890
Steps: Set Up Integration to Import Payment Status Reports.....	890
Steps: Set Up Credit Card Payment Integrations.....	891
Payroll Journal Line Export Connector.....	893
Steps: Set Up Payroll Journal Outbound Connector.....	893
Concept: Payroll Journal Outbound Connector.....	894
Reference: Payroll Journal Outbound Connector XML Schema.....	895
PSA Inbound Connector.....	897
Steps: Set Up PSA Inbound Connector Integration.....	897
Set Up PSA Inbound Connector Integration Attributes.....	898
Concept: PSA Inbound Connector.....	899
Reference: PSA Inbound Connector File Schema.....	901
Punchout Integrations.....	932
Setup Considerations: Supplier Punchout Integration.....	932
Steps: Set Up Punchout Catalog Integration.....	937
Steps: Set Up Punchout Purchase Order Integration.....	939
Steps: Set Up Supplier Invoicing Integration.....	943

SAF-T Integrations.....	944
Steps: Set Up SAF-T Integration.....	944
Concept: SAF-T Integrations.....	945
Supplier Accounts Integrations.....	946
Set Up Electronic Invoice Inbound Connector for Supplier Accounts.....	946
Reference: Electronic Invoice Connector XML Schema for Supplier Accounts.....	947
Third-Party Payments Integration.....	1008
Steps: Set Up Third-Party Payments Integration.....	1008
Concept: Third-Party Payments Integration.....	1009
Travel Booking Inbound Connector.....	1011
Steps: Set Up Travel Booking Inbound Connector.....	1011
Map Travel Booking Inbound Connector Integration Data.....	1012
Concept: Travel Booking Inbound Connector.....	1013
Reference: Travel Booking Inbound Connector File Schema.....	1013
Tax ID Validation Integrations.....	1017
Steps: Set Up Tax ID Validation Integration.....	1017
Reference: European VAT Information Exchange System Tax ID Types.....	1018
Example: Set Up Data Initialization Service for Tax ID Validation.....	1019
Workday Bank Connectivity.....	1022
Concept: Workday Bank Connectivity Integration.....	1022
Steps: Manage Workday Bank Connectivity.....	1024
Steps: Set Up Bank Connectivity - Payments Initiation Integration.....	1028
Steps: Set Up Bank Connectivity - Import Payment Status Integration.....	1030
Steps: Set Up Bank Connectivity - Import Bank Statements Integration.....	1031
Reference: Import Payment Status Files and Statuses.....	1033
FAQ: Workday Bank Connectivity Integration.....	1034
<b>HCM Connectors.....</b>	<b>1035</b>
Absence Third-Party Calendar Integration.....	1035
Steps: Set Up Absence Third-Party Calendar Integration.....	1035
Configure the Absence Third-Party Calendar Integration.....	1036
Steps: Register Your Client-Side Service Account for Google.....	1039
Steps: Register Your Client-Side Application for Microsoft Outlook.....	1040
Steps: Create an External Client CredStore for Google Calendar.....	1040
Create a Third-Party X.509 Key Pair for Google Calendar.....	1042
Create an X.509 Private Key Pair for Google Calendar.....	1042
Create an External Client CredStore for Microsoft Outlook.....	1043
Reference: Absence Third-Party Calendar Integration Output Files.....	1044
FAQ: Absence Third-Party Calendar Integration.....	1044
Troubleshooting: Absence Third-Party Calendar Integration.....	1048
Account Provisioning.....	1051
Steps: Set Up Account Provisioning Integration.....	1051
Set Up Account Provisioning Integration Fields.....	1052
Concept: Account Provisioning Integration.....	1053
Account Provisioning Connector.....	1054
Steps: Set Up Account Provisioning Connector Integration.....	1054
Concept: Account Provisioning Connector.....	1055
Affordable Care Act (ACA) Connector.....	1056
Steps: Set Up ACA Information Returns Connector.....	1056
Steps: Set Up ACA Mailing Connector.....	1057
Concept: Affordable Care Act (ACA) Connectors.....	1057
Troubleshoot: Affordable Care Act (ACA) Connectors.....	1059
AngelPoints.....	1060
Steps: Set Up AngelPoints Integration.....	1060
Steps: Set Up Worklets for SSO-Based Access to AngelPoints.....	1063

Concept: AngelPoints Integration.....	1065
Assign Organizations Inbound Connector.....	1066
Steps: Set Up Assign Organizations Inbound Connector Integration.....	1066
Set Up Assign Organizations Inbound Connector Attributes.....	1066
View Assign Organizations Inbound Connector Integration Audits.....	1067
Concept: Assign Organizations Inbound Connector.....	1068
Reference: Assign Organizations Inbound Connector File Schema.....	1069
Core Connector: Background Check Order.....	1071
Steps: Set Up Core Connector: Background Check Order Integrations.....	1071
Add Integration Steps to Background Check Business Process.....	1073
Concept: Core Connector: Background Check Order.....	1074
Reference: File Schema for Core Connector: Background Check Order Outbound.....	1075
Reference: File Schema for Core Connector: Background Check Inbound.....	1078
Core Connector: Candidate Outbound.....	1081
Steps: Set Up Core Connector: Candidate Outbound Integration.....	1081
Core Connector: Competency Model.....	1083
Steps: Set Up Core Connector: Competency Model Integration.....	1083
Concept: Core Connector: Competency Model.....	1083
Reference: Core Connector: Competency Model Integration Data Sections.....	1084
Core Connector: Global Worker.....	1085
Steps: Set Up Core Connector: Global Worker.....	1085
Concept: Core Connector: Global Worker.....	1086
Core Connector: Job Postings.....	1089
Steps: Set Up Core Connector: Job Postings.....	1089
Concept: Core Connector: Job Postings.....	1090
Reference: Core Connector: Job Postings XML Schema.....	1091
Core Connector: Job Profile and Job Family.....	1092
Steps: Set Up Core Connector: Job Profile and Job Family Integration.....	1092
Concept: Core Connector: Job Profile and Job Family.....	1093
Reference: Core Connector: Job Profile and Job Family Data Sections.....	1094
Core Connector: Job Requisitions.....	1096
Steps: Set Up Core Connector: Job Requisitions Integration.....	1096
Set Up Core Connector: Job Requisitions Integration Attributes and Maps.....	1097
Concept: Core Connector: Job Requisitions.....	1098
Reference: Core Connector: Job Requisitions Integration Data Sections.....	1100
Core Connector: LMS Outbound.....	1102
Steps: Set Up Core Connector: Worker for LMS Outbound Integration.....	1102
Create Core Connector: Worker for LMS Outbound Worker Selection Criteria.....	1106
Concept: Core Connector: Worker for LMS Outbound Integration.....	1107
Reference: Core Connector: Worker for LMS Outbound Integration Data Sections.....	1110
Core Connector: Location.....	1118
Steps: Set Up Core Connector: Location Integration.....	1118
Add Custom Fields to Core Connector: Location Integration.....	1118
Concept: Core Connector: Location.....	1119
Reference: Core Connector: Location Data Sections.....	1121
Core Connector: Organization.....	1122
Steps: Set Up Core Connector: Organization Integration.....	1122
Concept: Core Connector: Organization.....	1123
Reference: Core Connector: Organization Data Sections.....	1125
Core Connector: Positions.....	1125
Steps: Set Up Core Connector: Positions Integration.....	1125
Add Custom Fields to Core Connector: Positions Integration.....	1126
Concept: Core Connector: Positions.....	1128
Reference: Core Connector: Positions Integration Data Sections.....	1130
Core Connector: Worker.....	1132
Setup Considerations: Core Connector: Worker.....	1132

Steps: Set Up Core Connector: Worker Integration.....	1136
Configure Core Connector: Worker Integration Attributes.....	1140
Select Workers to Include in a Core Connector: Worker Integration.....	1145
Map Core Connector: Worker Integration Data.....	1145
View Core Connector: Worker Integration Audits.....	1146
Concept: Core Connector: Worker.....	1147
Concept: Core Connector: Worker Integration Data Mapping.....	1150
Concept: Core Connector: Worker Integration Launch Parameters.....	1151
Reference: Core Connector: Worker Integration Data Sections.....	1153
Directory Service.....	1160
Steps: Set Up Directory Service Integration.....	1160
Map Directory Service Integration Data.....	1161
Select Workers to Include in a Directory Service Integration.....	1162
View Directory Service Integration Audits.....	1163
Concept: Directory Service Integration.....	1164
Concept: Directory Service Integration Data Mapping.....	1166
FAQ: Directory Service Integration.....	1167
E-Verify.....	1167
Setup Considerations: E-Verify Integration.....	1167
Steps: Set Up E-Verify Integration.....	1171
Complete Set Up and Upgrade Prerequisites for E-Verify Integration.....	1173
Launch E-Verify Integration Manually.....	1174
Change E-Verify Account Password.....	1176
Concept: E-Verify Integration.....	1177
Concept: Mass Resubmit Forms I-9 to E-Verify.....	1179
Image Upload.....	1180
Steps: Set Up Integration to Load Worker Photos in Bulk.....	1180
Concept: Worker Photo Recommendations.....	1181
Inline Assessments.....	1182
Steps: Set Up Inline Assessments Integration.....	1182
Concept: Inline Assessments Integration.....	1182
Reference: Inline Assessments Integration XML Schema.....	1183
Kenexa Connectors.....	1183
Steps: Set Up Kenexa Foundation Data Integration.....	1183
Steps: Set Up Kenexa User Provisioning Connector.....	1184
Steps: Set Up Kenexa Hire Inbound Integration.....	1185
Concept: Kenexa Connector.....	1186
Reference: Kenexa User Provisioning Attributes.....	1187
Reference: Kenexa Hire Inbound Attributes.....	1189
Kronos Workforce Timekeeper Outbound.....	1202
Steps: Set Up Integration for Kronos Employee Extract.....	1202
Concept: Kronos Workforce Timekeeper Integration.....	1203
Concept: Kronos Integration Data Mapping.....	1203
FAQ: Kronos Outbound Integration.....	1204
LinkedIn Recruiter System Connect.....	1205
Steps: Set Up LinkedIn Recruiter System Connect.....	1205
Steps: Set Up LinkedIn One-Click Export.....	1206
Steps: Set Up Inbound LinkedIn Recruiter System Connect.....	1207
Steps: Set Up Outbound LinkedIn Recruiter System Connect.....	1208
Set Up Scheduled LinkedIn Recruiter System Connect Integrations.....	1209
Concept: LinkedIn Recruiter System Connect.....	1211
Troubleshooting: LinkedIn Recruiter System Connect Integration.....	1212
Medicare Integrations.....	1213
Steps: Set Up Medicare Integrations.....	1213
Concept: Medicare Integrations.....	1214
Okta.....	1215

Steps: Set Up Okta Integration.....	1215
Concept: Okta Integration.....	1215
Reference: Okta Integration Output Fields.....	1218
Organization Inbound Connector.....	1218
Steps: Set Up Organization Inbound Connector.....	1218
Concept: Organization Inbound Connector.....	1219
View Organization Inbound Connector Integration Audits.....	1220
Reference: Organization Inbound Connector File Schema.....	1221
Salesforce.com Chatter.....	1225
Steps: Set Up Salesforce.com Chatter Integration.....	1225
Create Custom Report for Salesforce.com Chatter Integration.....	1226
Concept: Salesforce.com Chatter Integration.....	1228
Salesforce.com Worker Sync.....	1228
Steps: Set Up Salesforce.com Worker Sync Integration.....	1228
Concept: Salesforce.com Worker Sync Integration.....	1230
Reference: Salesforce.com Worker Sync Integration Fields.....	1231
Skillsoft Integration.....	1232
Steps: Set Up Skillsoft Integration.....	1232
Concept: Skillsoft Integration.....	1233
Troubleshooting: Error When Syncing Course Data with Skillsoft Integration.....	1234
Social Security Number Verification Service.....	1235
Steps: Set Up Social Security Number Verification Service Integration.....	1235
Concept: Social Security Number Verification Service Integration.....	1235
Talent Profile Inbound Connector.....	1236
Steps: Set Up Talent Profile Inbound Connector.....	1236
Concept: Talent Profile Inbound Connector.....	1237
Reference: Talent Profile Inbound Connector File Schema.....	1237
Unistaff Connectors.....	1242
Steps: Set Up Unistaff Foundation Connector.....	1242
Steps: Set Up Unistaff Hire Inbound Connector.....	1243
Concept: Unistaff Connectors.....	1244
Reference: Unistaff Hire Inbound Connector XML File Schema.....	1246
Workday Connector for Equifax Verification.....	1289
Concept: Workday Connector for Equifax Verification.....	1289
Steps: Set Up Notifications for Workday Connector for Equifax Verification.....	1292
Steps: Enable Workday Connector for Equifax Verification.....	1293
Set Up Workday Connector for Equifax Verification.....	1295
Concept: Verification Inquiries.....	1295
Worker Time Block Inbound Connector.....	1296
Steps: Set Up Worker Time Block Inbound Connector.....	1296
Set Up Worker Time Block Inbound Connector Integration Attributes.....	1297
Concept: Worker Time Block Inbound Connector.....	1298
Reference: Worker Time Block Inbound Connector File Schema.....	1298
<b>Student Connectors.....</b>	<b>1301</b>
National Student Clearinghouse Connectors.....	1301
Setup Considerations: National Student Clearinghouse Connectors.....	1301
Steps: Set Up Integration to Export Student Degree Data.....	1305
Steps: Set Up Integration to Export Student Enrollment Data.....	1307
Concept: National Student Clearinghouse Connectors.....	1309
Reference: NSC Enrollment Reporting Outbound Connector.....	1314
Student Admissions Connectors.....	1321
Steps: Set Up Integration to Import Student Admissions Data.....	1321
Concept: Student Admissions Connectors.....	1322
Reference: Education Test Result Inbound Connector File Schema.....	1324

Student Financial Aid Connectors.....	1328
Steps: Set Up Student Alternative Loan Integrations.....	1328
Steps: Set Up Student Financial Aid Data Integrations.....	1329
Steps: Set Up TSM and FAH NSLDS Transaction Outbound Integration.....	1331
Concept: Student Financial Aid Connectors.....	1333
Concept: Transfer Student Monitoring and Financial Aid History.....	1339
Reference: COD Outbound Integration.....	1340
Student Financials Connectors.....	1341
Steps: Set Up Integration for Student Financials Data.....	1341
Concept: Student Financials Connectors.....	1342
Student Outbound Connector.....	1342
Steps: Set Up Student Outbound Connector.....	1342
Concept: Student Outbound Connector.....	1344
Reference: Student Outbound Connector File Schema.....	1344
Student Records Connectors.....	1345
Steps: Set Up Integration to Export Student Transcripts.....	1345
Concept: Student Records Connectors.....	1346
Reference: Student Transcript Connector File Schema.....	1347
Reference: PESC Student Transcript Connector File Schema.....	1348
Setup Considerations: PESC Compliant Transcript Outbound Connector.....	1380
Student Recruiting Connectors.....	1383
Steps: Set Up Integration for Student Recruiting.....	1383
Concept: Student Recruiting Connectors.....	1384
Student Transaction Log Outbound Connector.....	1385
Steps: Set Up Integration to Export Student Transaction Log Data.....	1385
Reference: Student Transaction Log Outbound Connector File Schema.....	1386
The Common Application Inbound.....	1386
Steps: Set Up Common Application Inbound Integration.....	1386
Concept: The Common Application Inbound Integration.....	1390

Global Payroll Connect.....	1391
Concept: Global Payroll Connect.....	1391
Third-Party Payroll Setup.....	1392
Third-Party Payroll Organizations.....	1392
Third-Party Payroll Pay Groups.....	1396
Third-Party Payroll Earnings and Deductions.....	1403
External Vendor Mapping and Associations.....	1413
Third-Party Payroll Concepts.....	1414
Additional Payroll Data.....	1419
Steps: Set Up Additional Payroll Data.....	1419
Concept: Additional Payroll Data.....	1422
Concept: Attachments for Additional Payroll Data.....	1422
Data Changes on Demand.....	1423
Setup Considerations: Data Changes on Demand.....	1423
Steps: Set Up Data Changes on Demand.....	1427
Create Integration System User for Data Changes on Demand.....	1429
Concept: Data Changes On Demand.....	1430
Concept: PECI and DCoD Comparison.....	1431
Concept: Data Changes on Demand Change Detection.....	1435
Reference: Data Sections for Data Changes on Demand.....	1437
Reference: Data Changes on Demand Request Criteria Parameters.....	1475
FAQ: Data Changes on Demand.....	1482
Event Outbound Notifications.....	1484
Steps: Set Up Event Outbound Notifications.....	1484
Create Integration System User for Event Outbound Notifications.....	1487

Global Payroll Hub.....	1487
Setup Considerations: Global Payroll Hub.....	1487
Steps: Set Up Global Payroll Hub.....	1490
Set Up Global Payroll Processing Checklists.....	1491
Inbound Notifications.....	1493
Steps: Set Up Inbound Notifications.....	1493
Create Integration System User for Inbound Notifications.....	1494
Reference: Inbound Notifications Request Samples.....	1494
Payroll Interfaces.....	1496
Concept: Workday Payroll Interfaces.....	1496
Setup Considerations: Payroll Interfaces.....	1496
Reference: Find Your Third-Party Payroll Interface Integration.....	1500
Payroll Effective Change Interface Connector.....	1504
Payroll Interface Integration Command Center.....	1636
Event-Driven Integration.....	1645
Payroll Interface Configurable Output.....	1657
Third-Party Payroll Errors Collaboration.....	1663
Global Payroll Reconciliation.....	1666
Payroll Interface Connector.....	1699
Local Payroll Data.....	1754
Steps: Set Up Local Payroll Data.....	1754
Concept: Local Payroll Data.....	1755
Worker Effective Change Interface.....	1756

# Setup Considerations: Integrations

You can use this topic to help make decisions when planning your configuration and use of Workday integrations. It explains:

- Why to set them up.
- How they fit into the rest of Workday.
- Downstream impacts and cross-product interactions.
- Security requirements and business process configurations.
- Questions and limitations to consider before implementation.

Refer to detailed task instructions for full configuration details.

## What It Is

Workday integrations enable you to exchange data efficiently between Workday and an external endpoint. Examples:

- Export payroll data from Workday to a third-party payroll provider.
- Import data for employee hires into Workday using Enterprise Interface Builder (EIB).

You can use Workday integrations to:

- Efficiently export and import large volumes of data.
- Initiate integrations ad hoc or on schedule.
- Complete most tasks in bulk that you can perform in Workday.

## Business Benefits

Workday integrations make some tasks easier and other tasks possible. Example, an integration:

- Can save you time and effort when transferring data from other applications into Workday.
- Is necessary to send large volumes of payroll results regularly to a third-party payroll service in the format they require.

When you need to exchange large volumes of data in a specific format with an external endpoint, Workday integrations are a good choice. With Workday integrations, you can avoid manual re-entry of data between Workday and an external application.

## Use Cases

Use case	Description
Account provisioning	With Workday integrations, you can send records of hires and terminations to other internal applications, including Active Directory. Account provisioning enables you to synchronize updates in Workday with related external accounts automatically.
Payroll, tax, and benefits processing	You can use Workday integrations to send worker data on a schedule to external payroll processing services and benefits providers.
Bulk import tasks	Workday integrations enable you to load data for large numbers of objects into Workday. Example:

Use case	Description
	You can change manager assignments for a large number of workers.

### Questions to Consider

Question	Considerations
Does a Workday-delivered integration template support your use case?	If a Workday-delivered integration template supports your use case, using that template can simplify building the integration.
Do you need to import and export data regularly, or infrequently?	You can configure most Workday integrations to run on a schedule.
Can workers at your organization build the integrations using the technology approach that you select?	Workday provides customer training for EIB, some Workday Connectors, and Workday Studio.

### Recommendations

Workday provides several integration technologies. The best technology for your use case varies depending on the use case.

Integration Technology	Description	Advantages
Inbound Enterprise Interface Builder (EIB)	A tool for building simple integrations that load data into Workday.	<ul style="list-style-type: none"> <li>Available in Workday tenant.</li> <li>Simpler to use than other Workday integration technologies.</li> <li>Can use an inbound web service as a data source.</li> <li>Can generate spreadsheet for data entry by workers who don't have access to Workday.</li> <li>Enables automation of multistep data entry in Workday (Example: Hire business process).</li> <li>Best for one-time bulk data loads.</li> </ul>
Outbound Enterprise Interface Builder (EIB)	A tool for building simple integrations that export data from Workday.	<ul style="list-style-type: none"> <li>Available in Workday tenant.</li> <li>Relatively simple to use.</li> <li>Can use 1 Workday Custom Report or outbound web service as a data source.</li> <li>Can run on schedule or launch from business process step.</li> </ul>

Integration Technology	Description	Advantages
Template-Based Integrations (for specific endpoints)	<p>Tools for building integrations to specific services and vendors (Example: Salesforce.com). These integrations support file formats that are specific to the service.</p>	<ul style="list-style-type: none"> <li>Available in Workday tenant.</li> <li>Workday preconfigures much of the template for the specific endpoint it supports.</li> <li>Integration supports vendor file format without additional configuration required.</li> <li>Can run on schedule or launch from business process step.</li> <li>Simpler than Workday Studio or WWS API.</li> <li>Best solution if you have to integrate with the endpoint that the integration template supports.</li> </ul>
Template-Based Connectors	<p>Tools for building integrations that export data of a specific type (Example: Worker, Organization) and export or import data in a Workday-defined XML format.</p>	<ul style="list-style-type: none"> <li>Available in Workday tenant.</li> <li>Provides a broad range of data fields.</li> <li>Can run on schedule or launch from business process step.</li> <li>Some Connectors can export additional report field output if the Connector doesn't already include a field for that data.</li> <li>Outbound Connectors can use Document Transformation Connector to convert Workday XML into the file format used by the external endpoint.</li> <li>Best solution when Workday doesn't provide an integration template for your specific endpoint.</li> </ul>
Orchestrate for Integrations	<p>A web-based, low-code, drag-and-drop development environment. Available from the Workday Developer Site at <a href="https://developer.workday.com">https://developer.workday.com</a>.</p>	<ul style="list-style-type: none"> <li>The central Orchestrate for Integrations tool is Orchestration Builder, a drag-and-drop development environment that enables you to create complex workflows called orchestrations without writing code.</li> </ul>

Integration Technology	Description	Advantages
		<ul style="list-style-type: none"> <li>Orchestrations can automate business processes, transform data, and facilitate real-time, event-driven interactions with third-party services.</li> <li>Entirely web-based. No downloads required.</li> <li>Data is encrypted in transit and at rest.</li> <li>Designed to handle high volumes of data and complex integration patterns.</li> <li>Extensible through the use of custom logic, third-party APIs, and Workday's extensive library of Orchestrate Expression Language global functions and member functions.</li> </ul>
Workday Studio	An Eclipse-based Integrated Development Environment (IDE). You can build custom integrations that follow the same template-based model as Workday Connectors.	<ul style="list-style-type: none"> <li>Flexible developer tool available from Workday.</li> <li>Enables you to build custom integrations that reside in your Workday tenant.</li> <li>Studio integrations can access data from any Workday Web Service operation.</li> <li>Can run on schedule or launch from business process step.</li> <li>Best solution if your developers have completed Workday Studio training.</li> </ul>
Workday Web Services (WWS) API	This Simple Object Access Protocol (SOAP) API supports several thousand Workday operations. The API provides programmatic access to most Workday functionality through exchange of XML documents.	<ul style="list-style-type: none"> <li>API provides access to Workday data from outside of Workday.</li> <li>API supports almost all operations available in Workday.</li> <li>Enables you to use developers trained on non-Workday development tools.</li> <li>Enables you to use any development tool.</li> </ul>

Integration Technology	Description	Advantages
Workday REST API	This API provides access to a limited number of Workday operations.	<ul style="list-style-type: none"> <li>• API provides access to a limited set of Workday operations from external applications.</li> <li>• API supports smaller transactions than WWS API.</li> <li>• Enables you to use developers trained on non-Workday development tools.</li> <li>• Enables you to use any development tool.</li> </ul>

## Requirements

No impact.

## Limitations

Integration Technology	Limitations
Inbound EIB	Supports only 1 data source per EIB.
Outbound EIB	Supports only 1 data source (Custom Report or web service) per EIB.
Template-Based Integration (specific vendor)	<ul style="list-style-type: none"> <li>• Can be more difficult to configure than EIB.</li> <li>• Each template supports a single, dedicated vendor that you can't change. Integration templates can't support any other endpoint, even if use case is similar.</li> </ul>
Template-Based Connector	<ul style="list-style-type: none"> <li>• Can be more difficult to configure than EIB.</li> <li>• The only additional data sources you can add are report fields.</li> </ul>
Orchestrate for Integrations	<ul style="list-style-type: none"> <li>• Orchestrate for Integrations is separate from your Workday tenant.</li> <li>• Requires Orchestrate-specific training for developers.</li> </ul>
Workday Studio	<ul style="list-style-type: none"> <li>• Studio is separate from your Workday tenant.</li> <li>• Requires Studio-specific training for developers.</li> <li>• Studio integrations generally take longer to build than template-based integrations, orchestrations, or connectors.</li> </ul>
Workday Web Services (WWS) API	Requires non-Workday development expertise and infrastructure.
Workday REST API	Requires non-Workday development expertise and infrastructure.

## Tenant Setup

The Edit Tenant Setup - Integrations task enables you to:

- Disable integration subscription notifications for all integrations in your tenant.
- Require that Studio integrations include source code.

## Security

Security setup varies between integration types and specific integrations. Non-EIB integrations require an associated *Integration System User* (ISU) account. ISUs enable you to give an integration *Get* and *Put* access to only the domains it needs to run the integration.

## Business Processes

Workday provides 1 business process and 1 type of business process step for all integrations except EIBs:

- You can configure the *Integration Process Event* business process definition in the Integration functional area to control how an integration runs. Examples:

Inbound integration	<ol style="list-style-type: none"> <li>1. Initiate.</li> <li>2. Retrieve file from external endpoint.</li> <li>3. Fire (load data into Workday).</li> </ol>
Outbound integration	<ol style="list-style-type: none"> <li>1. Initiate.</li> <li>2. Send approval request to the worker you designate.</li> <li>3. After approval, fire (extract data from Workday).</li> <li>4. Send data file to external endpoint.</li> </ol>

- The *Integration* business process step enables you to launch an integration from any business process that supports this step type. View the business process definition to see if the business process supports an Integration step. Example: You can add an integration step to the *Complete Form I-9* business process. This step launches an E-Verify integration to send data for the worker.

## Reporting

Workday provides these reports for integrations:

Report	Description
View Integration System	Displays all integration systems (EIB, Connector, Orchestrate for Integrations, Studio, and so on) that you've created.
View Integration Template	Displays all integration templates that Workday provides, enabling you to find the template you need efficiently.
Integration Events	Displays: <ul style="list-style-type: none"> <li>• A summary of integration events that are in process or completed.</li> <li>• Details about the status for each integration event.</li> </ul>
Integration Exception Audit	Displays: <ul style="list-style-type: none"> <li>• Critical errors and warnings.</li> <li>• Suggestions to resolve problems.</li> </ul>

## Connections and Touchpoints

Workday integrations interact with various parts of Workday, depending on the product area, purpose, and data sources for the integration:

- Outbound integrations extract data from Workday, but don't change the data in Workday.
- Inbound integrations add and update data in Workday.

Workday offers a Touchpoints Kit with resources to help you understand configuration relationships across your tenant. Learn more about the [Workday Touchpoints Kit](#) on Workday Community.

# Launch and Manage Integrations

## Launch an Integration

### Prerequisites

- Security: *Integration Event* domain in the Integration functional area.

### Context

You can run integrations:

- Immediately.
- One time.
- Regularly on a schedule.

This can help you to exchange large volumes of data in a specific format with an external endpoint. Example: You can send large volumes of payroll results regularly to a third-party payroll service in the format they require. You can also import external data in bulk and process it in Workday.

When you configure multiple integrations with the same run schedule time, Workday prioritizes them based on the priority configuration on the Edit Tenant Setup - Integrations task.

To avoid bottlenecks and performance issues for scheduled integrations, Workday recommends that you use start times beyond the beginning of the hour.

### Steps

1. Access the Launch / Schedule Integration task.

You can't select an integration system with critical errors.

2. (Optional) Select the Organization for manual launches. The contents of the prompt vary depending on the *Integration Process Event* and on your security access:

Option	Description
Owning Organization	Displays when you associate the integration with an organization. You can select the organization or its subordinate organizations when: <ul style="list-style-type: none"> <li>• You're a member of the organization.</li> <li>• You have an organizational role in the organization.</li> </ul>
Organization By Type	Displays when the integration has no associated organization. You can select any organization and subordinate organization that

Option	Description
	you're a member of or have an organizational role in.

For scheduled integrations, Workday ignores the Organization field value and bases the organization on the *Integration Process Event* of the integration.

You can also select an organization through the Integration System Context field.

The Integration System Context field enables you to limit access to your integration based on either organization or academic unit. This does not override any preexisting security prerequisites.

### 3. (Optional) Specify a Request Name.

Workday uses the Request Name field as the Integration Name.

### 4. Specify any required launch parameter values on the Integration Criteria tab. To configure a launch parameter based on a report or calculated field, specify a Value Type of *Determine Value at Runtime*.

## Result

When you schedule the integration, you own the schedule.

The integration background process performs required transformations and displays the appropriate files or web service messages on the Process Monitor report. When the integration runs for a specific organization, the organization displays on the business process event of the integration run.

Related Information

### Tasks

[Manage Scheduled Future Processes](#)

[Create Calculated Fields](#)

## Cancel an In-Progress Integration

### Prerequisites

Security: *Integration Event*, *Integration Build*, or *Integration Debug* domains in the Integration functional area.

### Context

You can cancel these types of integrations while they are in progress:

- *Core Connector: Global Worker*
- *Core Connector: Worker*
- Integrations that use Data Initialization Service (DIS)
- Inbound EIBs (except on the *Data Load* step).
- *Kenexa Foundation Data*
- Outbound EIBs
- *WPN - ACH IAT Payment (Enhanced Performance)*
- Consolidated Business Forms Printing
- DocuSign
- EIB Generate Spreadsheet
- Workday E-Signature

### Steps

1. Access the Integration Events or Process Monitor report and find the integration event for your integration.

2. From the related actions menu of the integration event, select Background Process > Abort.
3. Confirm that you wish to cancel the event. Integrations that finish quickly can invalidate your cancellation request.

## Result

Workday:

- Changes the background process status to *Aborted*.
- Changes the status of associated business process events to *Failed*.
- Attaches an integration message to the event, which explains that the current user aborted the integration for auditing purposes.

# Relaunch an Integration

## Prerequisites

Security: *Integration Event*, *Integration Build*, or *Integration Debug* domains in the Integration functional area.

## Context

You can relaunch an integration event with the same launch parameters. Workday sets the launch parameters and Organization automatically based on the previous integration event. Workday sets the Run Frequency to *Run Now*.

You can't relaunch an integration event when:

- The event is more than 30 days old.
- You deleted the associated integration system.
- The integration system has *Critical* errors.
- You don't have security permissions to launch the integration system.
- You can't run the integration using the Launch/Schedule Integration task.

## Steps

1. Access the Integration Events or Process Monitor report and find the integration event for your integration.
2. From the related actions menu of the integration event, select Integration Event > Relaunch Integration Event.
3. Confirm or modify the Request Name, Organization (or Academic Unit in the Integration System Context field), and Integration Criteria.

# Rerun Integration Document Delivery

## Prerequisites

Security: *Integration Event*, *Integration Build*, or *Integration Debug* domains in the Integration functional area.

## Context

You can redeliver the integration output document without rerunning the integration if:

- Your integration runs successfully but document delivery fails.
- You need to redeliver the document for any reason.

Document redelivery uses the same transport settings as the current document delivery configuration, and you can't override the delivery configuration. Workday appends the subsequent processes of the integration event, and doesn't update the event status.

You can't redeliver a document when:

- The event is more than 30 days old.
- The files you want to redeliver no longer exist.
- You've deleted the EIB configuration or document delivery configuration.
- The EIB configuration or document delivery configuration has critical exceptions.
- You don't have security permissions to redeliver the document.

### Steps

1. Access the View Integration Events report and find the integration event for your integration.
2. From the related actions menu of the integration event, select Integration Event > Redeliver Document.

## View Integration Events

### Prerequisites

Security: *Integration Event* domain in the Integration functional area.

### Context

View a summary of integration events that are in process or completed and see details about the integration status, including log files whose contents:

- Vary by integration system.
- Include integration data.
- Are useful for troubleshooting.

Note: Workday provides a tenanted ISU account called *Verify Status*. This ISU account verifies the status of an integration event in the background at regular intervals. ISUs have inherent permissions to the *Integration Process* security domain. You can access the Do Not Allow UI Sessions option when editing the Workday account associated with the ISU. Enable this option to prevent the ISU account from signing in to Workday through the interface.

### Steps

1. Access the Integration Events report.
2. Narrow your selection by specifying the Integration System, by Person, Status, Sent After or Sent Before dates.
3. To open the View Background Request report and view details about the background process and related messages, select a request.
4. To see more details in the View Background Request about the integration event, select a tab:

Option	Description
Integration Details	<p>Displays information specific to the integration event. Example: The parent business process event, integration system, initiator, and initiation time.</p> <p>Select View Consolidated Report and Logs or View Performance Logs to view additional</p>

Option	Description
	details about the integration event. These tasks aren't available when: <ul style="list-style-type: none"> <li>The consolidated report has expired.</li> <li>The consolidated report is larger than 10 MB.</li> <li>The consolidated report doesn't exist.</li> <li>You deleted the integration.</li> </ul>
Process Info	The Technical Details area displays a table of Process IDs for each child process in the integration event. These Process IDs enable Workday Support to troubleshoot integrations.
Output Files	Displays any output and audit files generated by the event.
Messages	Displays messages details generated by the integration during the integration event.
Child Processes	Displays details about each child process in the event.

5. If the integration event status has been processing for hours or days, as a related action on the integration event, select Integration Event > Verify Status.

Workday refreshes the integration status:

- If the event failed, Workday displays a message and changes the status to Failed. Workday also changes the status to Failed if the integration event is in progress for more than 7 days. You can optionally select Integration System > Delete as a related action on the event to delete the associated integration system.
- If the event is:
  - Still in progress.
  - Queued.
  - Temporarily suspended during a tenant Service Update.

Workday displays a message and doesn't change the status.

- If Workday can't locate the integration, Workday displays a message and doesn't change the status.
- If the verification feature isn't running, Workday displays a message and doesn't change the status.

## Next Steps

To rerun the document delivery for an EIB, access the integration event for the EIB and select Integration Event > Re-Deliver Document as a related action.

To rerun the document delivery of an Integration Process Event, access the integration event for the Document Delivery and select Integration Event > Re-Deliver Document as a related action.

Re-Deliver Document is available regardless of the status of the integration event. (Examples: Failed, Processing). When you confirm the task, Workday uses the transport settings from the current Document Delivery configuration. You can't override the configuration. Workday appends a subordinate process for EIBs or a subsequent process for Integration Process Events. Workday doesn't update the status of the integration event or Integration Process Event for the EIB, and Workday doesn't restart any subsequent business process steps.

The *Re-Deliver Document* option isn't available if:

- The event is more than 30 days old.
- The file that you want to redeliver no longer exists.
- You've deleted the EIB configuration or Document Delivery configuration.
- The EIB configuration or Document Delivery configuration has critical exceptions.

To relaunch an integration with the same launch parameters as a previous integration run, access the integration event and select Integration Event > Re-Launch Integration as a related action.

Re-Launch Integration is available regardless of the event status of the integration. Examples: Completed, Failed, or Processing. When you use this task, Workday sets the Run Frequency to Run Now, and uses the Launch Parameter values and Organization from the integration event. You can't change the launch parameters of subsequent integration BP steps.

Re-Launch Integration isn't available if:

- The event is more than 30 days old.
- You deleted the associated integration system.
- The integration system now has critical exceptions.

Re-Launch Integration is available only for integration systems that you can launch with the Launch / Schedule Integration task.

## Audit Integration Events

### Prerequisites

Security: *Integration Build* domain in the Integration functional area

### Context

You can audit outbound integrations to view the transmission data for troubleshooting and general reporting. Workday stores the output data in 2 formats:

- The original transmission format, such as XML, CSV, or fixed-width flat files.
- A readable version that displays data in a tabular format for functional users.

Workday enables auditing based on the retention period configuration for the integration. Audit files are available after you launch an integration and the integration extracts and transforms data. Anyone with security permission to view integration event data can view the files. Workday automatically deletes the audit files at the end of the retention period.

### Steps

1. Access the Integration Events report.
2. Narrow your selection by specifying the Integration System, by Person, Status, Sent After or Sent Before dates.
3. In the Integration Events report, select an integration event by selecting the event link.
4. On the View Background Process page, select the Output Files tab.
5. To open the original transmission file and the readable HTML version to view the data, select the links.

## Retrieve Technical Files for Integration Events

### Prerequisites

Security: These domains in the Integration functional area:

- *Integration Build*
- *Integration Event*

## Context

You can asynchronously retrieve technical files for your integration events to monitor performance and troubleshoot issues.

## Steps

1. Access the Integration Events report.
2. Select an integration event for retrieving technical files.
3. On the related actions menu of the integration event, select Integration Event > Retrieve Technical Files.

As you retrieve technical files for your integration event, consider:

Technical File Type	Description
Get Event Document Files	Retrieves data for any documents available to the integration event.
Other Technical Files	Retrieves documents that belong to the reference ID of the parent integration event. When you retrieve these files, Workday sorts them in a zip folder by document tag and sends them to My Tasks.
Static Schema Files	Retrieves the versioned static schema files for DIS.

## Result

### Next Steps

## Concept: Mass Actions on Integration Events

You can relaunch, redeliver, or abort multiple integration events in the Mass Action on Integration Events report.

You can relaunch an event if:

- The associated integration system doesn't have error messages.
- The current user can launch or schedule the integration.
- The integration system of the event can't be run using the Launch/Schedule Integration task.
- A user relaunched the integration before or is a relaunch event itself.

You can redeliver an integration event if:

- The event is less than 30 days old.
- The integration system of the event or delivery configuration of the business process don't exist or has critical exceptions.
- You have security permissions to redeliver.
- The file exists.
- You delivered the event less than 5 times.

You can abort:

- A processing integration event.
- An integration event that supports cancellation.

You can use the Force Failure button to force integrations to fail. The integration must have been running for at least 2 hours.

When you relaunch or redeliver an integration, Workday doesn't launch all the integrations at the same time. Workday gradually retriggers integration events in the background.

Use the View Mass Actions on Integration Events report to filter to when someone made the relaunch or redelivery. You can't add a filter for when the relaunch or redeliver occurred.

You can review integrations that you:

- Redelivered, are waiting to redeliver, and events that Workday couldn't redeliver.
- Relaunched, waiting for relaunch, and events that Workday couldn't relaunch.

#### Related Information Reference

[Workday 33 What's New Post: Mass Actions on Integration Events](#)

## Create Integration Notifications

### Prerequisites

Security: *Integration Build* domain in Integration functional area.

### Context

You can configure notifications that Workday sends to specified groups for integration events, such as launch, completion, or failure. You can send these notifications to Workday My Tasks, an email address, or both.

Note: If your integration is connected to a business process, we recommend that you configure [business process notifications](#) instead of integration notifications when possible to avoid potential duplicate notification messages.

### Steps

1. Access the View Integration System report.
2. Select Integration System > Configure Integration Notifications from the related actions menu of the integration.
3. As you complete the Trigger(s) section, consider:

Option	Description
Trigger on Launch	Triggers when the integration launches.
Trigger on Status	Triggers on the selected integration status. You can select 1 or more of these statuses: <ul style="list-style-type: none"> <li>• <i>Aborted</i></li> <li>• <i>Completed</i></li> <li>• <i>Completed With Errors</i></li> <li>• <i>Completed With Warnings</i></li> <li>• <i>Failed</i></li> <li>• <i>Not Run due to Exceptions on Future Process</i></li> <li>• <i>Processing</i></li> </ul>

Option	Description
	<p>This task also displays additional statuses that don't apply to integrations. Don't select these statuses:</p> <ul style="list-style-type: none"> <li>• <i>Initiated</i></li> <li>• <i>Purged</i></li> <li>• <i>Queued</i></li> <li>• <i>Skipped</i></li> <li>• <i>Throttled</i></li> </ul>

Note: Workday sends a notification after the service update completes for your tenant when:

- You configure a notification to trigger on launch for an outbound EIB integration.
- You schedule the integration to launch during the weekly service update window.

4. (Optional) In the Conditions and Rules section, select a rule from the list or configure a new rule.

Example: You can configure a rule to notify the integration administrator when an event fails, launches, or terminates.

5. (Optional) In the Repeat On section, select a related instance. Workday generates separate notifications for each instance of that field.

Example: You select *Launch Parameters* from the prompt. Workday generates 1 notification for each launch parameter of the integration system.

6. As you complete the Recipient(s) section, consider:

Option	Description
Recipients	Select <i>by Person</i> to send a notification message to the worker who launches the integration.
Groups	Select the active user-based security group that receives the notification in Workday.
Email Addresses	To send email notifications outside of Workday, enter 1 or more target email addresses.

7. Configure the Message Content section. The External Field can be a report field or a calculated field. Workday automatically includes a link to the integration event in the notification. If you have a custom email template for integration event emails, Workday creates the message using the Message Content that you configure here.

Example: To configure a notification that displays *Wanda Smith launched an Integration Event for the System: Production*, configure these Subject elements:

Option	Description
Text	Event
External Field	<i>Integration Event</i>
Text	Was Launched.

Configure these Body elements:

Option	Description
Field	<i>by Person</i>
Text	launched an Integration Event for the System:
Field	<i>Integration System</i>

Option	Description
Text	.

8. (Optional) To configure email notifications with attachments using the *Output Documents* option in the External Field prompt for these integrations:

- Payroll Effective Change Interface
- Payroll Interface Connector
- Worker Effective Change Interface

Ensure that users running the integration have View access to these additional security domains, as applicable:

- Reports: Pay Calculation Results for Pay Group (Results) - CAN.
- Reports: Pay Calculation Results for Pay Group (Results) - FRA.
- Reports: Pay Calculation Results for Pay Group (Results) - UK.
- Reports: Pay Calculation Results for Pay Group (Results) - USA.

9. (Optional) Click Preview to send a sample notification.

The sample notification contains field names, not values. Workday sends this notification using the routing rule for general notifications that you configure in the Alerts section on the Edit Tenant Setup - Notifications task.

## Result

Workday sends the notifications when both the Trigger(s) and Conditions and Rules that you configure occur.

## Next Steps

To add links to output files, create an Integration Event Email template and select *Attachment Links* from the Dynamic Content prompt.

[Create Business Process Condition Rules](#)

[Create Email Templates](#)

## Delete Integrations and EIBs

### Prerequisites

- (Delete a Connector or Studio integration) Security: *Integration Build* domain in the Integration functional area. You also need access to the integration domain within the functional area for the integration (such as Integrations: Cash Management).
- (Delete an EIB) Security: *Integrations: EIBs* domain in the Integration functional area.

### Context

You can delete any type of integration or EIB.

### Steps

1. Access the View Integration System report.

2. From the related actions menu of the integration system, select Integration System > Delete.
3. Select the Confirm Delete check box.

### Result

When you delete an integration, Workday deletes any scheduled future processes for that integration system.

## Concept: Integration Schedules and Weekly Service Updates

Workday integrations can perform differently than expected when your tenant enters service update mode 30 minutes before the Weekly Service Update. The behavior of your integrations differs based on when the process starts.

Consider these scenarios when you run integrations during the Weekly Service Update:

Scenario	Impact
The integration starts before the tenant enters service update mode and completes in the 30-minute window before the Weekly Service Update.	There's no impact to the integration.
The integration starts before the tenant enters service update mode, but doesn't complete before the Weekly Service Update begins.	<p>When the Weekly Service Update completes, Workday restarts the integration. Workday won't restart the integration when your integration:</p> <ul style="list-style-type: none"> <li>• Encounters one of these errors after the Service Update completes.             <ul style="list-style-type: none"> <li>• <i>Your job has been Terminated automatically by Workday as it couldn't finish by the start of our maintenance window.</i></li> <li>• 529 error code.</li> </ul> </li> <li>• Had the integration schedule run frequency set to <i>Run Once in the Future</i>.</li> <li>• Uses 1 of these integration templates:             <ul style="list-style-type: none"> <li>• ADP PayForce</li> <li>• Daily Digest</li> <li>• DocuSign</li> <li>• EBICS Configuration and Transmission - For Business Process or For EBICS Configuration</li> <li>• ESignature</li> <li>• Google Spreadsheet Export</li> <li>• Professional Profile Resume Parsing</li> <li>• WPN - AMEX Remittance v2 - CANADA, EMEA, JAPAN, or US</li> </ul> </li> </ul>
You schedule the integration to start after the tenant enters the service update mode.	The integration doesn't start at the scheduled time, but will start after the Weekly Service Update.

Workday recommends that you schedule your integrations to run outside of the Weekly Service Update when:

- An inbound integration updates data in Workday. The integration might attempt to reload the data on completion of the Weekly Service Update.
- The integration uses dynamic date fields that rely on the integration running on a specific day. The integration might use a different date when it restarts.
- Your integration creates a file for an external process that expects a file at a certain time. The integration might not create those files in the timeframe expected.
- The integration updates data outside of Workday. The integration might attempt to reupdate the data on completion of the Weekly Service Update.
- Your integration sends a file outside of Workday. The integration might attempt to resend the data on completion of the Weekly Service Update.

New inbound API calls to Workday fail when you request them during the Weekly Service Update. In-process inbound API requests fail when the Weekly Service Update begins.

Workday fails these requests with an HTTP response code of 503 Service Unavailable or 500 Internal Server Error.

Note: During the maintenance window, we patch our infrastructure components. As we patch our infrastructure, we can't guarantee which HTTP response code you will receive in a given moment – if any. For Soap and RaaS protocols, the 500 response code is standard for most failures. Some possible responses you can receive during the maintenance window are:

Request Type	HTTP Response Code	Response Body Text
SOAP	500	Service unavailable
RaaS	500 (relabelled to 503 in response body)	503: Service unavailable

When you encounter these response codes, we recommend that you:

- Implement caching.
- Rerun the API call after the Weekly Service Update completes.
- Configure an exponential back-off retry mechanism for the process that generates your API requests.

[Microsoft - Implement Retries with Exponential Backoff](#)

## Reference: Integration Message Components and Error Handling

### Message Severity

Integration messages have these severity levels and processing behavior:

Severity	Message Example	Processing Behavior	Integration Event Status
INFO	<i>Initiated process.</i>	Processing continues.	Completed.
WARNING	<i>Ann Smith has missing or invalid data. The value 123-456-78910 is too long for Phone Number and is truncated in the output. Phone Number should have length equal to or shorter than 12.</i>	Processing continues.	Completed with warnings.

Severity	Message Example	Processing Behavior	Integration Event Status
ERROR	<i>Errors during data load. See report for details.</i>	Processing continues unless the integration reaches the maximum number of allowable errors.	Completed with errors.
CRITICAL	<i>Unable to complete integration processing.</i>	Processing stops.	Failed.

## Message Components

Error messages provide information to help you determine the cause and solution for integration errors:

Context	Identifies the source of the problem, such as the name of the worker or integration map that caused an error.
Condition	Describes the error condition. Examples: invalid data or empty map values.
Requirement	Specifies the valid values or conditions that the integration must meet.
Response	Provides a suggested resolution to the problem.

## Field Truncation

Workday truncates fields when the field size in the endpoint is smaller than the corresponding fields in Workday. If Workday finds no other errors, Workday reports the issue as a warning when field truncation occurs, continues processing, and transmits the data.

## Inbound and Outbound Integration Error Processing

Workday processes inbound and outbound integrations differently when errors occur:

Type	Processing
Inbound Integrations	Workday processes the entire batch of transactions in inbound integrations. If an error occurs, Workday generates an error message, skips the transaction that caused the error, and continues to process the other transactions in the batch. Transactions without errors execute successfully.
Outbound Integrations	When an error occurs in an outbound integration, Workday doesn't transmit any data but fully processes the file to produce a comprehensive error report.

## Message Limits

An integration event can generate up to 500 error messages before processing stops. Although warnings don't affect integration processing, Workday generates a maximum of 500 warnings. At 500 warnings, Workday issues a final warning.

Related Information

### Concepts

[Concept: Workday Scheduled Processes](#)

## Reference: Integration Event Statuses

Integration events can have these statuses:

Status	Description
<i>Aborted</i>	An integration administrator stopped the integration event.
<i>Completed</i>	The background process completed with no warning or error messages.
<i>Completed with errors</i>	The background process completed with 1 or more error messages, but no critical messages. This status indicates an issue that you can troubleshoot.
<i>Completed with warnings</i>	The background process completed with 1 or more warning messages, but no critical or error messages.
<i>Failed</i>	The background process had a nonrecoverable critical error that prevented its completion and caused it to abort. For Workday-delivered integrations, this status can indicate a product defect or service issue.
<i>Not Run due to Exceptions on Future Process</i>	Workday couldn't run the background process because the integration has critical exceptions. Example: the EIB or schedule owner has insufficient security.
<i>Processing</i>	The background process is running.

## Example: Schedule Integration for Last Day of Each Calendar Quarter

This example illustrates how to schedule an integration to run on the last day of each calendar quarter for 1 year.

### Context

Your organization includes several legal entities. You use an external system to manage the accounting for these entities and consolidate their data in Workday. You need to schedule an integration to import financial results into Workday on the last day of each quarter so that you can approve the journals in Workday. To avoid interruptions from the Weekly Service Update, you schedule the integration to run outside of business hours.

### Prerequisites

- Set up accounting journal connector named *Quarterly Accounting Journal Results*.
- Security: *Integration Event* domain in the Integration functional area.

## Steps

1. Access the Launch / Schedule Integration task.
2. Specify these values:

Field	Enter
Integration	<i>Quarterly Accounting Journal Results</i>
Organization	Leave blank.
Run Frequency	<i>Monthly Recurrence</i>

3. Specify any required Integration Criteria.
4. On the Schedule tab, in the Monthly Recurrence Criteria section, specify these values:

Field	Enter
Months	<ul style="list-style-type: none"> <li>• <i>March</i></li> <li>• <i>June</i></li> <li>• <i>September</i></li> <li>• <i>December</i></li> </ul>
Day(s) of the Month	<i>Last Day of the Month</i>
Start Time	A time outside of business hours. Example: <i>11:55 PM PST</i> . If you've opted in to the Workday 32 - Time Zones feature and don't use an ISU, then Workday uses the user's local time zone.

5. In the Range of Recurrence section, specify these values:

Field	Enter
Start Date	<i>Last day of this quarter</i>
End Date	<i>1 year from the end of this quarter</i>

6. Click OK.

## Result

We deliver accounting data from your legal entities to your accounting journals in Workday on schedule for your approval.

[Steps: Set Up Accounting Journal Connector](#) on page 626

# Enterprise Interface Builder (EIB)

## Setup Considerations: Enterprise Interface Builder

You can use this topic to help make decisions when planning your configuration and use of Enterprise Interface Builder (EIB). It explains:

- Why to set it up.
- How it fits into the rest of Workday.
- Downstream impacts and cross-product interactions.
- Security requirements and business process configurations.
- Questions and limitations to consider before implementation.

Refer to detailed task instructions for full configuration details.

### What It Is

EIB is an integration tool that enables you to build simple inbound and outbound integrations between Workday and external endpoints.

### Business Benefits

EIB gives you a framework to build integrations based on your unique business needs. EIB enables you to import and export Workday data in bulk, saving you time and effort when you:

- Hire a large number of workers at the same time.
- Regularly send large volumes of data to a third party in the format that they require.

With EIB, you can avoid manual re-entry of data between Workday and an external application.

You can create an inbound EIB, then generate a spreadsheet based on that EIB. You can add data to the spreadsheet, then load the spreadsheet into Workday. You can also generate a spreadsheet with prepopulated rows, enabling you to understand the data requirements for each field more easily.

For EIBs based on web service operations that use Workday business processes, you can configure the level of automation for the business process.

### Use Cases

- Import accounting journals into Workday from a spreadsheet that you provide as an attachment.
- Import data into Workday from a spreadsheet to perform a bulk business process. Example: Hiring a group of employees or requesting mass compensation changes.
- Import transactions for expense credit cards from a card issuer to process the transactions in Workday Expenses.
- Import payroll data from external providers, such as absence or time off data, to process in Workday.
- Import off-cycle payments from external providers, such as end-of-year bonuses, to perform bulk payments.
- Import payroll history from multiple external sources by consolidating into a spreadsheet before importing into Workday.
- Load supplier invoices from a spreadsheet in Google Drive to process in Workday.
- Export active employee data from Workday in XML format and send it to an external endpoint with SFTP.
- Export employee hours and billing rates from Workday in CSV format and send it to an external Amazon Simple Storage Service bucket.

- Export employee headcount and contribution data from Workday in JSON format and send it to a life insurance provider by email.

### Questions to Consider

Questions	Considerations
What data source should you use?	EIB uses custom report and web service data sources. Web services data sources retrieve data from Workday using a <i>Get</i> or <i>Find</i> operation from the Workday public API. Custom report data sources are more flexible but they require some more setup effort.  Workday requires that you specify a value for many of the fields that custom reports and web services provide. When the report or web service that you select includes many unneeded fields, use a different data source.
How should you send the data to the external endpoint of an outbound EIB?	Ensure that your external endpoint is compatible with the transport protocol of your EIB. Example: HTTPS, SFTP.

### Recommendations

- Use the [Workday Web Service API documentation](#) to review available inbound and outbound web service operations.
- For outbound EIBs, review available Workday reports and report data sources to find reports that match your data needs.
- Determine the type of external endpoint for outbound EIBs, such as email server or SFTP server, and use the corresponding transport.
- When the web service operation of an inbound EIB is based on a Workday business process, review the business process definition. In your EIB spreadsheet, configure the processing rules of the business process to suit your business needs.

### Requirements

No impact.

### Limitations

EIBs can only use 1 data source:

- Inbound EIBs can use only 1 Workday Web Service operation as a data source.
- Outbound EIBs can use only 1 custom report or Workday Web Service operation.

EIBs include all fields from the web service operation or custom report. You can't select which fields to include or exclude.

Outbound EIBs can't export data in XSLX format. You can export data in CSV format, then import the CSV file into Microsoft Excel.

### Tenant Setup

No impact.

## Security

These domains in the Integration functional area:

Domains	Considerations
<i>Integration Build</i>	Enables you to: <ul style="list-style-type: none"> <li>Create or edit an EIB.</li> <li>View an integration system or EIB.</li> </ul>
<i>Integration Configure</i>	Enables you to configure an EIB.
<i>Integration Event</i>	Enables you to: <ul style="list-style-type: none"> <li>Launch an EIB.</li> <li>View resulting integration events for the EIB, including integration output documents.</li> </ul>
<i>Integration Reports</i>	Enables you to view integration reports, including reports for integration events, exception audits, messages, and integration IDs.
<i>Integrations: EIBs</i>	Enables you to set up and launch an EIB.

To schedule and launch an EIB, you must have:

- Access to a custom report that an outbound integration uses as a data source, unless you use a security proxy to run the report from another account.
- Get permission on a Workday Web Service operation that an outbound integration uses as a data source.
- Put permission on a Workday Web Service operation that an inbound integration uses as a transport protocol.

## Business Processes

Inbound EIBs can use Workday business processes, by using the corresponding web service operation, to enter data into Workday.

## Reporting

Report or Dashboard	Description
<i>Integration Events</i>	Displays: <ul style="list-style-type: none"> <li>A summary of events that are in process or completed.</li> <li>Details about the status for each integration event.</li> </ul>
<i>Public Web Services</i>	To verify that you have access permission, select Security > View Web Service Operations Security Groups from the related actions menu of a web service.
<i>Supported Inbound EIB Operations</i>	Displays: <ul style="list-style-type: none"> <li>Available web service operations, excluding Get operations.</li> <li>The parent Workday Web Service for each operation.</li> </ul>

Report or Dashboard	Description
	<ul style="list-style-type: none"> <li>Available web service operations for generating a spreadsheet with data.</li> </ul> <p>The report also indicates whether the web service operation enables you to rescind business processes in bulk.</p>
View Integration System	Displays all EIBs that you create.
EIB Dashboard	<p>Displays worklets for:</p> <ul style="list-style-type: none"> <li>EIB integration events by EIB type.</li> <li>Success metrics.</li> <li>Success metrics by EIB type.</li> </ul> <p>You can set up the dashboard and add the worklets using the <a href="#">Maintain Dashboards</a> report.</p>
Scheduled Future EIBs Exception Audit	<p>Displays:</p> <ul style="list-style-type: none"> <li>EIBs that the owner can't launch due to insufficient security.</li> <li>EIBs that business process steps can't trigger due to insufficient security. Modify the security of the worker specified in the workflow step or assign a different worker to the business process step.</li> </ul> <p>When you don't modify the security permissions of the scheduled owner or transfer ownership of an EIB with exceptions, the integration fails with a process status of <i>Not Run due to Exceptions on Process Definition</i>.</p>

## Connections and Touchpoints

Workday integrations interact with various parts of Workday, depending on the product area, purpose, and data sources for the integration:

- Outbound EIBs extract data from Workday but don't change the data in Workday.
- Inbound EIBs add and update data in Workday.

Workday offers a Touchpoints Kit with resources to help you understand configuration relationships across your tenant. Learn more about the [Workday Touchpoints Kit](#) on Workday Community.

### Related Information

#### Concepts

[Concept: EIB Template Models and Spreadsheet Templates](#) on page 55

[Enterprise Interface Builder \(EIB\)](#)

#### Tasks

[Steps: Set Up EIBs Using Templates from Web Service Organizations](#) on page 44

[Steps: Set Up Outbound EIB](#) on page 66

[Steps: Set Up Dashboards and Landing Pages](#)

## Concept: Enterprise Interface Builder

You can use Enterprise Interface Builder (EIB) to build simple inbound and outbound integrations between Workday and external endpoints. EIB gives you a framework to build your own integrations based on your unique business needs.

EIB Type	Description
Inbound	<p>You can upload data into Workday using:</p> <ul style="list-style-type: none"> <li>• An attachment.</li> <li>• A REST-based URL.</li> <li>• A file transfer from an external SFTP, FTP/SSL, or FTP endpoint.</li> </ul>
Outbound	<p>You can export data from Workday in various formats, such as:</p> <ul style="list-style-type: none"> <li>• CSV</li> <li>• Google Data (<i>GData</i>)</li> <li>• JavaScript Object Notation (JSON)</li> <li>• Really Simple Syndication (RSS)</li> <li>• Text files</li> <li>• Workday XML</li> </ul> <p>You can then send the data to an external endpoint using various protocols, such as:</p> <ul style="list-style-type: none"> <li>• AS2</li> <li>• Email</li> <li>• SFTP, FTP/SSL, or FTP</li> <li>• HTTPS</li> </ul>

You can design EIBs with the Create EIB task, which guides your configuration with appropriate options based on the data flow. You can launch EIBs using the Launch / Schedule Integration task.

### EIB Components

An EIB has 3 components:

#### Get Data

This component can indicate:

- The data Workday receives from an external source (example: a spreadsheet of budget data) and the location of that data (example: a specific URL or FTP site).
- The data that the integration extracts from Workday. Example: a specific custom report.

#### Transform

This component converts the data into a format that Workday or the receiving external endpoint can understand. You can use a transformation that Workday delivers or create your own custom transformation.

#### Deliver

This component defines how Workday imports data from or exports data to an external endpoint. Example: email, SFTP, or web service.

## Inbound EIBs

### Steps: Set Up EIBs Using Templates from Web Service Operations

#### Prerequisites

- Access the Supported Inbound EIB Operations report to see:
  - All available web service operations, excludes Get operations.
  - The parent Workday Web Service for each operation.
  - The web service operations available for generating a spreadsheet with data, if any.
  - If the web service operation supports mass rescinding of business processes.
- Review the Workday Web Service API documentation and familiarize yourself with the details of the web service operation.
- Review the Public Web Services report to verify that you have access permission. Select Security > View Web Service Operations Security Groups from the related actions menu of a web service.

#### Context

To load large amounts of data into Workday in bulk, create an Enterprise Interface Builder integration.

#### Steps

1. [Set Up Inbound EIB](#) on page 44.  
Create an EIB based on an inbound, public Workday Web Service operation.
2. (Optional) Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Integration Event* security domain.  
See: [Steps: Grant Integration or External Endpoint Access to Workday](#).
3. From the related actions menu of the integration system for the upload, select Template Model > Generate Spreadsheet Template.  
To maintain the correct spreadsheet format, don't change the .xml or .xlsx file extension.  
Security: these domains in the Integration functional area:
  - *Integrations: EIBs*
  - *Integration Configure* (including *Get* and *Put*)
  - *Integration Event*
4. [Customize EIB Spreadsheet Template](#) on page 48.  
To customize the template, edit the EIB template model.
5. [Generate EIB Spreadsheet Template](#) on page 49.
6. [Set Up EIB Spreadsheet](#) on page 50.  
Enter business data into the spreadsheet.
7. [Launch EIB Spreadsheet Upload](#) on page 52.

## Set Up Inbound EIB

#### Prerequisites

Security:

- *Integration Build* domain in the Integration functional area.
- *Integration Process* domain in the Integration functional area.
- *Put* access to the domain that secures the web service operation or custom report that your EIB uses.

## Context

You can import data into Workday in bulk by creating an inbound EIB. You can import data using these external sources:

- A custom object spreadsheet.
- A spreadsheet based on a Workday Web Service operation.

## Steps

1. Access the Create EIB task.
2. As you complete the Get Data page, consider:

Option	Description
Retrieval Method	<p>When you select:</p> <ul style="list-style-type: none"> <li>• Amazon Simple Storage Service, enter your S3 bucket name in the Bucket field. You can't specify a folder in this field.</li> <li>• FTP/SSL, enter the address using 1 of these formats:           <ul style="list-style-type: none"> <li>• Implicit SSL: <i>ftps://x.x.x.x:port-number</i></li> <li>• Explicit SSL: <i>ftps://x.x.x.x:port-number</i></li> </ul> </li> </ul> <p>When you don't specify a port number, Workday uses port 990 for implicit SSL and port 21 for explicit SSL.</p> <ul style="list-style-type: none"> <li>• Google Drive, select a web service spreadsheet template in the Data Format section.</li> </ul> <p>Decompression, decryption, and delete after retrieval aren't available with this option.</p> <ul style="list-style-type: none"> <li>• SFTP, enter the address using this format (when you don't specify a port number, Workday uses the default):           <ul style="list-style-type: none"> <li>• <i>sftp://x.x.x.x:port-number</i></li> </ul> </li> <li>• REST URL, enter the host name or server address in <i>http://www.example.com/rest</i> format for the REST Endpoint.</li> </ul>
Directory	(FTP/SSL and SFTP only) Name is case-sensitive. Include a leading slash (/) only for a full path, not a relative path.
Use Temp File	(FTP/SSL and SFTP only) Select this check box to write the output to a randomly named file. Workday renames the file to the correct

Option	Description
	name when it completes the data transfer. This option prevents automatic scripts from retrieving the file from the FTP server before the data transfer completes.
File Name	<p>Enter the name or regular expression (regex) pattern for the file to upload into Workday. This field is case-sensitive. Workday doesn't support full regex syntax for file retrieval. Workday only supports (*) and (?) characters as wild cards in the filename pattern. For SFTP and FTP/SSL transport protocols, entering an asterisk (*) character at the start of this field isn't valid for regular expressions.</p> <p>For Amazon Simple Storage, you can retrieve files from folders using this format: <i>folder1/folderN/filename.format</i>.</p>
Decrypt Using	(FTP/SSL and SFTP only) To decrypt the uploaded file using Pretty Good Privacy (PGP), select the PGP private key of the key pair you generated to decrypt the inbound integration file.
Restricted To	<p>Select the target environment for this transport protocol.</p> <p>When you don't select an environment, Workday applies the retrieval method to each environment in which the integration runs.</p> <p>Each environment can have only 1 transport protocol. To ensure that you don't exchange data between test and nontest endpoints, create a separate transport for each environment.</p>
File Type	<p>Select:</p> <ul style="list-style-type: none"> <li>• <i>Web Service Spreadsheet Template</i> to import data into a web service using a spreadsheet. Select a public, inbound web service operation from the Web Service Operation prompt.</li> <li>• <i>Custom Object Spreadsheet Template</i> to import data into a custom object. Select an active custom object definition from the Custom Object prompt. These items aren't available:           <ul style="list-style-type: none"> <li>• Custom object definitions that you haven't activated yet.</li> <li>• Custom objects that use instance references.</li> <li>• Effective-dated custom objects.</li> <li>• Multi-instance custom objects that don't have their Reference ID set.</li> </ul> </li> </ul>

3. (Optional) As you configure the Details section for your delivery method, consider:

Option	Description
Decrypt Using	(FTP/SSL and SFTP only) Select a PGP private key of the key pair that you generated to decrypt the inbound integration file.  When you decrypt an inbound integration file, you can also: <ul style="list-style-type: none"> <li>Include an integrity check of the data in the file.</li> <li>Digitally sign the file.</li> </ul>
Force Integrity Check	(FTP/SSL and SFTP only) To verify that the encrypted file didn't become altered or corrupt during transport, select this check box.
Digital Signature Validation Using	(FTP/SSL and SFTP only) To verify the origin of the encrypted inbound file, select a PGP public key provided by your trading partner.

4. As you complete the Transform page, consider:

Option	Description
Transformation Type	Select from: <ul style="list-style-type: none"> <li><i>Custom Transformation</i>: Select a custom transformation that you created on the Create XSLT Attachment Transformation task.</li> <li><i>Template Model</i>: Only applicable if the format of the data source is a spreadsheet template.</li> <li><i>Delivered Transformation</i>: Don't use.</li> </ul>

5. As you complete the Deliver page, consider:

Option	Description
Delivery Method	Select a method to define the destination of the inbound data.

## Next Steps

When your data source is a spreadsheet template based on a web service operation:

- Generate a spreadsheet template.
- Generate a spreadsheet template populated with Workday data.

When your EIB uses the Google Drive retrieval method:

- Select Enterprise Interface > Authorize for Google Drive from the related actions menu to authenticate with Google.
- Select a Google account to store and retrieve EIB spreadsheets. Grant permission for Workday to manage Google Drive files that you've created with Workday.
- Use the Workday Account > Edit related action to assign an integration system user to run the EIB.
- Use the Enterprise Interface > Assign Google OAuth Token to Workday Account related action to assign the Google Drive OAuth Token you created to the integration system user you assigned.

Launch or schedule the integration to upload data into Workday.

## Related Information

### Reference

[Bucket Restrictions and Limitations](#)

## Customize EIB Spreadsheet Template

### Prerequisites

- Generate a baseline EIB spreadsheet template and review the spreadsheet details.
- Security: These domains in the Integration functional area:
  - *Integrations: EIBs*
  - *Integration Configure*
  - *Integration Event*

### Context

You can customize EIB spreadsheets to meet business requirements by modifying the worksheets, areas, and columns of the template model.

You can create multiple versions of a template model for the same data source type, but each version requires its own EIB definition. However, when you populate multiple spreadsheets based on the same template model, you can use the same EIB for each upload.

### Steps

1. Select Template Model > View as a related action on the integration system.
2. (Optional) To hide an area, select Template Model Area > Hide from the related actions menu on the section.
3. (Optional) To edit column values, select Template Model Column > Edit Details from the related actions menu on the column.

The combined list of reference IDs for permitted values must not exceed 255 characters to ensure that the spreadsheet displays the permitted values.

Note: Shortening reference IDs can cause other integrations to fail.

4. As you complete the Edit Template Model Sheet or Edit Template Model Area task, consider:

Option	Description
Separate Type Column	Select this check box to ensure that each cell in the ID Value column provides a prompt listing all valid ID values.
Value Override	Workday adds this value to the spreadsheet when the integration runs.
Reference ID Type	When more than 1 reference ID type is available, Workday populates the first type alphabetically. You can select a different type from the prompt.

5. (Optional) To insert columns for fields that accept multiple values, such as worktags, select Template Model Column > Maintain Additional Columns from the related actions menu of a column. Example: You can create additional worktag columns in a financial spreadsheet and assign multiple worktags to a single entry line.
6. (Optional) To customize the template for a web service operation based on a business process, select Edit Business Processes for Template Model on the Business Process tab.

## Next Steps

Generate an EIB spreadsheet template.

Related Information

### Reference

[Reference: Integrations and Web Service Limits](#)

## Generate EIB Spreadsheet Template

### Prerequisites

- Customize your EIB Spreadsheet Template.
- Security: These domains in the Integration functional area:
  - *Integration Configure*
  - *Integration Event*
  - *Integrations: EIBs*

### Context

You can generate an EIB spreadsheet template to populate with data from an external source. You can either:

- Generate an empty spreadsheet.
- Generate a spreadsheet with data.

Generating a spreadsheet with data enables you to understand the data requirements more easily by showing current Workday data along with the column labels. You can use the Supported Inbound EIB Operations report to identify which web service operations support generation with data.

When you generate a spreadsheet using the Web Service Spreadsheet Template file type, Workday displays the web service version on the generated spreadsheet.

### Steps

1. Access the View Integration System report.
2. From the Integrations System prompt, select your EIB.

You can enter the name of the EIB or search alphabetically or by template category.

To filter by a list of mostly EIBs, select By Template Category > Integration.

To determine whether an integration system is an EIB:

- a. Access the related action menu of the integration system.
- b. Verify that Enterprise Interface Builder displays in the Integration Template field.

If you don't find the EIB you need, you can select *Create*. You must have access to create integration systems.

3. Select Template Model > Edit from the related actions menu of the EIB.
4. (Optional) To generate a spreadsheet with data, select Edit Template with Data Options. Configure a Filter for your template:

Option	Description
Reference ID	Specify 1 or more ID and ID Type pairs.

Option	Description
Condition Rule	Specify 1 or more rule conditions. If Workday displays an error message, use a reference ID filter instead.

Workday doesn't require a filter for EIBs created before v28.2 that have support for spreadsheet generation.

5. From the related actions menu of the EIB, select 1 of:

- Template Model > Generate Spreadsheet Template

You can generate XLSX spreadsheets in Google Drive when you configure your EIB with the Google Drive retrieval method and a Google OAuth Token. Workday uses the token linked to the EIB that you selected on the Integration System configured for Template Model field to generate a spreadsheet in the associated Google Drive. To avoid formatting errors, we recommend not converting the spreadsheet into a Google Sheet.

- Template Model > Generate Spreadsheet with Data

When you open and save an XML spreadsheet, Excel truncates fields with base64 data or other long text fields that exceed 32,767 characters.

For XLSX spreadsheets, Workday requires that you edit the template model to hide any columns with base64 or other long text fields that exceed the 32,767 character limit.

#### Related Information

##### Tasks

[Create Integration System](#) on page 1967

## Set Up EIB Spreadsheet

### Prerequisites

- Generate an Enterprise Interface Builder (EIB) spreadsheet template in Workday.
- Retrieve the required reference IDs using the Integration IDs report. Spreadsheet columns with a format of Lookup must be populated with a reference ID.
- Security: *Business Process Administration* domain in the System functional area.

### Context

You can save time when transferring data in bulk from other applications into Workday by entering reference IDs and business data into an EIB spreadsheet. For business processes, you can select processing options in your spreadsheet to trigger review and approval workflow, or automatically complete workflow steps. You can also process and perform actions in Workday with the data you upload.

### Steps

- (Optional) For high-volume business process EIBs, run the Business Process Configuration Options report to identify allowed subprocesses for your business process.

When your business process configuration includes subprocesses that have no corresponding spreadsheet section, you can run the spreadsheet upload for the supported subprocesses. However, you must complete the unsupported subprocesses in Workday.

When the spreadsheet is based on an Import Web Service operation with multiple business subprocesses, Workday displays separate sheets for each subprocess and for the:

- Header sheet.
- Line sheet for the business process. Line keys must be unique across header keys.
- Overview sheet for business processes and subprocesses.

2. Open your empty spreadsheet template.
3. (Optional) For high-volume business processes, select an option in the Processing Instruction prompt to specify the level of workflow automation for the main process and each supported subprocess.

Option	Description
Manual Processing	<p>When you select this option for a subprocess, you can enter partial data in the corresponding spreadsheet section and the remaining data in Workday.</p> <p>Provide all required data for the main process, even when the automation level for this process is manual.</p>
Automatic Processing	<p>When available on a business process, Workday automatically completes workflow steps for a process or subprocess and bypasses:</p> <ul style="list-style-type: none"> <li>• Approvals</li> <li>• Document reviews</li> <li>• Questionnaires</li> <li>• Notifications</li> <li>• To do tasks</li> </ul> <p>Enter data in all of the fields marked Required in the related worksheet. These fields represent the minimum amount of data required to automate the business process fully. Your business process configuration might require other fields.</p> <p>The EIB load initiates the event and finishes. Workday processes the workflow steps and subprocesses of the event asynchronously. The EIB can complete quickly but the overall business process can take longer to complete in the background.</p>
Skip Processing when Step is marked Optional	This option is only available on subprocesses.
Run Now Run Now with Automatic Processing	<p>Select to complete the business process before the EIB finishes loading. Although this option causes the business process to complete more quickly, it affects the performance of the EIB load. Example: Select when you want to chain together:</p> <ul style="list-style-type: none"> <li>• An EIB and a Studio integration and the subsequent integration depends on the EIB completing.</li> <li>• Multiple EIBs.</li> </ul>

Note: Workday recommends selecting a Processing Instruction for each subprocess row.

You can also enter an optional Processing Comment that Workday adds to the business process event for each worker.

4. Manually populate the spreadsheet with the required reference IDs to protect cell formatting.

**Note:** When you copy and paste reference IDs from the Integration IDs report, you can overwrite the data type format of the spreadsheet cells.

Columns that contain reference IDs enable you to select a specific reference ID type.

5. Provide any other necessary information.

#### Related Information

##### Concepts

Concept: [Inbound EIB Template Guidelines](#) on page 89

## Set Up Business Process Security for EIB Upload

#### Prerequisites

Security: *Security Configuration* domain in the System functional area.

#### Context

Before you upload data into a high-volume business process with the Enterprise Interface Builder (EIB), configure security for the web service that initiates the business process.

#### Steps

1. Access the View Security for Securable Item report.
  2. In the Domain Item field, search for the business process that receives data from the spreadsheet upload.
- Note:** Due to naming differences in the time off business processes and web services, use the web service name to find the correct domain item. Search for *Adjust Time Off* rather than *Correct Time Off* and *Enter Time Off* instead of *Request Time Off*.
3. From the search results, select the web service task that corresponds to the business process.
  4. Select Business Process Policy > Edit from the related actions menu of the applicable business process listed in the Initiating Action for Business Process column.
  5. Under Who Can Start the Business Process, find the web service initiating action for the business process. Example: *Request One-Time Payment (Web Service)*.
  6. Select 1 or more Security Groups that can launch the business process through the web service. Example: Select *Compensation Administrator* for a one-time payment upload.

#### Next Steps

Enable the new security policy using the Activate Pending Security Policy Changes task.

## Launch EIB Spreadsheet Upload

#### Prerequisites

- Set up your inbound Enterprise Integration Builder (EIB) integration.
- Generate a spreadsheet template in Workday and populate it with data.
- Security:
  - *Put* permission on the Workday Web Service that your EIB uses as a transport protocol.
  - *Integrations: EIBs* domain in the Integration functional area.
  - *Integration Event* domain in the Integration functional area.

## Context

To import spreadsheet data into Workday, launch an EIB upload. Run every EIB upload process in a sandbox environment before uploading data into your production environment. To troubleshoot errors before you run a full upload, select these launch options:

- Validate Only Load
- Add Errors to Attachment

## Steps

1. Access the Launch / Schedule Integration task.  
You can't select an integration system with *Critical* errors.
2. On the Integration prompt, select the EIB to launch.
3. (Optional) To schedule an integration for later, select another frequency on the Run Frequency prompt.
4. As you configure the Integration Criteria, consider:

Option	Description
Integration Attachment	Select an existing file or create a new attachment.
Load Error Limit	The default Load Error Limit is <i>Unlimited</i> , which sets the limit to 10000 errors before Workday stops processing the upload. To change the limit, select an option between 1 and 10000.  Load Error Limit isn't available to EIBs that use: <ul style="list-style-type: none"> <li>• Web services that use custom objects.</li> <li>• Import web services.</li> </ul>
Validate Only Load	(Not available for EIBs that use custom objects.)  Select this check box to create a trial run before performing an actual upload.  Workday validates the data until it reaches the Load Error Limit, after which it attaches a failure report to the integration event.  Validate Only Load applies only to validations that Workday documents in the Workday API documentation. Documented validations include line level validations but don't include: <ul style="list-style-type: none"> <li>• Custom validations or validations that occur postprocessing.</li> <li>• Validations that occur at the operation level after Workday persists data.</li> </ul>
Add Errors to Attachment	(Not available for EIBs that use Import web services. Use the Errors & Warnings Spreadsheet instead.)  Select this check box to create an Excel spreadsheet attachment in the Integration Events report. Workday inserts comments in the <i>key</i> fields of rows that have errors.

Option	Description
Errors & Warnings Spreadsheet	<p>(Available only for EIBs that use Import web services.)</p> <p>Select this check box to create an Excel spreadsheet attachment in the View Background Process report for the EIB upload.</p> <p>The spreadsheet includes only headers and lines that have standard and custom validation errors and warnings.</p> <p>The integration generates messages after completing the Import Web Service requests. Workday inserts comments about these errors and warnings in the <i>Header Key</i> field of each row.</p>
Handle Import Processing Errors	<p>(Available only for EIBs that use Import web services v43.0 or greater.) Selected by default. Enables Workday to report on these types of import processing errors:</p> <ul style="list-style-type: none"> <li>• Update conflict errors. Example: Duplicate record inserts.</li> <li>• Custom validation errors.</li> </ul> <p>When Workday encounters these types of errors, it reports them on the View Background Process page. If the EIB fails to load, you can view the error and address the issue. When you clear the check box, Workday no longer reports these types of errors on the View Background Process page.</p>
Google Drive File	<p>(Only available for EIBs that use the Google Drive retrieval method.) Select a file to retrieve from Google Drive. Workday retrieves the spreadsheet based on the unique Google Drive File ID assigned when you generate the spreadsheet.</p>

## Result

The integration runs at the scheduled time, uploading the data as if you entered it manually.

[API Documentation: Workday Web Services Directory](#)

## Concept: EIB Template Models and Spreadsheet Templates

To load data into Workday using Workday Web Services, Workday provides template models and corresponding spreadsheet templates. The template model:

- Represents the columns associated with a particular Workday Web Service definition.
- Provides the basis for both generating a spreadsheet template and transforming spreadsheet data during an upload.

### Generating Template Models

Each spreadsheet template is based on a template model that defines the column information for an upload. When you generate a spreadsheet using the Web Services Spreadsheet Template file type, Workday displays the web service version on the generated template. To simplify data entry and streamline the upload process, you can edit the template model. Examples:

- Override column values.
- Provide your own labels and cell comments.
- Reorder worksheets.
- Hide unwanted items to customize the template for a specific purpose.

To update the web service version of your template model without losing customizations, you can use the Generate Merged Template Model related action.

To configure a spreadsheet upload, use the Create EIB task. When you select a spreadsheet template as a data source, Workday completes the EIB configuration by:

- Creating a template model.
- Selecting a data transformation.
- Selecting a Workday Web Service.

From the related actions menu of the EIB, you can view and edit the template model and generate your own spreadsheet template for data entry.

You can create multiple template models for different purposes. Example: To upload annual compensation changes into several plan types, you can create separate template models for:

- Base pay.
- Bonus plan data.
- Allowance plan data.

For each template model, you can hide the columns that aren't relevant to that compensation plan. Each version of a template model requires a separate EIB.

### Spreadsheet Templates Based on Business Processes

Some spreadsheet templates load data into Workday business processes. To manage the online workflow that an upload triggers, you can:

- Enforce or bypass certain business processes when you prepare the spreadsheet.
- Specify whether Workday performs a business process automatically or manually.
- Cancel or rescind certain business processes to undo the results of an upload.

### Generating Spreadsheets with Data

For some web service operations, you can generate a spreadsheet with existing data from your Workday tenant. By using this option, you can make the data entry process easier by showing current Workday data along with the column labels.

Don't generate a spreadsheet with data:

- As a means of sending data to an external endpoint, such as payroll processing.

- For validation of loaded data.
- To receive setup data or functionality.
- To learn how to populate EIB spreadsheets.

Workday orders the data in the prepopulated spreadsheet by WIDs of the filter criteria. Workday prepopulates a maximum of 50,000 items matching the filter criteria.

If you configure a Reference ID with an invalid ID value, you won't be able to generate a spreadsheet with data.

## Concept: EIB Spreadsheet Data Entry Guidelines

For troubleshooting information and examples of how to populate the spreadsheet for common EIBs, see: [Concept: Inbound EIB Template Guidelines](#) on page 89

Note: Additional restrictions apply when using spreadsheets with custom object data.

### Template

- Always generate a spreadsheet template in Workday for the upload.
- Keep the template in its original *XML Spreadsheet 2003* or XLSX format. Don't save a template to any other format.
- Add only data values to the generated spreadsheet. Don't make formatting changes, introduce hard breaks or returns, use formulas, rearrange rows or columns, or add new rows and columns. Doing so can cause the upload to fail. When adding data to an XLSX spreadsheet, ensure that there are no whitespace characters. XLSX treats whitespace characters, such as spaces, as values. To prevent translation issues:
  - Avoid using multiple fonts in XML spreadsheets.
  - Use XSLX spreadsheets if you require multiple fonts for your data.

You can make a limited number of spreadsheet changes by editing the template model associated with your EIB. Example: you can customize the template for a specific purpose by:

- Overriding column values.
- Providing your own labels and cell comments.
- Reordering worksheets.
- Hiding unwanted items.

### Editing or Deleting Data

For some web services, you can use an EIB spreadsheet to update or delete existing data in Workday. You can enter new values in spreadsheet cells to replace existing values.

Note: Some web services don't support partial updates. To avoid unintentionally deleting data, Workday recommends that you populate the spreadsheet with all existing data.

For some web service that supports updating data, you can delete data by entering *{empty}* in spreadsheet cells. You can only delete values in these field types:

- Boolean
- Date
- Lookup
- Number
- Text

Example: To replace or delete position data in Workday, enter these values in your EIB spreadsheet:

Spreadsheet Column (Field)	Current Data in Workday	Inbound Spreadsheet Data	Result in Workday
Updated Position ID	388.8	{empty}	No value in field.
Employee Type	Regular	Regular	Regular
Job Profile	Staff Recruiter	30350 (Workday reference ID for Senior Recruiter)	Senior Recruiter

## Updating Records

Some EIB templates enable you to update an existing record in Workday. To update an existing record, specify its Reference ID.

This example displays how to change the staffing model for the Information Technology department from Job Management to Position Management:

Spreadsheet Column (Field)	Current Data in Workday	Inbound Spreadsheet Data	Result in Workday
Organization Name	Information Technology	Information Technology	Information Technology
Organization Reference ID	2500.5	2500.5	Identifies all other entries in spreadsheet row as updates to existing organization.
Job Management Enabled	Y	N	Disables Job Management for the organization.
Position Management Enabled	N	Y	Enables Position Management for the organization.

## Loading Multiple Values

You can enter multiple values in multiselect fields by adding rows immediately after the first row for the multiselect field. Only enter data in key and multiselect fields. Workday ignores values that you enter beyond the key and multiselect fields.

When a spreadsheet template has multiple key fields, specify values for each on the additional rows.

Example: The Cost Center field accepts more than 1 value. To add multiple cost centers, specify only the Employee ID key field in the additional rows. Specify a reference ID for each Cost Center:

Employee ID	Employee Name	Company	Cost Center	Region
E01032	Julie Smith	2501.21	61200	2503.42
E01032			61210	

## Multi-Instance Custom Objects with Custom Object v2 Web Service Operations

You can create, update, and delete existing data for multi-instance custom objects in Workday using an EIB spreadsheet.

The Action column cells in the spreadsheet include a dropdown with Create, Update, and Delete options. To update existing data for a multi-instance custom object, specify its Reference ID. Ensure reference ID values are unique. Subsequent rows in the EIB with duplicate reference ID values overwrite previous rows.

Each multi-instance item must be on a separate row, with the spreadsheet key repeated on each row. Workday ignores records with comma-separated multi-instance items in a single cell.

Workday recommends that you populate the spreadsheet with all existing data to prevent data override if:

- You don't specify a reference ID.
- The web service for the EIB doesn't support partial updates.

To preserve historical changes in effective-dated custom object data, Workday recommends that you load data from oldest to most recent effective date.

### **Multi-Instance Custom Objects with Custom Object v1 Web Service Operations**

You can update existing data for multi-instance custom objects in Workday using an EIB spreadsheet based on one of these web services:

- *Edit Job Requisition Additional Data*
- *Edit Position Restrictions Additional Data*
- *Edit Worker Additional Data*
- *Put Job Application Additional Data*

To update existing data for a multi-instance custom object, specify its Reference ID. Ensure reference ID values are unique. Subsequent rows in the EIB with duplicate reference ID values overwrite previous rows. Workday recommends that you populate the spreadsheet with all existing data to prevent data override if:

- You don't specify a reference ID.
- The web service for the EIB doesn't support partial updates.

To preserve historical changes in effective-dated custom object data, Workday recommends that you load data from oldest to most recent effective date.

You can enter data for:

- Multi-instance reference fields by specifying a comma-separated list of reference IDs.
- Multi-instance custom list fields by specifying a comma-separated list of web service alias list values.

### **Required Data**

- Each worksheet section, or area, indicates whether an element is optional or required.
- Each column in the spreadsheet indicates whether a field is optional or required.

Note:

Workday displays *Optional* in the Restrictions row and doesn't display an asterisk or multi-occurs (+) next to the field name for:

- Required single- and multi-instance reference fields.
- Reference fields that you don't configure as single- or multi-instance.
- Required single- and multi-instance custom list fields.

### **Default Data**

- Some fields have default values. If the spreadsheet requires a field, and you want to use the default value, leave the field blank in the spreadsheet. EIB inserts default values before checking required fields for a value.
- To override a default value, enter *{empty}* in the spreadsheet cell.
- Use the spreadsheet key to coordinate the header information throughout the tabs of the spreadsheet. Keep the same spreadsheet key for each row as you add information in the subsequent tabs. Workday requires the spreadsheet key to coordinate multiple child rows that roll up to the same parent row.

### **Data Types**

- Each column in the spreadsheet indicates the data type.
- Columns with formats such as *YYYY-MM-DD*, *Y/N*, *Text*, or *Number* accept data only in the specified format.

- Dates must always be in *YYYY-MM-DD* format.
- Spreadsheet cells provide basic data validation for text, date, numeric, and currency formats only.
- To protect cell formatting, enter values manually or reapply the correct formats if you paste data from another spreadsheet or report.
- For rich text fields, ensure that you enter data that is valid HTML markup. Example: to enter *Sales Goal < \$4000*, enter *Sales Goal &lt; \$4000* in the spreadsheet cell. To enter line breaks, enter *<br>* in the spreadsheet cell.

## ID Type Columns

- For any Reference ID column, you can select the Reference ID Type from a drop-down list. This action applies the selected Reference ID Type to all row of data in the column.
- Columns identified as holding *ID Type* values enable you to select a Reference ID Type for each row of data. Example: if you're loading employees and contingent workers in a single EIB, select the Reference ID Type for each person/row.
- If Reference ID values are empty in Workday, assign values with the Maintain Reference IDs task. Assign Reference IDs before you can upload data.

You can also assign Reference IDs using the *Put Reference* web service operation or EIB.

## ID Columns

When left blank, some ID columns trigger the Workday ID generator to assign new ID values during the upload. To find out if Workday generates IDs automatically, refer to the spreadsheet comments in ID columns.

## Formatting Reference IDs

Workday formats Reference ID fields as text fields to retain trailing zeros. If the spreadsheet upload process fails to recognize a reference ID, enable trailing zeros for the field formatting.

Example: The spreadsheet converts the ID to 345.45 by dropping the zero under these conditions:

- The reference ID for a company insider type is 345.450.
- The Company Insider Types field has a format of *General* which doesn't support trailing zeros.

Note: To prevent XML-formatted spreadsheets from rounding numbers in text fields, add an apostrophe before the numerical value in each field.

### Tasks

[Set Up Reference IDs](#) on page 2307

## Concept: Guidelines for Spreadsheets That Launch a Business Process

### Data Entry

- Most spreadsheets have separate tabs for the main business process and each supported subprocess. Within each tab, Workday groups columns of related data into sections that correspond to the process elements.
- Workday always marks the main business process *Required*. Include all required data for this process; subprocesses can include full or partial data.

## Automation

- Workday disregards data in the spreadsheet for a subprocess that has no business process configuration for the worker. Workday continues processing the transaction as long as the automation level is set to *Skip* or *Manual*.
- An *Optional* subprocess can contain required fields (columns). If you provide data for this subprocess, all fields are required if you set the processing level to *Automatic*.
- Set a Processing Instruction value for each subprocess row in the Overview tab. Don't leave this field blank for any row.
- The fields (columns) marked *Required* represent the minimum amount of data required to automate a process or subprocess fully. Depending on your configuration, the spreadsheet can require additional fields.
- *Automatic* processing triggers data validation that produces errors when no data is provided. Set the automation level to *Skip* for any subprocess that isn't included in your business process configuration. Set the automation level to *Skip* for any subprocess for which there's no data to update.
- If you specify full automation for a subprocess but don't provide all required data, Workday automatically populates the data where possible. If automatic population isn't possible, Workday carries forward existing data without changes.
- If you specify full automation for any of these subprocesses but don't provide all required data, Workday generates an error. Workday doesn't initiate the inbound EIB request for that worker:
  - *Assign Matrix Organization*
  - *Assign Organizations* (Create Position and Edit Position templates only)
  - *Assign Pay Group*
  - *Create Benefit Life Event*
  - *Create Workday Account*
  - *Request One-Time Payment*
  - *Request Stock Option Grant*

- For fully automated business processes, Workday automatically skips:
  - Steps that require action or approvals.
  - Steps that are both not configurable within the web service and not a subprocess on the EIB.

Workday continues to evaluate entry condition rules for *Integration* steps, *Service* steps, and *Action* steps that initiate subevents.

- The process history for an automated process displays only the completion step in the Process Monitor and Integration Events reports. It doesn't display the individual process steps. Workday identifies the person who launched the process and indicates that an external load triggered the event.

#### Included Employees

- You can include employees from multiple supervisory organizations in the same spreadsheet. Workday processes each employee using the business process configured for their supervisory organization.

The business process definition used by the EIB upload process is the same one used when a business process runs online.

- Include each employee included in a subprocess in the main process. However, a subprocess can include all or only a portion of the employees in the main process under these circumstances:
  - For leave of absence uploads. The list of workers submitted for a subprocess can be a subset of the workers in the main process.
  - For hire, terminate, and edit position uploads. The list of workers submitted for a subprocess doesn't have to match the workers in the main process. This option is available as long as the subprocess uses manual processing. If you want to automate the upload fully, all workers in the spreadsheet must have identical processing requirements. If you have data for some processes and not others, set the automation level to *Automatic* for processes with data. Set the automation level to *Skip* for subprocesses without data (or *Manual* for required subprocesses without data). If some employees skip a subprocess and others require an auto-process update for the

same subprocess, perform separate spreadsheet uploads.

## Reference: Inbound Transport Protocol Types for EIBs

### Overview

An inbound transport protocol tells Workday how to load data into Workday. When creating an integration transport protocol for an EIB, Workday supports these transport protocol types to import data:

Custom Object

Imports data into Workday by using a Custom Object definition. You can create an inbound integration that has a spreadsheet template as a data source. Workday selects the correct Custom Object transformation to deliver the data.

Workday Web Service

Imports data into Workday using a Workday Web Service.

## Reference: Inbound Integration Transformations for EIBs

An integration transformation defines how Workday converts inbound data between Workday and external endpoints. Workday supports these transformations:

- Template model.
- Delivered transformations:
  - *ACH Returns Inbound File Upload Service*
  - *AMEX Credit Card KR1025 Transformation Inbound*
  - *Currency Conversion Rates from Foreign Exchange Site*
  - *Schwab 401K Spreadsheet Upload*
  - *VISA BofA SBF Transformation*
- XSLT attachment transformations. XSLT attachment transformations are custom transformations that you create using Extensible Stylesheet Language Transformations (XSLT).

## Reference: Inbound Integration Data Sources

An integration data source tells Workday how to retrieve data from an external endpoint. If you're uploading a file in Workday XML format, place each web service request in the file in a `<root>` element. Since your file can include an arbitrary number of web service requests, Workday identifies each `<root>` element and its contents as a separate web service request. Workday supports these types of integration data sources.

Attachment

Attaches a file during upload.

FTP/SSL

Exchanges data with external endpoints using an FTP server over a Secure Sockets Layer (SSL). Workday supports FTP with passive mode; Workday doesn't support active mode. Workday supports implicit and explicit SSL.

Active and Passive Mode:

- Workday doesn't support Active mode processing for FTP/SSL or FTP.
- Passive mode enables Workday to use a random unprivileged port for communication.

This mode doesn't require the server to establish a connection to the client.

#### Implicit and Explicit SSL:

- Implicit SSL automatically encrypts connections between FTP clients and servers. For implicit SSL, the FTP server defines a specific port for the client (990). The address string format for implicit SSL is `ftpsi://x.x.x.x`.
- Explicit SSL enables FTP clients to explicitly activate encryption on connections. Explicit SSL connections use port 21. If Workday is unable to establish a secure connection, it transfers the data using the basic unencrypted FTP protocol. The address string format for explicit SSL is `ftpse://x.x.x.x`.

#### REST URL

Workday can:

- Provide the results of a custom report by using REST-based web services.
- Upload the data found at the REST-enabled URL.

#### SFTP

Retrieves a file from the specified SFTP endpoint.

## Reference: EIB Upload Reports

Workday records the data upload as an integration event. You can configure notification messages for integration events. To view EIB process details and integration messages, access these reports:

Report	Security Domain	Purpose
Process Monitor	<i>My Reports</i>	<p>View status of background processes that are currently running or completed.</p> <p>Report displays:</p> <ul style="list-style-type: none"> <li>• The start date and time.</li> <li>• The process type and name.</li> <li>• The request name.</li> <li>• Status of the process.</li> <li>• Who started the process.</li> <li>• Percent complete.</li> </ul> <p>View process messages by drilling down on the numbers in the <i>Errors &amp; Warnings</i> column.</p>
Integration Events	<i>Integration Event</i>	<p>View status of EIB upload process.</p> <p>Report displays:</p> <ul style="list-style-type: none"> <li>• The date and time that you launched the upload.</li> </ul>

Report	Security Domain	Purpose
		<ul style="list-style-type: none"> <li>• Who started the upload.</li> <li>• The status of the upload.</li> <li>• The event response message.</li> </ul> <p>To open the View Background Process report, select a specific integration event. The View Background Process report summarizes the data load results on the Integration Details tab. Verify the number of uploaded records, failed records, and the completion percentage. Access a failure report if the upload was unsuccessful. If you selected the Add Errors to Attachment launch option, you can access the spreadsheet under <i>Attachment With Failure Details</i>.</p> <p>Select View Consolidated Report and Logs or View Performance Logs to view additional details about the integration event. These tasks aren't available when:</p> <ul style="list-style-type: none"> <li>• The consolidated report has expired.</li> <li>• The consolidated report is larger than 10MB.</li> <li>• The consolidated report doesn't exist.</li> <li>• You deleted the integration system.</li> </ul>
Integration Messages	<i>Integration Event</i>	<p>View status summary and details of the EIB upload.</p> <p>Report includes links to the View Integration System and View Background Process report for the EIB upload.</p>

## Example: Generate EIB Spreadsheet Template with Data

This example illustrates how to generate an EIB spreadsheet template with data.

### Context

You set up an EIB to bulk import supplier invoices into Workday. You want to populate the EIB spreadsheet with data in the correct format. To guide your data entry, you generate a spreadsheet template with data from your tenant. Workday requires you to configure a filter to generate a spreadsheet with data.

## Prerequisites

- Set up an inbound EIB named *Submit Supplier Invoice EIB* using the *Submit Supplier Invoice* web service.
- Security:
  - *Integration Build* domain in the Integration functional area.
  - *Set Up: System* domain in the System functional area.

## Steps

1. Access the View Reference IDs report.
2. From the Business Object prompt, select *Supplier Invoice*.
3. Click OK.
4. Note the first 5 reference ID values on the grid.
5. Access the View Integration System report.
6. Select *Submit Supplier Invoice EIB* from the Integration System prompt.
7. Click OK.
8. Select Template Model > Edit from the related actions menu of the EIB.
9. Click Edit Template with Data Options.
10. In the Filter section, add 4 rows to the grid.
11. In the ID column on each row, specify the reference ID values you noted.
12. Click OK.
13. On the Edit Generate Spreadsheet Template with Data Options page, click Generate Spreadsheet Template with Data.
14. Select the Generate Spreadsheet with Data check box.
15. Click Submit.
16. Click Refresh until the generation completes.
17. To download the spreadsheet, select the file in the Output Files section.

## Next Steps

Open the spreadsheet and note the formatting requirements of the supplier invoice data for the reference IDs you entered.

## FAQ: EIB Spreadsheet Templates

Can I use the same spreadsheet to load data with different reference IDs?

Yes. You can modify the spreadsheet template model to split a column into:

- ID type, a lookup column where you select the type of reference id.
- ID value, a column where you enter the reference id.

Example: To upload data for both employees and contingent workers, you can add an Employee Type ID column that enables you to select Contingent\_Worker\_Type\_ID, WID, or Employee\_Type\_ID.

1. Select Template Model > View from the related actions menu of the integration system.

2. In the right pane, navigate to the template model area and select Edit Template Model Area.
3. In the Area Details grid, access the row for the data you want to load and select Separate Type Column.
4. Select Template Model > Generate Spreadsheet Template from the related actions of the template model.

How can I find reference IDs?

Access the Integration IDs report and specify the appropriate Business Object at the prompt. Each lookup column in the spreadsheet contains a comment that identifies the relevant business object and reference ID type.

Where is there a list of EIB templates to select from?

Access the Supported Inbound EIB Operations report to see a list of templates for Workday Web Services. You can use these templates to set up EIB integrations. The report lists:

- All available web service operations that Workday makes available for inbound EIB integrations, excluding Get operations.
- The parent Workday Web Service for each operation.
- If the web service operation supports mass rescinding of business processes.
- The web service operations available for generating a spreadsheet with data, if any.

Run the report for all web services to see which operations can generate a spreadsheet with data.

How can I use more than 1 ID type per column?

Access the Template Model for your EIB. In the Edit Template Model Sheet or Edit Template Model Area tasks, select the Separate Type Column check box. Then, generate a spreadsheet from the EIB template. Each cell in the ID Type column provides a drop-down listing all valid ID values.

## Outbound EIBs

### Steps: Set Up Outbound EIB

#### Prerequisites

Determine the data source (web service or custom report) that best fits your needs.

#### Context

You can export Workday data in bulk to an external endpoint using an outbound EIB. You can configure your EIB to get data from 1 of these data sources:

- Web service. You can select a public, outbound Workday Web Service operation.
- Custom report. You can select (or create and select) a custom report.

## Steps

1. (Optional) For custom report EIBs, select the Enable As Web Service check box when you create the custom report.
2. Create a data source for the outbound EIB:
  - (Web service) [Create Web Service Data Source](#) on page 72.
  - (Custom report) Steps: [Create Advanced Reports](#).
3. (Custom report) [Create Security Proxy to Grant Report Access](#) on page 73.
4. (Web service) [Set Up Launch Parameters for Web Service Data Source](#) on page 74.
5. [Set Up Outbound EIB](#) on page 67.
6. Grant the Integration System User *Get* and *Put* access to the *Integration Event* domain.  
See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

## Set Up Outbound EIB

### Prerequisites

- Security: *Integration Build* domain in the Integration functional area.
- Create a security proxy to grant report access when:
  - Your integration uses a custom report data source.
  - The integration owner doesn't have permission to run the report.

### Context

To export data from Workday to an external endpoint, you can create an outbound Enterprise Interface Builder (EIB) integration. You can export data from Workday using these data sources:

- Custom reports.
- Web services.

If you plan to use a web service as your data source, you must first create the web service data source using the [Create Web Service Data Source](#) task.

## Steps

1. Access the [Create EIB](#) task.
2. As you complete the [Get Data](#) page, consider:

Option	Description
Custom Report	Select a custom report definition. Displays only custom reports that you enable for web services.
Web Service	Select the web service data source that you created using the <a href="#">Create Web Service Data Source</a> task.  See <a href="#">Create Web Service Data Source</a> on page 72.

3. As you complete the [Details](#) section, consider:

Option	Description
Alternate Output Format	Select an alternate output format to generate custom reports in a format other than Workday

Option	Description
	XML. Workday removes Workday IDs and reference IDs from these alternate formats.
Run As System User	When the integration owner doesn't have permission to run the report, select a Workday account with the appropriate permissions. Only lists Workday users that have a security proxy.

4. As you complete the Transform page, consider:

Option	Description
Custom Report Transformation	Select to format the output of custom reports.
Custom Transformation	Select a custom transformation that you created on the Create XSLT Attachment Transformation task. You can only use custom transformations for these data sources: <ul style="list-style-type: none"> <li>Custom reports that don't have an Alternate Output Format or have an Alternate Output Format of Simple XML.</li> <li>Web services.</li> </ul>
New Custom Report Transformation	When you select this option, Workday creates a new custom report transformation.

5. As you configure a Delivery Method, consider:

Delivery Method	Description
Amazon Simple Storage Service	Note: For S3 transports, add a tag to your IAM user with a key of <i>workday-type</i> and a value of <i>integration</i> . This tag is case sensitive and doesn't ignore whitespace. <ul style="list-style-type: none"> <li>Enter your S3 bucket name in the Bucket field. You can't specify a folder in this field.</li> <li>Enter a key alias for AWS KMS client-side encryption.</li> <li>Pretty Good Privacy (PGP) encryption isn't configurable for EIBs using Amazon Simple Storage.</li> <li>Select the Enable Transfer Acceleration check box to increase transfer speeds.</li> <li>When you select an option from the Storage Class prompt, you don't need to update the storage class manually in Amazon Simple Storage Service.</li> <li>To deliver files to a specific folder, enter a File Name using this format: <i>folder1/folderN/filename.format</i>.</li> </ul>
AS2	To specify a port number, add it to the end of the URL in the AS2 Endpoint field. When you don't specify a port number, Workday uses the default.

Delivery Method	Description
Email	<ul style="list-style-type: none"> <li>Separate multiple email addresses with semicolons.</li> <li>This transport protocol requires you to encrypt the outbound file by selecting a PGP public key certificate in the Encrypt Using prompt. When you don't encrypt the output, you can save the EIB but need approval from your security administrator to run it. When your security administrator overrides this requirement, you can run the EIB an unlimited number of times. If you edit the EIB later, your security administrator must approve the override again.</li> </ul>
FTP	<ul style="list-style-type: none"> <li>To specify a port number, add it to the end of the URL in the FTP Address field. When you don't specify a port number, Workday uses the default.</li> <li>This transport protocol requires you to encrypt the outbound file by selecting a PGP public key certificate in the Encrypt Using prompt.</li> <li>Directory names are case-sensitive. Include a leading slash (/) only for a full path, not a relative path.</li> <li>Select the Use Temp File check box to write the output to a randomly named file. Workday renames the file to the correct name when it completes the data transfer. This option prevents automatic scripts from retrieving the file from the FTP server before the data transfer completes.</li> </ul>
FTP/SSL	<ul style="list-style-type: none"> <li>Use these formats: <ul style="list-style-type: none"> <li>Implicit SSL: <code>fpsi://x.x.x.x:port-number</code></li> <li>Explicit SSL: <code>ftps://x.x.x.x:port-number</code></li> </ul> </li> <li>When you don't specify a port number, Workday uses port 990 for implicit SSL and port 21 for explicit SSL.</li> <li>Directory names are case-sensitive. Include a leading slash (/) only for a full path, not a relative path.</li> <li>Select the Use Temp File check box to write the output to a randomly named file. Workday renames the file to the correct name when it completes the data transfer. This option prevents automatic scripts from retrieving the file from the</li> </ul>

Delivery Method	Description
	FTP server before the data transfer completes.
HTTPS	<ul style="list-style-type: none"> <li>To specify a port number, add it to the end of the URL in the HTTP Address field. When you don't specify a port number, Workday uses the default.</li> <li>Types of web service invocation: <ul style="list-style-type: none"> <li><i>Basic Auth:</i> Basic access authentication that encodes the user name and password.</li> <li><i>No Security:</i> Indicates that you trust the connection and that the connection doesn't need security.</li> <li><i>OAuth 2.0:</i> Authorizes access using Bearer tokens. Contact your OAuth service provider to obtain token values.</li> </ul> </li> <li>When the Access Token expires, Workday uses the Client ID, Client Secret, and Refresh Token values to reach your Refresh Token URL and generates a new access token. Workday then uses the new access token to deliver the files.</li> <li><i>WS-Security User Id/Password:</i> Applies security to web service messages through the Web Services Security protocol.</li> <li>When you use an Outbound EIB with HTTP and select <i>WS-Security User Id/Password</i> or <i>No Security</i>, consider: <ul style="list-style-type: none"> <li>When you configure an XSLT transformation, the XSLT must wrap the payload using a SOAP envelope.</li> <li>When you use a custom report and the output isn't XML, add an XSLT transformation to wrap the payload using a SOAP envelope.</li> </ul> </li> </ul>
SFTP	<ul style="list-style-type: none"> <li>To specify a port number, add it to the end of the URL in the SFTP Address field. When you don't specify a port number, Workday uses the default.</li> <li>Directory names are case-sensitive. Include a leading slash (/) only for a full path, not a relative path.</li> <li>Select the Use Temp File check box to write the output to a randomly named file. Workday renames the file to the correct name when it completes</li> </ul>

Delivery Method	Description
	the data transfer is complete. This option prevents automatic scripts from retrieving the file from the FTP server before the data transfer completes.

6. Specify how long Workday retains the EIB output file in the Document Retention Policy (in Days) field.

Workday requires a retention period when you send an output file back to Workday as an attachment. Workday recommends retaining files for audit purposes when you send an output file to an external endpoint.

7. As you configure the Details section for your delivery method, consider:

Option	Description
Sequence Generator for Filename	Select a sequence generator to create output files with unique filenames.  The initiating user account that launches or schedules the integration must have security access to the sequence generator you select. Verify that the user has access to the sequence generator.
Dynamic Filename	Select this check box to enable you to configure dynamic filenames for output files for EIBs based on custom report data sources.
MIME Type	Select a Multipurpose Internet Mail Extensions (MIME) type for the output file. This option doesn't change the actual file format. To change the file format, select an alternate output format or modify your transformation.
Compressed	Select to compress the output file in ZIP format. Workday adds a .zip file extension to your output file. Workday compresses files delivered to external endpoints only. Workday ignores this check box for output files attached to the integration event.
Encrypt using	Select a PGP public key to encrypt the file.  Workday ignores the Encrypt using setting for output files attached to the integration event.  When you use FTP, FTP/SSL, or SFTP protocols to encrypt an outbound integration file, you can also: <ul style="list-style-type: none"> <li>• Include an integrity check of the data in the file.</li> <li>• Digitally sign the file.</li> </ul>
Containing Integrity Check	(FTP, FTP/SSL, and SFTP only) Select to verify that the outbound file doesn't become altered or corrupt during transport.
Digitally Sign Using	(FTP, FTP/SSL, and SFTP only) Select a PGP private key of the key pair that you generated to sign the outbound file digitally.

Option	Description
Restricted To	Select a target environment for this transport protocol.  When you leave this field empty, Workday applies the delivery method to every environment in which the integration runs. Each environment can have only 1 transport protocol. To ensure that you don't exchange data between test and nontest endpoints, create a separate transport for each environment.

## Next Steps

- When you create a custom report data source that uses a custom report transformation, configure the transformation.
- When you create a web service data source, define the launch parameters for the XML request message.

Launch or schedule the integration.

## Create Web Service Data Source

### Prerequisites

Security: *Integrations: EIBs* domain in the Integration functional area

### Context

You must first create a web service data source if you plan to use a web service as your data retrieval method in an outbound Enterprise Interface Builder (EIB) integration. The data source tells Workday how and from where to access and export the data.

### Steps

1. Access the Create Web Service Data Source task.
2. As you specify details about the web service data source, consider:

Field	Description/Notes
Web Service Operation	You can continue to use this web service data source with subsequent Workday releases. However, if you edit the data source, Workday updates the version number to the current version number.

Field	Description/Notes
Version	Keep the default setting. The initial version of a web service data source defaults to the current version of the public API.

### Next Steps

Define launch parameters for the XML request message.

Related Information

### Concepts

Concept: [EIB Template Models and Spreadsheet Templates](#) on page 55

## Create Security Proxy to Grant Report Access

### Prerequisites

Security: *Security Administration* domain in the System functional area

### Context

In an Enterprise Interface Builder integration that uses a custom report, the Workday account that launches the integration sometimes doesn't have security privileges to run the report. You can create a security proxy to grant report access.

This feature only grants access through web services. By creating a security proxy, you ensure that the integration user can access only the report, not other items that the report owner can also access.

You can specify 1 or more user accounts to access the report.

### Steps

1. Access the Create Security Proxy task.
2. Configure the proxy:

Option	Description
For Report Definition	Don't select any reports under the <i>Standard Reports by Action</i> filter. You can't use standard reports as a data source.
Expiration Date	If you leave this field blank, the proxy doesn't expire until you delete or edit the proxy.
Proxied Workday Account	Select a proxied account that has permission to access the specified report.
Authorized Workday Accounts	The authorized accounts access the report by using the credentials of the proxied account. However, the accounts can't access any other data to which the accounts wouldn't otherwise have access. Example: If the report has other ways to see data that the Workday account would ordinarily not see, the account doesn't have access to those actions.

### Result

You can now select one or more authorized Workday accounts to run the custom report in your integration. When you create the custom report data source using these tasks, the Run as System User prompt lists authorized users:

- Create Custom Report Data Source
- Create EIB

## Next Steps

To change or delete a security proxy, use the related actions menu for the proxy or access the Edit Security Proxy or Delete Security Proxy task.

# Set Up Launch Parameters for Web Service Data Source

## Prerequisites

- Create a web service data source (WSDS).
- Security: *Security Administration* domain in the System functional area.

## Context

You can define the launch parameters for a WSDS in outbound Enterprise Interface Builder (EIB) integrations. When you launch the EIB, you can specify parameter values to define what data Workday retrieves for the EIB.

Workday provides a prepopulated XML request that includes tokens you can use as input parameters. The request contains all subelements, including subelements that are optional or mutually exclusive to other subelements. You can edit the prepopulated request XML to remove unwanted tokens and subelements. You can create launch parameters for the tokens that you keep.

The XML request and launch parameters for a particular WSDS apply to all integration systems that use that data source. However, you can specify different values for the parameters at each launch. Workday appends integration system IDs to the data source name to differentiate each launch, and the View Web Service Data Source report also displays usage details.

## Steps

1. Access the View Web Service Data Source report.
2. From the related actions menu of the data source that you want to create launch parameters for, select Web Service Data Source > Edit.
3. As you edit the prepopulated XML request message in the Request XML field, consider:

Option	Description
Token	<ul style="list-style-type: none"> <li>• Tokens have the format %Token%.</li> <li>• Remove tokens that you don't want to use as input parameters.</li> <li>• Assign each token a unique name. Example: When 2 subelements have an %Effective Date% token, rename them %Effective Date1% and %Effective Date2%.</li> </ul>
Subelement	<ul style="list-style-type: none"> <li>• Subelements have the format &lt;Element_Tag&gt;...&lt;/Element_Tag&gt;.</li> <li>• Remove unwanted subelements and subelements from which you remove tokens.</li> </ul>

Option	Description
	<ul style="list-style-type: none"> <li>When you add multiple occurrences of a particular subelement, give the related tokens a unique name.</li> </ul>

To revert to the prepopulated request XML after you create launch parameters for a WSDS, you can select Edit from the related actions menu of the WSDS.

4. Create a launch parameter for each token in the Request XML field.

As you complete the Launch Parameters grid, consider:

Option	Description
Name	Enter the parameter exactly as it displays in the Request XML field, excluding the % delimiters.
Launch Parameter Type	Select the parameter Data Type, or select Enumeration to define your own web service enumeration. Example: When you select a report field for a parameter that represents an instance set from the Data Type prompt, Workday prompts you to select the instance when you launch the integration.
Default Processing	Specify default parameter behavior at launch. Example: By selecting <i>Determine Value at Runtime</i> , you can specify that Workday automatically populates the current date when you launch the integration.

5. (Optional) When your WSDS supports paging, maintain the %WWS Page% and %WWS Count% tokens in the prepopulated message and create corresponding launch parameters to limit data retrieval. As you complete the task consider:

Option	Description
%WWS Page%	<p>Retrieves a single page of data. Create a numeric launch parameter and specify the number of the page that you want to retrieve.</p> <p>To retrieve all pages, remove the token from the request message. If you specify a page that doesn't exist, Workday retrieves no data.</p>
%WWS Count%	<p>Only applies to the page returned by the %WWS Page% parameter.</p> <p>Create a numeric launch parameter to specify the number of records per page, up to a maximum of 999. When you remove the token, Workday sets the number of records per page to 100.</p>

## Result

When you launch or schedule the integration, Workday prompts you to specify values for all parameters, excluding parameters set to *Do Not Show*.

## Example

This is an example of a prepopulated XML request message for an EIB using the Get\_Compensation\_Grades web service operation as a data source:

```
<wd:Get_Compensation_Grades_Request xmlns:wd="urn:com.workday/bsvc">
  <wd:Request_References>
    <wd:Compensation_Grade_Reference>
      %Compensation Grade Instances%
    </wd:Compensation_Grade_Reference>
  </wd:Request_References>
  <wd:Response_Filter>
    <wd:As_Of_Effective_Date>
      %Effective Date%
    </wd:As_Of_Effective_Date>
    <wd:As_Of_Entry_DateTime>
      %Entry Moment%
    </wd:As_Of_Entry_DateTime>
    <wd:Page>
      %WWS Page%
    </wd:Page>
    <wd:Count>
      %WWS Count%
    </wd:Count>
  </wd:Response_Filter>
  <wd:Response_Group>
    <wd:Include_Reference>
      %Include Reference%
    </wd:Include_Reference>
  </wd:Response_Group>
</wd:Get_Compensation_Grades_Request>
```

To retrieve information about a particular compensation grade based on an effective date, remove these tokens from the prepopulated request message:

- <wd:As\_Of\_Entry\_DateTime>%Entry Moment%</wd:As\_Of\_Entry\_DateTime>
- <wd:Page>%WWS Page%</wd:Page>
- <wd:Count>%WWS Count%</wd:Count>

You only use these tokens to retrieve data based on the moment of entry in Workday or limit the response size.

Create launch parameters for the remaining tokens:

Name	Data Type	Option(s)	Default Processing
Compensation Grade Instances	Compensation Grades	Required	Leave blank.
Effective Date	Date	Required	<ul style="list-style-type: none"> <li>• Select the Default at Launch check box.</li> <li>• Select <i>Determine Value at Runtime</i> from the Value Type prompt.</li> <li>• Select <i>Current Effective Date</i> from the External Field used</li> </ul>

Name	Data Type	Option(s)	Default Processing
			as Default for Launch Parameter prompt.
<i>Include Reference</i>	<i>Boolean</i>	<i>Do Not Show</i>	<ul style="list-style-type: none"> <li>Select the Default at Launch check box.</li> <li>Select <i>Specify Value</i> from the Value Type prompt.</li> <li>Select the Boolean check box.</li> </ul>

When you launch the integration, Workday prompts you to select the compensation grade instances. The *Effective Date* parameter automatically populates to the current date when you run the web service operation. You can view the launch parameters and values on the View Background Process page.

[Launch an Integration](#) on page 24

## Create HTTPS Transport Protocol

### Prerequisites

Security: *Integrations: EIBs* domain in the Integration functional area.

### Context

You can create an HTTPS transport protocol to use in Enterprise Interface Builder (EIB) integrations. Use this option only if you need to configure HTTP headers.

### Steps

- Access the Create HTTPS Transport Protocol task.
- Specify details about the transport protocol:

Option	Description
HTTP Address	<p>Use this format: <i>https://x.x.x.x:port-number</i> . If you don't specify a port number, Workday automatically selects the port number.</p>
Web Service Invocation Type	<ul style="list-style-type: none"> <li><i>Basic Auth</i>: Basic access authentication that encodes the account name and password.</li> <li><i>No Security</i>: Indicates that you trust the connection, and that the connection doesn't need security.</li> </ul>

Option	Description
	<ul style="list-style-type: none"> <li>• <i>OAuth 2.0:</i> Authorizes access using Bearer tokens. Contact your OAuth service provider to obtain token values.</li> </ul> <p>When the Access Token expires, Workday uses the Client ID, Client Secret, and Refresh Token values to reach your Refresh Token URL and generates a new access token. Workday then uses the new access token to deliver the files.</p> <ul style="list-style-type: none"> <li>• <i>WS-Security User Id/Password:</i> Applies security to web service messages through the Web Services Security protocol.</li> </ul>
<a href="#">User ID, New Password, and Verify Password</a>	Required if you select: <ul style="list-style-type: none"> <li>• <i>Basic Auth.</i></li> <li>• <i>WS-Security.</i></li> </ul>
<a href="#">Header Name and Header Value</a>	Add one or more HTTP request fields. Workday adds the headers to each HTTP request. The HTTP requests must be valid for the endpoint.

## Next Steps

When you set up your outbound EIB, select *Use Existing Delivery Method* from the Delivery Method field. Select the HTTPS transport protocol you created.

## Create Integration Transformation

### Prerequisites

- Determine which type of integration transformation you need (custom report, delivered, or XSLT attachment) to convert the source data to a format that the target endpoint can read.
- Security: *Integrations: EIBs* domain in the Integration functional area.

### Context

Create a transformation associated with an Enterprise Interface Builder (EIB) integration in your tenant. You can use a Workday-delivered transformation or your own custom transformation.

### Steps

1. Access the task for the type of transformation that you want to create:
  - Create Custom Report Transformation
  - Create XSLT Attachment Transformation
2. Configure the transformation:

Option	Description
<a href="#">Custom Report Transformation</a>	Select the source Custom Report from the prompt.

Option	Description
	To customize the report transformation, access the EIB and select Enterprise Interface > Configure Transformation from the related actions menu.
<a href="#">XSLT Attachment Transformation</a>	<p>From the XSLT Version Used in Attachment prompt, select the version of the XSLT file you're uploading. Workday recommends that you upload version 3.0 files. Workday displays this version when you view an inbound or outbound integration system.</p> <p>Select Browse and upload your XSLT file.</p>

### Next Steps

If you created a Custom Report Transformation, configure the transformation to specify how the Custom Report formats the output.

Related Information

### Tasks

[Set Up Custom Report Transformation](#) on page 80

## Manage Outbound EIBs with Custom XSLTs

### Prerequisites

Security:

- *Integrations: EIBs* domain in the Integration functional area
- *My Reports* domain in the System functional area

### Context

Outbound EIBs with custom XSLT transformations use as much as 10 times the amount of memory that the source data requires. Workday recommends that you transform no more than 100 MB of data. Although EIBs that transform more than 400 MB of data have a high risk of malfunctioning, Workday still attempts to complete all EIBs.

### Steps

Workday strongly recommends that you take these steps to avoid failed data loads:

1. Monitor the data source size of your outbound EIBs that use custom XSLT transformations.  
To find the related EIB requests, use the Process Monitor report. If you transformed more than 400 MB, the Messages tab displays the actual data source size transformed, as well as a warning message.
2. Filter the data source by running the EIB with either:
  - Custom report filters.
  - Web service data source launch parameters.
3. Use Studio with splitter and aggregator components.
4. Test your XSLT for infinite loops using an XML editor.

Related Information

### Concepts

[Concept: Components](#)

## Set Up Custom Report Transformation

### Prerequisites

- Create an outbound EIB that uses a:
  - Custom report data source.
  - Custom report transformation.
- Security: *Integrations: EIBs* domain in the Integration functional area.

### Context

You can configure how an EIB formats the output file for the custom report it uses. When configuring the custom report transformation:

- Configure as much as you can in the custom report, rather than in the transformation.
- Use a custom report that already has the fields you want in the order that you want. You can't add or remove fields in the Custom Report Transformation.
- If you add or remove report fields from the custom report definition, Workday updates the corresponding columns in the transformation. Workday performs this action when you select Enterprise Interface > Configure Transformation.
- If you make other changes to the custom report after creating the transformation, edit the transformation to accommodate these changes. When you change a custom report, Workday recommends that you test any EIBs or Studio integrations that depend on it.
- Ensure that report fields in the custom report are in Text or Numeric format. Create a calculated field to transform report fields that are of a different type into Text or Numeric format.

### Steps

1. Access the EIB that includes the Custom Report Transformation.
2. From the related actions menu of the EIB, select Enterprise Interface > Configure Transformation.
3. Specify the Delimiter character such as (,) or (;) to separate the columns in the output file.  
Enter \t for tab or \b for space. Workday disables the Delimiter when you select *Fixed Width* mode.
4. Select any row and specify formatting options for the column. As you complete the task, consider:

Option	Description
Source Column	Select a new Source Column if you want to place that column at the selected position in the grid.
Column Width	Enter a numeral to set the column width or zero for no limit.
Column Heading Override	(Optional) Enter a custom column heading for the Target Column or leave empty for a blank heading. Workday trims starting spaces for any Column Heading Overrides that start with a space.
Pad Character	If you specified a column width, enter a character that pads the report field content. Enter \s to pad with spaces.
Left Padding / Right Padding	Select whether the column is left- or right-justified.

Option	Description
Target Column	Previews the formatting options that you configured using the Column Heading Override.

5. (Optional) Select the Header tab and configure an Optional Report Header.

This text displays at the top of the output file. Enter plain text or select 1 of:

- *Actual Start Date and Time* for the date and time the background process began. You can't configure the format of this field.
- *Row Count* for the number of rows in the custom report data. Each row of a custom report can have multiple lines.
- *Line Count* for the number of lines in the output file, excluding the header and footer.
- *File Name* for the name of the output file.

6. (Optional) Select the Footer tab and enter plain text or select a tag for the Optional Report Footer.

## Result

Workday performs the transformation, populating dynamic report fields with the corresponding values at that moment. Examples:

- If you later alter the sort order of the columns in the custom report definition, Workday doesn't update the column sort in the transformation. If you change the order of the columns in your report, Workday might require you to delete the existing transformation and create a new custom report transformation for the column sort to match.
- If you delete a column in the custom report definition, Workday doesn't update the transformation. Reconfigure the transformation in order to accept the changes to the custom report definition.

## Next Steps

To delete your custom report transformation, select Custom Report Transformation > Delete from the related actions menu of the transformation. When you run the EIB, Workday doesn't transform the output file. When you delete a custom report transformation, Workday doesn't delete the custom report itself.

## Set Up Dynamic Filename Definition

### Prerequisites

Create an outbound EIB with a custom report data source and a dynamic filename.

Security: *Integrations: EIBs* domain in the Integration functional area.

### Context

You can configure dynamic filenames for the output files of your EIB. You can base these filenames on:

- Report prompts.
- External report fields.

Filenames can only be between 1-255 characters long and can't be more than 1 line.

### Steps

1. Select Enterprise Interface > Configure Dynamic Filename Definition as a related action on your EIB.

- On the Tags grid, assign report prompts or external report fields to tags 1 to 5, then insert the tags into the Filename Definition.

Workday doesn't support optional prompts or prompts configured with *Do Not Prompt at Runtime*. When you change or delete the report prompts used in tags, you must also update the filename definition.

## Result

Workday converts report prompts and external report fields into the filename:

- Boolean: Zero or 1.
- Currency: Display ID.
- Date: Display ID.
- Instance: Display ID.
- Numeric: The number value.
- Multi-instance: Comma-separated display IDs.

## Next Steps

When you launch the EIB, select *Use System Default* for the Filename integration criteria to use the configured dynamic filename definition.

## Reference: Outbound Transport Protocol Types for EIBs

### Overview

An outbound transport protocol tells Workday how to deliver data to an external endpoint. When creating an integration transport protocol for an EIB, Workday supports these transport protocol types to export data:

#### AS2

Exports data from Workday by using the Applicability Statement 2 (AS2) protocol. Workday requires that you encrypt and digitally sign AS2 data using an X.509 public key and X.509 private key pair.

#### Amazon Simple Storage Service

Exports data from Workday using the Amazon Simple Storage Service (s3) protocol. Workday requires Bucket and Access Key ID values. Workday requires a Secret Key ID value when you select Access Key ID.

#### Email

Exports data from Workday using email. Delivers data to multiple email addresses, including carbon copy (cc and bcc) recipients. Supports custom messages for the email body.

#### FTP

Exchanges data with external endpoints using FTP in passive mode. Workday doesn't support FTP with active mode. FTP requires PGP encryption.

#### FTP/SSL

Exchanges data with external endpoints using an FTP server over a Secure Sockets Layer (SSL). Workday supports FTP with passive mode;

Workday doesn't support active mode. Workday supports implicit and explicit SSL.

#### Active and Passive Mode:

- Workday doesn't support Active mode processing for FTP/SSL or FTP.
- Passive mode enables Workday to use a random unprivileged port for communication. This mode doesn't require the server to establish a connection to the client.

#### Implicit and Explicit SSL:

- Implicit SSL automatically encrypts connections between FTP clients and servers. For implicit SSL, the FTP server defines a specific port for the client (990). The address string format for implicit SSL is `ftpsi://x.x.x.x`.
- Explicit SSL enables FTP clients to explicitly activate encryption on connections. Explicit SSL connections use port 21. If Workday is unable to establish a secure connection, it transfers the data using the basic unencrypted FTP protocol. The address string format for explicit SSL is `ftpse://x.x.x.x`.

#### HTTPS

Exports data from Workday by using Hypertext Transfer Protocol Secure (HTTPS).

#### SFTP

Exchanges data with external endpoints using Secure File Transfer Protocol (SFTP).

#### Workday Attachment

Exports data from Workday by creating a Workday attachment. Create this transport protocol once and then reuse it as needed.

#### Related Information Reference

[2020R2 What's New Post: Explicit FTPS Support](#)

## Reference: Outbound Integration Transformations

### Integration Transformations Overview

An integration transformation defines how Workday converts outbound data between Workday and external endpoints. Workday supports these types of integration transformations:

- Custom report transformations.
- XSLT attachment transformations.

### Custom Report Transformations

Custom report transformations are custom transformations that you define in Workday. Custom report transformations enable you to:

- Include or exclude report fields.
- Define output order.

- Format individual report fields.
- Add headers and footers to output files.

## XSLT Transformations

XSLT attachment transformations are custom transformations that you create using Extensible Stylesheet Language Transformations (XSLT).

## Reference: Outbound Integration Data Sources

An integration data source tells Workday what sort of data it can export to an external endpoint. Workday supports these types of integration data sources.

### Custom Report

Workday runs the custom report and gathers the results for export. You can optionally generate the report data in a format other than Workday XML. Alternate output options include:

- CSV (comma-separated values).
- GData (Google data).
- JSON (JavaScript Object Notation).
- RSS (Really Simple Syndication).
- Simple XML.

Workday removes Workday IDs and reference IDs from these alternate formats.

Before you can use custom reports in integrations, enable the reports for web services. This step enforces additional validations that stabilize the report structure. When you transform a report to CSV format, the report columns in the integration output files sometimes don't match the columns that Workday displays:

- If you set the display option for a column as Do Not Show If Empty, Workday still includes the column in integration output files. Field display options only apply to the report output in Workday, not to integration output. Workday always includes empty columns in outbound EIB integration files.
- If a column name starts with a number or a punctuation character, Workday adds a *XMLNAME* prefix to the name in the transformed spreadsheet.

### Web Service

Retrieves data from Workday by using a *Get* or *Find* web service operation from the Workday public API. The initial version of a web service data source defaults to the current Workday version number. You can continue to use this version of the data source with subsequent Workday releases. However, if you edit the data source, Workday updates the version number to the current version of the public API.

[Concept: EIB Template Models and Spreadsheet Templates](#) on page 55

## EIB General Errors and Guidelines

### View Error Messages for an EIB

#### Prerequisites

Security: *My Reports* domain in the System functional area

#### Context

View error messages for EIBs that didn't complete successfully.

#### Steps

1. Access the Process Monitor report and run the report with these filters:

Option	Description
From Date and Time and To Date and Time	Select a date and time range for the integration.
Process Type	Select <i>Integration</i> .

2. Find the integration event in the list and note the Correlation ID for that integration in the Integration Event Correlation ID column.  
When you open a support case to resolve an integration issue, Workday Support asks you for this Correlation ID.
3. Select the event link in the Integration Event column, then select the Messages tab.  
The Severity column displays icons for each message.
4. Select the message link in the Message column.

#### Result

Workday displays the error message in the Detail field.

#### Next Steps

Depending on the type of error:

- Resolve the error condition and run the EIB again.
- View the consolidated report for the EIB for more detailed information about why Workday returned errors and warnings for the EIB.
- See if your error and the required resolution display in the Common EIB Issues FAQ.
- Open a case with Workday Support if you can't resolve the error condition. Provide the Correlation ID for the EIB when you contact Workday Support.

### Troubleshooting: Enterprise Interface Builder

- [Integration prompt on the Launch / Schedule Integration task doesn't display the EIB.](#) on page 86
- [Characters display incorrectly in Microsoft Excel when you open a CSV output file.](#) on page 86
- [EIB output is missing data and spreadsheet column headings display Instance# instead of the configured column heading.](#) on page 86
- [Filename doesn't include the date and time variables configured on the sequence generator.](#) on page 86

- Workday doesn't use a configured sequence generator for Filename. on page 87
- Workday doesn't generate a sequenced filename for an outbound EIB integration. on page 87
- Workday displays a BadRequestException error message. on page 87
- Workday displays a transform failed error message. on page 87
- Workday displays an Invalid Subelement error. on page 88
- Numbers with leading zeros don't display correctly in Microsoft Excel. on page 88
- Microsoft Excel for Mac crashes when you copy a spreadsheet cell. on page 88
- Microsoft Excel for Mac returns a stylesheet error when you save the XML spreadsheet file. on page 88
- Can't recover an XSLT transformation file

### Integration prompt on the Launch / Schedule Integration task doesn't display the EIB.

Cause	Solution
You don't have the security permissions required to launch the EIB.	Verify the security configuration of your EIB. Ask your security administrator to grant you access.
The EIB contains critical errors.	<p>Security: These domains in the Integration functional area:</p> <ul style="list-style-type: none"> <li>• <i>Integration Build</i></li> <li>• <i>Integration Configure</i></li> </ul> <p>Use the Edit EIB task to resolve any critical errors.</p>

### Characters display incorrectly in Microsoft Excel when you open a CSV output file.

Cause: The CSV file encoding doesn't use UTF-8 encoding.

Solution: Use any of these workarounds.

- Before you open the CSV file in Excel, open it in Notepad and save with UTF-8 encoding.
- Import the CSV file into Excel.
- Load the CSV file into Google Docs.

### EIB output is missing data and spreadsheet column headings display Instance# instead of the configured column heading.

Cause: The web service version of the underlying custom report is V8 or lower.

Solution:

#### Steps

1. Select Custom Report > Edit from the related actions menu of the custom report.  
Security: *Manage: All Custom Reports* domain in the System functional area.
2. In the Advanced tab, select the latest Web Service API Version.
3. Delete the existing EIB.  
See [Delete Integrations and EIBs](#) on page 33.
4. Create a new EIB based on the same custom report.  
See [Set Up Outbound EIB](#) on page 67.

### Filename doesn't include the date and time variables configured on the sequence generator.

Cause: The File Name launch parameter isn't configured to use the sequence generator.

Solution:

### Steps

Security: *Integration Event* domain in the Integration functional area.

1. Access the Launch / Schedule Integration task and select your EIB from the Integration prompt.
2. For the File Name integration criteria, select:

Option	Description
Value Type	<i>Determine Value at Runtime</i>
Value	<i>Next Sequence for Integration File Utility</i>

### Workday doesn't use a configured sequence generator for Filename.

Cause: You configure a segment-based security group with:

- A constrained integration system security group.
- An integration system security segment.

Solution:

### Steps

Security: *Security Configuration* domain in the System functional area.

1. Access the Create Security Group task.
2. From the Security Groups prompt, select an unconstrained security group.  
Ensure that you don't grant the unconstrained security group access to other domains, such as *Integration Build* or *Integration Event*.
3. From the Access to Segments prompt, select an integration system security segment.

### Workday doesn't generate a sequenced filename for an outbound EIB integration.

Cause: The account for the initiating user of the outbound EIB integration doesn't have permissions to the sequence generator that you selected.

Solution:

### Steps

Security: *Integration Event* domain in the Integration functional area.

1. Look up the security group for the sequence generator that you selected for the outbound EIB integration.
2. Add the initiating user account to the security group for the sequence generator.
3. Relaunch or reschedule the outbound EIB integration.

### Workday displays a BadRequestException error message.

Cause: You haven't set a value for a required prompt on the report for your EIB.

Solution: Ensure that Workday completes all required prompts when the EIB launches. When the scheduler launches the EIB, edit the scheduler.

### Workday displays a transform failed error message.

Cause: The encoding used in the custom XSLT transformation doesn't support a character in the report output.

Solution:

### Steps

1. Open the XSLT transformation file in a text editor.
2. Set the `encoding=` value for the `<xsl:output>` element to `UTF-8`.
3. When the recipient of the EIB can't accept UTF-8-encoded files, change the source data in Workday to exclude unsupported characters.

### **Workday displays an Invalid Subelement error.**

Cause: There are missing processing instructions for business processes on the Overview tab of the spreadsheet.

Solution: Select a Processing Instruction for all business processes on the Overview tab of the spreadsheet. If you're not uploading data for a specific sheet, select Skip Processing when Step is marked Optional.

### **Numbers with leading zeros don't display correctly in Microsoft Excel.**

Cause: Excel changes the data type of cells in the spreadsheet.

Solution:

### Steps

Security: These domains in the Integration functional area:

- *Integration Build*
- *Integration Configure*

1. Access the Edit EIB task and select your EIB.
2. In the Get Data section, select *CSV* from the Alternate Output Format prompt.
3. Launch the EIB.  
See [Launch an Integration](#) on page 24.
4. Import the CSV output file into Excel.
5. For dates, change the format of the column to Date.
6. For numeric values with leading zeros, change the format of the column to Text.

### **Microsoft Excel for Mac crashes when you copy a spreadsheet cell.**

Cause: The spreadsheet contains comments on each column header cell.

Solution: Clear comments from column header cells.

### **Microsoft Excel for Mac returns a stylesheet error when you save the XML spreadsheet file.**

Cause: Excel for Mac corrupts the spreadsheet file when you save more than 1 stylesheet.

Solution: Select the sheet, then select *Edit > Clear > Formats*.

### **Can't recover an XSLT transformation file**

An Enterprise Interface Builder (EIB) outbound integration system has an incorrect XSLT transformation file attached to it. You need to replace it with the correct file, but you don't have it.

Cause: Unavailability of the correct XSLT transformation file.

If the correct file was originally attached to the EIB but then removed using the Trash icon in Edit the XSLT Attachment Transformation task, the removal also unlinked the correct file from the EIB. Although you can see the correct file as the Prior Value in the View Instance Viewer by ID or WID report, you can't click the filename to access it.

Solution: If the correct XSLT transformation file is already used in a previous EIB integration event, you can access it through the EIB for that integration event.

### Steps

Security: *Integration Event* domain in the Integration functional area.

1. From the related actions menu of the EIB for the integration event, select Integration System > Integration Events.
2. Select a date range that includes the time when the integration event occurred using the XSLT transformation file that you want to recover.  
Ensure the date range is before the incorrect file was uploaded.
3. On the integration event, click the XSLT file in the Transformation field on the Enterprise Interface Event section.

Cause: The correct XSLT transformation file was never used in an integration event.

Solution: Contact your Named Support Contact. Provide them with the filename of the XSLT transformation file that you need from the View Instance Viewer by ID or WID report.

### Tasks

[Launch EIB Spreadsheet Upload](#) on page 52

### Reference

[Handling Accent Characters and Changing Character Encodings](#)

## Inbound EIB Template Guidelines and Troubleshooting

### Concept: Inbound EIB Template Guidelines

This section provides topics for widely used inbound Enterprise Interface Builders (EIBs). Each topic includes:

- A description of the web service operation, including alternate web service operations to use.
- The equivalent Workday task for the EIB.
- Template-specific guidance for filling out the EIB spreadsheet.
- Common issues and errors for the EIB.
- The business process type used by the EIB, if any.
- Details about the add, update, and delete capabilities of the EIB.
- Details about how to recover from a bad EIB upload.
- A link to a sample EIB spreadsheet for the web service operation.

### Absence Management EIBs

#### Concept: Adjust Time Off EIB

##### Background

You can use this EIB to adjust an existing time off entry. The adjusted units must be passed in (and not the corrected units).

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

## Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- On the Worker Profile related actions menu, select Time and Leave. Then depending on your configuration, select either Correct Absence or Correct Time Off.
- The Enter Absence or Enter Time Off tasks, depending on your configuration.

You can also use these EIBs:

EIB Name	Purpose
Enter Time Off and Import Time Off Request Event Batch	Use to submit new time off entries.
Put Absence Input	Use to add or update an accrual or time off adjustment/override for a worker.
Put Override Balance	Use to add or update a new time off plan override balance record for a given worker and time off plan.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB:
  1. From the related actions of the EIB, by selecting Template Model > View.
  2. On the View Template Model page, by checking the Version field to verify you're using the latest web service version.
  3. When you're using an older web service version, by creating a new EIB to get the latest version.
- You must have access to the *Correct Time Off* business process type in the Time Off and Leave functional area to run this EIB.

### Additional Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.

As you populate these fields in the input file, consider:

Field	Considerations
Spreadsheet Key	Specify a unique value for each worker.
Run Time Off Validations	Turn this flag on when you're validating time

Field	Considerations
	off entries for a time off request. If this flag is turned on and any time off entries fail validation for a time off request, it will reject the entire time off request.
Worker	This section is required. Update the reference in row 4 from Contingent_Worker_ID to Employee_ID.
Row ID	This is typically 1 value for each entry, unless you have multiple row entries for the same worker.
Time Off Entry ID	Leave blank if you want the EIB to autoassign reference ID values. You can specify a value here if you want to assign your own ID values. If you specify a value, verify it's not already in use.
Time Off Entry	Specify the reference ID of the time off entry that you're adjusting. To find the reference ID value, access the View Reference IDs report and search for the <i>Time Off Entry</i> business object.
Adjustment to Requested	Specify the number of units to add or remove from the time off entry. Example: if you want to adjust the time off from 8 hours to 6 hours, specify -2.
Comments	Optional. You can add comments for your entries if needed.

## Common Issues and Errors

Issue	Cause and Solution
EIB issues error <i>Validation error occurred. Invalid ID value. 'xxxxx is not a valid ID value for type = 'Contingent_Worker_ID'</i>	This usually occurs if the reference id type is set to contingent worker instead of employee ID. If you're attempting to adjust time for employees, check the value in cell D4 and ensure it's <i>Employee_ID</i> .
Slow Performance	This issue can be caused by how you store balances. Workday recommends that you store balances for 91 days or more. For more details, see <a href="#">Concept: Guidelines for Storing Time Off Balances</a> .

## Use Cases and Guidelines for Recovering from a Bad Load

- This EIB only adjusts existing time off entries. You can't delete entries.
- There's no Mass Rescind option for this EIB. If you've uploaded incorrect entries, you can update the original EIB input file and reverse the Adjustment to Requested values for each row. Example: if Adjustment to Requested is -2, you can change it to 2. Then reload the EIB. This will negate the original entries that you loaded.
- The Correct Time Off event has a cancel option. If the business process events are still in progress, you can run the Mass Cancel Business Processes task (secured to the *Business Process Administrator* domain in the System functional area) to back them out if needed.
- For reference documentation for all web services including *Adjust Time Off*, see [Operation Directory](#).

## Sample EIB Input File

[Adjust\\_Time\\_Off-WD32](#)

## Concept: Enter Time Off EIB

### Background

You can use this EIB to load new time off entries.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- On the Worker Profile related actions menu, select Time and Leave. Then depending on your configuration, select either Enter Absence or Enter Time Off.
- The Enter Absence or Enter Time Off tasks, depending on your configuration.

You can also use these EIBs:

EIB Name	Purpose
Adjust Time Off	Use to adjust an existing time off entry.
Import Time Off Request Event Batch	Use to load large volumes of new time off entries. For performant data loads, we recommend using this EIB when the batch exceeds either:

EIB Name	Purpose
	<ul style="list-style-type: none"> <li>• 100 requests against an absence table.</li> <li>• 1,000 requests directly against a time off type or plan.</li> </ul>
Put Absence Input	Use to create or update time off adjustments or overrides for a worker.
Put Override Balance	Use to create or update a time off override balance for an employee.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB:
  1. From the related actions of the EIB, by selecting Template Model > View.
  2. On the View Template Model page, by checking the Version field to verify you're using the latest web service version.
  3. When you're using an older web service version, by creating a new EIB to get the latest version.
- You must have access to the *Request Time Off* business process type in the Time Off and Leave functional area to run this EIB.

### Additional Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.

As you populate these fields in the input file, consider:

Field	Considerations
Spreadsheet Key	Use a unique value for each worker.
Row ID	Use a unique value for each time entry for a given worker.

## Common Issues and Errors

Issue	Cause and Solution
Slow performance.	<ul style="list-style-type: none"> <li>• This issue can occur depending on how you store balances. Workday recommends that you persist balances for 91 days or more.</li> </ul>

Issue	Cause and Solution
	<ul style="list-style-type: none"> <li>If you have to load time offs for terminated employees, load the time offs before completing the termination.</li> <li>If you're loading large volumes of new time off requests, consider using the Import Time Off Request Event Batch EIB instead. For performant data loads, we recommend using the Import Time Off Request Event Batch EIB when the batch exceeds either:           <ul style="list-style-type: none"> <li>100 requests against an absence table.</li> <li>1,000 requests directly against a time off type or plan.</li> </ul> </li> </ul> <p>This EIB is designed to process large volumes of data. To determine which web service performs best for your EIB, test these EIBs in a nonproduction tenant.</p>

## Business Processes

*Request Time Off.*

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service is add-only. It doesn't support deletions or updates.
- The *Request Time Off* business process doesn't enable you to rescind. If you inadvertently upload incorrect entries and they're still in progress, you can use mass cancel; otherwise, use the Adjust Time Off EIB to reverse the incorrect entries.

For reference documentation for all web services including *Enter Time Off*, see [Operation Directory](#).

### Sample EIB Input File

[Enter\\_Time\\_Off-WD31](#)

### Concept: Import Time Off Request Event Batch EIB

#### Background

You can use this EIB to load large volumes of new time off entries. For performant data loads, we recommend using this EIB when you bulk upload new time off entries that exceed either:

- 100 requests against an absence table.
- 1,000 requests directly against a time off type or plan.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- On the Worker Profile related actions menu, select Time and Leave. Then depending on your configuration, select either Enter Absence or Enter Time Off.
- The Enter Absence or Enter Time Off tasks, depending on your configuration.

You can also use these EIBs:

EIB Name	Purpose
Enter Time Off	Use to submit new time off entries.
Put Absence Input	Use to add or update an accrual or time off adjustment/override for a worker.
Put Override Balance	Use to add or update a new time off plan override balance record for a given worker and time off plan.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB:
  1. From the related actions of the EIB, by selecting Template Model > View.
  2. On the View Template Model page, by checking the Version field to verify you're using the latest web service version.
  3. When you're using an older web service version, by creating a new EIB to get the latest version.

### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- As you populate these fields in the input file, consider:

Field	Considerations
Header Key	Determines the batch for a leave event. Use the same header key to group all events in a batch.  Example: To load events in 2 batches, use 1 for the first 5,000 rows and 2 for the next 5,000 rows.
Line Key	An incremental value for each row

Field	Considerations
	within a header key batch.  Example: Use 1 for the first row, 2 for the second row, 3 for the third row, and so on. Each worker should have only 1 line key value. Restart the numbering at 1 for new header key value.
Row ID	You need a unique row ID for each time off entry.
Turn Off Run Time Calculations with Time Off Approval	Set to Y to turn OFF Run Time Calculations with Time Off Approvals. Setting to Y will improve performance. Set to N to turn ON calculations. If you set to Y, you can find instructions to run calculations after the import in <a href="#">Manually Run Time Calculations</a> .
Run Time Off Validations	Set to Y if you DO want to validate Time Off Entries. Set to N if you do NOT want to validate them. Setting to N will improve performance.

- Below are other considerations to take when preparing the EIB file and loading the data. We recommend you abide by these recommendations to obtain optimal performance:
  - Preparing the EIB
    - You can use multiple header keys. All Time Off requests for

the same worker must be under the same header key.

- Each worker should have only 1 line key value.
- Each Time Off request in the same Time Off Type has only 1 unit for the same date per row. Example: A worker requests 3 hours time off and 2 hours time off, of the same type and on the same date. Include these requests as 5 hours on the same row. If you're loading requests with Start and End Times, you can use multiple rows.
- Each row has a unique ID in the tenant.
- Don't split workers across files. All entries for a worker should be in the same file.
- Order requests chronologically, from oldest to most recent.
- Consider not entering a Time Off request before the latest persisted balance date.
- Consider entering an optional Time Entry ID to help manage requests by batch.

- **Loading Data**

- Don't split workers across files. All entries for a worker should be in the same file.
- Order requests chronologically, from oldest to most recent.
- For manageable high volume of data, load the data in 1 file.
- For extremely high volume of data, you could split the data across multiple files, but this option introduces risk.
- Loading multiple files in parallel doesn't give a performance improvement and also introduces risk.
- Re-evaluation should always remain on. Turning it off can create invalid data that impacts workers' balances and downstream payroll.

## Common Issues and Errors

Issue	Cause and Solution
No option to launch the EIB	This issue is security-related. Check the Request Time Off business process security policy and ensure you have access to the <i>Import Time Off Request Event Batch (WS Background Process)</i> initiating action.
Slow performance	Consider these options: <ol style="list-style-type: none"> <li>Persist balances up to just before the earliest data. Example: If your earliest data is in January 2020, persist up to December 2019. Don't enter a time off entry before the latest persisted balance date.</li> <li>If you must load time offs for terminated employees, load the time offs before completing the termination.</li> </ol>

## Business Processes

*Request Time Off.*

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service is add-only. It doesn't support deleting or updates.
- Note that the *Request Time Off* business process doesn't allow you to rescind. If you've inadvertently uploaded incorrect time off entries, rescind isn't an option. Therefore, you would need to use the *Adjust Time Off* EIB to reverse the incorrect entries unless the entries are still in-progress. In that case, you could use the *Mass Cancel* business process.

For reference documentation for all web services including *Import Time Off Request Event Batch*, see [Operation Directory](#).

### Sample EIB Input File

[Import\\_Time\\_Off\\_Request\\_Event\\_Batch-WD36](#)

### Concept: Put Absence Input EIB

#### Background

You can use this EIB to add or update time off adjustments/overrides for a worker.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

The Maintain Accrual and Time Off Adjustments/Overrides is the equivalent task.

You can also use these EIBs:

EIB Name	Purpose
Adjust Time Off	Use to adjust an existing time off entry.
Enter Time Off	Use to submit new time off entries.

EIB Name	Purpose
Import Time Off Request Event Batch	Use to load large volumes of new time off entries (approximately 2,000 requests or more).
Put Override Balance	Use to create or update a time off override balance for an employee.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From related actions of the EIB, select Template Model > View.
  2. You can view the version on this page. Verify you're using a newer version.
  3. If using an older web service version, you can create a new EIB to get the latest version.
- You must have access to the *Worker Data: Time Off (Accrual and Time Off Adjustments/Overrides by Batch ID)* domain in the Time Off and Leave functional area to run this EIB.

### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- This EIB has a Generate Spreadsheet with Data option, which is very helpful to use when you aren't certain how to populate the input file. To use it:
  - First manually enter an adjustment or override like the ones you wish to load.
  - Then, from related actions of your EIB, select Template Model -> View.
  - Go to bottom of page and select Edit Template with Data Options.
  - Set filter to *Condition Rule Filter*.
  - Go to the *Rule Conditions Filter* and add conditions to retrieve the information you entered. Note that the conditions you need to enter will vary based on the information you wish to retrieve.

Below are some sample conditions that you could enter:

  - *Comment is not blank*
  - *Comment contains 2019*
  - *Unit of Time not in the Selection List Months* (if you have no absence inputs that use months,

- then this option would be a way to extract all entries)
- If you regenerate the template and select the Generate Spreadsheet with Data option, you can view how the EIB populates the file for the existing absence input entries.
  - Refer to [Customize EIB Spreadsheet Template](#) for more details.
  - After you load the file, you can use 1 of these standard reports to validate the loaded data:
    - Accrual and Time Off Adjustments/ Overrides: Is a standard report, so you also have the option of making a copy if you wish to add additional fields.
    - Accrual and Time Off Adjustments/ Overrides by Batch ID.
  - As you populate these fields in the input file, consider:

Field	Considerations
Spreadsheet Key	Specify a unique value for each entry.
Absence Input	Populate this field only if updating an existing absence input. Note that if there's no <i>Absence_Input_ID</i> value assigned to the absence input that you wish to update, then you can use the Workday ID (aka WID). Change the reference id type (in cell C4) from <i>Absence_Input_ID</i> to <i>WID</i> . You can find the <i>Absence_Input_ID</i> or <i>WID</i> value that you need to populate by making a copy of the standard report Accrual and Time Off Adjustments/ Overrides report and add fields Workday ID and/or Reference ID.

Field	Considerations
Batch ID	Optional field. We highly recommend you provide a value as it enables you to easily remove the entry in the event you make an error and need to back out your changes. Typically you would use the same batch id value for all entries in the input file.
Worker	Workday requires a Worker ID.
Position	Typically optional unless using a position-based plan.
Absence Component	Can refer to an accrual or time off. Make certain you specify the appropriate reference id in row 4 (Typically you use this EIB to make adjustments or overrides to accruals. Therefore the reference id type would be Accrual_Code)
Start Date	The start date of start period. Workday requires the field.
End Date	The end date of End Period. The field is optional for overrides but required for adjustments.
Reference Date	Used to determine the effective date to retrieve the snapshot for the absence component for the input. For Accruals,

Field	Considerations
	set the reference date to start date
Hours	Optional field. Specify the units for the absence input.
Adjustment	Enter <i>Y</i> for Adjustment or <i>N</i> if Override.
Comment	Optional field. We recommended including a comment.

## Common Issues and Errors

Issue	Cause and Solution
The EIB successfully completes, but the worker's accrual/time off values haven't changed.	<p>You can start by checking what happens if you manually make the same change with the User Interface. This check will help you determine whether it's an issue with the EIB or a configuration issue. If that doesn't help, below are a few other items to check:</p> <ol style="list-style-type: none"> <li>1. Make certain you didn't run the EIB in validation mode.</li> <li>2. Verify that the worker is eligible for the adjustment.</li> <li>3. Enable the absence component (accrual or time off) that you're using to allow for adjustments and overrides.</li> <li>4. Make certain the worker hasn't reached the upper limit for the accrual.</li> </ol>
EIB issues error: <i>Validation error occurred. Start Period must equal End Period when Adjustment is true.</i>	<p>Check the start and end dates that you select and make certain they're valid. Note that for adjustments, you can specify only 1 period. If everything looks ok, then you can test entering the adjustment with the User Interface to see if you can enter the same values specified in the EIB input file. If there's no issue manually entering the values, then generate spreadsheet with data to verify how to populate the input file.</p>
Slow Performance	Refer to the suggestions on the EIB page for Enter Time Off EIB – Inbound.

## Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new entries or update existing entries. You can't delete entries using the web service.
- This web service doesn't use a business process, therefore there's no rescind option. However, if you have inadvertently uploaded incorrect entries, use can use task Delete Accrual and Time Off

Adjustments/Overrides by Batch ID to remove the entries. If you didn't specify a batch id when you loaded the entries, then the solution becomes a bit more involved: but 1 option would be to:

- Get the *WID* (Workday ID) for all the bad entries. To obtain the ID, make a copy of the standard report Accrual and Time Off Adjustments/Overrides and add field *workday id* to the report definition. This action would then get you the WID.
- Then, rerun the original load and:
  - Add the Workday ID value (from above report) in column C (and change C4 to *WID*)
  - Add a batch id
- You can then use task Delete Accrual and Time Off Adjustments/Overrides by Batch ID to remove the absence input entries.

For reference documentation for all web services including Put Absence Input, see [Operation Directory](#).

### **Sample EIB Input File**

[Put\\_Absence\\_Input-WD32](#)

### **Concept: Put Override Balance EIB**

#### **Background**

You can use this EIB to add or update a time off override balance for an employee.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### **Equivalent Workday Task**

The Maintain Time Off Plan Override Balances is the equivalent task.

You can also use these EIBs:

EIB Name	Purpose
Adjust Time Off	Use to adjust an existing time off entry.
Enter Time Off	Use to load new time off entries.
Import Time Off Request Event Batch	Use to load large volumes of new time off entries (approximately 2,000 requests or more).
Put Absence Input	Use to add or update time off adjustments/overrides for a worker.

### **EIB Input File Guidelines**

#### **Web Service Version and Security Configuration Guidelines**

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  1. From related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.

## Additional Input File Guidelines

- You must have access to the *Worker Data: Time Off (Time Off Balances)* domain in the Time Off and Leave functional area to run this EIB.
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- After you load the file, you can run the Time Off Plan Override Balances by Batch ID report to validate the data.
- As you populate these fields in the input file, consider:

Field	Considerations
Spreadsheet Key	Specify a unique value for each override balance entry.
Override Balance	Leave empty.
ID	Populate this field if you want to assign reference ID values to new entries that you're uploading. You need a unique value for each override balance entry.
Batch ID	Although optional, we highly recommend you provide a value. By providing a value, you can easily remove the entry if you made an error and need to back out your changes. Typically you would use the same batch ID value for all entries in the input file.
Worker	Workday requires an ID. Most likely, you'll need to change the reference ID type (cell F4) from <i>Contingent_Worker_ID</i> to <i>Employee_ID</i>

Field	Considerations
Position	Typically only needed when using a position-based plan.
Time Off Plan Name	Enter the time off plan. To identify the reference ID value, run Integration IDs report and search for business object <i>Absence Plan</i> .
Override Balance Date	Effective date for the balance override.
Override Balance Units	Enter the new balance value

- Only populate these fields if the time off plan has a carryover expiration date. To help you determine how to populate these fields (and how many entries to add for the worker), run task Maintain Time Off Plan Override Balances. Enter the time off plan for one of the employees that you're updating:

Field	Considerations
Row ID	There might be multiple carryover periods (if the expiration time spans multiple balance periods). Enter a unique row ID value for each carryover period for a given employee/time off plan. Keep in mind that you should populate only the number of carryover periods that are applicable based on the employee's hire date.
Carryover Date	Date the amount carries over.
Carryover Expiration Date	Enter expiration date of each carryover period.

Field	Considerations
Carryover Override Balance Units	Enter any applicable override balance units.

## Common Issues and Errors

Issue	Cause and Solution
The EIB issues an error like this: <i>Override Balance needs exactly 5 carryover components</i>	This error will occur if the plan permits carryover balances for multiple periods. In this case, you need to populate an entry in the input file for each carryover period.
The EIB issues an error like this: <i>Processing error occurred. Duplicate insert on index: Time Off Plan Balance-ID-Calculated and Override Balance Index (95\$2026), value: 1, new instance: id=2161\$48673967 wid=e6328055bc6201f7df8bbcb686428dfc disp=2161\$48673967, existing: id=2161\$4104 wid=c2544f9572a81055cf9a7f107bcfab7fdisp=2161\$4104</i>	This type of error indicates that the load contains duplicate information. This duplication will occur if ID (column D) doesn't contain unique values—you need to either specify a unique value for each employee/time off plan, or leave it blank.
Slow Performance	Refer to the suggestions in Future: <a href="#">Concept: Enter Time Off EIB</a> .
The EIB issues an error like this:  <i>Carryover Expiration Date for XXXXX with an Override Balance Date of MM/DD/YYYY must be a valid date (MM/DD/YYYY) that the Carryover Balance expires for XXX</i>	<ol style="list-style-type: none"> <li>1. Make certain you're using the latest web service version. If you're not sure what version you're using, create a new EIB to uptake the latest version.</li> <li>2. If the latest web service version doesn't resolve it, test adding a 12-month expiry date to the plan. This option should open up the desired field.</li> </ol>
EIB issues an error like this:  <i>Error Message: Validation error occurred. The value specified for Time Off Hours, 1215.000000, must be less than 1000.</i>	Time Off balance design currently doesn't permit a value higher than 3 digits. If over 999 hours, you'll need to split into multiple entries.
There's no option to launch the EIB.	<p>This problem is most likely security-related. When running the Report View Security for Securable Item and specifying securable item <i>Put Override Balance</i>, you'll see that you need access to domain <i>Worker Data: Time Off (Time Off Balances)</i>. To change the security, complete these steps:</p> <ol style="list-style-type: none"> <li>1. Edit the domain security policy for <i>Worker Data: Time Off (Time Off Balances)</i>.</li> <li>2. Go to the Integration Permissions Section and add the appropriate security groups. Ideally you should have access through an unconstrained security group so you can add entries for any worker.</li> <li>3. Check the box for <i>Put</i> access.</li> <li>4. Activate the security change.</li> </ol>

Issue	Cause and Solution
<p>EIB issues an error like this:</p> <p><i>The entered information does not meet the restrictions defined for this field. (Employee_Reference).</i></p>	<p>Make certain you aren't performing an override on your own employee ID. If you are, then have someone else enter the override value for you, or configure the Integration System User (ISU) to run the EIB.</p>

## Business Processes

None.

## Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new entries or update existing entries. You can't delete entries using the web service.
- To update existing override balances, just populate the input file with the employee/time off plan/balance date that you wish to update (no need to supply a reference ID). The web service will then update the entry if it exists for that employee/time off plan/balance date combination. Otherwise, it will add a new entry.
- This web service doesn't use a business process, therefore there's no rescind option. However, if you have inadvertently uploaded incorrect entries, you can use task Delete Override Balances by Batch ID to remove the entries. If you didn't specify a batch ID when you loaded the entries, do these steps:
  - Edit the EIB input file that you originally loaded and add a batch ID value for each entry.
  - Rerun the EIB to add the batch ID value to the override entries that you previously loaded.
  - After completing these steps, you can use task Delete Override Balances by Batch ID to remove the balance overrides.

For reference documentation for all web services including Put Override Balance, see [Operation Directory](#).

## Sample EIB Input File

[Put\\_Override\\_Balance-WD36\\_0](#)

## Concept: Request Leave of Absence EIB

### Background

You can use this EIB to create or update leave of absence events.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

If you want to create return from leave of absence requests, we recommend that you use a Request Return from Leave of Absence EIB.

## Equivalent Workday Task

The Place Worker on Leave task is the equivalent task.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  1. From related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- You must have access to the *Request Leave of Absence* business process in the Time Off and Leave functional area to run this EIB.
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- **IMPORTANT NOTE regarding Canadian Workers:** if you're loading Leave of Absence Events for Canadian workers, you must first edit the leave type and configure the Last Date for Which Paid field to be a required field. If you don't do this task, the date won't load, even if you populate the date in the EIB input file. See the first entry in the *Common Issues and Errors* section for more details on how to configure the leave type so that the EIB properly loads the data.
- **IMPORTANT NOTE regarding Notifications for Corrections:** The Correction functionality doesn't support suppression of notifications, even if you use the Automatic Processing processing instruction. If you have a business requirement not to send notifications for corrections, we recommend you:
  1. Add a condition to the business process notifications, such as, External Load is blank, to prevent them from firing when making corrections use the EIB.
  2. Also note that for any changes to the notifications, Workday only honors for newly initiated Request Leave of Absence events. If you need to correct leaves already initiated (before making the change in item#1 above), then you might want to temporarily disable all notifications in the tenant, using task Edit Tenant Setup - Notifications, while you run the EIB.

### Additional Input File Guidelines

- As you populate these fields in the input file, consider:
  - Overview worksheet in the EIB input file:

Field	Considerations
Processing Instructions	<p>Set to <i>Automatic Processing</i> if you want to bypass all approvals, review steps, to do steps and notifications.</p> <p>Set to <i>Manual Processing</i> if you want to manually process the approval/review/to do steps (and the notifications sent).</p>
Discard on Exit Validation Error	As of November 2022, this field isn't yet available for use. Leave blank.
Comment	You'll need to enter a comment if you're correcting any Leave of Absence Entries.

- Request Leave of Absence worksheet in the EIB input file:

Field	Considerations
Spreadsheet Key	(Required) Specify a unique value for each Leave of Absence Event.
Worker	(Required) Most likely, you'll need to change the reference ID in Cell C4 from <i>Contingent_Worker_ID</i> to <i>Employee_ID</i> .

Field	Considerations
Request Leave of Absence ID	<p>A required field only if you're correcting an existing Leave of Absence Request. See the <i>Use Cases and Guidelines for Recovering from a Bad Load</i> section, which demonstrates how to identify the values for Request Leave of Absence ID. Note that if correcting a Leave of Absence request, you also need to set the Correction field to Y.</p>
Correction	<p>Set this field to Y to correct an existing Leave of Absence Request. You'll also need to populate the Request Leave of Absence ID field.</p>
Leave of Absence Type	<p>(Required) To determine the reference ID type value needed to populate this field, run the View Reference IDs report and search business object <i>Event Classification Subcategory</i>. You can then filter the Business Object Instance column (such as, search Leave or</p>

Field	Considerations
	(Disability) to find the reference ID value for the leave types you wish to use.
First Day of Leave	(Required) Date for first day of leave. Enter using format YYYY-MM-DD.
Last Day of Work	Date for last day of work. Enter using format YYYY-MM-DD.
Estimated Last Day of Leave	(Required) Date value for estimated last day of leave. Enter using format YYYY-MM-DD.
Last Date for Which Paid	Workday requires this field for Canada. In addition, be sure to configure the leave type in your tenant, so that this field becomes a required field. Refer to the first entry in the <i>Common Issues and Errors</i> section for more details.

## Common Issues and Errors

Issue	Cause and Solution
The EIB doesn't load the Last Day for Which Paid (LDFWP) field even though it's populated in the EIB input file. Workday requires this field to submit an ROE for Canada.	<p>When using the EIB, you must make certain to configure the Leave Type so that Last Date for Which Paid (LDFWP) is a required field. Resolve as follows:</p> <ol style="list-style-type: none"> <li>1. Run task <i>Edit Leave Type</i>.</li> <li>2. Select the Leave Type that you're referencing in the EIB input file.</li> <li>3. Click OK.</li> </ol>

Issue	Cause and Solution
	<p>4. Go to the Additional Field tab.</p> <p>5. Select the + in the <i>Additional Fields</i> section.</p> <p>6. In the Additional Field, select Last Date for Which Paid.</p> <p>7. Check the Required check box.</p> <p>8. You might see a warning that there are Pending requests that need corrected or canceled. Go ahead and click OK.</p> <p>9. If you've already loaded Leave of Absence events where the LDFWP is missing, then you'll need to do one of these options:</p> <ul style="list-style-type: none"> <li>• Option 1: Mass Rescind the Events and reload them.</li> <li>• Option 2: Correct the existing events by rerunning the EIB and populating the Request Leave of Absence ID and Correction fields.</li> </ul>
Unable to launch the EIB	<p>This issue is most likely security-related. When running report View Security for Securable Item for securable item Request Leave of Absence (Web Service), you'll see that you need access to business process Request Leave of Absence. To change the security, you can:</p> <ol style="list-style-type: none"> <li>1. Edit the business process security policy for Request Leave of Absence.</li> <li>2. Go to the section for Initiating Action Request Leave of Absence (Web Service).</li> <li>3. Make certain you have access (ideally you should have access through an unconstrained security group so that you can load Leaves for any worker).</li> <li>4. Activate the change.</li> </ol>
EIB issues an error like this:  <i>Invalid ID value. '21133' isn't a valid ID value for type = 'Contingent_Worker_ID'.</i>	Verify that the reference ID type in cell C4 of your EIB input file is <i>Employee_ID</i> .
EIB issues errors like this: <ul style="list-style-type: none"> <li>• <i>Invalid format for date text=3/1/2020 on attr Event Effective Date</i></li> <li>• <i>Invalid format for date text=02/29/2020 on attr Last Day of Work.</i></li> <li>• <i>Invalid format for date text=02/29/2020 on attr Estimated Last Day of Leave.</i></li> <li>• <i>Invalid format for date text=02/29/2020 on attr Last Day for which Paid.</i></li> </ul>	Enter the dates in your EIB input file with format YYYY-MM-DD.
EIB issues error:  <i>Each correction must have a comment. Add comments for each correction that you're processing..</i>	<p>If you're making any corrections, you must:</p> <ol style="list-style-type: none"> <li>1. Edit the EIB input file.</li> </ol>

Issue	Cause and Solution
	2. In the Overview tab, add a value for Processing Comment for the <i>Request Leave of Absence</i> business process.
When submitting corrections, notifications occur even though I specified processing instruction Automatic Processing.	The Correction functionality doesn't support suppression of notifications. See the <i>EIB Input File Guidelines</i> section for tips on working around this restriction.

## Business Processes

Request Leave of Absence.

### Use Cases and Guidelines for Recovering from a Bad Load

This web service enables you to add new entries or correct existing entries. You can't delete entries. However there are options to rescind or cancel the Business Process event.

If you've inadvertently uploaded incorrect entries, there are a couple options to recover.

- Option 1: Cancel or rescind the incorrect entries. Run task Mass Cancel Business Processes or Mass Rescind Business Processes (depending on whether the business process event completed or in progress). You can then select Business Processes Loaded by EIB to find the integration event that you wish to cancel or rescind. Or the other method is to enter Request Leave of Absence at the Business Process Types prompt; then enter a date range that you ran the EIB.
- Option 2: Correct the existing entries by rerunning the EIB with the correct values. To correct the data:
  - Edit the EIB input file.
  - Set the Correction field to Y for entries that need corrected.
  - Populate the Request Leave of Absence ID field with the Leave of Absence event that needs corrected. You can create a custom report to identify the values to populate in the Request Leave of Absence ID field.
  - Change any fields that have incorrect values before reloading.

For reference documentation for all web services including Request Leave of Absence, see [Operation Directory](#).

## Sample EIB Input File

[Request\\_Leave\\_of\\_Absence-v39](#)

### Concept: Request Return from Leave of Absence EIB

#### Background

You can use this EIB to create return from leave of absence requests.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

If you want to create new leave of absence requests or correct existing leave of absence events, we recommend that you use a Return from Leave of Absence EIB.

#### Equivalent Workday Task

The Return Worker from Leave task is the equivalent task.

See also [Concept: Importing Leave of Absence Events](#) for more information.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB using these methods:
  1. From related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- You must have access to the *Request Return from Leave of Absence* business process in the Time Off and Leave functional area to run this EIB.
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- As you populate the EIB input file, consider:
  - Overview worksheet in the input file:

### Additional Input File Guidelines

Field	Considerations
Processing Instructions	<p>Set to <i>Automatic Processing</i> if you want Workday to bypass all approvals, review steps, to-do steps and notifications.</p> <p>Set to <i>Manual Processing</i> If you want to manually process the approvals, review, and to-do steps and send notifications.</p>
Comment	You need to enter a comment if you're correcting any <i>Return from Leave</i>

Field	Considerations
	of Absence Entries.

- Request Return from Leave of Absence worksheet in the input file:

Field	Considerations
Spreadsheet Key	(Required) Specify a unique value for each worker.
Worker	(Required) Most likely, you need to change the reference id in Cell C4 from <i>Contingent_Worker_ID</i> to <i>Employee_ID</i> .
First Day Back at Work	(Optional) Enter using format MMM-YY-DD.
Row ID	(Required) Enter a unique Row ID value for each leave of absence event for a given worker. Most likely, there is just 1 return per worker, so the Row ID value is always 1.
Request Leave of Absence	(Required) Refer to the sample report below, which demonstrates how to identify the values for this field.
Correction	Set to Y to correct an existing Return from Leave of Absence entry.
Actual Last Day of Leave	(Required) Enter using format MMM-YY-DD.

- Make certain that the steps on the *Request Return from Leave of Absence* business process

definition align to what you're populating in the EIB input file. Example: If the business process has an *Assign Roles to Worker* step, you need to either populate the role information in the EIB input file or add a condition rule to skip the step in the business process. Example: Add condition rule *External Load = N*.

## Common Issues and Errors

Issue	Cause and Solution
The EIB completes successfully but the workers remain on leave	<p>This issue might occur because the business process events are still in progress. Check the worker history for one of the workers and verify that the <i>Return from Leave of Absence</i> event successfully completed. If not, you can:</p> <ol style="list-style-type: none"> <li>1. Check why the business process event is still in progress. Then make appropriate changes to the <i>Request Return from Leave of Absence</i> business process definition. Example: You might need to remove steps or add a condition rule such as <i>External Load is not blank</i> so that Workday skips the steps.</li> <li>2. Use Mass Cancel Business Process task to cancel the business process events.</li> <li>3. Rerun the EIB.</li> </ol> <p>The other reason that the workers might still display as being on leave is that the return date is in the future.</p>
Unable to launch the EIB	<p>This issue is most likely security-related. When running the View Security for Securable Item report for securable item <i>Request Return from Leave of Absence (Web Service)</i>, you can see that you need access to the <i>Request Return from Leave of Absence</i> business process. To change the security:</p> <ol style="list-style-type: none"> <li>1. Edit the business process security policy for <i>Request Return for Leave of Absence</i>.</li> <li>2. Go to the section for Initiating Action on <i>Request Return from Leave of Absence (Web Service)</i>.</li> <li>3. Make certain you have access. Ideally, you have access through an unconstrained security group so that you can load Returns for any worker.</li> <li>4. Activate the security change.</li> </ol>
<p>EIB issues an error like this:</p> <p><i>Validation error occurred. Invalid ID value. '21001' is not a valid ID value for type = 'Contingent_Worker_ID'.</i></p>	<p>Make certain that the reference ID type in cell C4 of your EIB input file is Employee_ID.</p>

Issue	Cause and Solution
<p>EIB issues errors like this:</p> <p><i>The "Request Leave of Absence Reference" must be for the employee specified in the "Employee Reference".</i></p> <p><i>Return from Leave of Absence Requests can only be made to "Successfully Completed" but not yet returned from Request Leave of Absence Events.</i></p>	<p>Make certain that you specified the correct Employee ID and Request Leave of Absence ID in the EIB input file.</p> <p>Also, if making a correction to an existing Return, set the Correction field to <i>Y</i>.</p>
<p>EIB issues error:</p> <p><i>Validation error occurred. A correction cannot be processed without a comment.</i></p>	<p>Enter a comment if correcting a return from leave of absence event. You can:</p> <ol style="list-style-type: none"> <li>1. Edit the EIB input file.</li> <li>2. Go to the Overview tab.</li> <li>3. Enter a value in the Processing Comment field for the <i>Request Return from Leave of Absence</i> business process.</li> </ol>
<p>EIB issues error:</p> <p><i>Validation error occurred. Element Content 'Leaves_Returning_from_Data' is required, on internal element 'Request Return from Leave of Absence Data'.</i></p>	<p>Make certain you include a value for Row ID in the EIB input file.</p>
<p>When running the <i>Request Return from Leave of Absence</i> EIB, it triggers the Compensation subprocess (which is an optional step) despite setting processing instruction as <i>Skip when marked optional</i>.</p>	<p>Workday is looking into this issue. For now, you can work around the problem using these steps:</p> <ol style="list-style-type: none"> <li>1. Go to the business process definition for <i>Request Return from Leave of Absence</i>.</li> <li>2. Either remove the compensation step or add a condition step to the compensation step, such as <i>External Load is Blank</i>.</li> </ol> <p>If the workaround isn't acceptable to your organization, open a case with Workday Support and reference ticket HRCOMPROC-184.</p>

## Business Processes

Request Return from Leave of Absence.

## Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new entries or correct existing entries. You can't delete entries, but you have options to rescind or cancel the Business Process event.
- When you inadvertently upload incorrect entries, you have a couple of options:
  - Option 1: Cancel or rescind the incorrect entries. Run the Mass Rescind Business Processes task. You can also run the Mass Cancel Business Processes task when the business process event is in progress. You can then select *Business Processes Loaded by EIB* to find the integration event that you wish to cancel or rescind. The other method is to enter *Request*

*Return from Leave of Absence* in the Business Process Types prompt; then enter a date range that you ran the EIB.

- Option 2: Correct the existing entries by rerunning the EIB with the correct values. To correct the data:
  - Edit the EIB input file.
  - Set the Correction field in the EIB input file to *Y*.
  - Change any fields that have incorrect values before reloading.
  - If you need a report to get the reference ID values for the Request Leave of Absence events, you can create a custom report.

For reference documentation for all web services including Request Return from Leave of Absence, see [Operation Directory](#).

### Sample EIB Input File

[Request\\_Return\\_from\\_Leave\\_of\\_Absence-WD34](#)

## Benefits Administration EIBs

### Concept: Add Dependent EIB

#### Background

You can use this EIB to add new dependents in Workday. For updating existing dependents, you can use the Edit Dependent EIB.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

See Benefits > View Dependents from the related actions of the worker's profile.

#### EIB Input File Guidelines

##### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- You must have access to the *Dependent Event* business process type in the Benefits functional area to run this EIB.

##### Additional Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate these fields in the input file, consider:

Fields	Consideration
Spreadsheet Key	Specify a unique value for each dependent, even if multiple dependents are associated with the same employee.
Dependent ID	If you leave this blank, the EIB automatically assigns an ID value at launch. Alternatively, you can assign your own ID by entering a value. If you enter a value, it must be unique and not already in use.
Employee	Update cell F4 to Employee_ID.
Related Person Relationship	You can find a list of reference ID values by running the View Reference IDs report and searching for the <i>Related Person Relationship</i> business object.
Use Employee Address	If set to Y, then the dependent shares the same primary home address as the employee.
Use Employee Phone	If set to Y, then the dependent shares the same primary home phone data as the employee.
Country	<p>The country of the dependent. If you click the down arrow in cell M4, you'll see 3 different reference ID types that you can use for the country:</p> <ul style="list-style-type: none"> <li>• ISO_3166-1_Alpha-2_Code</li> <li>• ISO_3166-1_Alpha-3_Code</li> <li>• ISO_3166-1_Numeric-3_Code</li> </ul> <p>You can find a list of reference ID values by running the View</p>

Fields	Consideration
	Reference IDs report and searching for the <i>Country</i> business object.
Address Data	If you set the Use Employee Address field to <i>N</i> , then you must enter an address.
Date of Birth	Use format YYYY-MM-DD.
Gender	You can find a list of reference ID values by running the View Reference IDs report and searching for the <i>Gender</i> business object.

## Common Issues and Errors

Issue	Cause and Solution
Failure to load Add Dependent EIB data after completion.	<ol style="list-style-type: none"> <li>1. Verify that you ran the EIB in live mode and not validate only mode.</li> <li>2. Verify that the business process successfully completed. If it's still in progress, take the necessary actions to ensure it processes or skips all steps.</li> <li>3. Mass cancel the dependent events that you loaded using the Mass Cancel Business Processes task and rerun the EIB.</li> </ol>
EIB issues an error like this: <i>Invalid ID value. '21001' is not a valid ID value for type = 'Contingent_Worker_ID'</i>	Check the reference ID type specified in the Employee field. You need to change cell F4 to <i>Employee_ID</i> .
EIB issues an error like this: <i>Validation error occurred. At least one address is required for beneficiaries or dependents. Please enter an address for the beneficiary or dependent.</i>	Specify an address for the beneficiary. <ul style="list-style-type: none"> <li>• If you want to use the same address as the employee, enter <i>Y</i> in the Use Employee Address field.</li> <li>• If you aren't using the same address as the employee, then you must enter an address.</li> </ul>
EIB issues an error like this: <i>Country Reference is required unless address is being deleted.</i>	Verify that you've populated the country in the address data section.
EIB issues an error like this: <i>Validation error occurred. Instance ID cannot be parsed.</i>	You're populating a field that has reference ID type IID (Instance ID). Check for any government or national IDs that populate in the EIB input file,

Issue	Cause and Solution
	and confirm that you're populating the correct field.
Unable to launch the EIB.	This is most likely security-related. Verify you have the correct security configuration. Ensure that you are in the relevant security group and have access to the <i>Dependent Event</i> business process type in the Benefits functional area.

## Business Processes

Dependent Event.

### Use Cases and Guidelines for Recovering from a Bad Load

This EIB only adds dependents. It can't update or delete existing dependents. If you've uploaded incorrect entries, you can:

- Option 1: Use the Edit Dependent EIB to update the entries with the correct information.
- Option 2: Use either the Mass Cancel Business Processes task (if the event is still in progress) or Mass Rescind Business Processes task (if the event is complete). Both of these tasks are secured to the *Business Process Administrator* domain in the System functional area. You can then select Business Processes Loaded by EIB to find the integration event that you want to cancel or rescind. Alternatively, you can enter *Dependent Event* in the Business Process Types prompt and enter the date range that corresponds to when you ran the EIB.

For reference documentation for all web services including Add Dependent, see [Operation Directory](#).

## Sample EIB Input File

[Add\\_Dependent-v37\\_0](#)

## Concept: Change Benefits EIB

### Background

You can use this EIB to change benefit elections for an employee.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB

### Equivalent Workday Task

See Benefits > Change Benefits from the related actions of a worker profile.

#### Note:

The Change Benefits EIB has some differences from the user interface (UI) task.

Example: The UI task has additional functionality that the EIB doesn't support, such as: coordination of events, calculation of FSA and HSA per pay periods and benefit defaulting.

We recommend using the EIB only to mass load new employees during initial setup, or to support the acquisition of a large volume of new employees.

For this reason, we don't recommend using the Change Benefits EIB for loading ongoing benefit enrollments from third-party systems.

## EIB Input File Guidelines

We recommend that you:

- Review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- Submit a test benefit event in a nonproduction tenant using the information that you intend to specify in the EIB input file.
  - This enables you to test your configuration in Workday and identify what information you want to supply in the EIB input file.
- Specify each benefit plan on a separate row in the EIB input file. Example: if you want to add a health plan and an HSA for an employee, put each of them on a separate row.
  - Specify each dependent on a separate row as well.

If you want to:

- Submit additional coverage for an existing benefit event type, then populate the EIB input file with all the plans that the worker already has for that benefit event type - not just the new coverage you're adding. We recommend creating a specific benefit event type that only contains the coverage types that you want to change.
- Remove an existing plan, then specify the event type in the input file and include no other information regarding the plan. This is equivalent to waiving the plan. You can't waive autoenroll plans. To remove workers from autoenroll plans, change the eligibility rule to make the workers ineligible for the plan.

As you populate these fields in the input file, consider:

Field	Considerations
Spreadsheet Key	Specify a unique value for each combination of worker and benefit event type.
Coverage Begin Date	(Required) Specify a Coverage Begin Date that's on or after the benefit event date.  Workday bypasses the Coverage Begin Date value in the input file and instead calculates the Coverage Begin Date based on the Start or Waive Coverage tab of the Enrollment Event Rule. We also calculate the Deduction Begin Date based on the Enrollment Event Rule.
Original Coverage Begin Date	Leave blank. Avoid populating this field. If you include this data on the file, it displays as the Coverage Begin Date for the election. There's no way to edit or correct this date in the user interface.

## Common Issues and Errors

Issue	Cause and Solution
The EIB completes successfully but there's no benefit information added or updated.	Check if the employee is eligible for any plans:  1. From the related actions menu of the worker profile, click Worker History > View Worker History by Category.

Issue	Cause and Solution
	<p>2. Select the Benefits tab and check the business process event that you loaded with the EIB.</p> <p>3. Check the Details tab. If you see a message stating that there are no elected benefit plans, then it's likely that the employee wasn't eligible for the plans listed in the input file. You can manually submit the same benefit changes in Workday to determine the employee's plan eligibility. Remove any ineligible plans from the input file and resubmit the EIB.</p>
The EIB is wiping out existing benefit plans for the worker.	If you want to add or update coverage for an existing benefit event type, include all existing plans for the worker. Otherwise, Workday removes any existing plans that weren't included.
Even when setting the EIB processing instructions to Manual Processing, the EIB skips notifications and bypasses all approval steps, document review steps, and so on.	This is working as we would expect. This EIB is intended for administrators to load data without any employee actions. It was specifically designed to finalize the events, bypassing any steps in the business process.

## Business Processes

This EIB uses the *Change Benefits for Life Event* business process. The parent business process is *Change Benefits*.

## Use Cases and Guidelines for Recovering from a Bad Load

If you've uploaded incorrect entries, you can use either the Mass Cancel Business Processes task (if the event is still in progress) or Mass Rescind Business Processes task (if the event is complete). Both of these tasks are secured to the *Business Process Administrator* domain in the System functional area. Enter *Change Benefits* in the Business Process Types prompt and enter the date range that corresponds to when you ran the EIB.

For reference documentation for all web services including Change Benefits, see [Operation Directory](#).

## Sample EIB Input File

[Change\\_Benefits-WD30\\_0](#)

## Concept: Edit Dependent EIB

### Background

You can use this EIB to update a dependent.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB

## Equivalent Workday Task

Select Benefits > Dependents from the related actions of the worker's profile.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- You must have access to the *Dependent Event* business process type in the Benefits and Personal Data functional areas to run this EIB.

### Guidelines for Creating a Custom Report for the EIB Input File

To get information needed to populate the EIB input file, you might find it helpful to create a custom report using the *All Dependents* data source and the *Dependent* primary business object. This table lists a sampling of the business objects and report fields that you can select. You'll need to make some modifications based on the type of information you're loading.

Business Object	Field
Dependent	Dependent
Dependent	Reference ID
Worker	Employee ID
Dependent	Legal Name
Dependent	Relationship
Dependent	Date of Birth
Dependent	Uses Tobacco
Dependent	Phone Number - Primary with Country Code
Dependent	Primary Address - Full
Other IDs	Custom ID
Other IDs	Workday ID
Other IDs	Custom ID Type
Government Identifiers	Identification Number
National Identifiers	National Identifier
National Identifiers	Identification Number

## Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- As you populate these fields in the input file, consider:

Field	Considerations
Spreadsheet Key	Specify a unique value for each dependent.
Dependent	Enter the reference id value of the dependent you wish to update. You can get the id from the report above or you get the ids by running the View Reference IDs report and enter business object <i>Dependent</i> .
Dependent ID	Enter a value here only if you wish to assign a new reference id value to the dependent. Otherwise, leave this field empty. If you wish to update the reference ID only, Workday recommends that you use Put Reference ID instead.
Reason	To view values, run the View Reference IDs report and select business object <i>Event_Classification_Subcategory</i> . Then filter the Business Object Instance column by searching on a string such as <i>Dependent</i> to find the relevant values.
Related Person Relationship	Reference to the relationship between the

Field	Considerations
	dependent and the related person. To find the reference id values, run the View Reference IDs report and enter business object <i>Related Person Relationship</i> .
Custom ID	If updating or deleting an existing Custom ID (aka Other ID), you must supply the Workday ID (aka WID) of the ID. You can get the ID for a custom report if you created one. Note: the WID value can change each time you update the Custom ID. So make certain you check the WID value before each new EIB load.
ID Type	If providing Custom ID information, populate the ID type. To get a list of reference id values, run the View Reference IDs report and enter business object <i>Custom ID Type</i> .
Date of Birth	Enter the date of birth for the dependent in format YYYY-MM-DD. Workday requires this field.
Gender	Enter the gender of the dependent. Workday requires this field. For a list of reference id values, run the View Reference IDs report and

Field	Considerations
	search business object <i>Gender</i> .
Inactive Date	Enter a date if you wish to deactivate the dependent.

## Common Issues and Errors

Issue	Cause and Solution
EIB issues these errors:	Workday requires Gender and Date of Birth values when updating dependents using the web service. You might want to create a custom report as described in the <i>Guidelines for Creating a Custom Report for the EIB Input File</i> section to get the Gender/Date of Birth values needed to populate the EIB.
Unable to launch the EIB.	This issue is most likely security-related.

## Business Processes

Dependent Event.

## Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to update existing dependents only. If you need to add or delete dependents, select 1 of these options:
  - Add dependents: use web service *Add Dependent*
  - Delete dependents: Workday doesn't support deleting dependents in bulk. If you need to delete, you must manually do so. And even if manually deleting, you can delete dependents only if they have never enrolled.
- If you have inadvertently uploaded incorrect entries, use the Mass Cancel Business Processes or Mass Rescind Business Processes. Select cancel or rescind based on whether the business process event has completed or is still in progress. You can then select *Business Processes Loaded by EIB* to find the integration event that you wish to cancel or rescind. Or the other option is to enter *Dependent Event* at the Business Process Types prompt and enter a date range that you ran the EIB.

For reference documentation for all web services including Edit Dependent, see [Operation Directory](#).

## Sample EIB Input File

[Edit\\_Dependent-WD35](#)

## Concept: Import 1095-C Form Recipients Data EIB

### Background

You can use this EIB to add or update 1095-C form data for a given 1095-C recipient.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- You must have access to the *Process: ACA Tax Filing 1094-C/1095-C (Run) - USA* domain in the Benefits functional area to run this EIB.

### Additional Input File Guidelines

- To ensure you're using the latest web service version, create a new EIB integration each 1095 Season.
- We suggest you start by reviewing [Steps: Import ACA 1095-C Recipient Data](#) for instructions on using this EIB.
  - Start by running the Create ACA 1095-C/1094-C task. Then, run the View 1095-C Form Recipient Data. Export report. Use the report output as input for the EIB.
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:
- As you populate these fields in the input file, consider:

Field	Considerations
Header Key	Specify 1 header key value for each unique combination of year and company. We recommend you load just 1 company and year within each EIB input file. Loading 1 company and year will make it easier to identify and fix any errors issued when loading the data.

Field	Considerations
Line Key	Use the same line key value for a worker and their covered individuals. Populate all covered individuals for the worker. If you don't include all of them in the input file, they get removed.
Employee	Populate the employee ID when making updates to any worker who already exists in the Workday tenant. If you leave the field blank, a new entry gets added and you'll have duplicates. Also, note that the reference ID type (in cell D4) defaults to <i>Contingent_Worker_ID</i> . Most likely you'll want to change it to <i>Employee_ID</i> . If you make any changes to an employee, include any dependents for this employee in the EIB input file. Include the dependents even if you aren't making changes to the dependents.
Zip Code	You only need to populate this field if there's an Individual Coverage Health Reimbursement Arrangement (ICHRA).
Plan Start Month	The EIB requires this entry as of Tax Year 2020. Enter

Field	Considerations
	a 2-digit number from 00-12 for Plan Start Month. If there's no health plan under the coverage offered to the employee, enter <i>00</i> . Format this field as a text box so that the leading 0 doesn't get truncated when entering a single digit value such as 01.
External 1095-C Recipient ID	If you're transmitting information for a worker who doesn't exist in Workday, specify the External 1095-C Recipient ID instead of employee ID. The first time you load the external recipient, leave this field blank. If you make any subsequent updates, reference the value that got assigned to the external recipient ID, so that a duplicate doesn't get created.
Generation Source	This field is for internal use, so leave it blank.
Is Transmitted	Leave this field blank.
Row ID	Use a different value for each of the covered individuals for a given worker.
Covered Individual Reference	When updating an existing Covered Individual, you can populate the Covered Individual

Field	Considerations
	<p>Reference ID if the unmasked SSN isn't available. You can leave this field blank if one of these conditions exists:</p> <ul style="list-style-type: none"> <li>• You're adding a new covered individual.</li> <li>• The entry is for an existing covered individual and you're able to supply an unmasked SSN.</li> </ul>
SSN	<p>When populating the worker SSN or the SSN for the covered individual</p> <ul style="list-style-type: none"> <li>• For any entry where you don't specify an employee ID/contingent worker ID (in column D), make certain all SSNs get unmasked for that entry.</li> <li>• Note: there are 2 places in each row where an SSN can get specified: Column L is the</li> </ul>

Field	Considerations
	<p>Employee SSN and Column BL is the Covered Individual SSN.</p> <ul style="list-style-type: none"> <li>• If you're adding an SSN for a new covered individual, enter an unmasked SSN in column BL.</li> <li>• If the SSN starts with a 0, follow one of these options:           <ul style="list-style-type: none"> <li>• Option 1: Format the cell as text and then ensure that the leading zero is there.</li> <li>• Option 2: Format the cell as number and then add an apostrophe to the beginning of the number (an example would</li> </ul> </li> </ul>

Field	Considerations
	be '011223333).
DOB	If the SSN isn't available for a covered individual, then provide a Date of Birth.

- After you've loaded the data through EIB, you might find it helpful to rerun the View 1095-C Form Recipient Data report to validate that the data loaded as you expected. Also, you might find it helpful to filter by the Generation Source column. All recipients initially have value WG for Generation Source, but after the EIB load, you'll notice that:
  - The Generation Source column displays value WE for employees updated through EIB.
  - The Generation Source column displays value EG for any External Recipients that you uploaded through EIB.

## Common Issues and Errors

NOTE: When Workday returns errors, the Line Number value in the error report isn't the line number in the Excel file. Rather, it signifies the nth employee in the EIB input file. Example: If the error indicates a problem for line #5, check the fifth employee in the EIB input file.

Use sequential line key values in the EIB input file. Otherwise, the line # specified in the error message might not match up to the Line Key value in the EIB input file.

Issue	Cause and Solution
The EIB issues the error <i>SSN of new records cannot be masked</i> .	<ul style="list-style-type: none"> <li>This issue occurs if the Covered Individual Reference value in the EIB input file is incorrect.</li> <li>Note: every time you create the ACA data, the covered individual Reference IDs will get newly assigned. Also, IDs won't match up between different tenants such as Sandbox and Production. You might need to rerun the View 1095-C Form Recipient Data report to pick up the correct values.</li> <li>This issue also occurs when the EIB input file contains masked SSN values for covered individuals, yet the Covered Individual Reference value is blank. If the Covered Individual Reference value is blank, specify unmasked SSNs in column BL.</li> <li>This issue can also occur if the SSN starts with a 0. If the SSN starts with a 0, make</li> </ul>

Issue	Cause and Solution
	sure it's a text box, and that the 0 isn't getting dropped. Also, when entering the SSN, use dashes (such as 011-22-3333). Be sure to verify the SSN values for the employee (column L) as well as the covered individual (column BL).
<p>The EIB issues the error <i>The SSN for this 1095-c is not valid. Please use the valid formatting. xxx-xx-xxxx.</i></p>	This issue can occur if the SSN starts with a 0. If the SSN starts with a 0, make sure it's a text box and that the 0 isn't getting dropped. Also, when entering the SSN, use dashes (such as 011-22-3333). Be sure to verify the SSN values for the employee (column L) as well as the covered individual (column BL).
<p>The EIB issues these errors:</p> <ul style="list-style-type: none"> <li>• <i>Element Content 'Social_Security_Number' is required, on internal element 'Employee Information Data'</i></li> <li>• <i>The SSN for this 1095-c is not valid. Please use the valid formatting. xxx-xx-xxxx</i></li> </ul>	For the entry where failure occurred, check that a Social Security Number gets populated in column L.
<p>The EIB issues an error similar to <i>ERROR: com.workday.index.DuplicateIndexException: Duplicate insert on index: ACA Report Form Box (Dependent Month Based)-ID-Covered Individual Box ID (95\$3951), value: CoveredIndividual-....</i></p>	<p>This issue can occur if you're trying to modify the recipient name. If this error occurs, we recommend you:</p> <ol style="list-style-type: none"> <li>1. Remove the Covered Individual Reference value in the EIB input file, for any persons where the error occurs.</li> <li>2. Unmask all SSNs in the EIB input file for the individuals where error occurs.</li> <li>3. Rerun the EIB.</li> </ol>
<p>The EIB issues an error for an entry that has no errors.</p>	<ul style="list-style-type: none"> <li>• This issue might occur if you're loading more than 1 company (and subsequently more than 1 header key value) in the same EIB input file.</li> <li>• If there's more than 1 header key in the input file, and you receive an error in Par Count Line Number 1, you won't know the cause of the error. The error can be the first entry for header key 1 or the first entry for header key 2. To avoid this problem, load only 1 header key per input file.</li> </ul>
<p>The EIB issues an error similar to <i>Invalid ID value.'21001' is not a valid ID value for type = 'Contingent_Worker_ID'.</i></p>	<p>This issue usually occurs because in the input file, the reference ID for Employee references <i>Contingent_Worker_ID</i> instead of <i>Employee_ID</i>. Workday populates the EIB input file with the reference ID type for the first valid type that it finds. Workday selects the ID based on alphabetical order. To resolve this issue, change the value in cell D4 from <i>Contingent_Worker_ID</i> to <i>Employee_ID</i>.</p>

Issue	Cause and Solution
The EIB issues an error <i>Invalid Attribute Generation_Source-urn:com.workday/bsvc for element ACA_1095-C_Form (6\$89256)</i> .	This issue occurs if there's a value in the Generation Source column of the EIB input file. Remove any values in this column.
The EIB issues error: <i>Enter a 2-digit number from 00-12 for Plan Start Month.</i>	<p>This issue might occur if you're entering a 1-digit number (Example: 1) instead of a 2-digit number (01). To resolve this issue:</p> <ol style="list-style-type: none"> <li>1. Edit the EIB input file.</li> <li>2. Click the column for Plan Start Month (this column is column R if using the latest EIB version).</li> <li>3. Format Cells and select Text.</li> <li>4. Then if you're entering a single digit month, reenter it with the leading 0. Example, enter 01 instead of 1.</li> </ol>
<i>The EIB issues an error Invalid boolean value=Yes for type All 12 Months Bool.</i>	This issue occurs if you specify the value Yes or No in the All 12 Months column (column BN) of the EIB input file. Instead, you need to specify Y or N.
The EIB completes successfully, however no updates got made.	<ol style="list-style-type: none"> <li>1. Ensure that you didn't run the EIB in validation mode.</li> <li>2. If you specified covered individual reference values in the EIB input file, ensure that they're correct. <ul style="list-style-type: none"> <li>a. The reference IDs aren't the same across all tenants, and the IDs get regenerated each time you create the 1095 data. Use the View 1095-C Form Recipient Data report to validate the values.</li> <li>b. You don't need to supply the reference IDs if SSNs get unmasked and are for existing covered individuals.</li> </ul> </li> <li>3. Ensure that you're using the latest web service version. If you aren't certain, create a new EIB, which will pick up the latest web service version.</li> <li>4. Also, note that EIB creates corrections only if there's a change in worker data to what you sent previously. If no changes get detected in the incoming record, it gets ignored.</li> </ol>
The EIB completes with some errors. However I don't see the updates in the tenant, for the entries that got successfully processed.	For some of the Import Web Service operations, such as this operation, the load is all or nothing for each given header key value. Workday processes all the entries for a given header key in 1 batch. Therefore you must resolve all errors before the entries get loaded.

Issue	Cause and Solution
The EIB is adding duplicate entries for an employee or external recipient instead of updating the existing entries.	If you're updating an employee, ensure that the employee ID gets specified in the input file (Column D). If you're updating an external recipient, ensure that the External 1095-C Recipient ID gets specified in the input file (Column E). If these fields are empty, the web service assumes it's a new entry.
When importing corrections, the EIB issues the error <i>This 1095-C cannot be added or updated because the Integration Event is in Processing. Please wait until all transmissions for the Integration Event are either Accepted or Accepted with Errors.</i>	You can't use the EIB to import 1095-C data if any of the transmissions aren't in Accepted or Accepted with Error status. Check the status: <ul style="list-style-type: none"> <li>Check the status of the transmission using the ACA Transmission Status Report.</li> <li>If you think that the transmission has the incorrect status, launch the integration again in Check Status mode. This action returns the status of the transmission from the IRS. It might take 2-3 days for the IRS to process your data during busy times, so check the status every few hours.</li> </ul> See: <a href="#">Concept: Affordable Care Act (ACA) Connectors</a>
<i>When importing corrections, the EIB issues an error similar to <b>ERROR:</b> <b>com.workday.index.DuplicateIndexException:</b> <b>Duplicate insert on index: ACA Report Form Box (Dependent Month Based)-ID-Covered Individual Box ID (95\$3951), value: CoveredIndividual.....</b></i>	If this error occurs, we recommend you: <ol style="list-style-type: none"> <li>Remove the Covered Individual Reference values in the EIB input file.</li> <li>Unmask all SSNs in the EIB input file for the covered individuals.</li> <li>Rerun the EIB.</li> </ol>
After importing corrections, you can't locate them in Workday.	This issue occurs if you run the <b>Create 1095C/1094C Data(Corrections)</b> task after uploading EIB corrections. The task will revert the changes created through EIB.
EIB issues these errors: <ul style="list-style-type: none"> <li><i>Could not retrieve a file with the label: EIB Transformation</i></li> <li><i>Empty message received on step id CopyInputFile.</i></li> </ul>	Check the header and line keys in the EIB input file. Some rows might not have line key or header key values. Alternately, you're specifying header key values in worksheet2 that are invalid in worksheet1(or the other way around).
There's no option to launch the EIB.	If you run the report <b>View Security for Securable Item</b> and search for securable item import 1095-c, it will display you that you need Put access to domain security policy Process: ACA Tax Filing 1094-C/1095-C (Run)-USA to use the web service.  To resolve the issue, add the appropriate security groups to the above domain with Put access. Then activate the change.

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new entries or update existing entries. You can't delete entries.

- If you have inadvertently uploaded incorrect entries, rerun the EIB using an input file with same workers and corrected data.
- To delete ACA data, use task Delete ACA 1095-C/1094-C Data. If you do so, it will delete all data. You'll need to start all over using the Create 1094-C/1095-C data and then use the EIB again to import any updates.

For reference documentation for all web services including Import 1095-C Form Recipients Data, see [Operation Directory](#).

### **Sample EIB Input Files**

[Import\\_1095-C\\_Form\\_Recipients\\_Data-WD35-Example1-One-Company](#)

[Import\\_1095-C\\_Form\\_Recipients\\_Data-WD35-Example2-Multiple-Companies](#)

### **Concept: Put Benefit Individual Rate EIB**

#### **Background**

You can use this EIB to update benefit individual rates for employees. These rates are calculated outside of Workday.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

This EIB doesn't create benefit events. Before you use this EIB, ensure that there's a benefit event in Workday for each employee.

#### **Equivalent Workday Task**

The Manage Individual Rates task is the equivalent task.

#### **EIB Input File Guidelines**

##### **Web Service Version and Security Configuration Guidelines**

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- You must have access to the *Manage: Benefits for Organizations* domain in the Benefits functional area to run this EIB.
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.

##### **Additional Input File Guidelines**

- As you populate these fields in the input file, consider:

Field	Considerations
Spreadsheet Key	Specify a unique value for each Benefit Individual Rate.
Benefit Individual Rate	Leave blank.
Benefit Individual Rate ID	Use a custom report to identify the value.

- If you need to change the rate for existing coverage, we recommend that you first create a new benefit event for when the new rate becomes effective. Then use this EIB to update the rate associated with the new event.
- Although this web service provides the ability to generate with data, this feature isn't particularly helpful for this EIB. There's no employee ID field populated in the EIB input file, making it difficult to identify the employee associated with each entry. Instead, there's a *Benefit Individual Rate ID* in the EIB input file, which links to the employee's ID and rate. For this reason, it's better to use a custom report to help you populate the EIB input file, as it will display the Benefit Individual Rate ID in EIB input file with the employee that it belongs to. If you still choose to generate with data:
  - From related actions of your EIB, select Template Model > View.
  - Select Edit Template with Data Options.
  - Set the filter to Condition Rule Filter.
  - Add a rule condition that picks up all entries. Example: Always True (Workday Delivered) isn't blank.
  - Regenerate the template.
  - Use a custom report to identify the employees associated with each entry in the EIB input file. You can use the Excel vlookup tool to link the Benefit Individual Rate ID with the employee.

## Common Issues and Errors

Issue	Cause and Solution
There's no column to populate Employee ID in the EIB input file.	This EIB doesn't use employee ID. Instead, populate Benefit Individual Rate ID, which is linked to the employee.
EIB issues an error like this:  <i>Validation error occurred. This web service can only be used to update existing Individual Rates. Please make sure the Benefit Individual Rate ID is a valid one.</i> ADDITIONAL_BENEFITS_INDIVIDUAL_RATE-1-12345.	The reference ID value in the Benefit Individual Rate ID field is invalid.  Verify the Benefit Individual Rate ID you populated in the EIB input file is correct.
Unable to launch the EIB	This issue is most likely security-related.

## Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to update individual rates. You can't delete entries.
- Since this EIB doesn't use a business process, there's no option to rescind or cancel. If you've inadvertently uploaded incorrect entries, rerun the EIB with the correct amounts.

For reference documentation for all web services including Put Benefit Individual Rate, see [Operation Directory](#).

## Sample EIB Input File

[Put\\_Benefit\\_Individual\\_Rate-WD37](#)

## Concept: Put Health Care Rate EIB

### Background

You can use this EIB to add or update health care rates.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

This EIB loads calculated health care rates only. You can't use it to update rates that require configuration directly on health care plans. Those rates still require a manual update.

## Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Create Health Care Rate
- Edit Health Care Rate

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  1. From related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- You must have access to the *Set Up: Benefits* domain in the Benefits functional area to run this EIB.
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- To prevent data loss, we recommend that you generate your spreadsheet with data for the Put Health Care Rate EIB. See: [Example: Generate EIB Spreadsheet Template with Data](#) on page 64.
- As you populate these fields in the input file, consider:

Field	Considerations
Spreadsheet Key	Specify a unique value for each Health Care Rate. All entries for a given Health Care Rate should have the same spreadsheet key value.
Health Care Rate (column C)	Leave blank.
Effective Date:	Effective date of health care rate. If you want to update existing entries, populate the same effective date that the health care rate is currently using.
Health Care Rate ID (column E)	If updating an existing health care rate, enter the reference id value.

Field	Considerations
	The best way to get this information is to use the <i>Generate Spreadsheet with Data</i> functionality. If you're creating a new health care rate, you can enter a value, or else leave it blank and the EIB will automatically assign a value.

## Common Issues and Errors

Issue	Cause and Solution
Although the EIB completes successfully, it appears that it didn't load the data.	Check and confirm: <ol style="list-style-type: none"> <li>1. You didn't run the EIB in Validate Only mode.</li> <li>2. The effective date in the EIB input file is accurate.</li> </ol>
EIB issues an error like this: <i>Benefit Rate Name already in use</i>	If loading rates for an existing Benefit Rate, it's considered an update. You'll need to populate the existing Health Care Rate ID in the EIB input file (column E).
Unable to launch the EIB	This issue is most likely security-related. When running the report View Security for Securable Item for securable item <i>Put Health Care Rate (Web Service)</i> , you'll see that you need Put access to domain security policy <i>Set Up: Benefits</i> . To change the security, complete these steps: <ol style="list-style-type: none"> <li>1. Edit domain security policy for <i>Set Up: Benefits</i></li> <li>2. Confirm you have Put access to the domain. Ideally you should have access through an unconstrained security group.</li> <li>3. Activate the security change</li> </ol>

## Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new health care rates or update existing health care rates. You can't delete the health care rates nor can you delete the rate bands.
- Since this EIB doesn't use a business process, there's no option to rescind or cancel. If you have inadvertently uploaded incorrect entries, there are options to correct the information:
  - Rerun the EIB and update with the corrected healthcare rate information (you might need to use the *Generate Spreadsheet with Data* option to populate the spreadsheet with the existing

data). When you update the data, use the same effective date you used when you previously loaded the data to ensure that the incorrect data gets replaced.

If you can't find a way to easily correct the loaded health care rate, another option is to start fresh by:

1. Manually edit the health care rate and rename it to indicate that you shouldn't use it anymore. Example: You could add *DNU* to the beginning of the name.
2. Use the EIB to create a brand new health care rate with the correct information.
3. Edit the benefit plan that uses the health care rate and change it to use the newly created health care rate.

For reference documentation for all web services including Put Health Care Rate, see [Operation Directory](#).

### **Sample EIB Input File**

[Put\\_Health\\_Care\\_Rate-WD35](#)

## **Cash Management EIBs**

### **Concept: Submit Payment Election Enrollment EIB**

#### **Background**

You can use this EIB to replace a worker's current payment elections with new elections.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB

#### **Equivalent Workday Task**

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Maintain Payment Elections for Worker.
- On the related actions menu of the worker profile, select Pay > Payment Elections.

#### **EIB Input File Guidelines**

##### **Web Service Version and Security Configuration Guidelines**

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by

1. From related actions of the EIB, select Template Model > View.
2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
3. If you're using an older web service version, you can create a new EIB to get the latest version.

## Additional Input File Guidelines

- You must have access to these domains to run this EIB:
  - *Manage: Payment Election* domain in the Express functional area.
  - *Worker Data: Payroll (Payment Elections)* domain in the Core Payroll functional area.
  - *Worder Data: Payroll Interface (Payment Elections)* domain in the Payroll Interface functional area.
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- Important notes regarding this web service:
  - When you load payment elections for a given worker, the EIB is expecting the input file to include ALL elections for the worker. That is, existing elections and any new or updated elections for the worker. If you don't include existing elections, the web service assumes that you want them removed.
  - It's normally not possible to retain in-progress and unused bank accounts for a worker when using this EIB.
  - Due to the above behavior of this web service, we suggest you thoroughly test in Sandbox before loading the EIB in your Production tenant
  - You can distribute payments to multiple accounts by creating multiple rows for a single payment election rule. The distribution amount for the payment election rule must add up to 100 or one of the last accounts must be marked as distribution balance.

Example: To distribute half of a worker's regular payments to 1 account and split the remainder evenly between 2 others, add rows to the template with Payment Election Rule set to *Regular Payments* to the appropriate account numbers, with a Distribution Percentage of 0.50 on the first, 0.25 on the second, and Y for Distribution Balance on the third.
  - You can use the Integration IDs report to help identify reference id values needed to populate the EIB input file. Example: You can search these business objects, from

the Integration IDs report, to get a list of values and reference ids:

- *Bank Account Type*
  - *Payment Type*
  - *Payment Election Rule*
- As you populate these fields in the input file, consider:

Field	Considerations
Spreadsheet Key	Specify a unique value for each worker.
Row#	The row number can be tricky to populate, especially if the worker has multiple pay types and is using split distributions. You might find it helpful to review the attached sample input file to determine how to populate the row numbers.
Retain Unused Worker Bank Accounts	This field can be a bit misleading as it implies that you're able to keep the worker's unused bank accounts. However, make note of the full description for this field. While True, the request won't remove any existing and unused Worker Bank Accounts in the most recently Completed Enrollment (not including In-Progress Enrollments). If you're using the Worker Bank Account but don't reference it in the incoming request, then

Field	Considerations
	the EIB removes the Worker Bank Account regardless of this attribute. While False, the request will remove all Worker Bank Accounts not assigned to a Payment Election.
Auto Complete	This flag controls whether the business process skips approvals, reviews, to do steps and notifications. Set to Y to skip.
Role ID	Specify the Employee or Contingent worker. Note that if you're adding payment elections for both employees and contingent workers, you might find it helpful to split the columns using the <i>Separate Type Column</i> option as described in <a href="#">Customize EIB Spreadsheet Template</a> . By doing this, you can list both employees and contingent workers in the same input file.

- Refer to the attached sample input file for examples, as this file will help in determining how you need to populate other fields within the input file.

## Common Issues and Errors

Issue	Cause and Solution
The EIB is unexpectedly removing the worker's previous payment elections.	This EIB is expecting you to include all elections (new and existing) in the input file. If you don't include existing elections, the EIB assumes you want them removed. If you inadvertently remove

Issue	Cause and Solution
	the worker's payment elections, mass rescind the business process events. Then correct the input file and reload.
The EIB is unexpectedly removing bank accounts that aren't part of the current payment elections.	As noted in the <i>Additional Input File Guidelines</i> section, it's normally not possible to retain in-progress or unused bank accounts when using this EIB. If you inadvertently removed this information, mass rescind the business process events. Then correct the input file and reload
<p>The EIB issues error:</p> <p><i>You must have the balance option selected for the last election or the percentage must add up to 100%.</i></p>	<p>There's 1 of 2 possible issues that could trigger this error:</p> <ol style="list-style-type: none"> <li>1. The EIB input file specified percentages don't add up to 100%.</li> <li>2. Or the EIB input file specified amounts but didn't select <i>balance</i> for the last entry for the worker.</li> </ol> <p>Check the last 3 columns in the input file to make certain the EIB properly populate Distribution Amount, Distribution Percentage, and Distribution Balance.</p>

## Business Processes

Payment Election Enrollment Event.

### Use Cases and Guidelines for Recovering from a Bad Load

This web service enables only *replace all payment elections* capability for each worker, therefore, you can't selectively delete or modify specific payment elections for a worker. The only option is to reload all the worker's payment elections each time you need to make a payment election modification for a worker.

If you've inadvertently uploaded incorrect entries, an option would be to use task Mass Rescind Business Processes (or Mass Cancel if the events are still in progress), to remove the entries. There's currently no Business Processes Loaded by EIB option available when using the mass cancel or mass rescind tasks for this web service. Instead, you can:

- Make certain you have the necessary permission to cancel or rescind. If you're not certain, check the business process security policy for business process *Payment Election Enrollment Event* to make certain that rescind and cancel sections specify the appropriate security groups.
- Enter the task that you need to use. That is, Mass Rescind Business Processes or Mass Cancel Business Processes
- Go to the business process types prompt and enter *Payment Election Enrollment Event*.
- Then select the date range used for the EIB to find the events that you need to cancel or rescind.

For reference documentation for all web services including Submit Payment Election Enrollment, see [Operation Directory](#).

### Sample EIB Input File

[Submit\\_Payment\\_Election\\_Enrollment-WD31](#)

## Compensation EIBs

### Concept: Import Eligible Earnings Override EIB

#### Background

You can use this EIB to add or update eligible earnings override information for an employee.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

If you have an in-progress bonus process with configured participation rules, then that process will interact with the eligible earnings in this EIB.

#### Equivalent Workday Task

The Create Eligible Earnings Override task is the equivalent task.

#### EIB Input File Guidelines

##### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the *View Template Model* page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- You must have access to the *Set Up: Compensation Management* domain in the Advanced Compensational functional area to run this EIB.

##### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- As you populate these fields on the Import Eligible Earnings Override worksheet in the input file, consider:
  - There should be just 1 entry in this worksheet.

Field	Considerations
Spreadsheet Key	
Eligible Earnings Override Period	To find the reference id for the Eligible Earnings Override Period:

Field	Considerations
	<p>1. Run the View Eligible Earnings Override Period report.</p> <p>2. From the related actions of the period you wish to use, select Integration IDs &gt; View IDs.</p>
Eligible Earnings	Leave this field blank.
Eligible Earnings ID	This field is optional when creating a new entry. If you're creating a new earnings override, you can enter a value here if you wish to assign the ID. However, you can also leave the field blank and the web service will assign a value. When updating an existing earnings override, you must specify the Eligible Earnings ID.
Employee	You might want to change the value in cell F4 from Contingent_Worker_ID to Employee_ID.
Position	Only required if the employee

Field	Considerations
	has multiple positions.
Apply to All Bonus Plans	Enter <i>Y</i> or <i>N</i> depending on whether it applies to all bonus plans.
Restrict to Bonus Plans	To restrict this entry to bonus plans, enter them here (enter each bonus plan on a separate line). If you enter a value in this field, then the Apply to All Bonus Plans field must be value <i>N</i> .
Amount	Enter the amount.
Currency	Enter the Currency code. To find the value, you can run the Integration IDs report and search for the Currency business object.

## Common Issues and Errors

Issue	Cause and Solution
EIB completes successfully but no data loads, or just the first entry in the EIB input file loads.	<p>You can:</p> <ol style="list-style-type: none"> <li>1. Make certain there's a different line key value populated for each unique employee and position combination. If you use the same line key value for all the entries, then only the first entry in the EIB input file will get processed.</li> <li>2. You can run the Eligible Earnings Override report to verify that the values display correctly in this report. This action will verify that EIB loads the data is properly.</li> </ol>

Issue	Cause and Solution
	<p>3. If the amounts only reflect incorrectly in the bonus process:</p> <ul style="list-style-type: none"> <li>• Verify that the compensation grid includes the Eligible Earnings field.</li> <li>• Make certain that the bonus plan specified in the EIB input file is using eligible earnings override as a compensation basis.</li> <li>• Verify that the correct eligible earnings period displays.</li> </ul> <p>4. If the issue persists after checking steps 1 to 3, test manually by entering the eligible earnings override for one of the employees. This test will help determine whether the issue is specific to the web service.</p>
<p>The EIB completes with errors for just some of the eligible earnings overrides loaded. However, you find that none of the entries loaded, even the eligible earnings overrides where no errors appeared.</p>	<p>This issue occurs for this Import web service since a background process loads the data. Make certain all errors get addressed before you load all the eligible earnings overrides.</p>
<p>EIB fails with error:</p> <p><i>The Eligible Earnings Override Period is currently in use by another Import Web Service. Please wait for that one to finish before starting another.</i></p>	<p>You can:</p> <ol style="list-style-type: none"> <li>1. Make certain that no one else is updating the eligible earning overrides, through User Interface or another integration, while you're running the EIB.</li> <li>2. If the issue persists after checking steps 1 and 2, open a case with Workday Support.</li> </ol>
<p>The EIB fails with these 3 errors:</p> <ul style="list-style-type: none"> <li>• <i>Position submitted is not filled as of the effective date.</i></li> <li>• <i>The entered information does not meet the restrictions defined for this field. (Employee_Reference).</i></li> <li>• <i>The job is not valid for the employee.</i></li> </ul>	<p>Make certain you aren't performing an override on your own employee ID. If you are, have someone else enter the override value for you, or configure the EIB to have an Integration System User (ISU) run it.</p>
<p>The EIB fails with these 2 errors:</p> <ul style="list-style-type: none"> <li>• <i>Position submitted is not filled as of the effective date.</i></li> <li>• <i>The job is not valid for the employee.</i></li> </ul>	<p>Make certain you have unconstrained access to the domain security policy that secures web service (Set Up: Compensation Management).</p>
<p>The EIB fails with these 3 errors:</p> <ul style="list-style-type: none"> <li>• <i>Position submitted is not filled as of the effective date.</i></li> <li>• <i>The employee you have selected has more than one job. You must supply the job to which this operation applies.</i></li> <li>• <i>The job is not valid for the employee</i></li> </ul>	<p>These issues can occur if the worker has more than 1 position, but you don't populate the position value. Check the employee and if there are multiple positions, populate the appropriate position in column G.</p>
<p>The EIB fails with error:</p>	<p>If you specify an Eligible Earnings ID in the EIB input file, it must be unique for each worker.</p>

Issue	Cause and Solution
<i>Duplicates exist for Eligible Earnings ID. Eligible Earnings IDs should be unique.</i>	Otherwise you'll receive this error. Verify there's a unique value for each worker in column E (if worker has multiple positions, you need a unique eligible earnings ID for each worker/position combination).
Unable to launch the EIB	When running report View Security for Securable Items, you'll see that you need Put access to domain security policy Set Up: Compensation Management to run this EIB. Add the access and activate the change. Then retest.
The EIB fails with these 2 errors: <ul style="list-style-type: none"> <li>• <i>Could not retrieve a file with the label: EIB Transformation</i></li> <li>• <i>Empty message received on step id CopyInputFile.</i></li> </ul>	This issue occurs if the Line Key values are missing in your EIB input file. To resolve the issue, check the Line Key values in column C of the Eligible Earnings worksheet and make certain there's a value populated for each entry.
Unable to update an existing Eligible Earnings Override entry.	When updating an existing Eligible Earnings Override entry, the Eligible Earnings ID field is required.
The EIB fails with these 3 errors: <ul style="list-style-type: none"> <li>• <i>An Eligible Earnings Override for worker [worker_id] already exists for the selected eligible earnings period and plan.</i></li> <li>• <i>A worker can have more than 1 eligible earnings override for the same period if the plans differ. Select a different plan for the worker.</i></li> <li>• <i>Worker [worker_id] already has eligible earnings defined for the period (PERIOD). You may edit the eligible earnings to restrict it to specific bonus and stock plans or create new eligible earnings for a different period.</i></li> </ul>	This error occurs when you try to create a new eligible earnings override for a worker and period where one already exists. You can either update the existing eligible earnings override (using its Eligible Earnings ID) or create a new eligible earnings override for a different period.

## Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to create or update eligible earnings overrides. You can't remove eligible earnings overrides.
- There's no rescind or cancel option since this web service doesn't use a business process.
- If you've inadvertently uploaded incorrect entries, update the entries to specify the correct information.

For reference documentation for all web services including Import Eligible Earnings Override, see [Operation Directory](#).

### Sample EIB Input File

[Import\\_Eligible\\_Earnings\\_Override-WD33](#)

### Concept: Put Compensation Eligibility Rule EIB

#### Background

You can use this EIB to create or update a compensation eligibility rule.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

## Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Create Compensation Eligibility Rule
- Edit Compensation Eligibility Rule

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  1. From related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- You must have access to the *Set Up: Compensation* domain in the Core Compensation functional area to run this EIB.

### Guidelines for Modifying the EIB Template

Modify the template to specify multiple types of fields in the EIB input file.

1. From the related actions of your EIB, select Template Model > View.
2. On the left window pane, click Condition Item Data+.
3. On the right window pane, locate Source External Field.
4. From related actions of the magnifying glass next to Source External Field select Template Model Column Edit Details.
5. Select the Reference ID Type as Separate Column check box.
6. Click OK.
7. Regenerate the template with data.

### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- To prevent data loss, we recommend that you generate your spreadsheet with data for the Put External Disability Self Identification Record EIB. See: [Example: Generate EIB Spreadsheet Template with Data](#) on page 64.

## Common Issues and Errors

Issue	Cause and Solution
<p>EIB issues this error:</p> <p><i>Validation error occurred. The entered information does not meet the restrictions defined for this field. (Relational_Operator_Reference).</i></p>	<p>This issue will occur if the EIB file doesn't populate the field <i>Source External Field</i>. The default reference id for this field is <i>Calculated_Field_ID</i>. However, the condition rule might be using a different reference ID. And if that happens, then the Generate Spreadsheet with Data option doesn't know how to populate Source External Field, leading to the error.</p> <p>To address this issue, see section <i>Guidelines for Modifying the EIB Template</i> to use the Separate Column option.</p>
<p>When I generate the spreadsheet with data, it's missing some information.</p>	<p>See the tips in the <i>Guidelines for Modifying the EIB Template</i> section about using the Separate Column option.</p>
<p>Unable to launch the EIB</p>	<p>This issue is most likely security-related. When running report View Security for Securable Item for securable item <i>Put Compensation Eligibility Rule (Web Service)</i>, you need Put access to the <i>Set Up: Compensation</i> domain security policy. To change the security, you can:</p> <ol style="list-style-type: none"> <li>1. Edit the domain security policy for <i>Set Up: Compensation</i>.</li> <li>2. Make sure you are in a security group that has <i>Put</i> access. Ideally, you should be in an unconstrained security group so that you can move any candidate using the web service.</li> <li>3. Activate the security change.</li> </ol>
<p>The EIB fails with one of these errors:</p> <ul style="list-style-type: none"> <li>• <i>Validation error occurred. The entered information does not meet the restrictions defined for this field. (Compensation_Plan_Reference).</i></li> <li>• <i>The entered information does not meet the restrictions defined for this field (Compensation_Grade_Reference)</i></li> </ul>	<p>This issue will occur if the eligibility rule is for an inactive compensation plan or compensation grade. Proceed as follows:</p> <ol style="list-style-type: none"> <li>1. Display the eligibility rule.</li> <li>2. Go to the <i>Rule Usage</i> tab.</li> <li>3. This tab will allow you to check where the rule is used, so that you can identify any inactive plans or grades. You might want to delete the inactive plans/grades or remove the eligibility rule from the plans/grades.</li> </ol>
<p>The EIB fails with errors indicating that certain fields can't be used in a Compensation Eligibility Rule. Examples:</p> <ul style="list-style-type: none"> <li>• <i>Validation error occurred. The field(s) Expense Items on Expense Report cannot be used in a Compensation Eligibility Rule.</i></li> <li>• <i>Validation error occurred. The field(s) Country cannot be used in a Compensation Eligibility Rule.</i></li> </ul>	<p>This issue will occur if you're loading rules that aren't compensation eligibility rules. You can check if a rule is for compensation by running the Compensation Eligibility Report.</p> <p>If you're using the Generate Spreadsheet with Data option, make sure you're adding a condition to the filter to check <i>Used As = Compensation Eligibility Rule</i>.</p>

Issue	Cause and Solution
<ul style="list-style-type: none"> <li><i>Validation error occurred. The field(s) Status cannot be used in a Compensation Eligibility Rule.</i></li> </ul>	

## Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add, update, and delete entries.
- If you have inadvertently uploaded incorrect entries, we suggest you reload the entries with correct information.
- If you need to delete the entries, try one of these options:
  - Delete using the EIB by setting the *Delete* flag to Y in the EIB input file (this might not work as the EIB might perceive the rule as in use).
  - If above doesn't work, you could update the compensation eligibility rules and append zzDNU to the beginning of the description so the rules display in the bottom of list.
  - Or you could manually delete the compensation eligibility rules.

For reference documentation for all web services including Put Compensation Eligibility Rule, see [Operation Directory](#).

## Sample EIB Input File

[Put\\_Compensation\\_Eligibility\\_Rule-WD34\\_0](#)

## Concept: Put Compensation Grade EIB

### Background

You can use this EIB to add or update compensation grades including compensation grade profiles, pay ranges, and compensation step information.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB

### Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Add Compensation Grade Profile
- Create Compensation Grade
- Edit Compensation Grade
- Edit Compensation Grade Profile
- Maintain Compensation Steps

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  1. From related actions of the EIB, select Template Model > View
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- You must have access to the *Set Up: Compensation Packages* domain in the Core Compensation functional area to run this EIB.

### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- To prevent data loss, we recommend that you generate your spreadsheet with data for the Put Compensation Grade EIB. See: [Example: Generate EIB Spreadsheet Template with Data](#) on page 64.
- As you populate these fields in the input file, consider:

Field	Considerations
Spreadsheet Key	Specify a unique value for each compensation grade.
Compensation Grade ID (column E)	If updating an existing compensation grade, populate this field with the reference id of the compensation grade. If adding a new compensation grade, you can leave this field blank and the web service will autoassign the id. Or if you prefer, you can enter a value (if creating a new compensation grade, make

Field	Considerations
	certain you assign a value that isn't already in use).
Delete	There are multiple delete fields in the EIB input file, as you can delete different components of the compensation grade such as profiles, pay ranges and steps. But note that you can delete these components only if they aren't in use. Also, you can't delete the compensation grade through the web service. However, if you've never used the grade, you do have the option of manually deleting it.
Inactive	There are 2 inactive fields in the EIB input file since you can deactivate the compensation grade or the compensation profile.

## Common Issues and Errors

Issue	Cause and Solution
Although the EIB completes successfully, it appears that the data wasn't loaded.	<p>There are a few different reasons that this issue might occur. Check to make sure:</p> <ol style="list-style-type: none"> <li>1. You populated the spreadsheet key value in the EIB input file</li> <li>2. If you specified an effective date, make certain that there's not already another change for the compensation grade with a newer effective date: if so, that change will take precedence since it's more recent.</li> <li>3. You're not running the EIB in validate-only mode</li> </ol>

Issue	Cause and Solution
Unable to launch the EIB.	<p>This issue is most likely security-related. When running report View Security for Securable Item for securable item <i>Put Compensation Grade (Web Service)</i>, you'll see that you need access to domain <i>Set Up: Compensation Packages</i>. To change the security:</p> <ol style="list-style-type: none"> <li>1. Edit the domain security policy for <i>Set Up: Compensation Packages</i>.</li> <li>2. Make certain you're in a security group that has Put access (ideally you should have access through an unconstrained security group).</li> <li>3. Activate the security change.</li> </ol>
I can't find a way to delete the compensation grade using the EIB.	<p>You can't delete compensation grades with this EIB, but you can inactivate them. See <i>Use Cases and Guidelines for Recovering from a Bad Load</i> section.</p>

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new compensation grades or update existing compensation grades.
- You can't delete compensation grades. However, you can inactivate them. Also, you can delete and inactivate some components of the compensation grade such as profiles, pay ranges and steps.
- This EIB doesn't use a business process, therefore there's no option to rescind or cancel. If you inadvertently uploaded incorrect compensation grades that you want to delete, there are 2 options:
  - Update the compensation grades and set them to *Inactive*. You can also update the compensation name and add *zDNU* to the beginning of the name.
  - Or, manually delete the compensation grades.

For reference documentation for all web services including Put Compensation Grade, see [Operation Directory](#).

### Sample EIB Input File

[Put\\_Compensation\\_Grade-WD34\\_0](#)

### Concept: Put EEO Data Record EIB

#### Background

You can use this EIB to upload W-2 Box 1 and EEO hours worked data for the Equal Employment Opportunity Commission (EEOC), helping you to meet U.S. regulatory reporting requirements.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  1. From related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- You must have access to the *Reports:EEO Compliance* domain in the Regulatory Reporting (HCM) functional area to run this EIB.

### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:
- There are 3 sections below that cover creating, updating, and deleting entries. Note that if updating or deleting entries, you might find it helpful to create a custom report to help you populate the EIB input file. Refer to the *Sample EIB Input File* section for an example.
- **Creating New Entries:** *Spreadsheet Key, Employee ID, Calendar Year, Company, and at least W-2 Box 1 or EEO Hours Worked* are required fields if your goal is to create new external EEO data records. As you populate these fields in the input file, consider:

Field	Considerations
Spreadsheet Key	Use a unique value for each EEO data record.
External EEO-1 Data	Leave blank.
Reference Record	Use a unique value for each EEO data record. You can leave this field blank if you would like Workday to automatically generate the key. However, we recommend

Field	Considerations
	you populate the value as it will make it easier to apply subsequent updates, if needed.
Employee ID	Enter the Employee ID.
Calendar Year	Enter 2017 or later.
Company	Enter Company_Reference_ID, Organization_Reference_ID, or WID.
W-2 Box 1	Enter an employee's W-2 Box 1 information. Workday Payroll customers don't need to enter this information.
EE Hours Worked	Enter in either the actual hours worked or proxy hours worked.

- **Updating Existing Entries:** If your goal is to update an existing external EEO data record, then *Employee ID*, *Calendar Year*, *External EEO-1 Data*, and *Company* are required fields along with the updated fields. Details are as follows:

Note: To clear out any unwanted fields, enter zero. As you populate these fields in the input file, consider:

Field	Considerations
Spreadsheet Key	Use a unique value for each EEO data record.
External EEO-1 Data	Enter the reference record value that you used when you added the entry. If you don't know the value, you can run the Integration IDs report and search business object <i>External EEO-1 Data</i> for a list of all the existing EEO-1

Field	Considerations
	entries and their reference IDs.
Employee ID	Enter Employee ID.
Calendar Year	Enter 2017 or later.
Company	Enter Company_Reference_ID, Organization_Reference_ID, or WID.
W-2 Box 1	Enter new value or enter zero to clear out a previous value.
EE Hours Worked	Enter new value or enter zero to clear out a previous value.

- Deleting Existing Entries: If your goal is to delete an existing external EEO data record, then *Spreadsheet Key*, *Delete Flag*, *External EEO-1 Data* and *Delete* are required fields. As you populate these fields in the input file, consider:

Field	Considerations
Spreadsheet Key	Use a unique value for each EEO data record.
External EEO-1 Data	Enter the reference record value that you used when you added the entry. If you don't know the value, you can run the Integration IDs report and search business object External EEO-1 Data. This search will provide a list of all the existing EEO-1 entries and their reference IDs.
Delete	Enter Y.

## Common Issues and Errors

Issue	Cause and Solution
Unable to launch the EIB	You can:

Issue	Cause and Solution
	<ul style="list-style-type: none"> <li>• Edit Domain Security Policy Permissions for Report: EEO Compliance.</li> <li>• Add the appropriate security groups to the Integration Permissions.</li> <li>• Activate the change.</li> </ul>
<p>Receive this error when attempting to generate the template:</p> <p><i>View your template model and configure a filter using the Edit Template with Data Options button.</i></p>	<p>Don't check the Generate Spreadsheet with Data option. Note that if you check this check box, then you need to provide a filter specifying the existing data that you want populated in the EIB template.</p>
<p>The EIB completes successfully. However, you don't see EEO Hours Worked in reports.</p>	<p>This issue will occur if you don't have W-2 Box 1 data since Workday categorizes Hours Worked by pay bands. For non-Workday Payroll customers to correct the problem, you must upload W-2 Box 1 data for all employees missing from reports.</p>
<p>The EIB completes successfully. However, you don't see W-2 Box 1 data that the EIB uploaded.</p>	<p>This issue will occur if you're a Workday Payroll customer. Workday will automatically retrieve W-2 Box 1 data from the employee's profile. If no data exists in the employee's profile, then the Workday uses the external W-2 Box 1 data.</p>
<p>EIB issues this error:</p> <p><i>Validation error occurred. This employee already has an EEO1 Record for that Company and Calendar Year.</i></p>	<p>There's already an EEO entry for the employee that you're loading. If updating an existing entry, make certain you're supplying the correct <i>External EEO-1 Data</i> value that the EIB assigned when the entry initially loaded.</p> <p>You can try to find the entry by running the Integration IDs report and search business object External EEO-1 Data. This search will provide a list of all the existing EEO-1 entries and their reference IDs.</p>

### Workday Reports Used to Report Information Loaded by This EIB

1. EEO-1 Component 2 Employee Data
2. EEO-1 Component 2 Employee Data by Establishment or Location

Note: You need access to domain security policy *Reports: EEO Compliance* to access these reports.

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add, update, or delete entries.
- Note that this web service doesn't use a business process. If you inadvertently uploaded incorrect entries, rescind isn't an option. However, you have 2 options:
  - Use the *Delete* option in the EIB input.
    - Refer to the attached EIB input file for an example of how to remove an entry.
  - Update the existing entry and populate the correct values.
    - Refer to the attached EIB input file for an example of how to update an existing entry.

For reference documentation for all web services including Put EEO Data Record, see [Operation Directory](#).

## Sample EIB Input File

[Put\\_EEO\\_Data\\_Record-WD33](#)

## Concept: Request Compensation Change EIB

### Background

You can use this EIB to request a compensation change for an employee using the *Request Compensation Change* business process.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Request Compensation Change
- From the related actions menu of the worker profile, select Compensation > Request Compensation Change.

You can also perform mass compensation changes through:

- Remove Compensation Plans from Employees.
- Rollout Compensation Plans to Employees.

### EIB Input File Guidelines

#### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:

1. From related actions of the EIB, select Template Model > View.
2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
3. If you're using an older web service version, you can create a new EIB to get the latest version.

- You must have access to the *Request Compensation Change* business process in the Core Compensation functional area to run this EIB.

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- As you populate these fields in the input file, consider:

Field	Considerations
Spreadsheet Key	Specify a unique value for each employee.

#### Additional Input File Guidelines

Field	Considerations
Reason	<p>Most likely, you'll want to change the reference id, in cell H4, from <i>Benefits_Event_Subcategory_ID</i> to <i>General_Event_Subcategory_ID</i>.</p> <p>To get a list of reasons and their reference code values, navigate to View Reference IDs &gt; Business Object: General Event Subcategory and then find the <i>Request Compensation Change</i> reason you need.</p> <ul style="list-style-type: none"> <li>If you need to remove compensation plans, there are sections at the end of the input file that enable you to remove plan data. See the examples in the attached EIB input file. If you plan on replacing existing compensation plans with other plans, then the other option you can take is to use the Replace All option. Example: If you want to replace a couple of the employee's allowance plans with another allowance plan, then check the Replace All option in the Allowance Plan section of the input file and populate information for the new allowance plan.</li> </ul>

## Common Issues and Errors

Issue	Cause and Solution
The EIB completes successfully but you don't see the compensation changes you loaded.	<p>Most likely the business process events are still in progress as one of the steps didn't complete. You can:</p> <ol style="list-style-type: none"> <li>1. Make certain you're specifying <i>Automatic Processing</i> in the <i>Overview</i> tab of the EIB input file.</li> <li>2. Check the business process definition. If there are action steps that the EIB should skip, add a condition rule <i>External Load=N</i>.</li> </ol>
The EIB issues an error such as: <i>Validation error occurred. Invalid ID value. "Request_Compensation_Change_Adjustment_Ad-</i>	Check the reference id that you're using for Reason. In cell H4, change the value from <i>Benefits_Event_Subcategory_ID</i> to <i>General_Event_Subcategory_ID</i> .

Issue	Cause and Solution
<i>hoc' isn't a valid ID value for type = 'Benefits_Event_Subcategory_ID'.</i>	
<p>The EIB issues this error:</p> <p><i>Validation error occurred. Multiple Element Contents, including Request Compensation Change Data/d1/Event Effective Date [DT(day)[LD]], contain data where only one is allowed by mutex Request Compensation Change Data.</i></p>	<p>This error occurs if you populate the EIB input file with both a <i>Compensation Change Date</i> and you enter <i>Y</i> for field <i>Compensation Change On Next Pay Period*</i>: if you specify a <i>Compensation Change Date</i>, then you need to enter <i>N</i> for <i>Compensation Change On Next Pay Period*</i>.</p>
<p>The EIB issues an error such as:</p> <p><i>Validation error occurred. Multiple Element Contents, including Proposed Base Pay Plan Assignment Data/b2/Percent Change [NM], contain data where only one is allowed by mutex Proposed Base Pay Plan Assignment Data.</i></p>	<p>This error will occur if you're providing too much information for the plan. Note that some of the plans enable you to populate either an amount, a percent change, or an amount change. Be sure you're populating only one of these fields.</p>
<p>The EIB issues an error like this:</p> <p><i>Plan ABC doesn't allow for individual overrides.</i></p>	<p>This error occurs when you configure the allowance plan for no override. Therefore the input file isn't expecting any parameters to be passed. Below are the options to resolve this issue:</p> <ul style="list-style-type: none"> <li>• Option 1: If it's acceptable to use the value assigned to the allowance plan, then just remove the value from the input file.</li> <li>• Option 2: If you need to override the value, 1 option would be to use <i>Set Up Allowance Plan Adjustment</i>.</li> <li>• Option 3: If you need to override the value, another option is to remove the allowance plan, then add a new one with correct values.</li> </ul>
<p>The EIB issues this error:</p> <p><i>Validation error occurred. Compensation step isn't valid for the compensation grade profile.</i></p>	<p>This error will occur if changing to a compensation grade/profile that doesn't use steps. If there shouldn't be a step, then set the step value to <i>{empty}</i>.</p>
<p>EIB performs slowly.</p>	<p>This issue can occur when you have in progress merit events. The web service then needs to examine each of the participation rules within the event and runs all the eligibility rules. It also needs to process the participation options if the eligibility rule evaluates to true. To determine if you have in progress merit requests, run the <i>Compensation Review Process Status</i> report. At the <i>Compensation Review Process</i> prompt, check for any reviews with <i>In Progress</i> status.</p> <p>Also, if loading more than 1,000 compensation requests, you might want to consider using Import Request Compensation Change. It's designed for importing high volumes of compensation changes.</p>

## Business Processes

Request Compensation Change.

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add, delete, and replace entries.
- If you've inadvertently uploaded incorrect entries, use task Mass Cancel Business Processes or Mass Rescind Business Processes (depending on whether the business process event is completed or in progress). You can then select *Business Processes Loaded by EIB* to find the integration event that you wish to cancel or rescind. Or the other option is to enter *Request Compensation Change* at the Business Process Types prompt, and enter a date range that you ran the EIB.

For reference documentation for all web services including Request Compensation Change, see [Operation Directory](#).

## Sample EIB Input Files

[Import\\_Employee\\_Awards\\_v45.0](#)

[Request\\_Compensation\\_Change\\_v45.0](#)

### Concept: Request One-Time Payment EIB

#### Background

You can use this EIB to request a one-time payment for an employee.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

The Request One-Time Payment task is the equivalent task.

#### EIB Input File Guidelines

##### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- You must have access to the *Request One-Time Payment* business process in the Core Compensation functional area to run this EIB.
- If you need to populate multiple worktags for the one-time payments, you'll want to add additional worktag fields to your spreadsheet for each worktag you use.

##### Modifying the EIB Template to Add Additional Worktag Fields

- To add worktags:
  1. From the related actions of the EIB, select Template Model > View.
  2. In the left pane, click One Time Payment Sub Data+ .
  3. Click the magnifying glass for One Time Payment Worktags+ row.
  4. From the related actions of the One Time Payment Worktags row, select Template Model Column > Maintain Additional Columns.
  5. Add a row for each possible worktag type that you might be specifying in your EIB input file. Note that you don't have to populate worktag values for all the worktags you specify. Example: If you currently don't use the Fund worktag but think you might use it in the future, you can add it now to avoid editing the template later.
  6. After you complete the changes, regenerate the template.

#### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- As you populate these fields in the input file, consider:

Field	Considerations
Processing Instruction	<p>Specify the instruction in the Overview tab of the EIB input file. Use value:</p> <ul style="list-style-type: none"> <li>• Automatic Processing to skip approval, review, to do steps and to bypass notifications.</li> <li>• Manual Processing if you want the business process event to stop at the approval/review/to-do steps</li> </ul>

Field	Considerations
	and send notifications.
Spreadsheet Key	Specify a unique value for each one-time payment.
Employee_ID	Workday requires an Employee ID.
Position	Required field only if the employee has multiple positions.
Effective Date	Effective date of the One-Time Payment. Workday requires this field.
Employee Visibility	Date the employee can view the one-time payment event. Enable the Employee Visibility Date in the HCM tenant settings.
Reason	You'll need to change the reference id type (cell G4) from <i>Benefit_Event_Subcategory_ID</i> to <i>General_Event_Subcategory_ID</i> .  To determine the reference id value, you can run the View Reference IDs report and select business object <i>General Event Subcategory</i> . Then filter Business Object Instances containing <i>One-Time Payment</i> , to find the entries specific to one-time payments.
Row ID	Enter a unique row id value for each bonus plan for a given one-time payment request.

Field	Considerations
One Time Payment Plan	For a list of the reference id values, run the View Reference IDs report and select business object <i>One-Time Payment Plan</i> .
Scheduled Payment Date	Date the employee will receive the one-time payment. Workday defaults the effective date if you don't provide a Scheduled Payment Date. Enable Multiple One-Time Payments on the Edit Tenant Setup - HCM task to use this field.
Do Not Pay	If set to <i>Y</i> , Workday Payroll doesn't process the payment (this is equivalent to the Send to Payroll field when manually creating a one-time payment).
FLSA Workweek Calendar	Although this field displays as a required field, you shouldn't enter any value.
Worktag	If you need to populate multiple worktags, see <i>Modifying the EIB Template to Add Additional Worktag Fields</i> section to add all relevant worktag columns to the EIB template. Also, note that there's no need to populate the related worktags as they'll automatically populate. If

Field	Considerations
	needed, you can configure worktag type precedence. See <a href="#">Configure Worktag Defaulting</a> for more details.

## Common Issues and Errors

Issue	Cause and Solution
The EIB fails with errors such as: <ul style="list-style-type: none"> <li><i>Position submitted is not filled as of the effective date</i></li> <li><i>The job is not valid for the employee</i></li> <li><i>The entered information does not meet the restrictions defined for this field (Employee_Reference)</i></li> </ul>	You can: <ul style="list-style-type: none"> <li>Make certain you have security properly configured for business process Request One-Time Payments. You need access to initiating action <i>Request One-Time Payment (Web Service)</i>. If you have role-based access, you might want to retest with unconstrained access</li> <li>You'll receive this type of error if you're adding a one-time payment for yourself. The web service and user interface don't permit this action.</li> <li>If above doesn't help, you might want to manually enter the one-time payment for the employee where you're receiving the error, as the user interface might provide a more descriptive error message, indicating the cause of problem.</li> </ul>
The EIB issues an error such as: <i>The value could not be loaded (decimal precision set to 2).</i>	Note that decimal precision of the amount must match the currency. You can find the precision for each currency running <i>View Country Currency</i> . Also, note that currency precision is Workday Delivered, and you can't configure it.
The EIB issues an error like this: <i>Validation error occurred. 'Within relationship' is empty for index 95\$1943</i>	Make certain that you're not populating any of the FLSA Workweek Calendar fields in the EIB input file. Although these fields display as required, you should leave them blank
The EIB issues this error: <i>Error: "Validation Error occurred. Scheduled Payment Date must be equal to Event Effective Date when Multiple One-Time Payment is not..."</i>	Only enter a scheduled payment date value when you've enabled Multiple One Time Payment (MOTP).
The EIB issues an error like this: <i>Validation error occurred. Invalid ID value. 'One-Time_Payment_Incentive_Bonus' is not a valid ID value for type = 'Benefits_Event_Subcategory_ID'</i>	Edit the EIB input file and change the reference id type in cell G4, from <i>Benefit_Event_Subcategory_ID</i> to <i>General_Event_Subcategory_ID</i> .
The EIB loads One-Time Payments for plans that the worker isn't eligible for.	The web service doesn't enforce eligibility rules. We typically use web services as an

Issue	Cause and Solution
	administrative tool to mass upload large volumes of date because they provide more flexibility.

## Business Processes

Request One-Time Payment.

### Use Cases and Guidelines for Recovering from a Bad Load

- The web service enables you to add only. You can't change, correct, or delete the One-Time Payment Request through the EIB.
- If you've inadvertently uploaded incorrect entries, the options are:
  - Run Mass Rescind Business Processes or Mass Cancel Business Processes, depending on whether the business process event completed or is in progress. You can then select the *Business Process Loaded by EIB* option to find the EIB used for the load. Or the other option is to go to the Business Process Types prompt and enter *Request One-Time-Payment*. Then enter the date and time range that you submitted the EIB.
  - The other option would be to manually correct the One-Time Payment Requests from the related action of each event.

For reference documentation for all web services including Request One-Time Payment, see [Operation Directory](#).

### Sample EIB Input File

[Request\\_One-Time\\_Payment-WD34](#)

## Compensation Review EIBs

### Concept: Import Compensation Review Budget Pools EIB

#### Background

You can use this EIB to update budget pool, holdback, and reserve information for supervisory organizations.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

If you want to run this EIB, you must do so after completing the distribute pools step of the compensation review event - but before the process fully completes. Your compensation administrator should also have the Launch Award Proposals task in their inbox. You can't create holdbacks before the distribute pools step.

For more information about compensation review budget pools in Workday, see [Setup Considerations: Compensation Reviews](#).

#### Equivalent Workday Task

This EIB is equivalent to updating budget pool information during the distribute pools step of the compensation review event.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- You must have access to the *Process: Compensation Management Events* domain in the Advanced Compensation functional area to run this EIB.
- As you populate these fields on the first worksheet of the input file, consider:

Field	Considerations
Header Key	This cell should have a value of <i>I</i> .
Compensation Review Event	You can specify the Workday ID (aka WID) or the value for the Compensation_Review_Event_ID. To get these values, select Integration IDs->View IDs from related actions of the compensation event.
Include All Organizations	Select <i>Y</i> to update all organizations in the process. This selection will replace all holdbacks and adjustments accordingly.

Note: There should be *only 1* row in this worksheet, assuming you're updating pools for only 1 compensation review event.

- As you populate these fields on the second worksheet of the input file, consider:

Field	Considerations
Header Key	This cell should have a value of <i>I</i> for all entries, assuming you're updating pools for only 1 compensation review event.
Line Key	Each organization should have a unique line key value.

Note: You can run the report Compensation Review Budget Pools to help you populate this worksheet. This EIB worksheet should contain the same organizations and plans/award types that you see in the Compensation Review Budget Pools report.

## Common Issues and Errors

Issue	Cause and Solution
EIB issues one of these errors: <ul style="list-style-type: none"> <li><i>"Not all organizations are configured in the web service. Please add all organizations prior to proceeding, or use Maintain Pools to adjust select organizations. Missing."</i></li> <li><i>"Not all plans/award types are configured in the web services. Please add all plans/award types prior to proceeding or use Maintain Pools to adjust pools."</i></li> </ul>	This issue occurs if you have not populated all organizations and plans/award types in the input file that are visible in the Compensation Review Budget Pools report. If you encounter this error: <ol style="list-style-type: none"> <li>Run the Compensation Review Budget Pools report.</li> <li>Populate the EIB input file with all the organizations and award types included in the report. Make certain each organization has a unique line key value.</li> </ol> Another option to consider, based on your business requirements, is to set theUpdate All Organizations field, in worksheet 1 of the input file, to <i>N</i> .
Error: <i>"An Import Compensation Review Budget Pool web service has not completed for this Compensation Review Process."</i>	Make certain you specify only 1 header key value for each compensation review event. If you're importing budget pools for 1 compensation review process, all entries should be header key value <i>I</i> (refer to attached example).
The budget amounts loaded for some organizations aren't exactly the same as what was in the EIB input file. Example: they might be off by a penny.	Since Workday calculates pools at an employee level, some rounding can occur.

## Use Cases and Guidelines for Recovering from a Bad Load

This web service enables you to load the budget pool information for the organizations within the event. If needed, you can reload the pool information if you need to make corrections or adjustments.

If there were mistakes, the recovery process will depend on what you need to undo or correct. Consider these options:

- Cancel the parent event (exampleInitiate Merit Process).
- Use theCompensation Review Process Maintain Pools task.

For reference documentation for all web services including Import Compensation Review Budget Pools, see [Operations Directory](#).

### Sample EIB Input File

[Import\\_Compensation\\_Review\\_Budget\\_Pools-WD31](#)

### Concept: Import Employee Awards EIB

#### Background

You can use this EIB to update employee awards for a specific employee or employees in a compensation review process.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

The My Task item in which planners and compensation administrators make their award recommendations on the grid.

#### EIB Input File Guidelines

##### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:

1. From the related actions of the EIB, select Template Model > View.
2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
3. If you're using an older web service version, you can create a new EIB to get the latest version.

- You must have access to the *Process: Compensation Management Events* domain in the Advanced Compensation functional area to run this EIB.

##### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.

- As you populate these fields on the first tab of the input file, consider:

Field	Considerations
Line Key	Employees can have more than 1 line key depending on the award types you're updating.

- Ensure that the spreadsheet contains only 1 row for each compensation review event.
- When an employee is eligible for multiple awards of different types in a compensation review process, you only need to populate the fields that you want to update.
- To remove an existing award for an employee, enter zero in the appropriate field. Example: to change a merit increase % from 3.5% to zero, enter *0* in the Merit Increase Percent field.
- If you have a bonus plan set up with Multiple Factors, Workday includes only the discretionary portion of the award on the Get Employee Award Data Outbound EIB. In addition, only the Import Employee Award Inbound EIB can update only the discretionary portion of the award.
- Minimize the time between pulling current budget pools and employee awards and importing new values into the compensation cycle. Minimizing this time is especially important when you include parallel processing rules. To mitigate the risk of planners submitting conflicting award updates, Workday recommends that processing take place only after you submit all organizations.

## Common Issues and Errors

Issue	Cause and Solution
The employee awards EIB for a bonus process loaded without error, but the EIB didn't update the data.	If employees have multiple bonus plans in process, specify all bonus plans on the EIB spreadsheet.
Workday returns this error: <i>Please confirm the compensation review process is in progress.</i>	The compensation review must have a unique Reference ID. Ensure that you specify the correct compensation review process Reference ID in the template. To avoid errors with EIB processing, Workday recommends that you don't change the Initiate Compensation Review business process after launching the event.

Issue	Cause and Solution
Workday returns this error: <i>Invalid ID value. 'XXXXX' is not a valid ID value for type</i>	In the Employee column of the Employee Award Data tab, change the format from <i>Contingent_Worker_ID</i> to <i>Employee_ID</i> before running the EIB.
Workday returns this error: <i>Invalid ID value. 'XXXXX' is not a valid ID value for type = Position_ID.</i>	For employees who have multiple positions, include both the Employee ID and Position ID on the Employee Award Data tab that is associated with the compensation review process.

### Use Cases and Guidelines for Recovering from a Bad Load

The *Import Employee Awards* web service operation enables you to load the employee award information for the employees in a compensation review event. You can reload the employee award information if you need to make corrections or adjustments. When you do, the recovery process depends on what you need to undo or correct. You can also reenter the award information on the configurable grid or Compensation Review Process Search Employees report.

### Sample EIB Input File

[Import\\_Employee\\_Awards\\_v43.0](#)

## Custom Objects EIBs

### Concept: Non Effective-Dated Custom Object EIBs

#### Background

You can use this EIB to load Non Effective-Dated Custom Objects. Note that Workday uses REST API for Custom Objects.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

If you're using effective-dated custom objects, then use a different EIB, based on the type of effective-dated object you're using. Examples:

- If you're using an effective dated worker object, use the Edit Worker Additional Data EIB.
- If you're using an effective dated job requisition object, use the Edit Job Requisition Additional Data EIB.

For instructions on creating a custom object, see [Create and Edit Custom Object Definitions](#).

If you plan to populate the custom object using an EIB, specify a Reference ID on the *Activate Custom Object* page (this page is the last page that Workday displays when you create a custom object). If you don't supply a Reference ID, you won't be able to create the EIB if it's a multi-instance custom object.

If you're creating a multi-instance custom object, select a Reference ID that makes each entry unique for a given worker. Example: if the Reference ID that you select for a *worker* object is a date field, then you can't add multiple entries with the same date for the same worker.

The Reference ID value that you select must be of type *date*, *number*, or *text*.

How to create an EIB for a Non-Effective Dated Custom Object.

When creating an EIB for a non-effective-dated object, perform these steps:

1. Use task Create EIB and select Inbound.

- In the Data Format section, set File Type to Custom Object Spreadsheet Template and select your custom object. If you're unable to find your custom object, refer to the *Common Issues and Errors* section.

## Equivalent Workday Task

From the related actions menu of the worker profile, select Additional Data > Edit.

### Common Issues and Errors

Issue	Cause and Solution
When creating the EIB, the custom object doesn't display in the list	<ol style="list-style-type: none"> <li>Ensure that you have this security access: <ul style="list-style-type: none"> <li>Modify access to the <i>Integration Events</i> domain.</li> <li>View access to the <i>Integration: EIBs</i> domain.</li> </ul> </li> <li>Verify that the custom object is active by accessing the View Custom Object task, then selecting the search option to view active custom objects.</li> <li>When you display the custom object, set the Effective Dated field to <i>No</i>. If you don't set this value, then you need to use a different web service such as Edit Worker Additional Data,</li> <li>When you display the custom object, the Reference ID field should have a value (if it's a multi-instance object). If you don't see a Reference ID, then delete the custom object and rebuild it. See the <i>Add/Update/Delete Capabilities for this EIB and how to recover from Bad Load</i> section of this topic for instructions on how to delete the custom object. Then refer to the (<i>Requirements for creating Custom Object used by EIB</i>) section for instructions on how to rebuild the custom object.</li> <li>If the custom object includes a custom instance reference such as <i>Worker Reference</i>, you can't use this EIB.</li> </ol>
Unable to run EIB in validate only mode	Workday doesn't support Validate mode for custom objects.
EIB issues an error similar to this message: <i>Validation error occurred in the custom object API: "error": "invalid request: errors have occurred", "errors": [{"error": "not found:Small", "location": "Line:1, column: 95"}]</i>	An issue that will cause this error is specifying an invalid <i>custom list</i> value in the input file. Also, note that custom list values are case-sensitive. If one of the custom list values is <i>small</i> and you specify <i>Small</i> , then you'll receive this error.
When you load the data, the EIB fails with an error similar to one of these messages: <ul style="list-style-type: none"> <li><i>The transformation expected worksheet 'Vehicle &amp; Make for Worker' but encountered worksheet 'Vehicle and Make for Worker'. Check that the spreadsheet template is the correct version and/or that the transformation deployed in your environment is the correct version.</i></li> </ul>	This issue occurs if there are special characters in the name of the custom object. Example: a custom object that is titled <i>Worker's Shoe Size</i> or <i>Vehicle &amp; Make</i> would cause the error due to the apostrophe and ampersand in the names. See <a href="#">Create and Edit Custom Object Definitions</a> , which states:

Issue	Cause and Solution
<ul style="list-style-type: none"> <li><i>The transformation expected worksheet 'Worker's Shoe Size for Worker' but encountered worksheet 'Worker's Shoe Size for Worker'. Check that the spreadsheet template is the correct version and/or that the transformation deployed in your environment is the correct version.</i></li> </ul>	<p><i>Workday recommends that you don't use special characters because it might result in an error when generating an EIB template for the custom object. Examples: forward-slash (/), colon (:), apostrophe (').</i></p> <p>Edit the custom object and remove the special character from the name.</p>
<p>After generating an EIB template, you receive one of these errors when you try to open the input file:</p> <ul style="list-style-type: none"> <li><i>Problem came up in the following area during load: Workbook Setting</i></li> <li><i>The file is corrupt and cannot be opened</i></li> </ul>	<p>This issue occurs if the custom object name contains a special character such as a colon or asterisk. Edit the custom object and remove the special character from the name.</p>
<p>One of these issues occurs:</p> <ol style="list-style-type: none"> <li>EIB is removing existing entries</li> <li>Or when loading the EIB, the EIB doesn't load all entries, yet Workday returns no errors.</li> </ol>	<p>Use View Custom Object to review your custom object. Check the value for Reference ID. Note that this ID is the value that makes each entry unique for a given worker. Example: if the reference id is a date field, then you can't have 2 entries with the same date for the same worker. If you add an entry within the EIB input file using a date that already exists for the worker, the EIB file value replaces the existing entry. Thus it can seem as if Workday removed an entry.</p> <p>Perform these steps:</p>
<p>EIB issues an error similar to this message:  <i>Validation error occurred in the custom object API: internal error", "caseId ":"20aaa626-aec4-4805-8632-c2b11ae0b8c9"</i></p>	<ul style="list-style-type: none"> <li>Make certain that you populate all required fields in the input file. If you're not certain of which fields the file requires, then manually add the custom object using the Workday UI, to check which fields Workday requires.</li> <li>This issue can also occur if you've changed the format of the fields in the EIB input file. Example: changing a field from <i>Text</i> format to <i>Percent</i>. Check the format of the fields in input file and verify that they're correct. Or create a new EIB template. And when you paste in values, use Excel's <i>paste special</i> so that you don't paste in any invalid formats</li> <li>This issue also occurs if you enter 0 (zero) in a field whose field type is Integer. To solve this issue and enter 0 (zero), the field type should be Decimal not Integer.</li> <li>You might also encounter this issue in a decimal field due to an Excel limitation with storing decimals when using xml files. To check for this issue, edit the EIB input file with a text editor such as Notepad++. You might notice that Excel is storing some of the numbers with many digits. Example:</li> </ul>

Issue	Cause and Solution
	<p>7.4999999999999 instead of 7.5. Work around this issue with these steps:</p> <ul style="list-style-type: none"> <li>• Copy the column of numbers to a separate Excel file.</li> <li>• Then use a formula to convert them. Ex: =text(a1,"0.00").</li> <li>• Paste Special from Excel to the EIB input file.</li> </ul>

## Business Processes

There's no business process used when creating or updating non effective-dated custom objects.

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new entries or update existing entries. You can't delete entries.
- If you've inadvertently uploaded incorrect entries, you could reload the same entries with the correct values. If they need deleted, refer to the information below.

If you need to remove just some of the custom object entries, consider one of these options:

- Option 1: Use the Delete Custom Object Additional Data task and use a condition rule to indicate which entries to remove (back up the data before performing this action). See [Delete Custom Object Data](#).
- Option 2: You could extract the data from the custom object, then remove all data (using task Delete Custom Object Additional Data), then reload the data you need to keep.
- Option 3: You can also delete data from custom objects using the REST API. However, if you aren't familiar with using REST API, this option can be complex. See [Reference: DELETE Custom Objects \(Multi-Instance\)](#).
- Option 4: You can also manually remove the custom object entries, one at a time, using the Workday UI.

If you have a need to remove the custom object completely and start over, perform these steps:

1. If the custom object contains data that you wish to save, extract the data so that you can reload the data into the newly created custom object. You could create a custom report to extract the data. Example: if using Worker object, create a custom report with data source *All Workers* and report the custom object fields.
2. You need to delete the data before removing the custom object. So if the object contains data, use the Delete Custom Object Additional Data task to remove the data
3. Now use task Delete Custom Object to remove the custom object definition. You won't be able to delete the custom object if:
  - The custom object contains data.
  - A custom report, calculated field, EIB, or other Workday object references the custom object.
4. Now you can create another custom object and reload data if needed.

If for any reason, you can't completely remove the custom object, you can hide access to the custom object:

1. Edit the custom object and change the name (Example: add DNU to the beginning of the name).
2. Secure the custom object to a domain that no one has access to. Note: there are 200 custom domains available in your tenant available to use.

## Sample EIB Input File

[Apparel](#)

## Financial Management EIBs

### Concept: Import Accounting Center Detailed Journal EIB

#### Background

You can use this EIB to create or update accounting center detailed journals (ACDJs), which enable you to upload manual journals with worktags and additional attributes. Workday summarizes the ACDJs before Workday posts them to the general ledger.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

The Create Accounting Center Detailed Journal task is the equivalent task.

#### EIB Input File Guidelines

##### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- You must have access to the *Accounting Center Detailed Journal Approval Event* and *Accounting Center Detailed Journal Batch Initiation Event* business process types in the Accounting Center functional area to run this EIB.

##### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- As you populate these fields on the Worksheet#1 for Accounting Center Detailed Journal Header data in the input file, consider:

Field	Considerations
Header Key	Use a unique header key value for each journal.
Accounting Center Detailed Journal ID	Specify the Reference ID of an existing Accounting Center Detailed

Field	Considerations
	Journal if updating an existing journal. You can update the journal only if it isn't yet Approved or Canceled.
Autocomplete	Set this value to <i>Y</i> to bypass approval steps. Recommended to hide in your Production tenant.
Submit	Set to <i>N</i> if you want to create the journal but not submit it for Approval (Workday processes a blank value in this field as <i>N</i> ).
Accounting Source	Required. Enter the Accounting Source that the ACDJ is for.

- As you populate these fields on the Worksheet#2 for Accounting Center Detailed Journal Line data in the input file, consider:

Field	Considerations
Header Key	Populate this field for every row in the EIB and correspond to a Header Key provided in the first tab.
Line Key	Use a unique value for each unique line entry for a given journal. The EIB groups multiple rows with the same Line Key to form a single ACDJ line. Populate this field for every row in the EIB.
Account Set	Ensure this field has a value. Otherwise you might get an invalid

Field	Considerations
	Ledger Account ID error.
Worktags	<p>You can specify worktags by adding additional columns to the template model corresponding to specific worktag types. Example: Cost Center. Alternately, you can select the Separate Type Column check box for the Worktags column when editing the Template Model Area.</p>
Additional Attributes (AA)	<ul style="list-style-type: none"> <li>Unlike Worktags, you don't need to add additional columns to the Template Model for AAs, and we recommend you <i>not</i> check the Separate Type Column check box in the template model.</li> <li>You can find the External_Analytics_Data_Source for the AA found directly off of the AA in the Journal Line Rules of the Accounting Source. Alternately, you can find it in the View Detailed Journal Additional</li> </ul>

Field	Considerations
	<p>Attributes Configuration task. You can also run the View Reference ID task and enterAnalytics Data Source Field External as the Business Object.</p> <ul style="list-style-type: none"> <li>Enter each AA in 2 columns, one for the name and another column for the value. These columns automatically display on the template so they don't need to be added manually to the template.</li> </ul>

## Performance Considerations

These factors might impact EIB performance:

### Journal Size

We recommend a maximum of 20,000 as-entered lines per individual journal for optimal performance. You'll see performance degradation with journals above 20,000 lines. If you have journals above this threshold, we recommend splitting these journals into multiple journals that have a max of 20K lines each. Performance degradation below 20,000 lines is possible depending on other factors below.

### Intercompany Accounting

Intercompany detailed journals require Workday to create additional ACDJs, thus increasing overall processing time.

### Custom Validations

Custom validations can slow down performance, especially if you have a large number of custom validations or if the validations are complex.

## View ACDJ

Similar to Accounting Journals, we display up to 1,000 ACDJ lines using the View ACDJ page *before* displaying the Summarized Journal Lines grid. This grid enables you to review more journal lines without UI performance degradation. You can still view the detailed lines of a summarized ACDJ by clicking the Display Journal Lines Details button. Clicking this button affects UI performance at high line volumes.

## Edit ACDJ

Trying to edit ACDJs with high line volumes in the UI negatively impacts performance. We recommend using the EIB to edit high-volume ACDJs to avoid performance issues in the UI. Don't use the UI as the primary method of creating or modifying high-volume ACDJs.

## Common Issues and Errors

Issue	Cause and Solution
The EIB completes successfully but you can't find the journal in the UI.	Run the Find Accounting Center Detailed Journal report to search for the journal. The EIB might have loaded the journal to the wrong period, loaded with Submit set to No, or have some other issue causing it to not fully load.
When running the EIB in Validation mode, it doesn't catch all errors	Validate mode only tests the validations listed in the API Documentation for a given web service operation. We don't test custom validations and validations that occur postprocessing after Workday persists the lines.
EIB issues this error: <i>A processing fault occurred generating the spreadsheet.</i>	<ul style="list-style-type: none"> <li>Make certain you've populated the Line Key value in all entries in the Journal Entry Line Replacement tab of the EIB input file</li> <li>If the issue persists, regenerate the spreadsheet template and use the new template</li> </ul>
EIB issues these errors: <ul style="list-style-type: none"> <li><i>Could not retrieve a file with the label: EIB Transformation.</i></li> <li><i>Empty message received on step id CopyInputFile.</i></li> </ul>	Check the header and line keys in the EIB input file. Possibly some rows don't have line key or header key values. Or you might be specifying header key values in Worksheet2 that Worksheet1 doesn't use (or the other way around).

## Business Processes

- Accounting Center Detailed Journal Approval Event
  - To submit the EIB, the user security group must have access to:
    - Create Accounting Center Detailed Journal
    - Import Accounting Center Detailed Journal (WS Background Process)
  - This business process (BP) is the first BP that Workday initiates after the EIB has passed validations.

- Accounting Center Detailed Journal Batch Initiation Event
  - This BP automatically starts once the Accounting Center Detailed Journal Approval Event is complete. You don't have to make any security policy updates.

For reference documentation for all web services including Import Accounting Center Detailed Journal, see [Operation Directory](#).

### Sample EIB Input File

[Import\\_Accounting\\_Center\\_Detailed\\_Journal\\_v45.0](#)

### Concept: Import Accounting Journal EIB

#### Background

You can use this EIB to create or update accounting journals.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

The Create Journal task is the equivalent task.

You can also use these EIBs:

EIB Name	Purpose
Core Connector: Accounting Journal Inbound integration	You can use this integration template to import accounting journal data files into Workday from an external SFTP endpoint. See <a href="#">Steps: Set Up Accounting Journal Connector</a> on page 626.
Submit Accounting Journal	You can use this EIB to load small volumes of journals (Example: less than 1000).

### EIB Input File Guidelines

#### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- You must have access to the *Accounting Journal Event* business process type in the Financial Accounting functional area to run this EIB.

#### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page

56, which provides a general overview for populating EIB files.

- As you complete these fields in Worksheet#1 for Import Accounting Journal input file, consider:

Field	Considerations
Header Key	Use a unique header key value for each journal.
Accounting Journal	Specify a value if updating an existing journal (you can update the journal only if it hasn't posted yet).
Autocomplete	Set this field to <i>Y</i> to bypass approval steps.
Submit	Set to <i>N</i> if you want to create the journal but not post it.
Locked	If you set this field to <i>Yes</i> , you can't unpost the journal.

- As you complete these fields in Worksheet#2 for Journal Entry Line Replacement input file, consider:

Field	Considerations
Line Key	Use a unique value for each line entry for a given journal.
External Supplier Invoice Source	Originating source of the supplier contract. Populate this field only if using the Supplier Contract ID External field on the spreadsheet to reference a supplier contract.

- We recommend splitting the journals into smaller groups when the line volume approaches 100,000 lines per journal.
- After loading the journals, you can use report Find Journals to review the uploaded journals.

## Common Issues and Errors

Issue	Cause and Solution
The EIB is running slowly.	Refer to the Guidelines for Improving EIB Performance section below for recommendations to improve performance
After loading a large journal, you're unable to edit it. You might receive a notify me later message if editing during the review step. You might see that the step has a Withdrawn status.	There are some restrictions within the Workday UI in regard to editing large transactions (even within the business process event). So we expect to see this behavior when editing a transaction that is too large for the UI to process and display. For this reason, you need to rely on the web service to supply all information for the journal. Using the web service ensures that you don't have to make any updates in the UI. Workday enables you to add an attachment to the journal without actually entering edit mode. If you merely need to add an attachment, use the Journal > Add/Change Attachmentrelated action on the journal.
The EIB completes successfully but you can't locate the journal in Workday.	Running the Find Journals report and search for the journal. The EIB might have loaded the journal to the wrong period, loaded with Submit set to No, or have some other issue causing it to not fully load.
EIB issues this error when you attempt to attach the input file to the EIB event: The size of the file 'xxxx' is greater than the maximum permitted file size....	<p>Workday returns this error when the size of the EIB input file exceeds the 30 MB maximum attachment size limit. To resolve this issue:</p> <ol style="list-style-type: none"> <li data-bbox="894 1100 1454 1296">Load your EIB input file to an SFTP site. Then, configure your EIB with a retrieval step that pulls the file from the SFTP site (instead of you manually attaching the file from your browser). This approach enables you to load a file up to 1 GB.</li> <li data-bbox="894 1296 1454 1495">If you don't have an SFTP site available, split up the EIB input file into smaller files. Then, load into multiple journals. Alternately, check if you can condense the size of the input file (Example: edit the template and hide the fields you don't use).</li> </ol>
When running the EIB in Validation mode, it doesn't catch all errors	Validate mode only tests the validations listed in the API Documentation for a given web service operation. We don't test custom validations and validations that occur postprocessing or at the operation level after Workday persists the lines.
EIB issues errors such as:Invalid ID value. '5000' is not a valid ID value for type = 'Ledger_Account_ID'	Make certain you're populating the Account Set field in the Journal Entry Line Replacement tab of the EIB Input file.
EIB issues error: A processing fault occurred generating the spreadsheet	<ul style="list-style-type: none"> <li data-bbox="894 1797 1454 1896">Make certain you've populated the Line Key value in all entries in the Journal Entry Line Replacement tab of the EIB input file</li> </ul>

Issue	Cause and Solution
	<ul style="list-style-type: none"> <li>If issue persists, regenerate the spreadsheet template and use the new template</li> </ul>
<p>EIB issues these errors:</p> <ul style="list-style-type: none"> <li><i>Could not retrieve a file with the label: EIB Transformation</i></li> <li><i>Empty message received on step id CopyInputFile.</i></li> </ul>	<p>Check the header and line keys in the EIB input file. Possibly some rows don't have line key or header key values. Or you might be specifying header key values in worksheet2 that aren't used in worksheet1 (or the other way around).</p>

### Guidelines for Improving EIB Performance

Below are factors that might cause your EIB to run slowly, along with recommendations to improve performance:

#### Custom Validations

Custom validations can slow down performance, especially if you have a large number of custom validations or if the validations are complex. Check the validation rules for accounting journals using task *Maintain Custom Validations*. There's a *Test validations* button that will help you determine if a validation rule has a slow execution time.

#### Journals with a Large Number of Lines

If loading a journal with a large number of lines, we recommend 10,000 lines per journal for optimal performance. Example: splitting 10 journals with 50,000 lines each into 50 journals with 10,000 lines each might cut processing by as much as 50%.

*\* If using Worktag Balancing, use 5,000 lines per journal instead of 10,000 lines per journal.*

#### Intercompany Accounting

Intercompany accounting requires Workday to create additional journals, which increases processing time. Consider this factor when splitting large journals into smaller chunks.

#### Worktag Balancing

You have the option to specify the balancing worktag in the transaction header. Workday automatically creates due to or due from entries for the other balancing worktag values in the journal. As a result, the journal line volumes can increase when you enable the feature, thus increasing processing time. When using Enhanced Worktag Balancing, we recommend 5,000 lines per header.

### Business Processes

#### Accounting Journal Event.

## Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to create new journals or update existing journals (that haven't posted yet). You can't delete journals. And also, there's no Cancel or Rescind option available in the Account Journal Event.
- If you've inadvertently uploaded incorrect entries, below are options to consider:
  - If the journals haven't posted yet:
    - Get the reference IDs of the accounting journals that you loaded and populate your EIB input file with these values. To get the reference ID values, make a copy of the standard report Find Journals and then add Reference ID to the report.
    - Make any other necessary data corrections to the EIB input file.
    - Rerun the EIB to update the previously loaded journals with corrections.
  - If the journals have posted:
    - You might want to consider using the Cancel Accounting Journal EIB to back out the entries.
    - You can also use the Unpost Reverse Accounting Journal EIB (if the journal isn't in locked status) to unpost the journal. Unposting the journal enables you to correct it.

For reference documentation for all web services including Import Accounting Journal, see [Operation Directory](#).

## Sample EIB Input File

[Import\\_Accounting\\_Journal-WD32](#)

## Concept: Import Budget EIB

### Background

You can use this EIB to add or update budget details.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

The Maintain Budget task is the equivalent task.

You can also use the Import Position Budget EIB to create or update position budgets.

### EIB Input File Guidelines

#### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.

## Additional Input File Guidelines

- You must have access to the *Process: Budget* domain in the Budgets functional area to run this EIB.
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- Before populating the EIB input file, you might want to test populating a budget entry through the user interface using the Maintain Budgets task. This step helps ensure that you've configured everything properly and that you're able to add a budget line successfully.
- You'll likely need to make some changes to your EIB template to add the worktags you've assigned to the plan structure. See [Customize EIB Spreadsheet Template](#) and the Adding Worktags to the Template section below.
- If your budget contains over 25,000 entries, we suggest you load 25,000 per EIB. For the first load, use import mode REPLACE\_ALL. For each additional load, use import mode INCREMENTAL\_ADD\_ONLY.
- Complete the Worksheet #1 for Import Budget High Volume worksheet:

Note: There should be only 1 row in this worksheet (assuming you're loading info for just 1 budget).

Field	Considerations
Header Key	This value should be <i>1</i> .
Budget	It's normally not necessary to populate this field.
Import Mode	<p>The View Plan Import Modes report displays the allowable values, descriptions, and their associated reference ID values. The most commonly used values are:</p> <ul style="list-style-type: none"> <li>• REPLACE_ALL: Replaces the budget with the info in</li> </ul>

Field	Considerations
	<p>the EIB input file.</p> <ul style="list-style-type: none"> <li>• INCREMENTAL_ADD_ONLY Adds new or update existing entries.</li> <li>• INCREMENTAL_ADD_WITH Deletes existing plan lines by specifying an amount of 0.00</li> <li>• REPLACE_ALL_BY_PERIOD Replaces all plan lines in a single budget period.</li> </ul>
AutoComplete	<p>Set this field to <i>Y</i> for the business process event to automatically process, then skip approval and To Do steps.</p>
Budget Structure	<p>You can use this method to identify the Budget Structure value:</p> <ol style="list-style-type: none"> <li>1. Locate your budget using Find Plan Templates.</li> <li>2. You'll then see the company, plan structure, plan name, and other items for your budget.</li> <li>3. From the related actions of your Plan Structure value, select Integration</li> </ol>

Field	Considerations
	<p>IDs &gt;View IDs.</p> <p>4. This view displays the value for the reference ID type <i>Budget_Structure_ID</i>.</p>
Budget Name	<p>Based on the Plan Type that you're importing, you'll need to update the format for the Budget Name. This field defaults to <i>Award_Proposal_ID</i>. For Project Budgets, specify the reference ID type <i>Project_Budget_ID</i>. For Financial Budgets, specify the reference ID type <i>Custom_Budget_ID</i>. To find the reference ID value:</p> <ol style="list-style-type: none"> <li>1. Locate your budget using Find Plan Templates. You'll then see the company, plan structure, plan name, and other items for your budget.</li> <li>2. From the related actions of your Plan Name value, select Integration IDs &gt;View IDs.</li> <li>3. This view displays the value for the</li> </ol>

Field	Considerations
	reference ID type and ID.

- Complete the Worksheet #2 for Budget Lines Data worksheet:

Field	Considerations
Header Key	This value should be <i>1</i> for all entries (assuming you're loading information for just 1 budget).
Line Key	Each entry needs a unique value. We recommend you start with value 1 and increment by 1 for each additional entry.
Year and Fiscal Time Interval	To determine the values for these fields: <ol style="list-style-type: none"> <li>1. Use the View Fiscal Year report and select the fiscal schedule used by your plan structure.</li> <li>2. Find the value for the fiscal year and fiscal time interval from the related actions of the fiscal year and fiscal posting interval.</li> <li>3. For Budgets by Duration, the fiscal year should be the fiscal year corresponding to the start of the project.</li> </ol>

Field	Considerations
	<p>Set the Fiscal Time Interval to Fiscal_Posting_Interval_ID and set the Fiscal Time Interval to the first period of the plan. If the plan starts on March 3, 2019 and your calendar year is the same as your fiscal year, then:</p> <ul style="list-style-type: none"> <li>The fiscal year is 2019.</li> <li>The Fiscal Posting Interval for all plan lines is March.</li> </ul> <p>4. For Project Budgets by Period, use the Fiscal Year and Fiscal Posting Interval corresponding with the budget period.</p>

### Common Issues and Errors

Issue	Cause and Solution
The EIB fails with a <i>Gumby Collision</i> error such as: <code>com.workday.instancecdatagumby.GumbyCollisionException</code> . <i>Import Budget (WS Background Process) cannot process Budget Details: 2019 Mar (2019 My Budget)</i>	The Import Budget web service locks the entire budget. This error can occur if the tenant detects 2 processes that are updating the same budget. If you encounter this error:

Issue	Cause and Solution
<p>- xxxx until Import Budget (WS Background Process) finishes.</p>	<ol style="list-style-type: none"> <li>1. Ensure that you haven't entered more than 1 entry in the first tab (worksheet) of the EIB input file when loading information for 1 budget. The first tab enables you to break up the data load into multiple batches or processes (each entry in this tab would represent 1 batch). Use only 1 entry here (for header key value 1) so that Workday doesn't split the processing for a single budget into multiple concurrent processes.</li> <li>2. Ensure that you don't concurrently launch more than 1 Import Budget EIB for the same budget.</li> <li>3. Ensure that no one is updating the budget using the user interface at the same time the EIB is running.</li> </ol>
<p>The EIB fails with the error:</p> <p><i>One or more budget lines have matching Company, Ledger Account Summaries/Ledger Accounts, and Accounting Worktags with another line.</i></p>	<p>If you encounter this error:</p> <ol style="list-style-type: none"> <li>1. Check for duplicate entries in the input file. When you compare the ledger account and all the worktags within each fiscal period, each line should be unique. To find duplicate lines, you can use this method:             <ol style="list-style-type: none"> <li>a. Sort the input file by company, ledger account, period, and worktags</li> <li>b. Add a new column and insert a formula that concatenates the company, ledger account, period, and worktag.</li> <li>c. You can now use any of several Excel tools to find duplicates. You can go to the Home tab and select Conditional Formatting &gt; Highlight Cell Rules &gt; Duplicate Values.</li> </ol> </li> <li>2. If your web service has related worktags enabled, it's possible the EIB is retrieving related worktags that then cause duplicate entries. To prevent this issue, run the Maintain Worktag Type Precedence task, delete any rows, then retest.</li> <li>3. Verify that you're using the most recent web service version. If you're not sure which web service version you're using, create a new EIB, which will pick up the latest web service version.</li> </ol>
<p>The EIB fails with the error:</p> <p><i>Budget Period does not exist for Budget.</i></p>	<p>This error indicates that you haven't specified the correct Year or Fiscal Time Interval.</p>
<p>The EIB fails with the error:</p> <p><i>Worktag is not valid for the Budget Line.</i></p>	<p>If you encounter this error, test whether you can enter the information through the user interface using Maintain Budget. Determine if this error is a configuration issue or an issue with how you're</p>

Issue	Cause and Solution
	<p>populating the EIB input file. This error can occur if:</p> <ol style="list-style-type: none"> <li>1. You specify an inactive worktag.</li> <li>2. You specify a worktag that references a related worktag that is inactive.</li> <li>3. The worktag doesn't have a configuration for the structure dimension. Alternately, the worktag has a configuration in the structure dimension but the configuration doesn't include all members.</li> </ol>
<p>EIB fails with one of these error messages:</p> <ul style="list-style-type: none"> <li>• <i>xyz is not a valid ID value for type = "Custom_Budget_ID"</i></li> <li>• <i>xyz is not a valid ID value for type = "Project_Budget_ID"</i></li> </ul>	<p>The errors occur when the EIB input file doesn't have correct reference ID value for the Budget Name field.</p> <p>There are 2 options to correct the EIB that isn't loading:</p> <ul style="list-style-type: none"> <li>• Option 1: Change the reference IDs to match what is in the EIB input file, by running the Maintain Reference ID task. Enter <i>Project Budget Source</i> or <i>Financial Budget</i> at the Business Object Prompt, depending on what you are loading. Select the <i>Include Default Values Only</i> check box. You can now change the values of the reference IDs to match what is in the EIB input file.</li> <li>• Option 2: Change the EIB input file to use the existing reference ID values by following the steps above to find Budget Name.</li> </ul> <p>To prevent the issue from reoccurring:</p> <ul style="list-style-type: none"> <li>• Option 1: Access the Edit Tenant Setup – Financials task and navigate to the Budget Options section. Select the <i>Generate Budget Source Reference ID as Plan Name</i> check box</li> <li>• Option 2: Set the plan name, when running the Put Budget Template EIB, by populating the Budget Source ID field with the reference ID value you wish to use. Ensure that your EIB is using a recent web service version as the Budget Source ID field isn't available in older versions.</li> </ul>
<p>There's no option to launch the integration.</p>	<p>This error occurs if you don't have the proper access to the <i>Plan Event</i> business process security policy. To fix this issue, you can:</p> <ol style="list-style-type: none"> <li>1. Check the <i>Plan Event</i> business process security policy to make certain you have access to <i>Initiating Action Import Budget (WS Background Process)</i>.</li> <li>2. Activate the change.</li> </ol>

Issue	Cause and Solution
<p>The EIB Fails with the error: <i>You can't change the Multicurrency setting if plan lines exist.</i></p>	<p>This error can occur if you update a plan template without plan lines using the <i>Put Budget Template</i> web service to enable multicurrency.</p> <p>You can prevent this error from reoccurring on the Put Plan Template by:</p> <ul style="list-style-type: none"> <li>• Adding the Template ID to either Column D and Column E.</li> <li>• Entering No in Column C.</li> </ul>

## Business Processes

### Plan Event

#### Use Cases and Guidelines for Recovering from a Bad Load

There's no option to mass-rescind or mass-cancel the business process event. However, if you inadvertently loaded incorrect entries, you could reload the correct entries using import mode `REPLACE_ALL`.

##### Adding Worktags to the Template

1. From the related actions menu of your EIB, select *Template Model> View*.
2. On the left, select All under the *Budget Lines Data* section. On the right, scroll down to locate *Accounting Worktags..*
3. From the related actions on the magnifying glass next to *Accounting Worktags*, select *Template Model Column > Maintain Additional Columns*.
4. Enter all worktags you need to assign to the budget.
5. After you've completed the previous steps, regenerate the spreadsheet template and add newly added worktags to the spreadsheet template.

For reference documentation for all web services including Import Budget, see [Operation Directory](#).

### Sample EIB Input Files

[Import\\_Budget-WD31-Example1-Financial-Budget\\_0](#)

[Import\\_Budget-WD31-Example2-Project-Budget-by Period\\_1](#)

[Import\\_Budget-WD31-Example3-Project-Budget-by-Duration\\_0](#)

### Concept: Submit Customer Invoice EIB

#### Background

You can use this EIB to add or update customer invoices.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

## Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Create Customer Invoice
- Find Customer Invoices
- Manage Customer Invoices. See [Manage Multiple Customer Invoices at Once](#) for more information.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- We frequently update the Submit Customer Invoice web service. Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- You must have access to the *Customer Invoice Event* business process in the Customer Accounts functional area to run this EIB.
- If you need to populate multiple worktags for your customer invoice, you'll want to add additional worktag fields to your spreadsheet for each worktag you use.
- Note that you can add worktags fields at both the customer invoice header and at the line item level.
- To add worktags to the Header:
  1. From the related actions of the EIB, select Template Model > View.
  2. In the left pane click Customer Invoice Data.
  3. Click the magnifying glass for Worktags+ row.
  4. From the related actions of the Worktags+ row, select Template Model Column > Maintain Additional Columns.
  5. Add a row for each possible worktag type that you might be specifying in your EIB input file.
  6. Click OK.

### Modifying the EIB Template to Add Additional Worktag Fields

- To add worktags at the line level:
  1. From the related actions of the EIB, select Template Model > View.
  2. In the left pane click Customer Invoice Line Replacement Data+.
  3. Click the magnifying glass for Worktags+ row.
  4. From the related actions of the Worktags+ row, select Template Model Column > Maintain Additional Columns.
  5. Add a row for each possible worktag type that you might be specifying in your EIB input file.
  6. Click OK.

#### Modifying the EIB Template to Hide Attachment Data

If you plan on using the Generate Spreadsheet with Data option and some of the invoices contain attachments, you should change the template to hide the attachment file. We recommend this modification because the attachments are typically too large to fit in an Excel file (which has a limitation of 32,767 bytes per cell), so Excel truncates the data. To hide the attachment.

1. From the related actions of the EIB, select Template Model > View.
  2. In the left pane, click Invoice Attachment.
  3. Locate the *Template Model Area* and from the related actions select Template Model Area > Hide.
- It can be very helpful to generate the template with data if you're updating existing customer invoices or creating customer invoices and want to see how the EIB input file should be populated.
  - If creating new invoices, you might want to start by manually creating 1 customer invoice

#### Configure the EIB to Generate with Data

like the invoices you plan on loading using the EIB, then configure the EIB.

- Find an existing customer invoice similar to the type of invoices that you wish to load.
- From the related actions of the invoice, select Integration IDs > View.
- Copy the ID value. You'll use it in a later step.
- From the related actions of the EIB, select Template Model > View.
- Click Edit Template with Data Options.
- From the ID Type prompt, select Customer Invoice Reference ID.
- In the ID column, enter the reference ID you previously copied.
- Regenerate the EIB and select the Generate Spreadsheet with Data check box. Note: It populates all data including derived date. You might need to clean up the EIB input file and remove unnecessary field values before using it.

#### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- To prevent data loss, we recommend that you generate your spreadsheet with data for the Submit Customer Invoice EIB. See: [Example: Generate EIB Spreadsheet Template with Data](#) on page 64.
- Complete these options on the EIB input file:

Field	Considerations
Spreadsheet Key	Specify a unique value for each customer invoice.
Add Only	Set to Y only if adding new customer invoices. If adding new lines to existing invoices, set it to N.
Customer Invoice (column D)	Populate this field if updating an existing customer invoice.
Auto Complete	If set to Y, Workday skips all approval steps, review steps,

Field	Considerations
	and to do steps, and suppresses notifications.
Customer Invoice ID (column H)	Populate this field if updating an existing customer invoice, or if creating a new invoice and assigning your own customer invoice ID.
Submit	Set to Y to submit the Invoice. If set to N, it will stay in draft status.
Locked in Workday	If set to Y, you can make modifications to the invoice only using the EIB or web service.
Company	Workday requires the Company field. To find the value, you can use the Reference IDs report and search for business object <i>Company</i> .
Customer ID	Workday requires this field.
Invoice Line Data	<p>Specified in the Customer Line Replacement Data section, which starts in column ET in the attached sample input file. Note that:</p> <ul style="list-style-type: none"> <li>• Row ID (Column ET): Enter a unique row ID value for each line item.</li> <li>• Customer Invoice Line and Customer</li> </ul>

Field	Considerations
	Invoice Line Reference ID: If you're updating an existing customer invoice, you need to include the existing lines and you must populate these fields. The easiest way to populate this information is to use the Generate Spreadsheet with Data option.
Worktags	If you're populating worktag values in either the header or line item, see <i>Modifying the EIB Template to Add Additional Worktag Fields</i> section for instruction how to add additional worktag fields.
External Supplier Invoice Source	Originating system of the supplier contract. Populate this field only if using the Supplier Contract ID External field on the spreadsheet to reference a supplier contract.
Attachment Data	Although you can add or update attachments using this EIB, we don't recommend it as there are some challenges in loading document content using

Field	Considerations
	<p>the EIB. If you need to add attachments using an integration, you might find it helpful to refer to section <i>How to Populate File Attachments in EIB Input File</i> in the Community page for <i>Put Worker Document</i>. Although it's covering a different web service, the same information applies to Submit Customer Invoice in regard to populating attachments.</p>

## Common Issues and Errors

Issue	Cause and Solution
EIB performance is slow.	<p>Below are items to check:</p> <ul style="list-style-type: none"> <li>If you have a lot of custom validations, it can degrade performance.</li> <li>Evaluate which web service to use. If most of the invoices have very few line items, use Submit Customer Invoice. But if the invoices have a larger number of line items, test using Import Customer Invoice instead.</li> </ul>
After updating existing customer invoices, information is missing including line items.	If you don't include existing customer invoice information in the EIB input file, Workday might remove it. We recommend that you use the Generate Spreadsheet with Data functionality to avoid losing data.
The EIB issues this error when updating existing customer invoices:  <i>Validation error occurred. Usage Data is required unless address is being deleted.</i>	<p>If you generated the spreadsheet with data, the EIB input file populates both the bill-to address reference ID along with all the address attributes, which can cause confusion.</p> <p>If you aren't making any changes to the bill-to address, then remove the address values from the EIB input file from column R (Row ID of Bill to Address) to column BC (Municipality Local).</p>
When attempting to generate the spreadsheet with data, it fails with this error:	This EIB uses Get Customer Invoices web service to fetch the information needed to generate the template with data. You can find this information in the Supported Inbound EIB Operations report.

Issue	Cause and Solution
<p><i>Integration Failed.</i>  <i>com.capeclear.mediation.MediationException:</i>  <i>application=assemblyGenerateSpreadsheetE2 - Error code : 1" "The task submitted is not authorized.</i></p>	<p>The Get Customer Invoices web service is secured by the Process: Customer Invoice - View domain. Verify you have Get access to this domain security policy. Activate security policy changes.</p>
<p>When attempting to generate the spreadsheet with data, it fails with this error:</p> <p><i>Integration Failed.</i>  <i>com.capeclear.mediation.MediationException:</i>  <i>application=assemblyGenerateSpreadsheetE2 - Custom step id=GenerateWhenSplit,</i>  <i>ref=SpreadsheetGenerationBean_EIBWXF - Error while invoking bean, reason: One or more of the columns in your template model includes file-based (base64) data that will be cut off due to a spreadsheet cell limit of 32,767. To fix this, go to the template model and hide the related file-based data columns.</i>  <i>Root Cause: java.lang.Exception: One or more of the columns in your template model includes file-based (base64) data that will be cut off due to a spreadsheet cell limit of 32,767. To fix this, go to the template model and hide the related file-based data columns.</i>  <i>See the consolidated report for further details.</i></p>	<p>This issue occurs when extracting invoices with attachments. To work around this issue, complete the steps in the section <i>Modify the EIB Template to Hide Attachments</i>.</p>
<p>When launching the EIB, this error displays when attempting to attach the EIB input file:</p> <p><i>The size of the file 'xxxx' is greater than the maximum permitted file size (30,720KB). Please select a different file or reduce the size of this file.</i></p>	<p>The size of the EIB input file, for customer invoices, can be quite large due to the amount of data associated with each customer invoice. Unfortunately, there isn't a way to increase the file limitations when attaching EIB input files. But below are a couple suggestions that might help.</p> <ul style="list-style-type: none"> <li>• If you have an SFTP server, 1 option would be to load your EIB input file to the SFTP site, and then configure your EIB with a retrieval step that pulls the file from the SFTP site (instead of manually attaching the file from your browser). If you do this action, you can load a file up to 1 gig.</li> <li>• If you're using an XML input file, consider switching to XLSX format as the file size will be smaller.</li> </ul>
<p>Unable to launch the EIB</p>	<p>This issue is most likely security-related. See <i>Web Service Version and Security Configuration Guidelines</i> section for instructions to verify that you're using the most recent web service version and you've configured the security properly.</p>

## Business Processes

Customer Invoice Event.

## Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new customer invoices or update existing customer invoices. You can't delete or rescind customer invoices.
- If you've inadvertently uploaded incorrect customer invoices, check if 1 of these options will work for your situation:
  - Rerun the EIB and update the invoices with correct information.
  - Use the Cancel Customer Invoice EIB.
  - If the events are still in progress, try Mass Cancel Business Processes.

For reference documentation for all web services including Submit Customer Invoice, see [Operation Directory](#).

## Sample EIB Input File

[Submit\\_Customer\\_Invoice-WD35](#)

## Human Resources EIBs

### Concept: Add Update Organization EIB

#### Background

You can use this EIB to add a new organization or update an existing organization.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

The equivalent task in Workday depends on the type of organization that you're creating or updating. Examples of equivalent Workday tasks include:

- Create Cost Center
- Create Custom Organization

There are additional integrations and EIBs related to organizations functionality. Consider these options as you determine what works best for you:

- Change Organization Assignments: You can use this EIB to assign members to an organization. Workday recommends using Change Organization Assignments to assign members to an organization, however the Assign Organizations and Assign Members to Custom Organization EIBs are also available. Review the documentation for those EIBs to determine what works best for you.
- Inactivate Organization: You can use this EIB to deactivate an organization.
- [Org Studio and Mass Actions](#): Consider using this functionality if you're performing a reorganization.
- Organization Inbound Connector: You can use this integration to import organization changes into Workday.
- Put Company, Put Cost Center and Put Location: These are organization-related web services. Review the API documentation for these web services in the [Operation Directory](#) to determine if you wish to use them.
- Put Supervisory Organization Assignment Restrictions: You can use this EIB to assign and enable organization values for a Supervisory Organization.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Manage: Organization Update Integration* domain security policy in the Organization and Roles functional area to run this EIB.

### Additional Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:

- **Spreadsheet Key:** Specify a unique value for each organization that you're adding or updating.
- **Organization Reference ID:** If you're updating an existing organization, you need to specify its reference ID in this field. If you're creating a new organization, ensure the value that you enter isn't already in use.
- **Organization Type Name and Organization Subtype Name:** Populate these fields if you're creating new organizations. You can find a list of values by running the Integration IDs report and searching for the *Organization Type* and *Organization Subtype* business objects. Use the actual name of the organization type and subtype as you populate the EIB input file, not the reference ID value. The values that you need to populate in the EIB input file display in the Instance column of the Integration IDs report.
- **Superior Organization:** Populate this field if assigning:
  - A hierarchy to a superior hierarchy.
  - An organization to a parent organization. Example: Assigning a supervisory organization to a parent supervisory organization.

- Primary Business Site: If you create a supervisory organization, specify the location here.
- Container Organization: Populate this field if you're assigning an organization to a hierarchy. Example:
  - Assigning a cost center to a hierarchy.
  - Assigning a company to a hierarchy.
  - Assigning custom organization to a hierarchy.

## Common Issues and Errors

Issue	Cause and Solution
There's no option to launch the integration.	<p>This is typically a security-related issue.</p> <p>Verify you have the correct security configuration. Ensure that you are in the relevant security group and that you have access to the <i>Manage: Organization Update Integration</i> domain security policy in the Organization and Roles functional area.</p>
EIB issues errors when run in validate-only mode, but works fine when running in nonvalidate mode.	<p>This occurs if you're loading multiple organization assignments where each entry builds on the previous entry.</p> <p>Example: The first entry builds a hierarchy and the second entry assigns an organization to that hierarchy. This doesn't work in validate only mode since it fails to commit to each change. Therefore there isn't a way to run this scenario successfully in validate-only mode.</p>
I moved an organization to a new hierarchy using the EIB. After completing the change, the organization is in both the old hierarchy and the new hierarchy.	<p>Workday can't include an organization in more than 1 node within the same top-level hierarchy to avoid double-counting. We deliberately support an organization being able to be in more than one top-level hierarchy because each top-level hierarchy can serve a different purpose (roll up). Example: You can group cost centers in different ways. We don't plan to change the existing behavior since many customers currently rely on the ability to have the same organization belong to multiple hierarchies.</p>
<p>EIB issues this error:</p> <p><i>Validation error occurred. Organization Subtype isn't valid for Organization Type.</i></p>	<ul style="list-style-type: none"> <li>• Verify you're populating the name of the organization subtype in the EIB input file. The values that you need to populate in the EIB input file display in the Instance column of the Integration IDs report.</li> <li>• Run the Maintain Organization Subtypes task and verify that the same subtype doesn't occur in more than 1 entry.</li> </ul> <p>Example: Organization types Cost Center Hierarchy and Supervisory both use</p>

Issue	Cause and Solution
	<p>the Group organization subtype. There shouldn't be 2 separate entries, but rather just 1 entry for the subtype Group used by both organization types.</p> <ul style="list-style-type: none"> <li>Verify that you've configured the organization subtype for the organization type you're using. You can use the Maintain Organization Subtypes task to check.</li> <li>Verify that the organization subtype name isn't already in use. Example: There are Workday delivered organizations such as Region and Business Unit. So overlapping names can cause issues if you have custom organizations with these same names. To resolve the issue, use the Maintain Organization Subtype task to change the subtype to a unique value.</li> </ul>
After loading organizations, they aren't searchable.	There's an index build process that runs periodically in your tenant. Wait for this build to complete before the newly loaded organizations are searchable. The index build runs hourly in Production and every 6 hours in non-Production tenants.
Roles marked as <i>Self-Assign</i> are automatically assigned to the user who runs the EIB.	To prevent auto-assignment, use the Maintain Assignable Roles task to filter in the <i>Self-Assign</i> or <i>Leadership</i> columns and deselect the roles.

### Use Cases and Guidelines for Recovering from a Bad Load

This EIB enables you to add new entries or update existing entries. You can't delete entries and you can't rescind additions or updates since the web service doesn't use a business process event.

If you have uploaded incorrect entries, you can:

- Resubmit the EIB with the corrections.
- Inactivate the organizations by using the Inactivate Organization web service.

For reference documentation for all web services including Add Update Organization, see [Operation Directory](#).

### Sample EIB Input Files

[Add\\_Update\\_Organization-WD35-Example1-Miscellaneous](#)

[Add\\_Update\\_Organization-WD35-Example2-Build-Cost-Centers-and-Hierarchies](#)

### Concept: Add Vaccination EIB

#### Background

You can use the Add Vaccination EIB to load a worker's vaccine events, including their vaccine status, type, and manufacturer. If you want to load a worker's workplace health and safety tests, you can use the Add Workplace Testing EIB instead.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

## Equivalent Workday Task

Add Vaccination.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Add Vaccination* business process type in the Vaccination Tracking functional area to run this EIB.
  - You must have access to the *Person Data: Vaccination* domain in the Vaccination Tracking functional area to view the vaccination data for this EIB.

### Additional Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:

- **Spreadsheet Key:** Specify a unique value for each vaccination. If you load multiple vaccinations for the same person, the spreadsheet key value still needs to be unique for each entry.
- **Person:** Specify the reference ID of the person. Update the reference ID value in cell C4 from Academic\_Affiliate\_ID to Employee\_ID.
- **Vaccine Type:** Example: COVID-19. To find the reference ID value, access the View Reference IDs report and search for the *Vaccine Type* business object.
- **Vaccination Status:** Examples: Vaccinated, Partially Vaccinated. To find the reference ID value, access the View Reference IDs report and search for the *Vaccination Status* business object.
- **Vaccine:** Examples: Pfizer, Moderna. To find the reference value, access the View

- Reference IDs report and search for the *Vaccine* business object.
- Vaccination Event Type: Examples: First Dose, Booster. To find the reference value, access the View Reference IDs report and search for the *Vaccination Event Type* business object.
  - Vaccination Date: Use format YYYY-MM-DD.
- Consider creating a custom report from the Vaccinations report data source to:
- Determine which workers already have vaccination information, or
  - Verify that the EIB successfully loaded the vaccination information.

## Common Issues and Errors

Issue	Cause and Solution
Although the EIB completes successfully, it looks like the data didn't load.	<p>Check these:</p> <ul style="list-style-type: none"> <li>• Check the status of the event. If it's still in progress, consider mass canceling all in-progress events, making any needed changes to the EIB and rerunning it.</li> <li>• Verify you have the correct security configuration. Ensure that you are in the relevant security group and have access to these domains and business processes in the Vaccination Tracking functional area:           <ul style="list-style-type: none"> <li>• <i>Add Vaccination</i></li> <li>• <i>Person Data: Vaccination</i></li> </ul> </li> </ul>
<p>EIB issues an error like this:</p> <p><i>Validation error occurred. Invalid ID value. '21002' isn't a valid ID value for type = 'Academic_Affiliate_ID'</i></p>	<p>Verify that you have appropriately set the reference ID type in cell C4. Most likely, you'll need to change it to <i>Employee_ID</i>.</p>
Unable to attach a file, such as an image of a vaccination card, through the EIB.	<p>The EIB doesn't support attaching files. If you need to attach files, you need to submit the request using the SOAP API instead of using EIB.</p>
Unable to launch the EIB	<p>This is most likely security-related.</p> <p>Verify you have the correct security configuration. Ensure that you are in the relevant security group and have access to these domains in the Vaccination Tracking functional area:</p> <ul style="list-style-type: none"> <li>• <i>Add Vaccination</i></li> <li>• <i>Person Data: Vaccination</i></li> </ul>

## Business Processes

Add Vaccination.

## Use Cases and Guidelines for Recovering from a Bad Load

This EIB only enables you to add vaccinations. You can't update or delete existing vaccination entries with this EIB.

If you've uploaded incorrect entries, you can use either the Mass Cancel Business Processes task (if the event is still in progress) or Mass Rescind Business Processes task (if the event is complete). Both of these tasks are secured to the *Business Process Administrator* domain in the System functional area. You can then select Business Processes Loaded by EIB to find the integration event that you want to cancel or rescind. Alternatively, you can enter *Add Vaccination* in the Business Process Types prompt and enter the date range that corresponds to when you ran the EIB.

For reference documentation for all web services including Add Vaccination, see [Operation Directory](#).

### Sample EIB Input File

[Add\\_Vaccination-V37](#)

### Concept: Add Workday Account EIB

#### Background

You can use this EIB to add a new Workday account (Example: username and password) with the information you supply. You can create accounts for workers (Example: employee or contingent workers) and nonworkers (Example: recruiting agency users or supplier contacts).

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

The equivalent task in Workday for creating Workday accounts varies depending on the worker type. Examples of equivalent Workday tasks include:

- For employees or contingent workers, you can select Security Profile > Create Workday Account from the related actions menu of the worker profile.
- For recruiting agency user, you can use Add Workday Account for Agency User.
- For supplier contact, you can use Create Workday Account for Supplier Contact.
- There are additional EIBs you can use to create or update Workday Accounts. Consider these options as you determine what works best for you:
  - Manage Extended Enterprise Learner: You can use this EIB to create an extended enterprise learner and their Workday account.
  - Update Workday Account: You can use this EIB to update an existing Workday account.
  - There's also a Create Workday Account subprocess available from within some EIBs, such as Contract Contingent Worker and Hire Employee.

#### EIB Input File Guidelines

##### Security Configuration Guidelines

- If you set the Generate Random Password field to Y, then the EIB will generate the new password information and email it to the email address associated with the account.
- To test that the emails deliver successfully, you can:
  1. Access the Edit Tenant Setup – Security task and select the Enable Security Mails check box. Select the

## Guidelines for Modifying the EIB Template

appropriate option to send the email to either the home email address or work email address associated with the account.

2. Confirm that the recipients have an email configured in their account.
3. Verify that the recipients receive emails containing the:
  - Account name
  - Password.

You can modify the EIB template and use it for any type of worker or nonworker.

1. From related actions of your EIB, select Template Model > View. Select the second occurrence of All . Select the magnifying glass icon and then select Related Actions > Template Model Column > Edit Details.
2. Select the Reference ID Type as Separate Column check box.
3. Regenerate the template. On the regenerated template, you can choose any type of worker or nonworker.

## Guidelines for Populating Fields in the EIB Input File

Workday recommends that you populate the Worker ID and Reference ID type in the EIB input file. This ensures that the EIB creates an account that is associated with a person.

We also recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:

- **Spreadsheet Key:** Specify a unique value for each Workday account that you create.
- **Non-Worker:** Although this field is titled Non-Worker, you can use it to populate any type of person (Example: employee, contingent worker, supplier contact, and so on). Use option Reference ID Type as Separate Column as noted in the Guidelines for Modifying the EIB Template section above to select any type of worker or nonworker. You can find the IDs of the worker using a custom report. Workday recommends:
  - If you're building accounts for employees or contingent workers, create a custom report by using the

Indexed All Workers data source and include these fields:

- Employee ID
- Has Workday Account
- Worker Type
- If you're building accounts for supplier contacts, create a custom report using the Suppliers data source and include these fields from the Supplier Contacts for Supplier business object:
  - Name
  - Reference ID Value
  - Workday Account
- If you're building accounts for recruiting agency users, create a custom report using the Recruiting Agency data source and include these fields from the Agency Users business object:
  - Name
  - Reference ID Value
  - Workday Account
- Username: Specify the username.
- Generate Random Password: If you set this field to Y, the EIB will generate the new password information and email it to the email address associated with the account.
- Notifications: Below are details for populating fields associated with notifications. When you update a notification type, it replaces all instances. To avoid removing information, ensure that the EIB input file includes all channel information for the notification type. Also, you must supply Workday IDs (WIDs) for each of these fields. The WIDs would typically be available from the Integration IDs report. However, at this time they aren't available due to a permission-related issue that the Workday development team is investigating. Instead, refer to the lists of WID values in the tables below.
  - Notification Sub Type: This is the notification type. (Examples: Approvals, Give Feedback, Tasks.) Enter the WID of the notification type. (Refer to the tables below).
  - Channel: Specify the channel (Examples: Email, Mobile Push Notification). You'll need to enter the WID for the channel (Refer to the tables below).
  - Delivery Frequency: Specify the delivery frequency (Examples:

Immediately, Daily). You'll need to enter the WID (Refer to the tables below).

## Common Issues and Errors

Issue	Cause and Solution
The EIB completes successfully but it appears that the data didn't load.	<p>Check these:</p> <ul style="list-style-type: none"> <li>Check the status of the event. If it's still in progress, consider mass canceling all in-progress Create Workday Account events, making any needed changes to the EIB (Example: Removing any steps from the Create Workday Account business process definition that prevent it from completing, or adding condition rules to the steps to skip them) and then rerunning the EIB.</li> <li>Verify that you ran the EIB in live mode and not validate only mode.</li> <li>Check the EIB input file and verify that you properly populated the Reference ID type and Reference ID value for the user.</li> </ul>
EIB issues one of these errors: <ul style="list-style-type: none"> <li><i>Validation error occurred. Employee Reference Integration ID does not exist!"</i></li> <li><i>Validation error occurred. Contingent Worker Reference Integration ID does not exist!"</i></li> </ul>	<p>You can't create a Workday account until there's a valid worker record. If there's a valid worker, then verify that you've entered the correct value and Reference ID type for the worker, in the EIB input file.</p> <p>If the worker ID is numeric and starts with zeros, the leading zeros might be removed. You can fix this by changing the formatting of the column to text in the EIB input file.</p>
EIB issues an error like this:  <i>Validation error occurred. A Workday Account already exists for referenced Worker.</i>	<p>This indicates that there's already a Workday Account for the worker. If you're attempting to add a Workday Account for a worker who already has an account, consider:</p> <ul style="list-style-type: none"> <li>Use Update Workday Account to modify the existing account, instead of this EIB.</li> <li>If you haven't accessed the existing Workday account for the worker, then you could rescind it and use this EIB to add the desired account.</li> </ul>
EIB issues this error:  <i>Validation error occurred. User name already taken, please choose another one.</i>	<p>This indicates that there's already an account with the same username. You can run the All Workday Accounts report to find the account.</p>
When loading recruiting agency users with the Generate Random Password option, you receive this error:  <i>Validation error occurred. If Generate_Random_Password is true, the user must</i>	<p>Check the items listed in the error. Also verify that the EIB is using the latest web service version. This is necessary as you need v35.0 or higher to ensure you have the fix delivered for this issue. If you haven't verified the web service version you're</p>

Issue	Cause and Solution
<i>have an email address on file, the tenant must be set up to send security emails, and the user cannot use delegated authentication.</i>	using, create a new EIB, which will uptake the latest version.
EIB issues this error when attempting to create a Workday account for a former worker:  <i>The entered information does not meet the restrictions defined for this field. (Non_Worker_Reference).</i>	You can't create Workday accounts for former workers with the Add Workday Account web service. Former Workers shouldn't sign into Workday. Terminees can sign in, but former workers can't.
The users aren't receiving an email notification for their new account.	<ul style="list-style-type: none"> <li>• Review the EIB input file and verify that Generate Random Password = Y. Set this to Y to trigger an email notification.</li> <li>• Access the Edit Tenant Setup – Security task. Verify that you've enabled the <i>Enable Security Emails</i> option, and that you have set it appropriately to send the email to home or work.</li> <li>• Verify that the worker or nonworker has an email configured in their profile.</li> <li>• Ask users to check if the email notifications are in their SPAM folder.</li> </ul>
You selected the <i>Generate Random Password</i> option and are concerned the temporary password will expire before users can reset it.	Randomly generated passwords expire the same way as any other passwords. The Maximum Password Age in Days field on the Maintain Password Rules task or the Maintain Payment Card Industry Password Rules task controls password expiration. You can check that field to determine how many days the user has to reset their temporary password.
Unable to launch the EIB	<p>This is most likely security-related.</p> <p>Verify you have the correct security configuration. Ensure that you are in the relevant security group and have access to the <i>Workday Accounts</i> security domain in the System functional area.</p>

## Business Processes

Create Workday Account.

### Use Cases and Guidelines for Recovering from a Bad Load

This EIB only adds new Workday accounts. To edit existing Workday accounts, use the Update Workday Account EIB.

If you need to back out business process events that are in-progress, you can run the Mass Cancel Business Processes task (secured to the *Business Process Administrator* domain in the System functional area). You can enter *Create Workday Account* on the Business Process Types prompt and enter the date range that corresponds to when you ran the EIB.

If you've uploaded incorrect entries, consider:

- If the user hasn't yet accessed the account, you can run the Mass Rescind Business Processes task (secured to the *Business Process Administrator* domain in the System functional area) to remove

- it. Enter *Create Workday Account* on the Business Process Types prompt and enter the date range that corresponds to when you ran the EIB.
- If the user has already accessed the account, you can still run the Mass Rescind Business Processes task, but it won't fully rescind it. This will disable the account. You can then use the Update Workday Account EIB instead to modify the existing account to meet your needs.

For reference documentation for all web services including Add Workday Account, see [Operation Directory](#).

### **Sample EIB Input File**

[Add\\_Workday\\_Account-WD35](#)

### **Concept: Add Workplace Test EIB**

#### **Background**

You can use the Add Workplace EIB to load a worker's workplace health and safety tests, including the test type and results. If you want to load a worker's vaccine events, including their vaccine status, type, and manufacturer, you can use the Add Vaccination EIB instead.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### **Equivalent Workday Task**

Add Workplace Test.

#### **EIB Input File Guidelines**

##### **Security Configuration Guidelines**

- Verify you have the correct security configuration.
  - You must have access to the *Add Workplace Test* business process type in the Workplace Test Tracking functional area to run this EIB.
  - You must have access to the *Person Data: Workplace Testing* domain in the Workplace Test Tracking functional area to view the workplace test data for this EIB.

##### **Additional Input File Guidelines**

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.

As you populate the EIB input file, consider:

- Spreadsheet Key:** Specify a unique value for each workplace test. If you load multiple workplace tests for the same person, the spreadsheet key value still needs to be unique for each entry.
- Person:** Specify the reference ID of the person. Change the reference ID value in cell C4 from Academic\_Affiliate\_ID to Employee\_ID.

- Workplace Test Type: Example: COVID-19. To find the reference ID value, access the View Reference IDs report and search for the *Workplace Test Type* business object.
- Workplace Test Result: Examples: Negative, Positive. To find the reference ID value, access the View Reference IDs report and search for the *Workplace Test Result* business object.
- Workplace Test Result Date: Use YYYY-MM-DD format.

Consider creating a custom report from the Workplace Tests report data source to:

- View the existing workplace testing information for workers, or
- Verify that the EIB successfully loaded the workplace testing information.

## Common Issues and Errors

Issue	Cause and Solution
Although the EIB completes successfully, it displays that the data wasn't loaded.	<p>Check these:</p> <ul style="list-style-type: none"> <li>• Check the status of the event. If it's still in progress, consider mass canceling all in-progress events, making any needed changes to the EIB (Example: Removing any steps from the business process definition that prevent it from completing, or adding condition rules to the steps to skip them) and then rerunning the EIB.</li> <li>• Verify you have the correct security configuration. Ensure that you are in the relevant security group and have access to these domains and business processes in the Workplace Test Tracking functional area: <ul style="list-style-type: none"> <li>• <i>Add Workplace Test</i></li> <li>• <i>Person Data: Workplace Testing</i></li> </ul> </li> </ul>
Unable to attach a file, such as an image of a test result, through the web service	The EIB doesn't support attaching files. If you need to attach files, you need to submit the request using the SOAP API instead of using EIB.

## Business Processes

Add Workplace Test.

## Use Cases and Guidelines for Recovering from a Bad Load

This EIB only adds workplace tests. You can't update or delete existing test entries.

If you've uploaded incorrect entries, you can use either the Mass Cancel Business Processes task (if the event is still in progress) or Mass Rescind Business Processes task (if the event is complete). Both of

these tasks are secured to the *Business Process Administrator* domain in the System functional area. You can then select Business Processes Loaded by EIB to find the integration event that you want to cancel or rescind. Alternatively, you can enter *Add Workplace Test* on the Business Process Types prompt and enter the date range that corresponds to when you ran the EIB.

For reference documentation for all web services including Add Workplace Test, see [Operation Directory](#).

## **Sample EIB Input File**

[Add\\_Workplace\\_Test-V37](#)

## **Concept: Assign Members to Custom Organization EIB**

### **Background**

You can use this EIB to assign or unassign workers as members of a custom organization. The custom organization type must have this configuration on the Maintain Organization Types report (secured to the Set Up: Organizations domain in the Organizations and Roles functional area) in Workday:

- *Allow Reorganization Tasks = Yes*
- *Position Assignment Unique = No*

If the custom organization type doesn't have this configuration on the Maintain Organization Types report in Workday, the EIB will fail. The EIB needs to use reorganization tasks to assign and unassign members to custom organizations. We recommend using the Change Organization Assignments EIB for custom organization types that don't have this configuration.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### **Equivalent Workday Task**

There are similar EIBs that you can use to assign or unassign workers as members of organizations. Consider these options as you determine what works best for you:

- Assign Organization: You can also use this EIB to assign organizations to worker positions, however we recommend that you use the Change Organization Assignments EIB instead.
- Change Organization Assignments: We recommend that you use this EIB to assign members to organizations.
- Import Assign Matrix Organization: You can use this EIB to assign members to matrix organizations.
- Import Remove Matrix Organization: You can use this EIB to remove members from matrix organizations.
- Move Workers by Organization: You can use this EIB to move workers to different organization types.

The equivalent task in Workday also depends on your configuration. Examples of equivalent Workday tasks that enable you to mass-assign organizations to workers include:

- Move Workers (Supervisory)
- Move Workers (By Organization)

If you're performing a reorganization, you might also consider reviewing the [Org Studio and Mass Actions](#) functionality.

### **EIB Input File Guidelines**

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:

- Spreadsheet Key: Specify the same spreadsheet value (Example: *1*) for all the positions that you want to assign to the organization.
- Assign Members to Custom Organization: Change the value in cell C4 to *Custom\_Organization\_Reference\_ID*. You can find a list of reference ID values by running the View Reference IDs report and searching for the *Custom Organization* business object or by creating a custom report using the *Custom Organizations* report data source.
- Reorganization: You can find the reference ID by accessing the Reorganizations report (secured to the *Set Up: Reorganizations* domain in the Organizations and Roles functional area) and then selecting Integration IDs > View IDs on the related actions of your reorganization.

Note: The effective date of the reorganization date is the effective date of the organization assignment to the position.

- Positions to Add: Ensure that your EIB uses the latest version of the Assign Members to Custom Organization web service. Older versions require that you specify the Workday ID (WID) of the position in this column. You can find the position id values by creating a custom report using the *All Workers* report data source.
- Positions to Remove: You can find the position id values by creating a custom report using the *All Workers* report data source.

## Common Issues and Errors

Issue	Cause and Solution
The EIB load is taking a long time to process.	<p>This can occur if you're assigning more than 100 positions to an organization. Consider grouping position assignments together into 1 spreadsheet key.</p> <p>Ensure that your EIB is using the latest version of the Assign Members to Custom Organization web service. If you're unsure which version your EIB uses, consider creating a new EIB to uptake the latest version.</p>
The EIB completes successfully, but when checking the assignments, some positions aren't assigned to the custom organization.	<p>This can occur if your EIB uses an old reorganization date. Ensure that the effective date of reorganization events to assign workers or move retirees is after the hire or transfer date of all relevant workers in the affected organizations. Workers who haven't been hired or transferred as of the reorganization effective date can't be moved as part of the reorganization.</p> <p>See: <a href="#">Concept: Reorganizations</a>.</p>
<p>The EIB issues these errors:</p> <ul style="list-style-type: none"> <li>• <i>The entered Organization must be a custom organization whose organization type is configured with options: 'Allow Organization Tasks' = Yes and 'Position Assignment Unique' = No.</i></li> <li>• <i>The entered information does not meet the restrictions defined for this field.</i> <i>(Assign_Members_to_Custom_Organization_Reference)</i></li> </ul>	<p>The custom organization type must have this configuration on the Maintain Organization Types report in Workday:</p> <ul style="list-style-type: none"> <li>• <i>Allow Reorganization Tasks = Yes</i></li> <li>• <i>Position Assignment Unique = No</i></li> </ul> <p>You can check the custom organization type configuration by:</p> <ol style="list-style-type: none"> <li>1. Accessing the Maintain Organization Types report.</li> <li>2. Navigating to the Custom tab.</li> </ol>

Issue	Cause and Solution
	<p>3. Filtering the grid for these values:</p> <ul style="list-style-type: none"> <li>• <i>Allow Reorganization Tasks</i> = Yes</li> <li>• <i>Position Assignment Unique</i> = No</li> </ul> <p>We recommend using the Change Organization Assignments EIB for custom organization types that don't have this configuration.</p>

## Use Cases and Guidelines for Recovering from a Bad Load

This EIB enables you to assign or unassign workers as members of a custom organization.

You can't rescind this EIB. If you upload incorrect entries, you can remove them by populating the Positions to Remove column on the EIB input file and rerunning the EIB.

For reference documentation for all web services including Assign Members to Custom Organization, see [Operation Directory](#).

### Sample EIB Input File

[Assign\\_Members\\_to\\_Custom\\_Organization-v38\\_0](#)

### Concept: Change Business Title EIB

#### Background

You can use this EIB to update a business title for a worker.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

Change Business Title.

#### EIB Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:

- Spreadsheet Key: (Required) Specify a unique value for each business title change
- Worker: (Required) If you want to specify values for employees, you need to change the reference ID type in cell C4 from *Contingent\_Worker\_ID* to *Employee\_ID*.
- Job: If the worker has two or more jobs, you must populate the position id in this field.
- Event Effective Date: (Required) Specify the effective date of the business title change. Use YYYY-MM-DD format.
- Proposed Business Title: (Required) Specify the new business title.

#### Common Issues and Errors

Issue	Cause and Solution
Although the title change is successfully updated, it isn't listed in the worker history.	This might happen if you use an EIB that has a web service version of v30.1 or older.

Issue	Cause and Solution
	<p>Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:</p> <ol style="list-style-type: none"> <li>From the related actions of the EIB, select Template Model &gt; View.</li> <li>On the View Template Model page, check the Version field to verify you're using the latest web service version.</li> <li>If you're using an older web service version, you can create a new EIB to get the latest version.</li> </ol>
<p>EIB issues an error like this:</p> <ul style="list-style-type: none"> <li>Validation error occurred. Invalid ID value. '21001' isn't a valid ID value for type = 'Contingent_Worker_ID'</li> </ul>	<p>Change cell C4 to <i>Employee_ID</i> in the EIB input file.</p>
<p>Unable to launch the EIB</p>	<p>This is most likely security-related. Verify you have the correct security configuration. Ensure that you are in the relevant security group and have access to the <i>Title Change</i> business process type in the Staffing functional area.</p>
<p>EIB issues errors like this:</p> <ul style="list-style-type: none"> <li>Enter an Effective Date that is either on or before the date the position was last vacated or on or after the date the position was last filled.</li> <li>Job is required for workers with more than 1 position.</li> </ul>	<p>This occurs if you change a title for a worker with multiple positions but don't specify the job. To resolve this issue, edit the EIB input file and populate the Job field with the position id for the relevant position.</p>

## Business Processes

Title Change.

### Use Cases and Guidelines for Recovering from a Bad Load

If you've uploaded incorrect entries, you can use either the Mass Cancel Business Processes task (if the event is still in progress) or Mass Rescind Business Processes task (if the event is complete). Both of these tasks are secured to the *Business Process Administrator* domain in the System functional area. You can then select Business Processes Loaded by EIB to find the integration event that you want to cancel or rescind. Alternatively, you can enter *Title Change* in the Business Process Types prompt and enter the date range that corresponds to when you ran the EIB.

For reference documentation for all web services including Change Business Title, see [Operation Directory](#).

### Sample EIB Input File

[Change\\_Business\\_Title-WD34](#)

## Concept: Change Emergency Contacts EIB

### Background

You can use this EIB to add or update emergency contacts. You can't delete primary contacts with this EIB, but you can use the EIB to replace them. If you need to remove a primary emergency contact, you can only do this by using the *Clear Emergency Contact* task in Workday.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Emergency Contacts for Worker.
- On the related actions menu of the worker profile, select Personal Data > Change Emergency Contacts.

### EIB Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:

- Spreadsheet Key: Specify a unique value for each worker.
- Person: Specify the reference ID of the person. Change the reference ID value in cell C4 from *Academic\_Affiliate\_ID* to *Employee\_ID*.
- Replace All: Specify *Y* if you want to replace all the worker's emergency contacts with the information provided in the input file.
  - If you want to remove portions of the contact information for an emergency contact, you can specify *Y* in the Delete field of the relevant section of the input file.

### Common Issues and Errors

Issue	Cause and Solution
The EIB completes successfully but you don't find the changes you loaded.	<p>Check these:</p> <ul style="list-style-type: none"> <li>• Check if any row is missing a Row ID value. If a row ID is missing, Workday ignores any information you provide in that section.</li> <li>• Check if the emergency contact is linked to a dependent or beneficiary. If the emergency contact is linked to a dependent or beneficiary, you can't update it with this EIB. If you want to remove the contact, you can use the <i>Clear Emergency Contact</i> task (secured to the <i>Change Emergency Contacts</i> business process type in the Contact Information functional area).</li> <li>• Ensure that the business process isn't still in progress. Check the Business Processes tab on the EIB integration event to verify if the EIB successfully completes.</li> </ul>

Issue	Cause and Solution
Unable to launch EIB	<p>This is most likely security-related.</p> <p>Verify you have the correct security configuration. Ensure that you are in the relevant security group and have access to the <i>Change Emergency Contacts</i> business process type in the Contact Information functional area.</p>

## Business Processes

Change Emergency Contacts.

### Use Cases and Guidelines for Recovering from a Bad Load

This EIB enables you to add new emergency contacts or update existing emergency contacts.

If you've uploaded incorrect entries, you can use either the Mass Cancel Business Processes task (if the event is still in progress) or Mass Rescind Business Processes task (if the event is complete). Both of these tasks are secured to the *Business Process Administrator* domain in the System functional area. You can then select Business Processes Loaded by EIB to find the integration event that you want to cancel or rescind. Alternatively, you can enter *Change Emergency Contacts* in the Business Process Types prompt and enter the date range that corresponds to when you ran the EIB.

For reference documentation for all web services including Change Emergency Contacts, see [Operation Directory](#).

### Sample EIB Input File

[Change\\_Emergency\\_Contacts-WD31](#)

### Concept: Change Government IDs EIB

#### Background

You can use this EIB to add, update, or delete government IDs for a worker.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

See Personal Data > Edit Government IDs from the related actions of the worker's profile.

#### EIB Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:

- **Spreadsheet Key:** Specify a unique value for each person. Consider creating a custom report with the *Indexed All Workers* data source to get the reference IDs and other information for the workers.
- **Replace All:** Specify *Y* if you want to replace all the worker's ID information with the information provided in the input file.

## Common Issues and Errors

Issue	Cause and Solution
The EIB completes successfully but entries don't load or update.	<p>Check these:</p> <ul style="list-style-type: none"> <li>Check if any row is missing a Row ID value. If a row ID is missing, Workday ignores any information you provide in that section.</li> <li>Ensure that the business process isn't still in progress. Check the Business Processes tab on the EIB integration event to verify if the EIB successfully completes.</li> </ul>
<i>Workday displays this error when you delete IDs: Processing error occurred. Duplicate insert within same transaction: ADD of relationship...</i>	This occurs when the Replace All field isn't populated. To delete entries, set the field to <i>N</i> .

## Business Processes

Edit Government IDs.

### Use Cases and Guidelines for Recovering from a Bad Load

This EIB enables you to add, update, or delete government IDs for a worker.

If you've uploaded incorrect entries, you can use either the Mass Cancel Business Processes task (if the event is still in progress) or Mass Rescind Business Processes task (if the event is complete). Both of these tasks are secured to the *Business Process Administrator* domain in the System functional area. You can then select Business Processes Loaded by EIB to find the integration event that you want to cancel or rescind. Alternatively, you can enter *Edit Government IDs* in the Business Process Types prompt and enter the date range that corresponds to when you ran the EIB.

For reference documentation for all web services including Change Government IDs, see [Operation Directory](#).

### Sample EIB Input File

[Change\\_Government\\_IDs-v39](#)

### Concept: Change Home Contact Information EIB

#### Background

You can use this EIB to add, update, or remove home contact information for a worker.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

See View Dependents > Change Home Contact Information from the related actions of the worker's profile.

There are also similar EIBs that you can use to update contact information. Consider these options as you determine what works best for you:

- Change Emergency Contacts: You can use this EIB to update emergency contact information for a person.

- Change Work Contact Information: You can use this EIB to add or update work contact information for a person.

## EIB Input File Guidelines

We recommend that you:

- Review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- Test this EIB in a nonproduction tenant first to avoid inadvertently removing any contact information that you intended to keep.
  - Consider creating a custom report with the *All Active and Terminated Workers* data source to get the reference IDs and other information for the workers.

Additionally, as you populate the EIB input file, consider:

- Spreadsheet Key: Specify a unique value for each person.
- Person: If you want to specify values for employees, you need to change the reference ID type in cell C4 from *Contingent\_Worker\_ID* to *Employee\_ID*.
- Country\_Code: (Required for phone numbers) You can find a list of reference ID values by running the View Reference IDs report and searching for the *Country Phone Code* business object.
- Complete Phone Number: If you've configured phone validations in the Edit Tenant Setup – Global task, then this field should contain numbers only. Don't include the country code in this field.
- Replace All: Specify *Y* if you want to replace all current entries in Workday (Example: all email address contact entries). If you want to remove an entry and not replace it, specify: *Y* for Replace All, *Y* for Delete and then specify the reference ID for the item you want to remove.

## Common Issues and Errors

Issue	Cause and Solution
There's no option to launch the integration.	This is most likely security-related. Verify you have the correct security configuration. Ensure that you are in the relevant security group and have access to the <i>Home Contact Change</i> business process type in the Contact Information functional area.
The EIB fails with errors such as: <ul style="list-style-type: none"> <li>• <i>Address Line 1 is not valid for this Country.</i></li> <li>• <i>Postal Code is not a valid address component for certain countries.</i></li> <li>• <i>Municipality is not a valid address component for certain countries.</i></li> </ul>	These types of errors usually occur when the EIB can't identify the country. <ul style="list-style-type: none"> <li>• Check for any missing Row ID values. Ensure that you specify a row ID in the section of the input file where you populate the country.</li> <li>• Ensure that you populate the country value.</li> </ul>
Receive this error when attempting to delete an email: <i>E1: Email Reference is required.</i>	Ensure that you: <ul style="list-style-type: none"> <li>• Don't specify the existing email address (you don't need this when you delete an email).</li> <li>• Specify the email ID you wanted to delete.</li> </ul>
EIB fails with Error:  <i>Validation error occurred. Contact Change Events that change an Address must be done in order. To submit an event that changes an address with an earlier effective</i>	This can occur if: <ul style="list-style-type: none"> <li>• There's an existing contact event for the worker with an effective date that's after the date specified in the EIB input file.</li> </ul>

Issue	Cause and Solution
<p><i>date, you must rescind any Contact Change Events that change an address with a later effective date.</i></p>	<ul style="list-style-type: none"> <li>• The EIB input file doesn't specify an event effective date.</li> </ul> <p>To resolve this:</p> <ol style="list-style-type: none"> <li>1. Verify that you've populated the Event Effective Date in the EIB input file.</li> <li>2. If there are still issues, check the worker history for one of the workers where the error is occurring and verify that there are no contact dates with an effective date after the date you specify in the EIB input file.</li> </ol>

## Business Processes

Home Contact Change.

### Use Cases and Guidelines for Recovering from a Bad Load

This EIB enables you to add, update, and delete home contact information for a worker.

If you've uploaded incorrect entries, you can use either the Mass Cancel Business Processes task (if the event is still in progress) or Mass Rescind Business Processes task (if the event is complete). Both of these tasks are secured to the *Business Process Administrator* domain in the System functional area. You can then select Business Processes Loaded by EIB to find the integration event that you want to cancel or rescind. Alternatively, you can enter *Home Contact Change* in the Business Process Types prompt and enter the date range that corresponds to when you ran the EIB.

For reference documentation for all web services including Change Home Contact Information, see [Operation Directory](#).

### Sample EIB Input Files

[Change\\_Home\\_Contact\\_Information-WD32](#)

### Concept: Change Licenses EIB

#### Background

You can use this EIB to add, update, or delete licenses for a worker.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

See Personal Data -> Edit Licenses on the related actions menu of the worker's profile.

For similar EIBs, see:

- Change Other IDs
- Change Government IDs

### EIB Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:

- Spreadsheet Key: Specify a unique value for each person.

- Person: Change the reference id type in cell C4 from *Academic\_Affiliate\_ID* to *Employee\_ID*.
- Replace All: If you want to replace all of the worker's existing licenses with the values in the EIB input file, specify *Y* in this field.
- Row ID: Specify *1* for each entry, unless you have multiple row entries for the same person. For multiple row entries, increment the row ID sequentially.
  - Example: If a person has 2 row entries, specify *1* for the first row ID and *2* for the second row ID.
- Delete: If you want to delete a specific license for a worker, specify *Y* in this field.
- ID: Specify the license ID value.
- ID Type: Change the reference id type in cell J4 from *I9\_License\_Identifier\_Type\_Code* to *License\_ID\_Type\_ID*. You can find a list of reference ID values by running the Integration IDs report and searching for the *License ID Type* business object.
- License ID Shared: If you want to update or delete a license, specify the reference id of the license in this field.

## Common Issues and Errors

Issue	Cause and Solution
The EIB completes successfully but the licenses weren't changed.	<p>This can occur if the information in the EIB input file doesn't align with the steps in your <i>Edit Licenses</i> business process definition in Workday.</p> <ol style="list-style-type: none"> <li>1. Run the Mass Cancel Business Processes task (secured to the <i>Business Process Administrator</i> domain in the System functional area) to cancel any in progress <i>Edit Licenses</i> events.</li> <li>2. Update the information in your EIB input file to align with the steps in your <i>Edit Licenses</i> business process definition.</li> <li>3. (Optional) In Workday, consider updating the business process definition by:           <ul style="list-style-type: none"> <li>• Marking any unnecessary steps as optional and then setting the processing instructions in the EIB input file to <i>Skip Processing</i> for optional steps.</li> <li>• Adding condition rules on steps to skip them in the business process if needed. Example: Add a condition rule where External Load = N.</li> </ul> </li> <li>4. Rerun the EIB.</li> </ol> <p>You can use the Business Processes tab in the EIB integration event to view and identify the business processes that are still in progress.</p>
The EIB completes successfully, but there's no Edit License event.	<p>The EIB automatically detects duplicates if the Replace All field is set to N.</p> <p>If you attempt to add or update a license to match an existing license in Workday, the EIB automatically ignores the entry as a duplicate.</p>

Issue	Cause and Solution
<p>When attempting to remove a license, the EIB fails with an error like this:</p> <pre data-bbox="230 291 850 648"><i>Processing error occurred. Duplicate insert within same transaction: ADD of relationship=Global_Identifier_Event.change_to_Global IS (3\$2407), target=464\$621 within instance=4645\$38 with changeInfo=Chg: 70368744167663 Txn: 4294957295 entryDate: 2020-04-09T16:44:17.803 XpressO Call Stack Trace= 83\$12:464\$621, 371\$13198, 82\$22940:464\$621, 54\$29945:4645\$38, 371\$48428, 82\$22378:4645\$38, 54\$29944:4645\$38, 371\$48427, 82\$22377:4645\$38, 54\$29941:4645\$38, 371\$48422, 82\$22375:4645\$38, 2996\$3438</i></pre>	<p>Ensure that the Replace All field in the EIB input file is set to N.</p>

## Business Processes

Edit Licenses.

### Use Cases and Guidelines for Recovering from a Bad Load

This EIB enables you to add, update, or delete licenses for a worker.

If you've uploaded incorrect entries, you can use either the Mass Cancel Business Processes task (if the event is still in progress) or Mass Rescind Business Processes task (if the event is complete). Both of these tasks are secured to the *Business Process Administrator* domain in the System functional area. You can then select Business Processes Loaded by EIB to find the integration event that you want to cancel or rescind. Alternatively, you can enter *Edit Licenses* in the Business Process Types prompt and enter the date range that corresponds to when you ran the EIB.

For reference documentation for all web services including Change Licenses, see [Operation Directory](#).

### Sample EIB Input File

[Change\\_Licenses-WD32](#)

### Concept: Change Other IDs EIB

#### Background

You can use this EIB to add, update, or remove Other IDs for a person.

You can use Other IDs to store ID information from a third-party system for a worker.

This EIB is intended for static IDs. Avoid storing dynamic values that change frequently as this will cause performance degradation over time.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Edit IDs.
- On the related actions menu of the worker profile, select Personal Data > Edit Other IDs.

There are also similar EIBs that you can use to update IDs. Consider these options as you determine what works best for you:

- Change Government IDs: You can use this EIB to update government IDs and national IDs for a person.
- Change Licenses: You can use this EIB to update licenses for a person.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Edit Other IDs* business process type in the Personal Data functional area to run this EIB.
  - If you want to generate the spreadsheet with data, you must also access to the *Person Data: ID Information* domain in the Personal Data functional area.

### Guidelines for Modifying the EIB Template

You can modify your EIB template to change the person type.

1. From related actions of your EIB, select Template Model > View.
  - a. Select All in the left window pane.
  - b. Select the magnifying glass next to Person.
  - c. On the related actions menu of the magnifying glass, select Template Model Column > Edit Details.
  - d. On the Reference ID Type field, specify the person type you would like to use for the EIB.
    - Example: *Employee ID*.

See [Customize EIB Spreadsheet Template](#) on page 48.

### Additional Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56,

which provides a general overview for populating EIB files.

To prevent data loss, we recommend that you generate your spreadsheet with data for the Change Other IDs EIB. See: [Example: Generate EIB Spreadsheet Template with Data](#) on page 64.

As you populate these fields in the EIB input file, consider:

- Spreadsheet Key: Specify a unique value for each person.
- Person: Specify the reference ID of the person whose other ID that you're updating. Ensure that you specify the correct reference ID type in cell C4 of the EIB input file.
  - Example: For employees, specify Employee\_ID as the reference ID type in cell C4 of the EIB input file.
- Replace All: Consider:
  - If you don't want to replace all existing other IDs for the person, set this field to *N*. The default value is *Y*.
  - If you want to replace all existing other ID values for the person, then set this field to *Y* and populate the new values in the Custom ID Data section.
  - If you want to remove all existing other ID values for the person and not add any new IDs, then set this field to *Y* and leave the Custom ID Data section blank.
- Row ID: Specify a unique value for each ID that you're assigning to a person.
- Delete: Specify *Y* if you want to remove an ID. If you want to delete an ID (but not all IDs), you must also set the Replace All field to *N*. If you want to remove all existing other ID values for the person and not add any new IDs, then set the Replace All field to *Y* and leave the Custom ID Data section blank.
- Custom ID: Leave blank.
- ID: Specify the value for the ID that you're adding or updating (if you're removing an ID, leave blank).
- ID Type: Specify the reference ID value of the ID type. You can find a list of reference ID values by running the View Reference IDs report and searching for the *Custom ID Type* business object.
- Organization ID: (Optional) Specify a reference ID of the organization that issued the ID.

- Custom Description: (Optional) You can use this field to add a description of the ID.
- Custom ID Shared: If you're updating or removing an ID, this field is required. You can create a custom report to get the values you need for this field in the spreadsheet. Consider creating a custom report with the *Indexed All Workers* data source to get the custom shared IDs.

## Common Issues and Errors

Issue	Cause and Solution
The EIB completes successfully but there are no IDs added or updated.	<p>Check these:</p> <ul style="list-style-type: none"> <li>• Check if there are any <i>Edit Other IDs</i> business process events that are still in progress. This can happen if you don't specify automatic processing for the processing instructions in the EIB input file.</li> <li>• Ensure that you've specified a row ID for each row in the EIB input file.</li> <li>• Ensure that you haven't run the EIB in validate-only mode.</li> </ul>
<p>When deleting IDs, this error is issued: <i>A processing error occurred. Duplicate insert within same transaction: ADD of relationship.</i></p>	<p>This can happen if you leave the Replace All field blank. Ensure that you populate the Replace All field with either <i>Y</i> or <i>N</i> when you delete entries.</p>
There are duplicate IDs after loading the EIB input file.	<p>This can happen if you update existing IDs but don't specify the reference ID value of the IDs in the Custom ID Shared field in the EIB input file. To fix this problem:</p> <ol style="list-style-type: none"> <li>1. Remove the duplicate entries.</li> <li>2. Update the EIB input file to include the reference ID values.</li> <li>3. Rerun the EIB.</li> </ol>
<p>EIB issues this error: <i>Validation error occurred. Custom Identifier with reference is marked for deletion. Custom ID Data shouldn't be included.</i></p>	<p>This can happen if you attempt to remove an ID but have incorrectly populated the Custom ID Data section of the EIB input file. To fix the problem:</p> <ol style="list-style-type: none"> <li>1. Populate the reference ID value in the Custom ID Shared field.</li> <li>2. Leave the other fields in the Custom ID Data section blank.</li> <li>3. Rerun the EIB.</li> </ol>
<p>EIB issues this error: <i>The entered information doesn't meet the restrictions defined for this field. (Person_Reference)</i></p>	<p>This EIB doesn't support all person types. Ensure that you populate the Person field with a reference ID type that this EIB supports. Examples: <i>Employee_ID</i> or <i>Contingent_Worker_ID</i>.</p>

Issue	Cause and Solution
Error when generating template with datE	Ensure that you have access to the <i>Person Data: ID Information</i> domain in the Personal Data functional area.
Unable to launch the EIB.	This is most likely security-related. Verify you have the correct security configuration. Ensure that you are in the relevant security group and have access to the <i>Edit Other IDs</i> business process type in the Personal Data functional area.
EIB performs slowly.	This EIB is intended for static IDs. Avoid storing dynamic values that change frequently as this will cause performance degradation over time.

## Business Processes

Edit Other IDs.

### Use Cases and Guidelines for Recovering from a Bad Load

This EIB enables you to add, update, or delete other ID values for a person. If you've uploaded incorrect entries, you can:

- Option 1: Use either the Mass Cancel Business Processes task (if the event is still in progress) or Mass Rescind Business Processes task (if the event is complete). Both of these tasks are secured to the *Business Process Administrator* domain in the System functional area. You can then select Business Processes Loaded by EIB to find the integration event that you want to cancel or rescind. Alternatively, you can enter *Edit Other IDs* in the Business Process Types prompt and enter the date range that corresponds to when you ran the EIB.
- Option 2: You can delete the IDs using the Delete field in the EIB input file.

For reference documentation for all web services including Change Other IDs, see [Operation Directory](#).

### Sample EIB Input File

[Change\\_Other\\_IDs-WD35](#)

### Concept: Change Work Contact Information EIB

#### Background

You can use this EIB to add, update, or remove work contact information.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

See Personal Data > Change Work Contact Information from the related actions of the worker's profile.

There are also similar EIBs that you can use to update contact information. Consider these options as you determine what works best for you:

- Change Home Contact Information: You can use this EIB to add or update home contact information.
- Change Emergency Contacts: You can use this EIB to update emergency contact information.

- Change Institutional Contact Information: You can use this EIB to add or update institutional contact information.
- Import Change Work Contact Information: You can use this EIB to upload large amounts of contact information (Example: 1000 or more entries).

## EIB Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:

- Spreadsheet Key: Specify a unique value for each person.
- Person: If you want to specify values for employees, you need to change the reference ID type in cell C4 from *Contingent\_Worker\_ID* to *Employee\_ID*.
- Country\_Code: (Required for phone numbers) You can find a list of reference ID values by running the View Reference IDs report and searching for the *Country Phone Code* business object.
- Complete Phone Number: If you've configured phone validations in the Edit Tenant Setup – Global task, then this field should contain numbers only. Don't include the country code in this field.
- If you want to update or remove contact information, consider creating a custom report with the *All Active and Terminated Workers* data source to help find information to populate the EIB input file.
- If you want to remove contact information entries, consider these 2 approaches. We recommend that you test this EIB in a nonproduction tenant first to avoid inadvertently removing any contact information that you intended to keep:
  1. If you want to remove an entry and don't want to replace it with another entry:
    - Set the Replace all field to *N*.
    - Set the Delete field to *Y*.
    - Specify the reference ID for the item that you want to remove.
  2. If you want to remove all the entries (such as all entries for email) and replace them with another entry, set the Replace all field to *Y*. In this scenario, you don't need to specify the reference IDs of items you want to delete.

## Common Issues and Errors

Issue	Cause and Solution
There's no option to launch the integration.	This is most likely security-related. Verify you have the correct security configuration. Ensure that you are in the relevant security group and have access to the <i>Work Contact Change</i> business process type in the Contact Information functional area.
Receive this error when attempting to delete an email <i>E1: Email Reference is required when you delete an email address</i> .	Ensure that you specify the email ID that you want to delete. You don't need to specify the existing email address, just the email ID.
EIB fails with error:  <i>Validation error occurred. Contact Change Events that change an Address must be done in order. To submit an event that changes an address with an earlier effective date, you must rescind any Contact Change Events that change an address with a later effective date.</i>	This can occur if either: <ul style="list-style-type: none"> <li>• There's an existing contact event for the worker with an effective date that is after the date specified in the EIB input file.</li> <li>• There's no event effective date specified in the EIB input file.</li> </ul> To resolve this:

Issue	Cause and Solution
	<ul style="list-style-type: none"> <li>Populate the Event Effective Date field in the EIB input file.</li> <li>If there are still issues, check the worker history for one of the workers where the error is occurring. Verify that there are no contact dates with an effective date that's after the date you specify in the EIB input file</li> </ul>
<p>EIB fails with error:</p> <p><i>Validation error occurred. Address Reference must match an existing (and not deleted) address in use by the person subject of this request.</i></p>	<p>This can occur if the worker shares their home address with a dependent and the dependents have been removed. We recommend manually updating the address.</p>

## Business Processes

Work Contact Change.

## Use Cases and Guidelines for Recovering from a Bad Load

This EIB enables you to add, update, or remove work contact information.

If you've uploaded incorrect entries, you can use either the Mass Cancel Business Processes task (if the event is still in progress) or Mass Rescind Business Processes task (if the event is complete). Both of these tasks are secured to the *Business Process Administrator* domain in the System functional area. You can then select Business Processes Loaded by EIB to find the integration event that you want to cancel or rescind.

For reference documentation for all web services including Change Work Contact Information, see [Operation Directory](#).

## Sample EIB Input File

[Change\\_Work\\_Contact\\_Information-v38](#)

## Concept: Create Position EIB

### Background

You can use this EIB to create a position for a supervisory organization using the position management staffing model.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

## Equivalent Workday Task

Task: Create Position.

There are also similar EIBs that you can use for positions. Consider these options as you determine what works best for you:

- Change Job: You can use this EIB to perform a job change on an employee or contingent worker.
- Create Job Requisition: You can use this EIB to create new job requisitions for a position.
- Edit Position: You can use this EIB to edit a filled position.
- Hire Employee: You can use this EIB to hire a pre-hire (new or existing) into an employee position.

- Import Create Position: You can use this EIB to load large volumes of positions (Example: 1000 or more). If you need to load large volumes of positions, consider testing in your sandbox tenant to determine which EIB performs better for your use case.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  - From the related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Create Position* business process type in the Staffing functional area to run this EIB.

### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- You can find it helpful to start by manually creating a position similar to the type of positions you want to load using the EIB. By manually creating a position, you can verify which fields Workday requires. This method can also be helpful when populating reference ID values in the input file. You can view the reference ID values from the related actions of the position that you manually created.
- Make certain that the steps in the *Create Position* business process definition align to what you're populating in the EIB input file. Example: if the *Create Position* business process includes an *Assign Pay Group* step, then you need to complete 1 of these actions:
  - If you wish to update the pay group field, then populate the pay group information in the EIB input file.
  - If you don't want to update the pay group field, then you can add a condition rule to skip the step in the

*Create Position* business process definition.

- Example: you can add a condition rule with *N* for External Load.
- Or you can edit the *Create Position* business process definition and mark the step as *Optional*. Then in the EIB input file, set the processing instructions to *Skip Processing when Step is marked optional*.
  - Example: if you're populating Organization in the EIB input file, then the *Create Position* business process definition needs to have a *Change Organization Assignments* step.
- You'll need to go through the above check points for each step in the *Create Position* business process definition. If the business process definition and the EIB input file don't align, Workday sometimes doesn't load information and the *Create Position* event displays as in progress, after you complete the EIB load.
- Overview worksheet in the EIB Input File
  1. For sections where you want to load data and have it automatically processed by the EIB:
    - Set processing instructions to *Automatic Processing*.
    - Populate all required data in the corresponding worksheets.
  2. For sections that you aren't using:
    - Set processing instructions to *Skip Processing when Step is marked Optional*.
    - Edit the *Create Position* business process definition and you can either mark the corresponding step as *Optional* or else add a condition rule to the step such as *External Load is not blank*.
  3. Notifications: Note that the EIB doesn't submit notifications when using processing instructions *Automatic Processing*. Also, the EIB skips To Do steps, Approval, and review steps.

- Create Position worksheet in the EIB Input File
  - Spreadsheet Key: Specify a unique value for each position that you're creating.
  - Supervisory Organization (Required): Enter the reference ID for the supervisory organization. To find the values, you can run the *View Reference IDs* report for business object *Supervisory Organization*. Or create a custom report using a data source such as *Supervisory Organizations*.
  - Position Request Reason: If you wish to populate a reason, you can find the reference ID values by running the *View Reference IDs* report for business object *General Event Subcategory*. Then filter the business object instance column by a value such as *create position* to find the relevant values.
  - Position ID: Enter a value if you wish to assign a position ID. If you leave the field blank, the web service will autoassign a position ID.
  - Job Posting Title (Required): Value used in the job posting for this position opening.
  - Job Description Summary: If left empty, the value populates from the job profile assuming a job profile populates in the EIB input file and that the job profile *job description summary* has a value.
  - Job Description: If left empty, the value populates from the job profile assuming a job profile populates in the EIB input file and that the job profile *job description* has a value. (Optional) You can use html markup if desired.
  - Critical Job: This field is a boolean value, so select *Y* or *N* from the drop-down menu.
  - Difficulty to Fill: To find reference id values, run the *View Reference IDs*

report for the business object *Difficulty to Fill*.

- Enter a separate row for each of these sections:
  - Responsibility
  - Work Experience
  - Education
  - Language
  - Competency
  - Certification
  - Training
  - Skill
- Availability Date: Date the job opening is available. Defaults to current date if left empty. Use format YYYY-MM-DD
- Earliest Hire Date: Earliest date that a worker can be hired or contracted into the opening. Defaults to current date if left blank. Use format YYYY-MM-DD
- Job Family: To find the reference ID values, you can run the *View Reference IDs* report for business object *Job Family*. If you use this field, you'll need to change the reference ID type (cell BH4) from *Job\_Family\_Group\_ID* to *Job\_Family\_ID*.
- Job Profile: To find the reference ID values, you can run the *View Reference IDs* report for business object *Job Profile*.
- Location: To find the reference ID values, you can run the *View Reference IDs* report for business object *Location*.
- Worker Type: To find the reference ID values, you can run the *Integration IDs* report for business object *Worker Type*.
- Time Type: To find the reference ID values, you can run the *View Reference IDs* report for business object *Position Time Type*.
- Position Worker Type: To find the reference ID values for an employee, run the *View Reference IDs* report for business object *Employee Type*. To find the reference ID values for a contingent worker, run the *View Reference IDs* report for business object *Contingent Worker Type*. Also, you'll need to change the value in cell BM4 to either *Employee\_Type\_ID* or *Contingent\_Worker\_Type\_ID* depending on the reference ID value you're using.

- Edit Assign Organization worksheet in the EIB Input File
  - If you've configured the supervisory organizations to use default organization values, then those organizations will automatically default into the position. In this case, you don't have to populate the organization in the EIB input file, and you can skip the organization step in your *Create Position* business process. To add additional organization assignments to the positions, include both the default organization values and any additional organizations that you wish to assign.
- Request Default Compensation worksheet in the EIB Input File
  - Refer to the Example 2 attachment if you wish to default compensation values for the position. If you populate a compensation package that includes plans for bonuses, allowances, and so on, that the position is eligible for. It's not necessary to populate these plans in the EIB input file. Workday populates these plans automatically in the position as noted in [FAQ: Compensation Defaulting](#).
- Assign Pay Group worksheet in the EIB Input File
  - Refer to the Example 2 attachment for examples.

## Common Issues and Errors

Issue	Cause and Solution
Although the EIB completes successfully, it appears that the EIB didn't load any data.	<p>Most likely the business process events are still in Progress because the steps didn't complete. This issue is due to the EIB input file and business process definition being out of alignment. Refer to instructions in the Tips section on how to get the business process definition and input file aligned.</p> <p>To recover, you can run Mass Cancel Business Processes to cancel the In Progress change job events. Then correct the problem, and run the EIB again.</p> <p>Also, note that there's <i>Business Processes</i> tab that displays in the EIB integration event, after the EIB successfully completes. This tab enables you to view all business process events that the EIB loaded. From here, you can determine whether the events completed or are still in progress. You</p>

Issue	Cause and Solution
	can take a closer look at any of the job changes from the related action of the event.
<p>EIB issues an error like this:</p> <p><i>At least one of the Custom organization types is required based on the position assignment details settings but has no entries.</i></p>	<p>This issue occurs if there are custom organizations required for the position. Perform these steps to determine which organizations the position required:</p> <ol style="list-style-type: none"> <li>1. Access the Maintain Organization Types task</li> <li>2. Go to the Custom tab.</li> <li>3. Go to column Position Assignment Required and filter by Value=Yes</li> </ol> <p>Workday displays all custom organization types required when creating position</p> <p>For all custom organization types returned in above list, perform one of these actions:</p> <ul style="list-style-type: none"> <li>• Include the organization in the EIB input file</li> <li>• Edit the supervisory organization for the position and add the custom organization as a default organization</li> </ul>
Unable to launch the EIB	<p>This issue is most likely security-related. When running the Report View Security for Securable Item for securable item <i>Create Position (Web Service)</i>, you'll see that you need access to the <i>Create Position</i> business process security policy. To change the security, complete these steps:</p> <ol style="list-style-type: none"> <li>1. Edit the business process security policy for <i>Create Position</i>.</li> <li>2. Access the section for Initiating Action <i>Create Position (Web Service)</i>.</li> <li>3. Confirm you have access. Ideally you should have access through an unconstrained security group so that you can load positions for any worker.</li> <li>4. Activate the security change.</li> </ol>

## Business Processes

Create Position.

### Use Cases and Guidelines for Recovering from a Bad Load

This web service enables you to add new positions.

If you need to edit the positions, use Edit Position web service.

If you've inadvertently uploaded incorrect positions, use Mass Rescind or Mass Cancel. What you use depends on whether the business process event is complete or is still in progress. You can then select Business Processes Loaded by EIB to find the integration event that you want to cancel or rescind. Your other option is to enter *Create Position* at the Business Process Types prompt and enter the date range that you ran the EIB.

For reference documentation for all web services including Create Position, see [Operation Directory](#).

## Sample EIB Input Files

[Create\\_Position-WD35-Example1](#)

[Create\\_Position-WD35-Example2](#)

## Concept: Inactivate Organization EIB

### Background

You can use this EIB to deactivate an organization.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

See Reorganization > Inactivate Organization from the related actions of the organization.

### EIB Input File Guidelines

#### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Manage Organization Update Integration* domain in the Organizations and Roles functional area.

#### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:
  - Spreadsheet Key: Use a unique value for each organization.
  - System ID and ID:
    - This is an older web service that isn't yet using reference IDs. For this reason, you must specify the Workday ID (WID) of the organization that you want to deactivate. Note that the System ID should always have a value of WD-WID and the ID contains

the Workday ID (WID) for the organization you're inactivating.

- You might want to create a custom report to get a list of the organizations along with their Workday ID. The data source that you use for your custom report will depend on the types of organizations you're inactivating. Example: if you're inactivating custom organizations, use data source Custom Organizations. And if inactivating supervisory organizations, you would use data source Supervisory Organizations. There's also data source Cost Centers, and so on.
- Keep in Hierarchy: A Y or N value to indicate whether the organization should stay within its hierarchy. If you remove the organization from the hierarchy, it could affect role-based access if someone has role-based access to the superior organization and all subordinates.
- Organization for Subordinates: If the organization you're inactivating has active subordinate organizations, the EIB moves subordinates to the superior organization. If you want them to move to another organization, specify its Workday ID (WID) in this field.

## Common Issues and Errors

Issue	Cause and Solution
<p>The EIB issues these 3 errors:</p> <ul style="list-style-type: none"> <li>• <i>Organization is inactive as of entered effective date so it cannot be inactivated.</i></li> <li>• <i>Organization has events in progress, so it cannot be inactivated.</i></li> <li>• <i>Organization Reference Integration ID does not exist!</i></li> </ul>	<p>One cause of these errors is specifying the wrong Workday ID in the input file. If the EIB input file contains an ID that the integration doesn't recognize, it assumes that the organization must not be effective yet or is in progress.</p>
<p>The EIB issues error:</p> <p><i>Organization has events in progress, so it cannot be inactivated.</i></p>	<p>There are multiple causes for this error including:</p> <ul style="list-style-type: none"> <li>• There are indeed positions associated with the organization that you're inactivating. Try to manually deactivate the organization to confirm this is an issue.</li> </ul>

Issue	Cause and Solution
	<ul style="list-style-type: none"> <li>It could occur if you specify an older effective date and made changes to the organization after that effective date.</li> <li>If you don't specify the Workday ID in the input file, or specify the wrong ID, this error will occur.</li> </ul>

## Business Processes

Activation.

### Use Cases and Guidelines for Recovering from a Bad Load

If you inactivated the wrong organizations, you can mass rescind the business process (the business process is called Activation), however the role assignments and the superior organization don't get restored. So, you would need to either manually reassign the superior organization and role assignments, or else use other web services such as add update organization and assign roles.

You normally can't make updates using this EIB after the inactivating the organization. So, if you need to change something, the best bet is to rescind the event and start over.

For reference documentation for all web services including Inactivate Organization, see [Operation Directory](#).

### Sample EIB Input File

[Inactivate\\_Organization-WD30](#)

### Concept: Put Assign User-Based Security Group EIB

#### Background

You can use this EIB to assign Workday accounts to user-based security groups.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

Any information that you submit with this EIB replaces and overwrites the information currently in Workday.

To avoid data loss, include all existing users and any new users you want to add for a security group in your EIB input file.

#### Equivalent Workday Task

Task: Assign Users to User-Based Security Group.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  - From the related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *User-Based Security Group Administration* domain in the System functional area to run this EIB.

### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:
- For versions older than v41.2, this EIB can REPLACE ALL. To avoid issues with the REPLACE ALL functionality, we recommend to:
  - Thoroughly test in a nonproduction tenant first. And even when testing in a nonproduction tenant, you must be careful because if you don't properly populate the EIB input file, you could inadvertently remove your access from security groups, and subsequently lose access to some functionality within the tenant. When you run an initial test, avoid updating assignments for a powerful security group such as Security Administrator, just in case something goes wrong.
  - Use the *Generate spreadsheet with data option*.
  - It's easy to get this EIB mixed up with the other EIB that assigns security groups to a user (such as *Put User-Based Security Group Assignments*). Before you run the EIB, check the EIB input file and make certain you're running the correct EIB (cell A1 in the EIB input file, should display Assign User Based Security Group). Note that

*Group* is singular whereas it's plural for the other EIB)

- As you populate these fields in the input file, consider:
  - **Spreadsheet Key:** Specify a unique value for each security group specified in the EIB input file. It's important to properly set this value: if you assign different spreadsheet key values for the same security group, the EIB deletes assignments.
  - **User-Based Security Group:** Enter the reference id value of the security group. You can run the *View Reference IDs* report and select business object *User-Based Security Group* to get a list of security groups and reference IDs.
  - **Workday Accounts:** List each Workday account (in a separate row) to assign to the security group.

## Common Issues and Errors

Issue	Cause and Solution
After running the EIB, existing user accounts were removed from the security group.	This functionality is working as expected as the EIB removes all existing user assignments from the security group and replaces the assignments with the entries in the EIB input file. So be sure that you list all user accounts (existing accounts and new accounts you wish to assign) in the EIB input file.
The EIB assigns only the last user account listed in the EIB input file.	Verify that you're using the same spreadsheet key value for each security group specified in the EIB input file. Example: All entries for security group <i>A</i> use spreadsheet key <i>1</i> . And all entries for security group <i>B</i> use spreadsheet key <i>2</i>
When specifying multiple accounts for a security group, it fails with message:  <i>&lt;wd:Message&gt;Element Content Workday_Account_Reference Singular error Assign User-Based Security Groups Data&lt;/wd:Message&gt;</i> .	Verify that you're using the correct web service. You should be using web service <i>Put_Assign_User-Based_Security_Group</i> . Check the EIB input file and make certain that cell A1 displays Assign User Based Security Group. (Note that <i>Group</i> is singular whereas it's plural for the other EIB)  If not, you might want to create a new EIB to insure you have the correct web service.
There's no option to launch the EIB.	This issue is most likely security-related. Report <i>View Security for Securable Items</i> displays that you need <i>Put</i> access to domain security policy <i>User-Based Security Group Administration</i> to access the web service. So you'll need to: <ul style="list-style-type: none"> <li>• Edit the domain security policy for domain <i>User-Based Security Group Administration</i>.</li> </ul>

Issue	Cause and Solution
	<ul style="list-style-type: none"> <li>• Make certain you are in a security group that has <i>Put</i> access to this domain.</li> <li>• Activate the security change.</li> </ul>

## Use Cases and Guidelines for Recovering from a Bad Load

Since the web service doesn't use a business process, there isn't an easy way to recover if you load incorrect entries. An option would be to find another tenant that still has the correct security group assignments. Then use *Generate spreadsheet with data* option in that tenant to build an EIB input file to load to the tenant with the incorrect data.

For reference documentation for all web services including Put Assign User-Based Security Group, see [Operation Directory](#).

### Sample EIB Input File

[Put\\_Assign\\_User-Based\\_Security\\_Group\\_v44.0](#)

## Concept: Put External Disability Self Identification Record EIB

### Background

You can use this EIB to add, delete, or edit external disability self-identification records.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

This EIB is designed to load disability information from outside of Workday. Workday treats the information that you load with this EIB as external data and stores it separately from the information an employee enters in the Change Self-Identification of Disability task.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Worker Self-Identification of Disability - USA* domain in the Personal Data functional area to run this EIB.

### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page

56, which provides a general overview for populating EIB files.

- To prevent data loss, we recommend that you generate your spreadsheet with data for the *Put External Disability Self Identification Record EIB*. See: [Example: Generate EIB Spreadsheet Template with Data](#) on page 64.
- As you populate these fields in the EIB input file, consider:
  - **Spreadsheet Key:** Specify a unique value for each external disability self-identification record.
  - **Delete:** Set to Y if you wish to delete an entry (if deleting an entry, populate only 4 fields: *Spreadsheet Key*, *Delete*, *External Disability Self Identification Record* and *Employee*).
  - **External Disability Self Identification Record:** Populate this field only if removing a self-identification record. You can find values by either generating the spreadsheet with data or by using the *View Reference IDs* report and selecting business object *External Disability Self-Identification Record*.
  - **ID:** Populate this field in for these scenarios:
    - When updating an existing record. You can find values by either generating the spreadsheet with data or by using the *View Reference IDs* report and selecting business object *External Disability Self-Identification Record*.
    - If you're adding a new entry, you can populate a value here if you wish. If you don't populate a value, the web service automatically assigns a value for you.
  - **Employee ID:** Enter the id of the employee.
  - **Disability Status:** Enter the reference id for the Disability Status. To find the reference id values, run the *Integration IDs* report and select business object *Self-Identification of Disability Status*.
  - **Invitation Date:** The invitation date for the External Disability Self-Identification Record. The format is YYYY-MM-DD. If you wish to also

- include the time, use format YYYY-MM-DD00:00:00.000.
- Response Date: The response date for the External Disability Self-Identification Record. The format is YYYY-MM-DD. If you wish to also include the time, use format YYYY-MM-DD00:00:00.000.

To validate the data that you loaded, you might want to run report *Latest Disability Self-Identification Results for Active Employees*.

## Common Issues and Errors

Issue	Cause and Solution
When using the Generate Spreadsheet with Data option, it fails with error: <i>Select a condition rule that matches a business object.</i>	This issue will occur if there aren't any entries for external disability self identification. Load at least 1 entry before using the <i>Generate Spreadsheet with Data</i> option.
Unable to launch the EIB	This issue is most likely security-related. Verify you have security access for the EIB.

## Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add, update, and delete.
- Since this EIB doesn't use a business process, there's no option to rescind or cancel. If you have inadvertently uploaded incorrect entries, we suggest you reload the entries with correct information. If you need to restore the original values, you can
  - Find another tenant such as a sandbox or an implementation tenant that still has the correct information.
  - Then use *Generate Spreadsheet with Data* option in that tenant to build an EIB input file to load into the tenant where information needs corrected.

For reference documentation for all web services including Put External Disability Self Identification Record, see [Operation Directory](#).

## Sample EIB Input File

[Put\\_External\\_Disability\\_Self\\_Identification\\_Record-WD35](#)

## Concept: Put External Form I-9 EIB

### Background

You can use this EIB to load a record of an external form I-9 into Workday.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

Note: Any attachments that you might want to load with this EIB need to be base-64 encoded. This is extremely challenging to do in the input file for this EIB. For this reason, consider creating a custom Studio integration instead.

## Equivalent Workday Task

Task: Manage Form I-9 Assignment for Worker.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Put External Form I-9* business process in the Onboarding functional area to run this EIB.

### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:
- As you populate the EIB input file, consider:
  - Processing Instruction: Make certain the value for this field (in cell C7 of the Overview tab in the EIB input file) is blank. If it isn't blank, you'll receive the message *You can not start another Form I-9 until you have completed your pending/upcoming Form I-9 event* when you update Section 3.
  - Worker: You'll likely need to change the reference ID type in cell D4 from Contingent\_Worker\_ID to Employee\_ID.
  - Form I-9 Reference ID: This field is optional. If you don't specify a reference ID value, Workday will assign one.
  - External Form I-9 Source: Find reference ID values by running the Integration IDs report and searching for business object *External Form I-9 Source*. If you can't find the appropriate values, add External Record Source

options into Workday through the *Maintain Form I-9 Settings* task.

- Citizenship Status: Find reference ID values by running the Integration IDs report and searching business object *Form I-9 Citizenship Status (Workday Owned)*.
- Document Title: There are different reference ID types that you can select. Use the drop-down box in cells CB4, CH4, CM4, CS4, and CY4 to view reference ID types you can use. If you're using more than 1 reference ID type, it might be easier to populate the Workday ID (also known as WID) value. The other method is to edit the EIB template and configure the Separate Type Column option, so you can populate the values for the reference ID types in the EIB input file, instead of using the WID values. Below are instructions for populating the Workday ID/WID:

1. Find the WID value from the above report for the documents that you want to use and paste into the EIB input file.
2. Run the Integration IDs report and enter these 4 business objects:
  - a. National ID Type
  - b. Form I-9 License ID Type (Workday Owned)
  - c. Form I-9 Passport ID Type (Workday Owned)
  - d. Form I-9 Government ID Type (Workday Owned)
3. Change cells CB4, CH4, CM4, CS4, and CY4 to value WID.
- File Attachments: See *Populating File Attachments for the EIB Input File* section for more details.
- After loading the file, you can verify the entries loaded by using 1 of these options:
  - Run the *Form I-9 Process Status* report to see how many External Records loaded in the last week. If you hover over the number, you can see the list of forms and who they were for.
  - Run the *Form I-9 Internal Audits* report to view the loaded entries. You'll want to filter the *Latest Form I-9* column

- for any entries containing the string External.
- Run the report *View Form I-9 for Worker*.

## Common Issues and Errors

Issue	Cause and Solution
Unable to launch the EIB	<p>You can:</p> <ol style="list-style-type: none"> <li>Edit Business Process Security Policy for <i>Complete Form I-9</i>.</li> <li>Add the appropriate security groups to the Initiating Action Change External Form I-9 (Web Service).</li> <li>Activate the change.</li> </ol>
<p>The EIB issues this error:</p> <p><i>Processing error occurred. Duplicate insert on index: Form I-9-ID-Form I-9 Reference ID (95\$5262), value: Ext_Form_21001, new instance: id=6241\$325 wid=0184898ffffb601f223064ef82c009b02 disp=6241\$325, existing: id=6241\$324 wid=0184898ffffb601cc286bf1122c002e02 disp=6241\$324</i></p>	<p>This issue will occur if you attempt to load 2 external forms with same Form I-9 Reference ID.</p>
Even though the EIB completes successfully, the attachment loaded as a corrupted file.	<p>This issue can occur if the base-64 encoded value you pasted into the EIB input file is greater than 32,767 characters. If there are more characters than this, the encoding is truncated and the file is subsequently corrupted.</p> <p>If you encounter issues with corrupted attachments, see <i>Populating File Attachments in EIB Input File</i> section.</p>
<p>The EIB completes successfully. However, if you attempt to update section 3 after the load, you receive the message:</p> <p><i>You can not start another Form I-9 until you have completed your pending/upcoming Form I-9 event.</i></p>	<p>This issue will occur if you set the processing instruction field to Automatic Processing. To correct the problem, you must:</p> <ol style="list-style-type: none"> <li>Rescind the External Form I-9.</li> <li>Rerun the EIB and leave the processing instructions blank (in cell C7 of the <i>Overview</i> tab in the EIB input file).</li> <li>Retest completing section 3.</li> </ol>
<p>The EIB fails with this error when attempting to load an I-9 with no documents:</p> <p><i>Validation error occurred. Enter at least one document in List A, List B, or List C.</i></p>	<p>At this time, the web service doesn't support the creation of an I-9 without any documents. Workday is evaluating whether to change this functionality, but the current expectation is that you should have a least 1 supporting document for an I-9.</p>

## Business Processes

Complete Form I-9.

## Populating File Attachments for the EIB Input File

- It can be tricky loading documents using EIB for 2 reasons:
  - You need to base-64 encode the documents and then populate the base-64 value in the EIB input file.
  - Excel has a limitation of 32,767 characters per cell. After encoding the document, it needs to be fewer than 32,767 characters.
- For the above reasons, customers often opt to use a custom integration when it's necessary to load attachments. If you have someone at your organization experienced with Workday Studio, a custom integration might be a better option to take.
- If you wish to go forward with using the EIB, try these suggestions for populating attachments:
  - First, you'll need a tool to base-64 encode your file. There are many free tools available to base-64 encode files (such as Notepad++, for which you'll need to install the MIME Tools plug-in).
  - After you encode the document, the size needs to be under 32,767 characters to be able to paste it into Excel. If it's larger, there are a couple options:
    - If the document is an image, you could make it smaller using a third-party tool such as [Image Optimizer](#) (this tool isn't Workday endorsed. Proceed at your own risk).
    - You could edit the EIB input file with a text editor such as Notepad++ (instead of opening it with Excel) and paste in the encoded value. This removes the restriction of 32,767 characters.

## Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new entries only (not update or delete existing entries).
- If you have inadvertently uploaded incorrect entries:
  - Use task Mass Cancel Business Processes or Mass Rescind Business Processes (depending on whether the business process event completed or is in progress).
  - Then select Business Processes Loaded by EIB to find the integration event you wish to cancel or rescind, or enter Complete Form I-9 at the Business Process Types prompt.

For reference documentation for all web services including Put External Form I-9, see [Operation Directory](#).

## Sample EIB Input File

[Put\\_External\\_Form\\_I-9-WD36](#)

## Concept: Put Job Family Group EIB

### Background

You can use this EIB to add or update a job family group. It also adds or removes a group's associated job families. If you want to update the job families directly, consider using a Put Job Family EIB instead.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Create Job Family Group
- Edit Job Family Group

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration
  - You must have access to the *Job Information* domain in the Jobs & Positions functional area to run this EIB.

### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- As you populate the EIB input file, consider:
  - **Spreadsheet Key:** Specify a unique value for each job family group.
  - **Add Only:** Set to Y if only adding new entries.
  - **Job Family Group:** If updating an existing job family group, enter the reference id here. To find reference id values, run the View Reference IDs report and select business object *Job Family*. Note that it will display both job family groups and job families). You could also run a custom report to get this information. Refer to sample report definition below.
  - **ID:** If adding a new job family id, enter the ID value here.
  - **Effective Date:** Effective date of job family group. If you enter a date, use format YYYY-MM-DD. If no value is present, the effective date populates with the current date.
  - **Name:** If adding a new Job Family Group, enter the name. If updating an

- existing Job Family Group, enter name if you wish to change it.
- Inactive: Enter Y to inactivate the job family group.
- Job Family Data section:
  - Row ID (column J): If adding or removing job families from the job family group, enter a unique row id value for each family that you add/remove.
  - Delete: If removing a job family from a job family group, enter Y.
  - Job Family: Enter the reference id of the job family that you're adding or removing. To find reference id values, run the View Reference IDs report and select business object *Job Family*. Note that it will display both job family groups and job families. You could also run a custom report to get this information. Refer to sample report definition below.
- Job Profile Info Data section: This is information only and you can't update it.

## Common Issues and Errors

Issue	Cause and Solution
<p>When attempting to use the <i>Generate Spreadsheet with Data</i> functionality, it fails with this error:</p> <p><i>The entered information does not meet the restrictions defined for this field. (Job_Family_Reference).</i></p>	<p>The Generate Spreadsheet with Data functionality isn't available at this time. Workday is researching this issue (internal ticket HRCORE-55286).</p> <p>In the meantime, use a custom report to help you populate the EIB input file.</p>
Unable to launch the EIB.	<p>This issue is most likely security-related. See the <i>Additional Input File Guidelines</i> section.</p>

## Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new job family groups or update existing job family groups. You can't delete job family groups.
- Since this EIB doesn't use a business process, there's no option to rescind or cancel.
- You can't delete job family groups. So if you accidentally load new job family groups that you don't wish to keep, an option would be to:
  - Update the job family groups using the EIB.
  - Set the Inactive flag to Y.
  - You could also change the job profile group names and precede them with *zDNU* which will drop them to the bottom of the list.

For reference documentation for all web services including Put Job Family Group, see [Operation Directory](#).

## Sample EIB Input File

[Put\\_Job\\_Family\\_Group-WD36](#)

## Concept: Put Job Profile EIB

### Background

Note:

The *Put Job Profile* web service is deprecated starting with v44.0. Workday recommends that you use the *Submit Job Profile* web service instead. You can use this EIB to add or update job profiles. See [Concept: Submit Job Profile EIB](#) on page 265.

If you want to load skills to job profiles, consider using workbooks. See [Mass Update Job Profile Skills with Workbooks](#).

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Create Job Profile
- Edit Job Profile

### EIB Input File Guidelines

#### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration
  - You must have access to the *Job Information* domain in the Jobs & Positions functional area to run this EIB.

#### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- To prevent data loss, we recommend that you generate your spreadsheet with data for the Put Job Profile EIB. See: [Example: Generate EIB Spreadsheet Template with Data](#) on page 64.

- If updating existing job profiles, note that:
  - For many fields, you can use value {empty} if you need to remove an existing value.
  - For the fields where multiple values are possible, such as competencies, the web service generally performs a Replace All. If you're adding, changing, or removing values, you need to populate the EIB input file with the new values as well as any existing values you wish to keep.
- As you populate the EIB input file, consider:
  - Spreadsheet Key: Use a unique value for each job profile.
  - Job Code: Populate the job code if updating an existing job profile
  - Effective Date: Enter the effective date of the change. If field remains blank, it defaults to today's date.
  - Referral Payment Plan: If updating an existing job profile that uses this field, populate existing value in the EIB input file otherwise the EIB input file removes it.
  - Restrict to Country: If updating an existing job profile that uses this field, populate existing value in the EIB input file otherwise the EIB input file removes it.

## Common Issues and Errors

Issue	Cause and Solution
<p>The EIB issues 1 of these errors:</p> <ul style="list-style-type: none"> <li>• <i>Validation error occurred. Element Content 'Location_Context_Reference' is required, on internal element 'Job Profile Exempt Data'.</i></li> <li>• <i>Within relationship' is empty for index 95\$744.</i></li> </ul>	<p>This issue occurs if you don't properly populate the Location Context or ISO 3166 1 Alpha 2 Code. To correct this problem, populate column AL with the ISO_3166-1_Alpha2_Code value and leave column AM blank.</p>
<p>EIB issues this error:</p> <p>Validation error occurred. This Job Title along with one or more Job Families combination is already in the system. Combination of Job Title and Job Family has to be unique in the system.</p>	<p>This error occurs when a job profile name for a job code isn't unique in a job family.</p> <p>You might find it helpful to run report View Reference IDs (select business object <i>Job Profile</i>). Then extract the output to check for duplicate job profile names. In situations where there are identical names, you'll either need to:</p> <ul style="list-style-type: none"> <li>• Change one of the names</li> <li>• Make certain that the job families don't contain duplicate job profiles.</li> </ul>

Issue	Cause and Solution
<p>EIB returns this error when trying to add a new job classification:</p> <p><i>Validation error occurred. The entered information doesn't meet the restrictions defined for this field. (Job_Classifications_Reference).</i></p>	<p>This issue occurs when the effective date on the EIB is before the creation date of the new job classification. Enter an effective date that is on or after the creation date of the new job classification.</p>
<p>Although the EIB successfully completes, it didn't make the updates I specified in the EIB input file.</p>	<p>This issue can occur when updating existing job profiles and specifying an older effective date in the EIB input file. Example: If the existing job profile has an effective date of 9/1/2020 and you then load updates to the job profile and populate an effective date of 8/1/2000, those changes aren't visible if you view the job profile as of 9/1/2020, since they're outdated.</p> <p>To resolve this issue, you need to reload the data with a more recent effective date.</p>
<p>When using the Generate Spreadsheet with Data option, it doesn't generate the template file. And if viewing the template generation job in the process monitor, the error displays: The task submitted isn't authorized.</p>	<p>When running the View Security for Securable Item report and searching for the Put Job Profile web service, it displays that you need Put access to domain security policy Job Information.</p> <p>To fix this problem, complete these steps:</p> <ol style="list-style-type: none"> <li>1. Edit domain Job Information security policy.</li> <li>2. Give Put access to the appropriate security groups.</li> <li>3. Activate the change.</li> </ol>
<p>I'm unable to launch the EIB.</p>	<p>When running report View Security for Securable Item and searching for the Put Job Profile web service, it displays that you need Put access to domain security policy Job Information.</p> <p>To fix this problem, complete these steps:</p> <ol style="list-style-type: none"> <li>1. Edit domain Job Information security policy.</li> <li>2. Give Put access to the appropriate security groups.</li> <li>3. Activate the change.</li> </ol>
<p>I made changes to job classification, competencies, job family, and so on, and loaded the EIB successfully. However, when I use the view job profile off the related actions of the job profile, and select a date before the effective date on my EIB, it has the same information as what I loaded for my effective date. Shouldn't I see what it looked like before my load if I select an effective date that is before the effective date on my EIB?</p>	<p>The job profile currently doesn't take Snapshots of the qualifications at this time.</p>

### Use Cases and Guidelines for Recovering from a Bad Load

This web service enables you to add new entries or update existing entries. You can't delete entries nor can you rescind since there's no business process associated with this web service.

If you have inadvertently uploaded incorrect entries, you can update the entries to make corrections.

You can't delete job profiles. If you have job profiles that you no longer wish to use, you can update them and set the Inactive flag to *Y*. You could also change the name of the job profile and prefix it with DNU.

For reference documentation for all web services including Put Job Profile, see [Operation Directory](#).

## Sample EIB Input File

[Put\\_Job\\_Profile-WD30](#)

## Concept: Submit Job Profile EIB

### Background

You can use this EIB to add or update job profiles.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

If you want to load skills to job profiles, consider using workbooks. See [Mass Update Job Profile Skills with Workbooks](#).

### Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Create Job Profile
- Edit Job Profile

### EIB Input File Guidelines

#### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration
  - You must have access to the *Submit Job Profile* initiating action on the *Manage Job Profile* business process to run this EIB.

#### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- To prevent data loss, we recommend that you generate your spreadsheet with data for the Submit Job Profile EIB. See: [Example](#):

[Generate EIB Spreadsheet Template with Data](#) on page 64.

- If updating existing job profiles, note that:
  - You can leave the field blank if you need to remove an existing value. Workday will default today's date for the Effective Date field.
  - For the fields where multiple values are possible, such as competencies, the web service generally performs a Replace All. If you're adding, changing, or removing values, you need to populate the EIB input file with the new values as well as any existing values you wish to keep.
- As you populate the EIB input file, consider:
  - Spreadsheet Key: Use a unique value for each job profile.
  - Job Code: Populate the job code if updating an existing job profile
  - Effective Date: Enter the effective date of the change. If field remains blank, it defaults to today's date.
  - Referral Payment Plan: If updating an existing job profile that uses this field, populate existing value in the EIB input file otherwise the EIB input file removes it.
  - Restrict to Country: If updating an existing job profile that uses this field, populate existing value in the EIB input file otherwise the EIB input file removes it.

## Common Issues and Errors

Issue	Cause and Solution
<p>The EIB issues 1 of these errors:</p> <ul style="list-style-type: none"> <li>• <i>Validation error occurred. Element Content 'Location_Context_Reference' is required, on internal element 'Job Profile Exempt Data'.</i></li> <li>• <i>Within relationship' is empty for index 95\$744.</i></li> </ul>	<p>This issue occurs if you don't properly populate the Location Context or ISO 3166 1 Alpha 2 Code. To correct this problem, populate column AG with the proper ID Types.</p> <ol style="list-style-type: none"> <li>1. Access the Edit Template Model Area task for <i>Job Profile Exempt Data</i>.</li> <li>2. In the Location Context row, set the Separate Type Column to <i>Yes</i>.</li> <li>3. Use the Get Job Profile web service to retrieve the job profile data.</li> </ol> <p>See <a href="#">Customize EIB Spreadsheet Template</a> on page 48.</p>
EIB issues this error:	This error occurs when a job profile name for a job code isn't unique in a job family.

Issue	Cause and Solution
Validation error occurred. This Job Title along with one or more Job Families combination is already in the system. Combination of Job Title and Job Family has to be unique in the system.	<p>You might find it helpful to run report View Reference IDs (select business object <i>Job Profile</i>). Then extract the output to check for duplicate job profile names. In situations where there are identical names, you'll either need to:</p> <ul style="list-style-type: none"> <li>• Change one of the names</li> <li>• Make certain that the job families don't contain duplicate job profiles.</li> </ul>
<p>EIB returns this error when trying to add a new job classification:</p> <p><i>Validation error occurred. The entered information doesn't meet the restrictions defined for this field. (Job_Classifications_Reference).</i></p>	<p>This issue occurs when the effective date on the EIB is before the creation date of the new job classification. Enter an effective date that is on or after the creation date of the new job classification.</p>
Although the EIB successfully completes, it didn't make the updates I specified in the EIB input file.	<p>This issue can occur when updating existing job profiles and specifying an older effective date in the EIB input file. Example: If the existing job profile has an effective date of 9/1/2020 and you then load updates to the job profile and populate an effective date of 8/1/2000, those changes aren't visible if you view the job profile as of 9/1/2020, since they're outdated.</p> <p>To resolve this issue, you need to reload the data with a more recent effective date.</p>
When using the Generate Spreadsheet with Data option, it doesn't generate the template file. And if viewing the template generation job in the process monitor, the error displays: The task submitted isn't authorized.	<p>When running the View Security for Securable Item report and searching for the Submit Job Profile web service, it displays that you need Put access to domain security policy Job Information.</p> <p>To fix this problem, complete these steps:</p> <ol style="list-style-type: none"> <li>1. Edit domain Job Information security policy.</li> <li>2. Give Put access to the appropriate security groups.</li> <li>3. Activate the change.</li> </ol>
I'm unable to launch the EIB.	<p>When running report View Security for Securable Item and searching for the Submit Job Profile web service, it displays that you need Put access to domain security policy Job Information.</p> <p>To fix this problem, complete these steps:</p> <ol style="list-style-type: none"> <li>1. Edit domain Job Information security policy.</li> <li>2. Give Put access to the appropriate security groups.</li> <li>3. Activate the change.</li> </ol>
I made changes to job classification, competencies, job family, and so on, and loaded the EIB successfully. However, when I use the view job profile off the related actions of the job profile, and select a date before the effective date on my EIB, it has the same information as what I	<p>The job profile currently doesn't take Snapshots of the qualifications at this time.</p>

Issue	Cause and Solution
loaded for my effective date. Shouldn't I see what it looked like before my load if I select an effective date that is before the effective date on my EIB?	

## Use Cases and Guidelines for Recovering from a Bad Load

This web service enables you to add new entries or update existing entries. You can't delete entries nor can you rescind since there's no business process associated with this web service.

If you have inadvertently uploaded incorrect entries, you can update the entries to make corrections.

You can't delete job profiles. If you have job profiles that you no longer wish to use, you can update them and set the Inactive flag to *Y*. You could also change the name of the job profile and prefix it with DNU.

For reference documentation for all web services including Submit Job Profile, see [Operation Directory](#).

### Sample EIB Input File

[Submit\\_Job\\_Profile\\_v44.0.xlsx](#)

### Concept: Put Location EIB

#### Background

You can use this EIB to add or update a location.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Create Location
- Edit Location

### EIB Input File Guidelines

#### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration
  - You must have access to the *Manage: Location* domain in the Organizations and Roles functional area to run this EIB.

## Configure the EIB to Generate with Data

- This EIB has a Generate Spreadsheet with Data option. Always use this option when updating existing locations for these reasons:
  - This web service can remove existing fields if you don't populate values for them in the EIB input file. By generating the spreadsheet template with data, you can reduce the chances that the web service removes fields.
  - By generating the spreadsheet template with data, Workday populates all existing information in the EIB input file. Then you can merely update the EIB input file with the fields you need to change.
- If you're loading new locations, you might want to start by manually creating a location similar to the locations you're loading. Then you can generate the spreadsheet with data to determine how you'll need to build the EIB input file.
- To configure a filter to generate your spreadsheet with data:
  1. From the related actions of your EIB, select Template Model > View.
  2. Click Edit Template with Data Options.
  3. In the Filter section, select the Condition Rule Filter option.
  4. Enter the rule condition.
  5. From the related actions of the EIB, select Template Model > Generate Spreadsheet Template.
  6. Generate the spreadsheet with data.

## Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- To prevent data loss, we recommend that you generate your spreadsheet with data for the Put Location EIB. See: [Example: Generate EIB Spreadsheet Template with Data](#) on page 64.

- Note:

- Effective date must be blank for new locations to be consistent with new locations created in the UI.
- When effective date is blank, the value is effective as of the beginning of time.
- The Effective Date applies to these fields only: Location Name, Inactive, and Location Hierarchy Reference.
- If Location Hierarchy Reference is blank for an existing location, Workday removes location from all location hierarchies it's included in as of the effective date specified.
- If these fields are blank, the web service removes existing values: Altitude, Latitude, Longitude, Trade Name, Worksite Identification Code, Locale, User Language, Location Attribute, Location Type, Time Profile, Time Zone, Superior Location.
- Note: If you're updating an existing location that uses any of these fields, you must populate these fields in the EIB input file to prevent their removal. We recommend that you use the Generate Spreadsheet with Data option if updating existing locations to ensure that the location retains all existing data:

- Location Hierarchy
- Superior Location
- Time Zone
- Time Profile
- Location Type
- Location Attribute
- Trade Name
- Worksite
- Locale
- User Language
- Altitude/Latitude/Longitude

- As you populate these fields in the EIB input file, consider:

- Spreadsheet Key: Specify a unique value for each Location
- Location (column D): If updating an existing location, populate this field with the reference ID value of the location that you wish to update. We recommend that you use the Generate Spreadsheet with Data option if updating existing data. Then copy the

reference ID value in the Location ID column (column E) into this field. You can also find the reference ID value by creating a custom report using a report data source such as *Locations*.

- Location ID (column E): Populate this field in these situations:
  - If you're updating the location: place the reference ID value of the location in this field. Or if you want to change the current reference ID value for the location, place the new reference ID value in this field.
  - If you're creating a new location and you wish to assign the reference ID, place the value in this field. If the field is blank, the web service will automatically assign a reference ID value
- Effective Date: Specifies the Effective Date for updates to these fields only: Location Name, Inactive, and Location Hierarchy Reference. Blank means that these field values will be effective as of the beginning of time. Must be blank for new locations.
- Location Name: (Required)
- Location Usage (required): Enter the Location Usages. Note that if updating an existing location, you must populate all location usages as the web service does a Replace All. To identify the reference ID values for Location Usage, run the *Integration IDs* report and search business object *Location Usage*.
- Inactive: Set this flag to Y to deactivate a location. You might also want to append *zDNU* to the beginning of the location name.
- Trade Name and Worksite ID Code: If you populate these fields, it's also necessary to populate the primary address in the EIB input file.
- Location Hierarchy: You can specify one or more location hierarchies. Always populate this field if updating an existing location that already has a location hierarchy assigned, so that the value remains.
- Defaulted Business Site Address: Select Y for the EIB to ignore the address information, not trigger a

remove/add transaction for the address (which could impact integrations such as PECL). Select N if you want to update the address, with the address information provided in the EIB input file.

## Common Issues and Errors

Issue	Cause and Solution
<p>EIB issues this error when updating the Trade Name and Worksite ID even though the location is US-based:</p> <p><i>Validation error occurred. Worksite ID Code and Trade Name are valid only for Locations based in US</i></p>	<p>The EIB requires that the EIB input file contains the primary address when updating the trade name and worksite ID so that it can validate that the location is still in the US. You might want to use the Generate Spreadsheet with Data option to help populate the address in the EIB input file.</p>
<p>There's no option to launch the integration.</p>	<p>This issue is normally security-related:</p> <ol style="list-style-type: none"> <li>1. Edit the domain security policy for domain: <i>Manage: Location</i></li> <li>2. Make certain you are in a security group that has <i>Put</i> access.</li> <li>3. Activate the Security Change.</li> </ol>
<p>When attempting to generate the spreadsheet with data, it fails with error:</p> <p><i>Processing error occurred. The task submitted is not authorized.</i></p>	<p>This issue is normally security-related:</p> <ol style="list-style-type: none"> <li>1. Edit the domain security policy for domain: <i>Manage: Location</i></li> <li>2. Make certain you are in a security group that has <i>Put</i> access.</li> <li>3. Activate the Security Change.</li> </ol>
<p>I'm unable to populate an External URL value in the EIB input file.</p>	<p>There isn't an option to assign external URLs to locations, through a web service. If you need to do this task, consider:</p> <ul style="list-style-type: none"> <li>• There's a <i>Contact Information</i> section associated with the location, where you can enter web addresses.</li> <li>• There's an EIB called <i>Put External URL</i> that enables you to set up external URLs. However, you would still need to manually assign them to the locations.</li> </ul>
<p>Even though I populated address details in EIB input file, it doesn't load the information.</p>	<p>Verify that field Defaulted Business Site Addressvalue is N in the EIB input file.</p>
<p>EIB issues this error:</p> <p><i>Validation error occurred. Time Profile is required for a location whose usages include Business Site.</i></p>	<p>The EIB requires a Time Profile for locations whose usages include Business Site: note that even if you're updating an existing location, you must still populate the Time Profile in the EIB input file. If updating an existing location, we recommend using the generate with data option to help populate the existing data in the EIB input file.</p>

Issue	Cause and Solution
<p>After updating an existing location, the EIB removes some fields, including:</p> <ul style="list-style-type: none"> <li>• Location Hierarchy</li> <li>• Superior Location</li> <li>• Time Zone</li> <li>• Time Profile</li> <li>• Location Type</li> <li>• Location Attribute</li> <li>• Trade Name</li> <li>• Worksite</li> <li>• Locale</li> <li>• User Language</li> <li>• Altitude</li> <li>• Latitude</li> <li>• Longitude</li> </ul>	<p>When updating an existing location, populate all existing values. If you don't take this action, Workday removes the values.</p> <p>We recommend using the Generate Spreadsheet with Data option when updating existing locations so that you can ensure that all existing data remains.</p>
<p>Slow performance</p>	<p>Loading a large volume of locations with Worksite IDs can negatively impact performance. Workday is in the process of improving performance. In the meantime, if you encounter this issue, remove the worksite ID and rerun the EIB. You can also break the load into multiple files and load them concurrently.</p>

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new locations or update existing locations. You can't delete locations.
- Since this EIB doesn't use a business process, there's no option to rescind or cancel. If you have inadvertently uploaded incorrect entries, we suggest you reload the entries with correct information. If you need to restore the original values:
  - Find another tenant such as a Sandbox or implementation tenant, that still has the correct location information.
  - Use Generate Spreadsheet with Data option in that tenant to build an EIB input file to load into the tenant with incorrect location information.
- You can't delete locations. If you accidentally loaded new locations that you don't wish to keep, you can update the locations and set the Inactive flag to Y. You could also change the location names and precede them with *zDNU*, which would drop them to the bottom of the list.

For reference documentation for all web services including Put Location, see [Operation Directory](#).

### Sample EIB Input File

[Put\\_Location-WD35\\_0](#)

### Concept: Put Supervisory Organization Assignment Restrictions EIB

#### Background

You can use this EIB to update the assignment restrictions for a supervisory organization.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

## Equivalent Workday Task

See Supervisory Organization > Edit Supervisory Organization from the related actions of a supervisory organization.

There are also similar EIBs related to supervisory organizations. Consider these options as you determine what works best for you:

- Add Update Organization: You can use this EIB to add a new organization or update an existing organization.
- Change Organization Assignments: You can use this EIB to assign organizations to worker positions.

You can also perform mass organization changes through:

- Move Workers (Supervisory) task.
- Move Workers (by Organization) task.
- Workbooks: See [Initiate Change Organization Assignments in Mass Action Workbooks](#).
- Org Studio: See [Org Studio and Mass Actions](#).

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Manage: Supervisory Organization* domain in the Organizations and Roles functional area to run this EIB.

### Configure the EIB to Generate with Data

This EIB has a Generate Spreadsheet with Data option, which is very helpful to use when you aren't certain how to populate the input file. To use it:

- You might want to manually add default values and allowed values to one supervisory organization (like the updates you want to make to all the supervisory organizations through the EIB load).
- From the related actions of your EIB, select Template Model > View.
- Click Edit Template Model Sheet.
- Go to the template model area with label *Allowed Organization Data+* and change the reference id type for Allowed Organization\*+.

from *Business Unit ID* to *Organization Reference ID*.

- Go to the template model area with label *Default Organization Data+*, and change the reference id type for Default Organization from *Business Unit ID* to *Organization Reference ID*.
- Click OK then Done.
- Add a filter to your EIB template:
  - From the related actions of your EIB, select Template Model > View.
  - At the bottom of the page, select Edit Template with Data Options.
  - Set filter to Condition Rule Filter.
  - Create a condition rule to get the supervisory organizations you wish to update. Example: you could select *Primary Location in the selection list Chicago*. Or if you want it to extract everything, select *Primary Location not in the selection list Virgin Islands* (or some other location not associated with your supervisory organizations).
  - If you regenerate the template and select the Generate Spreadsheet with Data option, it will contain the supervisory organizations you selected. You can then make your modifications and run the EIB.

#### Additional Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.

#### Common Issues and Errors

Issue	Cause and Solution
The EIB issues an error such as <i>Validation error occurred. Invalid ID value. 'COMPANY-16-292' is not a valid ID value for type = 'Business_Unit_ID'</i>	You need to make certain that your template model is referencing the proper reference id type. Check your EIB input file for any references to <i>Business Unit_ID</i> and replace them to <i>Organization_Reference_ID</i>
No option to launch the EIB	Make certain you have <i>Put</i> access to domain security policy <i>Manage: Supervisory Organization</i>

#### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add, update, and delete entries.
- If you have inadvertently uploaded incorrect entries, you might want to download the original supervisory organization assignments from another tenant (where original entries are still intact) and then load them to production with the *replace all* option

For reference documentation for all web services including Put Supervisory Organization Assignment Restrictions, see [Operation Directory](#).

### Sample EIB Input File

[Put\\_Supervisory\\_Organization\\_Assignment\\_Restrictions-WD32](#)

### Concept: Put User-Based Security Group Assignments EIB

#### Background

You can use this EIB to assign user-based security groups to Workday accounts.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

Any information that you submit with this EIB replaces and overwrites the information currently in Workday.

To avoid data loss, include all existing users and any new users you want to add for a security group in your EIB input file.

#### Equivalent Workday Task

Task: Assign User-Based Security Groups for Person.

#### EIB Input File Guidelines

##### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *User-Based Security Group Administration* domain in the System functional area to run this EIB.

##### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- This EIB can be very dangerous since it does a *replace all*. We recommend you:
  - Make certain that it's truly the EIB that you wish to use. This EIB assigns user-based security groups to selected users. It's similar to the task *Assign User-Based Security Groups for Person*.

There's also another more commonly used EIB, titled *Put Assign User-Based Security Group* that assigns users to a selected user-based security group (similar to the task *Assign Users to User-Based Security Group*).

- Thoroughly test in a nonproduction tenant first. Even when testing in a nonproduction tenant you must be careful. If you don't properly populate the EIB input file, you could inadvertently remove your access from security groups, and subsequently lose access to some functionality within the tenant. When you run an initial test, avoid updating assignments for a super user, just in case something goes wrong.
- Use the Generate Spreadsheet with Data option. See *Configure the EIB to Generate with Data* section.
- It's easy to get this EIB mixed up with the other EIB that assigns users to a security group (*Put Assign User-Based Security Group*). Before you run the EIB, check the EIB input file and make certain you're running the correct EIB (cell A1 in the EIB input file, should display *Assign User Based Security Groups*. Note that *Groups* is plural whereas it's singular for the other EIB)

#### Configure the EIB to Generate with Data

- This EIB has a Generate Spreadsheet with Data option. We strongly recommend you use this option since this is a *replace all* web service. Therefore the Generate Spreadsheet with Data option will be helpful since you can populate the template with all existing security group assignments. To use this option:
  1. From related actions of your EIB, select Template Model > View.
  2. Click Edit Template with Data Options.
  3. Enter a Workday account (Example: lmcneil) in the ID field. Or if you want to extract multiple accounts, then select Condition Rule Filter and add a condition rule. Example: *Account Disabled or Expired is not blank*.
  4. Click OK.
  5. If you regenerate the template and select the Generate Spreadsheet with Data option, you can view all

<p><b>Additional Input File Guidelines</b></p>	<p>existing user-based security group assignments for selected accounts.</p> <ul style="list-style-type: none"> <li>• As you populate these fields in the input file, consider:           <ul style="list-style-type: none"> <li>• <b>Spreadsheet Key:</b> Use a unique value for each Workday account specified in the EIB input file. It's important to properly set this value: if you assign different spreadsheet key values for the same Workday account, you'll lose the assignments.</li> <li>• <b>Workday Account:</b> List the Workday account that you wish to assign security groups to.</li> <li>• <b>User-Based Security Group:</b> Enter the reference id value for each security group that you're assigning. You can run the View Reference IDs report and select business object <i>User-Based Security Group</i> to get a list of security groups and reference ids</li> </ul> </li> </ul>
--	---

## Common Issues and Errors

Issue	Cause and Solution
After running the EIB, the user account is missing security group assignments that they previously had.	This feature is working as expected. The EIB removes all existing security group assignments from the user and replaces the security group assignments with the entries in the EIB input file. Be sure to list all security group assignments (existing assignments and new assignments) in the EIB input file.
The EIB assigns only the last security group listed in the EIB input file.	Verify that you're using the same spreadsheet key value for each user account specified in the EIB input file. Example: All entries for user account A use spreadsheet key 1. And all entries for user account B use spreadsheet key 2, and so on.
There's no option to launch the EIB.	<p>This issue is most likely security-related. Report View Security for Securable Items displays that you need <i>Put</i> access to domain security policy <i>User-Based Security Group Administration</i> to access the web service. You'll need to:</p> <ul style="list-style-type: none"> <li>• Edit the domain security policy for domain <i>User-Based Security Group Administration</i>.</li> <li>• Make certain you're in a security group that has <i>Put</i> access to this domain.</li> <li>• Activate the security change.</li> </ul>
The EIB issues this error:	Make certain you're using the same spreadsheet key value for a given Workday account.

Issue	Cause and Solution
<i>Validation error occurred. Element Content 'Workday_Account_Reference' is required, on internal element 'Assign User-Based Security Groups Data'.</i>	

## Use Cases and Guidelines for Recovering from a Bad Load

Since the web service doesn't use a business process, there isn't an easy way to recover if you load incorrect entries. You can find another tenant that still has the correct security group assignments for the Workday accounts. Then use the Generate Spreadsheet with Data option in that tenant to build an EIB input file to load to the tenant with the incorrect data.

For reference documentation for all web services including Put User-Based Security Group Assignments, see [Operation Directory](#).

### Sample EIB Input File

[Put\\_User-Based\\_Security\\_Group\\_Assignments-WD34](#)

### Concept: Update Workday Account EIB

#### Background

You can use this EIB to update existing Workday accounts for employees, contingent workers, and implementers.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

Task: Edit Workday Account.

#### EIB Input File Guidelines

##### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- You must have access to *Workday Accounts* domain in the System functional area.
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.

##### Additional Input File Guidelines

- As you populate the EIB input file, consider:
  - Spreadsheet Key: Use a unique value for each Workday account that you're updating.
  - The EIB input file includes a section for specifying the Workday account for an employee and another section for specifying the Workday account for a contingent worker. Be sure to complete the correct section based on whether the worker is an employee or contingent worker.
  - System ID: Set the field value to WD-EMPLID in the employee section or contingent worker section depending on the account. For reference documentation of other role ID types, see [Operation: Update\\_Workday\\_Account](#).
  - Generate Random Password:
    - If set to Y, it generates a random password for the specified Workday Account and emails the new password to the email address associated with that account. (Run Edit Tenant Setup - Security and verify that the configuration enables security emails. For terminated workers, you might also need to temporarily change the setting to Send to home email, else work email.)
    - If set to N, you can provide a new password in a different field. If you don't provide a password, the associated Workday Account's password doesn't change. Note that the Maximum Password Age in Days field on the Maintain Password Rules task or the Maintain Payment Card Industry Password Rules task controls the password expiration for the randomly generated password.
  - Notifications: Below are details on how to populate the fields associated with Notifications. There's also 1 entry in the attached sample EIB Input file, demonstrating an update to notifications. When you update a notification type, it replaces all instances. To avoid removing

information, ensure that the EIB input file includes all channel information for the notification type. Also, you must supply Workday IDs (WIDs) for each of these fields. The WIDs are typically available from the Integration IDs report. However, at this time they aren't available due to a permission-related issue that the Workday development team is investigating. Instead, refer to the attached file *Workday-IDs-for-Notification-Fields.xlsx*, to get a list of WID values.

- **Notification Sub Type:** This is the notification type. (Examples: Approvals, Give Feedback, Tasks.) Enter the WID of the notification type. (Refer to the attached file *Workday-IDs-for-Notification-Fields.xlsx* for a list of values.)
- **Channel:** Enter the channel (Example: Email, Mobile Push Notification). You'll need to enter the WID for the channel. (Refer to the attached file *Workday-IDs-for-Notification-Fields.xlsx* for a list of values.)
- **Delivery Frequency:** Enter the delivery frequency (Example: Immediately, Daily). You'll need to enter the WID. (Refer to the attached file *Workday-IDs-for-Notification-Fields.xlsx* for a list of values.)

## Common Issues and Errors

Issue	Cause and Solution
<p>EIB fails with this error: <i>The value specified isn't configured for this country..</i></p>	<p>This issue occurs if your tenant configuration doesn't permit the preferred language populated in the EIB input file. You can:</p> <ol style="list-style-type: none"> <li>1. Run the Maintain Localization Settings task.</li> <li>2. At Area prompt, select <i>Personal Information</i>.</li> <li>3. Locate the row with Localized Field = Preferred Communication Language (Worker).</li> <li>4. Enter all applicable countries in the Allow for Countries or Regions prompt.</li> <li>5. Select the Active check box for the entry to activate settings.</li> <li>6. Run Configure Preferred Communication Languages task.</li> </ol>

Issue	Cause and Solution
	7. Add all applicable countries/languages.
After using EIB to update delivery frequency, some of the delivery frequency information is missing or has changed for other channels that weren't updated.	When you update a notification type using the Update Workday Account web service, it replaces all instances. To avoid removing information, make sure that the EIB input file includes all channel information for the notification type. Pay close attention to row IDs.
The notification fields in the sample EIB input file look different than what I see in my EIB input file.	There were many changes made to notification fields in recent web service versions. Verify you're using the latest web service version. If you're not certain what version you're using, create a new EIB to pick up the latest version.

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to update entries only. If you need to add new entries, use Add Workday Account EIB.
- If you have inadvertently uploaded incorrect entries, reload the entries with correct values.
- You can't delete Workday Accounts. If you have accounts that you don't want to use, you can disable them using this web service.

For reference documentation for all web services including Update Workday Account, see [Operation Directory](#).

### Sample EIB Input File

[Update\\_Workday\\_Account-WD36](#)

[Workday-IDs-for-Notification-Fields\\_0](#)

## Integrations EIBs

### Concept: Approve Business Process EIB

#### Background

You can use this EIB to approve business processes by user.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

The EIB must be run by a user who is listed in the awaiting action list for the business process step.

Example: If a Request Compensation Change event displays that the approval step is awaiting action for user A or B, then user A or B must run the EIB.

If you aren't a user listed in the awaiting action list for the business process step and need to run the EIB, consider:

#### Approach #1

Reassign the business process actions that you want to approve to 1 user, who can then run the EIB:

1. Mass reassign the business process steps to 1 user.

2. Sign in as the user you reassigned the tasks to and run the Approve Business Process EIB.

### Approach #2

Configure a service center representative to run the EIB. This is a preemptive approach that you can use to help avoid future issues with mass approving business process events.

1. Create a [service center](#) representative and a Workday account.
2. Add the service center representative to a security group.
3. For any business processes that you want to mass approve events for in the future:
  - a. Edit the business process security policy and add the service center security group (from step 2) to the approve section.
  - b. Edit the business process definition and add the security group to any business process approval steps that you want to mass approve in the future.
4. Add the security group (from step 2) to the *Integration Events* domain security policy so that the service center representative can run the EIB.
5. Activate the security changes.
6. Sign in as the service center representative to run the EIB.

### Equivalent Workday Task

You can approve the action from [My Tasks](#).

You can also mass approve using the *Bulk Approve* option from My Tasks.

Note: You can't undo an approval. Review any relevant business processes carefully before you approve events.

### EIB Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.

As you populate the EIB input file, consider:

- **Spreadsheet Key:** Specify a unique value for each event where you want to approve a business process step.
- **Event:** Specify the Workday ID (WID) and change the value in cell C4 of the EIB input file from *Absence\_Case\_ID* to *WID*.
- **Comment:** Required, unless you select the Disable Comments check box in the business process security policy.

## Common Issues and Errors

Issue	Cause and Solution
<p>The EIB issues this error:</p> <p><i>Validation error occurred. The entered information does not meet the restrictions defined for this field. (Event_Reference).</i></p>	<p>Displays if you try to run the EIB and aren't a user listed in the awaiting action list for the business process step.</p> <p>Refer to the Background section above for suggestions on how to address this situation.</p>
<p>The EIB issues an error like this:</p> <p><i>Validation error occurred. Invalid ID value. 'ad176699557701e05eed7775de07d00d' is not a valid ID value for type = 'Absence_Case_ID'</i></p>	<p>The EIB input file needs to specify WID as the reference ID type.</p> <p>Change the value in cell C4 of the EIB input file from <i>Absence_Case_ID</i> to <i>WID</i>.</p>
<p>EIB completes successfully but doesn't approve the step.</p>	<p>Verify that you're specifying an approvable step.</p> <p>Example: If you specify a to do step, the EIB ignores it.</p>

## Use Cases and Guidelines for Recovering from a Bad Load

You can't undo an approval. Review any relevant business processes carefully before you approve events. For reference documentation for all web services including Approve Business Process, see [Operation Directory](#).

### Sample EIB Input File

[Approve\\_Business\\_Process-WD34](#)

### Concept: Cancel Business Process EIB

#### Background

You can use this EIB to cancel a business process.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

You can also use this EIB to cancel individual steps in a business process if those steps are associated with a subprocess event. If the individual steps aren't associated with a subprocess event (Example: an approval step), then you can't cancel the step. See [Setup Considerations: Mass Operations on Business Processes](#) for more information.

#### Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Mass Cancel Business Processes
- Mass Operation Management

#### EIB Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:

- Spreadsheet Key: Specify a unique value for each event.

- Event: We recommend that you specify the Workday ID (WID) value for each event. Change the value in cell C4 of the EIB input file from *Absence\_Case\_ID* to *WID*. Consider creating a custom report with the *Business Process Transactions* data source to get the WIDs.
- Comment: (Required) Enter a comment for each event.
- Suppress Notifications: Enter *Y* to suppress notifications for each event you want to cancel.

## Common Issues and Errors

Issue	Cause and Solution
<p>The EIB issues this error:</p> <p><i>Validation error occurred. Business Process cannot be canceled via Web Service.</i></p>	<p>Check these:</p> <ol style="list-style-type: none"> <li>1. Check the security policy for the business process that you are canceling and ensure you have access to cancel it.</li> <li>2. Verify that you entered the correct Workday ID (WID) in the EIB input file.</li> <li>3. Verify that the event can be canceled. Create and run a custom report with the <i>Business Process Transactions</i> data source and check that the <i>Cancelable</i> field is set to <i>Yes</i>.</li> </ol>
<p>The EIB issues an error like this:</p> <p><i>Validation error occurred. Invalid ID value. 'ad176699557701e05eed7775de07d00d' is not a valid ID value for type = 'Absence_Case_ID'</i></p>	<p>The EIB input file needs to specify WID as the reference id type. Ensure the value in cell C4 of the EIB input file is <i>WID</i> instead of <i>Absence_Case_ID</i>.</p>

## Use Cases and Guidelines for Recovering from a Bad Load

You can't undo a Cancel Business Process EIB. If you cancel business process events in error, the only option would be to resubmit the original business process events to restore them.

For reference documentation for all web services including Cancel Business Process, see [Operation Directory](#).

### Sample EIB Input File

[Cancel\\_Business\\_Process-WD33](#)

### Concept: Deny Business Process EIB

#### Background

You can use this EIB to deny a business process.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

To run the EIB, Workday must display your name in the Awaiting Action list for the business process step.

Example: If a Request Compensation Change event displays that the approval step is awaiting action for Logan McNeil or Betty Liu, then one of them must run the EIB.

If Workday doesn't display your name in the *Awaiting Action* list for the business process step and need to run the EIB, consider:

Reassign to 1 Person

Reassign the business process actions that you want to deny to 1 person, who can then run the EIB:

## Reassign to Service Center Representative

1. Mass reassign the business process steps to 1 person.
2. Sign in as the person you reassigned the tasks to and run the Deny Business Process EIB.

Configure a service center representative to run the EIB. This method is a preemptive approach that you can use to help avoid future issues with mass denying business process events.

1. Create a [service center representative](#) and a Workday account.
2. Add the service center representative to a security group.
3. For any business processes for which you want to deny events in bulk in the future:
  - a. Edit the business process security policy and add the security group for the service center (from step 2) to the approval and deny sections.
  - b. Edit the business process definition and add the security group to any business process approval steps that you want to deny in bulk in the future.
4. Add the security group (from step 2) to the *Integration Events* domain security policy so that the service center representative can run the EIB.
5. Activate the security changes.
6. Sign in as the service center representative to run the EIB.

## Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Mass Cancel Business Processes
- Mass Operation Management

## EIB Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:

- **Spreadsheet Key:** Specify a unique value for each event
- **Event:** we suggest you enter the Workday ID (aka WID). You can find the WID value using the sample report definition below. Also, change the value in cell C4 of the EIB input file, from *Absence\_Case\_ID* to *WID*.

**Comment:** the EIB requires a comment , unless you select Disable Comments in the business process security policy.

- Note that you can't reverse a denial action. Proceed with caution if you deny events in bulk.

- You might want to create a custom report to help you populate the EIB input file. If you select this option, you can create a custom report based on the *Business Process Transactions* data source. Ensure that 1 column has a *Workday ID* field from the related business object *Action Event*. The *Workday ID* report field provides the Workday ID (WID) value that you need for the EIB input file.

## Common Issues and Errors

Issue	Cause and Solution
The EIB issues this error:  <i>Validation error occurred. The entered information does not meet the restrictions defined for this field. (Event_Reference).</i>	This error occurs if a worker not listed in the <i>Awaiting Action</i> step of the event you wish to deny runs the EIB. Refer to section Preparation Steps to use this EIB for suggestions on how to address this situation
The EIB issues an error like this:  <i>Validation error occurred. Invalid ID value. 'ad176699557701e05eed7775de07d00d' is not a valid ID value for type = 'Absence_Case_ID'</i>	The EIB input file needs to specify reference id type WID. To correct this problem, edit the EIB input file and replace <i>Absence_Case_ID</i> with <i>WID</i> in cell C4

## Use Cases and Guidelines for Recovering from a Bad Load

You can't reverse denial of a business process action. If you deny events in error, the only option is to resubmit the original events.

For reference documentation for all web services including Deny Business Process, see [Operation Directory](#).

### Sample EIB Input File

[Deny\\_Business\\_Process-WD34](#)

### Concept: Put Reference EIB

#### Background

You can use this EIB to update the reference ID on a business object.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

You can't update external IDs with this EIB.

You can use the Maintain Reference IDs task to find business objects with reference IDs that you might want to update.

### Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Maintain Reference IDs
- From the related actions of the object, see [Integration IDs > Edit Reference ID](#).

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Integration Build* domain in the Integration functional area to run this EIB

### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- As you populate the EIB input file, consider:
  - **Spreadsheet Key:** Use a unique value for each object that you're changing.
  - You might find it helpful to create a custom report for the object you're changing to get a list of the current reference IDs and Workday IDs (aka WIDs). Note that for most objects, the data source includes a Reference ID field and a Workday ID field. For workers, the reference ID is the Employee ID or Contingent Worker ID.

## Common Issues and Errors

Issue	Cause and Solution
Although the EIB completes successfully, it didn't update the reference ids with the values provided in the EIB input file.	If the EIB can't locate the reference id or WID that you populated in the EIB input file, it will ignore it rather than issuing an error.  If the updates aren't successful, double-check the EIB input file and verify that you provided the correct reference id or WID value.

## Use Cases and Guidelines for Recovering from a Bad Load

If you have inadvertently uploaded incorrect entries, you will need to resubmit the EIB with corrected values. There's no rescind or undo option.

For reference documentation for all web services including Put Reference, see [Operation Directory](#).

## Sample EIB Input File

[Put\\_Reference-WD35\\_0](#)

### Concept: Reassign Business Process Step EIB

#### Background

You can use this EIB to reassign a business process step.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

The user that runs the EIB must display in the awaiting action list for the business process step.

The recipient of the business process step must have security access to the domains that secure the business process step.

For more information about reassigning business processes, see [Reference: Actions Available on Business Processes](#).

#### Equivalent Workday Task

Task: Reassign Tasks.

You can reassign business processes in bulk using Mass Operation Management (MOM). See [Setup Considerations: Mass Operations on Business Processes](#) for more information.

You can also configure business processes to reassign automatically. See [Concept: Auto-Manage Business Processes for a Worker](#) for more information.

#### EIB Input File Guidelines

Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Tenant Non-Configurable* functional area to run this EIB.

Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.

- As you populate the EIB input file, consider:
  - Spreadsheet Key: Specify a unique value for each reassignment.
  - Event Record: Should be the Workday ID (WID) of the Awaiting Action step that needs reassigned. Also, note that you'll need to change the Reference ID type in row 4 of your EIB input file from *IID* to *WID*.
  - Reassign To: The employee id that you're reassigning the step to.
  - Reason: you can add a note as to the reason you're reassigning the step

## Common Issues and Errors

Issue	Cause and Solution
The EIB completes successfully but the reassessments didn't happen.	This issue occurs if you specify the incorrect WIDs in the input file.
The EIB issues these 3 errors: <ol style="list-style-type: none"> <li>1. <i>The business process step: Awaiting Assignment cannot be reassigned to xxxx.</i></li> <li>2. <i>The processing user does not have the privileges to reassign Awaiting Assignment .</i></li> <li>3. <i>The entered information does not meet the restrictions defined for this field. (Event_Record_Reference).</i></li> </ol>	This issue usually occurs if you try to reassign steps that are Awaiting Assignment. You can only reassign steps that are Awaiting Action.
EIB issues error: <i>Invalid instance 1673\$6181 for Event_Record_Awaiting_Action--IS (15\$362832).</i>	Make sure you're specifying the WID for the step that is in status Awaiting Action.

## Use Cases and Guidelines for Recovering from a Bad Load

If you have inadvertently reassigned the wrong person to the business process steps, update the input file to use the correct reassign to values and run the EIB again for the same entries.

For reference documentation for all web services including Reassign Business Process Step, see [Operation Directory](#).

### Sample EIB Input File

[Reassign\\_Business\\_Process\\_Step-WD31](#)

### Concept: Rescind Business Process EIB

#### Background

You can use this EIB to attempt to rescind a business process (if the business process is rescindable).

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

## Equivalent Workday Task

Task: Mass Rescind Business Processes.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Tenant Non-Configurable* functional area to run this EIB.

### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- As you populate the EIB input file, consider:
  - Spreadsheet Key: Specify a unique value for each event
  - Event: We suggest you enter the Workday ID (aka WID). You'll need to change the value in row #4 from Absence\_Case\_ID to WID.
  - Comment: Workday requires a comment.
  - Suppress Notifications: You can enter Y to suppress notifications when rescinding the event. If the business process you're rescinding also has subprocesses, then the Workday might not suppress notifications for subprocesses. Test a rescind first to verify whether you sent any unwanted notifications.
  - Note that you can't undo a rescind. Proceed with caution when mass rescinding events.
  - You might want to create a custom report to help you populate the EIB input file.

## Common Issues and Errors

Issue	Cause and Solution
The EIB successfully completes however the web service didn't rescind 1 or more events.	<p>If you use an older web service AND if an event isn't rescindable, the web service doesn't issue an error. Instead, it dismisses the entry and takes no action.</p> <p>Make certain you're using the most recent web service version.</p>
<p>The EIB fails with an error such as:</p> <p><i>Validation error occurred. Invalid ID value. '64914c4e8bc201da65c444b0a9204402' is not a valid ID value for type = 'Absence_Case_ID'.</i></p>	<p>The EIB input file isn't specifying the correct reference ID type.</p> <p>Edit the EIB input file and change cell C4 from Absence_Case_ID to WID.</p>
Workday still sends some notifications, despite setting the Suppress Notifications flag to Y.	<p>If the business process you're rescinding also has subprocesses, then Workday might not suppress the notifications on subprocesses. Test a rescind first to verify whether Workday sends any unwanted notifications. If the test yields unwanted results consider 1 of these options:</p> <ul style="list-style-type: none"> <li>• Disable notifications in tenant while running the EIB.</li> <li>• Test using task Mass Rescind Business Processes instead of the EIB. Test a rescind first.</li> </ul>
<p>The EIB fails with this error:</p> <p><i>Business Process cannot be rescinded via Web Service.</i></p>	<p>This error is most likely security related. Check the business process security policy for the business process that you're rescinding and verify that you have access to action <i>Rescind (Web Service)</i>. If you make any changes, activate them before retesting.</p>

## Use Cases and Guidelines for Recovering from a Bad Load

You can't undo a rescind. If you rescind events in error, the only option is to resubmit the original events.

For reference documentation for all web services including Rescind Business Process, see [Operation Directory](#).

### Sample EIB Input File

[Rescind\\_Business\\_Process-WD34](#)

### Concept: Send Back Business Process EIB

#### Background

You can use this EIB to send back business process events in bulk.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

## Equivalent Workday Task

On the related actions menu of the business process event, select Business Process > Manual Send Back.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration for the business process that you're sending back. The security requirement varies depending on the business process.

### Identifying the Step ID to populate in EIB

To identify the Business Process Step ID value that you'll need to populate in the EIB file:

1. Create a custom report from the Business Process Transactions (Indexed) Report Data Source that retrieves the WID values for the events that you want to send back.
2. Open the business process definition.
3. Locate the step that you're sending back to and click the magnifying glass.
4. From the related actions, select Integration IDs > View IDs.
5. Place the ID value in the Business Process Step ID column in the EIB input file.
6. You'll need the step ID from the subprocess if:
  - The event is in the middle of a subprocess event.
  - You want to send back to another step within the same subprocess.

Example: To send back to the initiation step of the Manager Evaluation, you'll need the reference ID value of this step.

### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.

- As you populate the EIB input file, consider:
  - Spreadsheet Key: Specify a unique value for each business process event.
  - Event (Required): Change the reference ID type in cell C4 from *Absence\_Case\_ID* to *WID*. Then populate the field with the WID values that you retrieved previously from the custom report in Step 1 above. Always populate the WID of the parent event. Example: If sending back to the initiation step within the Manager Evaluation subprocess, you would specify the WID of the Start Performance Review event.
  - Event Description: Workday doesn't save this information. You can use this field to include a more understandable description of the Event.
  - Business Process Step ID (Required): Populate the field with the reference ID of the Step ID that you're sending back to.
  - Business Process Step Description: Workday doesn't save this information. You can use this field to include a more understandable description of the business process step ID.
  - Comment (Required): Enter any information that you wish in this comment field.
- After you load the EIB, you might want to rerun the report in Step 1 to verify that Workday sent the events successfully back to the proper step.

## Common Issues and Errors

Issue	Cause and Solution
<p>EIB issues this error:</p> <p><i>Manual Send Back isn't available for this event. Ensure this event currently allows Manual Send Back, and you have the security permissions to perform this action.</i></p>	<p>You can:</p> <ul style="list-style-type: none"> <li>• Verify that the WID, populated in the EIB, is correct. Refer to Step 1 above for instructions to get the WID.</li> <li>• Verify that the Business Process Step ID, populated in the EIB input file, is correct. Refer to Step 2 above for instructions to get this ID.</li> <li>• Verify that you have permissions needed to complete the Manual Send Back.</li> <li>• You might also want to send back one of the events manually to verify that it works within the UI.</li> </ul>

Issue	Cause and Solution
<p>EIB issues this error:</p> <p><i>Element Content 'Comment' is required, on internal element 'Send Back Business Process Data'.</i></p>	Populate the Comment field in the EIB input file.
<p>EIB issues this error:</p> <p><i>Validation error occurred. You can't send the event back to this business process step. Specify a valid business process step ID.</i></p>	<p>You can:</p> <ul style="list-style-type: none"> <li>Verify that the Business Process Step ID, populated in the EIB input file, is correct.</li> <li>You might also want to send back one of the events manually to the business process step that you're specifying in the EIB. This action enables you to determine if the UI permits you to select the step.</li> </ul>

## Use Cases and Guidelines for Recovering from a Bad Load

- Once completing the send back, you can't reverse it. If you inadvertently send back the step, you might need to do 1 of these options:
  - Advance the step (if this option is available for the business process you're using).
  - If you can't advance: Manually complete the steps to get back to the proper business process step within the event.

For reference documentation for all web services including Send Back Business Process, see [Operation Directory](#).

### Sample EIB Input File

[Send\\_Back\\_Business\\_Process-WD35](#)

## Learning EIBs

### Concept: Cancel Learning Enrollment EIB

#### Background

You can use this EIB to cancel learning enrollments with a cancel reason.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Mass Cancel Learning Enrollments
- Waive Learning Assignment
- On the related actions menu of a learning enrollment, select Cancel Learning Enrollment.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Cancel Learning Enrollment* business process type in the Learning Core functional area to run this EIB.

### Additional Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:

- Spreadsheet Key: Specify a unique value for each enrollment that you want to cancel.
- Learning Enrollment: Specify the reference IDs of the learning enrollments that you want to cancel. Consider creating a custom report with the *Learning Enrollments* data source to get the learning enrollments IDs.
- Cancel Reason: Specify the reference IDs of the cancel reasons you want to use for each learning enrollment. You can find a list of reference ID values by running the View Reference IDs report and searching for the *Cancel Enrollment Event Subcategory* business object. You can create cancel reasons using the Maintain Cancel Enrollment Reason Categories task (secured to the *Set Up: Learning Catalog* domain in the Learning Core functional area).

## Common Issues and Errors

Issue	Cause and Solution
EIB issues an error like this: Validation error occurred. Enrollments that have learning assignments can't be canceled.	Currently, you can't waive or cancel a completed enrollment that's based on a learning assignment.
Unable to launch the EIB	This is most likely security-related.

Issue	Cause and Solution
	<p>Verify you have the correct security configuration.</p> <p>Ensure that you are in the relevant security group and have access to the <i>Cancel Learning Enrollment</i> business process type in the Learning Core functional area.</p>

## Business Processes

Cancel Learning Enrollment.

### Use Cases and Guidelines for Recovering from a Bad Load

You can't rescind this EIB. If you've canceled enrollments by mistake, and if the business process event is still in progress, you can run the Mass Cancel Business Processes task (secured to the *Business Process Administrator* domain in the System functional area) to attempt to cancel the business process before it completes.

For reference documentation for all web services including Cancel Learning Enrollment, see [Operation Directory](#).

### Sample EIB Input File

[Cancel\\_Learning\\_Enrollment-WD36\\_0](#)

### Concept: Enroll in Learning Content EIB

#### Background

You can use this EIB to enroll in learning content using the Enroll in Content business process. We recommend using this EIB for new enrollments that haven't started yet. The reminders you configure for learning content also work with this EIB. See [Create and Manage Reminders for Learning Content](#).

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

See:

- [Mass Enroll Learners](#).
- [Steps: Set Up and Launch Learning Campaigns](#) (for scheduling a campaign).

There are also similar EIBs that you can use for learning enrollments. Consider these options as you determine what works best for you:

- Put Learning Enrollment: You can use this EIB to create or update enrollments.
- Put Learning Imported Record: You can use this EIB to load historical enrollments.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Enroll in Content* business process type in the Learning Core functional area to run this EIB.

### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:
  - Spreadsheet Key: Specify a unique value for each enrollment.
  - Learning Content: Enter the reference ID value for the course or course offering. There are 3 different reference ID types that you can specify in cell C4: *Learning\_Course\_ID*, *Learning\_Course* and *Learning\_Course\_Offering\_ID*.
    - If loading enrollments for a course (with no offering), use either the *Learning\_Course\_ID* or *Learning\_Course* reference ID types. To find reference ID values, access the View Reference IDs report for the Learning Course business object.
    - If loading enrollments for offerings, use the *Learning\_Course\_Offering\_ID* reference ID type. To find reference ID values, access the View Reference IDs report for the *Learning Course Offering*

business object. Note: The course offering must be *open*.

- Learner: You might need to change the reference ID type in cell D4 from *Academic\_Affiliate\_ID* to *Employee\_ID* (or whatever learner type you're loading). If populating values for multiple types of learners, such as both employees and contingent workers, consider using the Separate Type Column option. This option enables you to load both types of learners in the same EIB input file. See [Customize EIB Spreadsheet Template](#).
- Required: Enter Y or N
- Due Date: If you specify a due date, use format YYYY-MM-DD

## Common Issues and Errors

Issue	Cause and Solution
<p>EIB issues an error similar to this message:</p> <p>Invalid ID value. '21289' is not a valid ID value for type = 'Academic_Affiliate_ID'</p>	<p>This issue can occur if the Learner has an incorrect reference ID type. If you're enrolling employees:</p> <ol style="list-style-type: none"> <li>1. Edit the EIB input file.</li> <li>2. Change the value in cell D4 from <i>Academic_Affiliate_ID</i> to <i>Employee_ID</i>.</li> </ol> <p>If you're populating values for multiple types of learners such as both employees and contingent workers, consider using the Separate Type Column option. This option enables you to load both types of learners in the same EIB input file. See <a href="#">Customize EIB Spreadsheet Template</a> .</p>
<p>EIB issues an error similar to this message:</p> <p>Invalid ID value. 'DIGITAL_COURSE-16-37' is not a valid ID value for type = 'Learning_Course'</p>	<p>This issue can occur if you specify a value for a <i>Learning_Course_ID</i>, but you've set the EIB input file to use a <i>Learning_Course</i> reference ID type. To resolve this issue, change the value in cell C4 from <i>Learning_Course</i> to <i>Learning_Course_ID</i>.</p>
<p>EIB issues an error similar to this message:</p> <p>Validation error occurred.</p> <p>Invalid instance 17815\$25 for Learning_Registerable_to_Enroll_In--IS (15\$394657)</p>	<p>Workday returns this error if you're adding an enrollment for a blended course, but specifying a course ID instead of an offering ID. Blended courses must have an open offering ID associated with the course. To resolve this issue:</p> <ol style="list-style-type: none"> <li>1. Ensure that there's an open offering associated with the blended course. If you don't have regular offerings, you can create a single offering for that blended course and use the same <i>Learning_Course_Offering_ID</i> each time.</li> <li>2. Change the value in cell C4 to <i>Learning_Course_Offering_ID</i>.</li> </ol>

Issue	Cause and Solution
Workday doesn't launch the EIB.	This issue is most likely security-related. See Web Service Version and Security Configuration Guidelines.
EIB fails with this error message: Validation error occurred. The entered information does not meet the restrictions defined for this field. (Learning_Course_Reference).	Ensure that you have <i>Put</i> access to the Learning Access domain security policy.
When configuring a notification within the Enroll in Content business process definition that includes a Due Date, the notification doesn't display the Due Date.	Currently, the only Due Date that is accessible from the notification is the due date of the business process event itself. The enrollment due date isn't accessible from within the Enroll in Content business process definition.  If you have to include the Enrollment Due Date in the notification, consider creating a custom report from the Learning Assignment by Learning Organization data source. Then, configure an alert that uses this custom report.

## Business Processes

Enroll in Content.

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new enrollments. You can't update existing enrollments or remove enrollments.
- If you've inadvertently uploaded incorrect entries, use the Mass Cancel Business Processes or Mass Rescind Business Processes tasks. What you use depends on whether the business process event has completed or is still in progress. You can then select Business Processes Loaded by EIB to find the integration event that you want to cancel or rescind. Alternately, enter Enroll in Content at the Business Process Types prompt and enter a date range that you ran the EIB.
- If you need to update due dates, another option is to use the Reset Learning Due Dates task.

For reference documentation for all web services including Enroll in Learning Content, see [Operation Directory](#).

### Sample EIB Input File

[Enroll\\_In\\_Learning\\_Content-WD36](#)

### Concept: Manage Course Offering EIB

#### Background

You can use this EIB to schedule and make changes to course offerings, including Microsoft Outlook calendar invites.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Tasks

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Edit Course Offering
- Schedule Offering

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Manage Course Offering* business process type in the Learning Core functional area to run this EIB.

### Guidelines for Modifying the EIB Template

There are some fields within the EIB input file, where you can specify multiple reference id types. If you want to make use of multiple reference id types, then you should edit the template model and configure these fields to use separate type column. You can then populate all reference id types in the same EIB input file. Example: To configure the template to support both external and internal instructors:

1. From the related actions of your EIB, select Template Model > View.
2. In the left panel, click each section to find the fields you want to configure to use multiple reference ID types.
3. From the related actions of the field you want to change, select Template Model Column > Edit Details.
4. Select the Reference ID Type as Separate Column check box.
5. Additional information to consider:
  - You can apply the same steps to other fields if needed.
  - If you're changing your EIB input file to accept multiple ID types for Instructors, you'll need to repeat the above steps for other sections of the template since the EIB input file uses the Instructor fields in multiple sections.

6. Regenerate the template. You'll have a column to specify the reference ID type and another column to populate the value.

#### Guidelines for Creating a Custom Report for the EIB Input File

You might find it helpful to create a custom report to assist with populating the EIB input file. This custom report might be particularly helpful if updating existing course offerings. Consider using Learning Content report data source. Using this data source, you can access fields such as:

- Blended Course
  - Course Offering
  - Learning Content Number
  - Start Date / End Date
  - Instructors
  - Course Offering Locations
  - Lesson Content Type
  - Title
- 
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:
  - NOTE: This web service doesn't support incremental updates. If you're updating an existing offering, it's important to populate all existing data in the EIB input file, so the EIB input field doesn't remove it. Also, if adding or updating an offering with multiple lessons, you should populate the EIB input file with all lessons so that they display on the offering.
  - Below are additional details for some of the fields with focus on the most commonly used fields:
    - Spreadsheet Key: Specify a unique value for each course offering.
    - Course Offering: If updating an existing course offering, enter the reference id here. Another option is to use a custom report to identify the reference id value.
    - Blended Course: Enter the reference id of the course where you're adding offerings. To find the reference id value, you can run the Integration IDs report and select business object *Multi Course Template*. You could also use a custom report. Note that when populating the Blended Course field, you can either enter the reference id for *Learning\_Course\_ID* or for *Learning\_Course*. Change the value in

#### Additional Input File Guidelines

cell E4 to reflect the reference id type that you use.

- Instructor: To find reference id values for this field, you can:

1. Run the *View Learning Instructor* report.
2. Get the reference id value from the related actions of the instructor that you're using. Note that you can have internal and external learning instructors. Make certain that the reference id type, in row 4, specifies the proper reference id type based on the type of instructor you're populating.
3. If you need to populate both internal and external instructors in the same input file, then follow the steps in *Guidelines for Modifying the EIB Template* section 2 so that you have a separate column to populate the reference id type.

- Required Learning Course Content: Set this field Y for at least 1 lesson.
- Location: To find reference id values for this field, you can run the Integration IDs report and select Location business object.
- Start Date and End Date: Enter date and time for start and end of lesson. No need to specify time zone since the EIB input file stores it in a separate field (Time Zone). The start date and end date fields should use format: YYYY-MM-DDTHH:MM. Example: 2021-09-01T14:00). If needed, you can enter times with precision down to the microsecond. Example: 2021-12-31T09:00:00.000). Make certain that the cells holding start/end dates are text format.
- Time Zone: To identify the reference id values, run Integration IDs report and search business object *Time Zone*.

## Common Issues and Errors

Issue	Cause and Solution
Some of the field values that were previously in the offering disappear after using the EIB to update existing offerings.	This web service doesn't support incremental updates. Therefore if you're updating an existing offering, it's important to provide all existing data

Issue	Cause and Solution
	<p>to avoid lost data. Also, if adding or updating an offering with multiple lessons, you should populate the EIB input file with all lessons so that they display on the offering.</p> <p>If you inadvertently remove data, use the mass rescind business process task to back out the EIB updates.</p>
<p>EIB issues an error like this:</p> <p><i>Validation error occurred. Invalid ID value. 'MULTI_COURSE_TEMPLATE-16-23' is not a valid ID value for type = 'Learning_Course'.</i></p>	<p>Double check the reference id type used in the <i>Blended Course</i> field in the EIB input file. Note that there are 2 reference id types you can select from:</p> <ol style="list-style-type: none"> <li>1. Learning_Course</li> <li>2. Learning_Course_ID</li> </ol> <p>Verify which one you're using and then change the value in cell E4 accordingly.</p>
<p>EIB issues an error like this:</p> <p><i>Validation error occurred. Element Content 'Learning_Course_Offering_Detail_Data' is required, on internal element 'Learning Course Offering Data'.</i></p>	<p>Populate row id in column F (section <i>Learning Course Offering Detail Data+</i> (<i>All &gt; Course Offering Data</i>)).</p>
<p>Offering loads but there are no lessons.</p>	<p>Make certain row id value displays in column A1 (section <i>Offering Lesson Data+</i> (<i>All &gt; Course Offering Data &gt; Learning Course Offering Detail Data +</i>)). Also, the EIB should have an entry for each lesson within the offering.</p>
<p>EIB issues an error like this:</p> <p><i>The Start Date must be on or after 11/05/2020, the Effective Date of the Learning Course..</i></p>	<p>Double check any start dates in the EIB input file to verify they are after the effective date specified in the error message. Also, verify that the dates are <i>intext</i> cells and are using this format: YYYY-MM-DDTHH:MM.</p>
<p>EIB issues an error like this:</p> <p><i>Set Make Lesson Mandatory on at least 1 lesson..</i></p>	<p>Edit the EIB input file and set field Required Learning Course Content to Y for at least 1 lesson.</p>
<p>Unable to launch the EIB.</p>	<p>This issue is most likely security-related. See the <i>Additional Input File Guidelines</i> section.</p>

## Business Processes

Manage Course Offering.

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new offerings or update existing offerings. You can't delete offerings.
- If you've inadvertently uploaded incorrect entries, use the Mass Cancel Business Processes or Mass Rescind Business Processes tasks. What you use depends on whether the business process event completed or in progress. You can then select Business Processes Loaded by EIB to find the integration event that you wish to cancel or rescind. Your other option is to enter Manage Course Offering at the Business Process Types prompt and enter a date range that you ran the EIB.

For reference documentation for all web services including Manage Course Offering, see [Operation Directory](#).

## Sample EIB Input File

[Manage\\_Course\\_Offering-v44](#)

## Concept: Manage Extended Enterprise Learner EIB

### Background

You can use this EIB to create or update extended enterprise learners.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

For more information about extended enterprise learners, see [Setup Considerations: Extended Enterprise Learning](#).

### Equivalent Workday Tasks

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Create Extended Enterprise Learner
- Edit Extended Enterprise Learner

### EIB Input File Guidelines

#### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Manage Extended Enterprise Learner* business process type in the Extended Enterprise for Learning functional area to run this EIB.

#### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- To prevent data loss, we recommend that you generate your spreadsheet with data for the Manage Extended Enterprise Learner EIB. See: [Example: Generate EIB](#)

[Spreadsheet Template with Data](#) on page 64.

- As you populate these field in the EIB input file, consider:
  - Spreadsheet Key: Specify a unique value for each Extended Enterprise Learner.
  - ID: If updating an existing Extended Enterprise Learner, enter the ID here. To find the ID, you could create a custom report from the Extended Enterprise Learners data source.
  - External Learning User: Enter the reference ID of the External Learning User (ELU). To find the ID, you can create a custom report using data source External Learning User.
  - Send Email Notification for User Name and Send Email Notification to Password: Set these fields to value Y if you're creating new accounts and want to notify the users.

## Common Issues and Errors

Issue	Cause and Solution
After running the EIB to update existing Enterprise Learners, some of the field values are missing such as the Extended Enterprise Learner Type.	This web service removes existing values for some fields, if the EIB input file doesn't populate a value. Therefore, we recommended you generate the spreadsheet with data so you don't lose existing data.
The extended enterprise learner isn't receiving email notifications their new account and password.	Edit the EIB input file and check the setting for fields Send Email Notification for Username and Send Email Notification for Password.
Unable to launch the EIB.	This issue is most likely security-related.

## Business Processes

Manage Extended Enterprise Learner.

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new Extended Enterprise Learners or update existing Extended Enterprise Learners. You can't delete Enterprise Learner.
- Although this web service uses a business process, it doesn't permit rescinds. However, you can cancel the event if it's still in progress.
- If you have inadvertently uploaded incorrect entries, we suggest you:
  - Reload the entries with correct information.
  - If you need to restore the original values, you could find another tenant, such as a sandbox or implementation tenant, that still has the correct information.
  - Use generate with data in that tenant to build an EIB input to load into the tenant with incorrect information.

- You can't delete Extended Enterprise Learners. If you accidentally load new Learners that you don't wish to keep, you could update the Learners and enable the Persona Inactive field.

For reference documentation for all web services including Manage Extended Enterprise Learner, see [Operation Directory](#).

### Sample EIB Input File

[Manage\\_Extended\\_Enterprise\\_Learner-WD37](#)

### Concept: Manage External Learning User EIB

#### Background

You can use this EIB to create or update external learning users.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

For more information about external learning users, see [Setup Considerations: Extended Enterprise Learning](#).

#### Equivalent Workday Tasks

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Create External Learning User
- Edit External Learning User

#### EIB Input File Guidelines

##### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:

1. From the related actions of the EIB, select Template Model > View.
2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
3. If you're using an older web service version, you can create a new EIB to get the latest version.

- Verify you have the correct security configuration.

- You must have access to the *Manage External Learning User* business process type in the Extended Enterprise for Learning and Learning Core functional areas to run this EIB.

##### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- To prevent data loss, we recommend that you generate your spreadsheet with data

for the Manage External Learning User EIB.  
See: [Example: Generate EIB Spreadsheet Template with Data](#) on page 64.

- As you populate these fields in the EIB input file, consider:
  - Spreadsheet Key: Specify a unique value for each External Learning User (ELU)
  - ID: If updating an existing ELU, enter the ID here. To find the id, you could create a custom report using the External Learning Users data source. Or the other option is to generate the spreadsheet with data.

## Common Issues and Errors

Issue	Cause and Solution
EIB issues errors like this: <ul style="list-style-type: none"> <li><i>Enter a username that isn't already in use..</i></li> <li><i>Submit an email address that isn't already in use by an external learning user..</i></li> </ul>	These messages indicate that you're attempting to add an ELU that has a username or email address that is already in use.  If you're updating an existing ELU, you need to populate the ID of the ELU in the ID column.
Unable to launch the EIB.	This issue is most likely security-related.

## Business Processes

Manage External Learning User.

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new External Learning Users (ELUs) or update existing ELUs. You can't delete ELUs.
- Although this web service uses a business process, it doesn't permit rescinds. However, you can cancel the event if it's still in progress.
- If you have inadvertently uploaded incorrect entries, we suggest you:
  - Reload the entries with correct information.
  - If you need to restore the original values, you could find another tenant, such as a sandbox or implementation tenant, that still has the correct information.
  - Use generate with data in that tenant to build an EIB input file to load into the tenant with incorrect information.
- You can't delete ELUs. If you accidentally load new ELUs that you don't wish to keep, you could update the ELUs and change the email, name, and so on. You could precede the values with DNU or another value to indicate they aren't of use. Note that the username can't be changed. Also, the ELUs will remain inactive as long as there are no active persona's associated with the ELU.

For reference documentation for all web services including Manage External Learning User, see [Operation Directory](#).

### Sample EIB Input File

[Manage\\_External\\_Learning\\_User-WD37](#)

## Concept: Manage Learning Course EIB

### Background

You can use this EIB to create or update blended and digital learning courses.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

Task: Create Course.

### EIB Input File Guidelines

#### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Manage Learning Course* business process in the Learning Core functional area.

#### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:
- You might find it helpful to start by manually entering a course similar to the courses you want to load using the EIB. It can help you verify which fields Workday requires. It might also be helpful when populating reference id values in the input file, as you can view the reference id values from the related actions of the course you manually created.
- If updating existing learning courses, to avoid losing data, you must populate all existing data in the EIB input file.
- Be certain you test first in a nonproduction tenant, as it can be difficult to reverse the updates, if incorrectly loaded.
- When populating reference ideas, you might find it helpful to create a custom report from the Learning Content data source to identify the reference id values.

- There are separate sections within the input file for Blended Courses and Digital Courses. You'll need to fill out the appropriate sections based on the type of courses you're loading.
  - First Section (Blended Courses): If you're populating fields in this section of the input file, consider:
    - Spreadsheet Key: Specify a unique value for each Course: note that all Lesson entries within the Course will have the same spreadsheet key value.
    - Learning Blended Course Field: If updating an existing blended course, supply the reference id value here. Also, when updating a course, to avoid losing information, you must include existing information for all lessons in the input file.
    - Workdrive Document Content: If you need to populate images that Drive previously uploaded, run View Reference IDs report for Workdrive Document Content to get the image's file ID. Then populate in the Workdrive Document Content field.
  - If populating images that the input field didn't previously load, refer to Images section below.
  - Images: Refer to Images section below for more details about populating images.
  - Course Lesson Data Section: You'll need to add 1 row for each lesson. Each row needs to have a unique row id assigned.
  - Language: Specify the Language Workday ID (WID) or the User\_Language\_ID. Run the Integration IDs report and select the User Language business object to find the list of User\_Language\_IDs.
- Second Section (Digital Courses): If you're populating fields in this section of the input file, consider:
  - You need to load your media before running the EIB. Then you can reference the media

reference id value in the EIB input file.

- Also note that versioning and capacity functionality isn't available at this time (Oct 2018) for Digital Course so leave these fields blank.
- Spreadsheet Key: Specify a unique value for each Course. Note that all Lesson entries within the Course will have the same spreadsheet key value.
- Learning Digital Course: If updating an existing digital course, supply the reference id value here. When updating a course, you need to include existing information for all lessons in the input file to avoid losing the information.
- On Demand: When a course is On Demand it means it doesn't require enrollment, and that the students can take the course at their convenience. If a course isn't On Demand, the student must enroll in the course to take it. So, if you would like a course to require enrollment, you would fill out the EIB and set On Demand to N. If you would like a course not to require enrollment, you would fill out the EIB and set On Demand to Y .
- Course Lesson Data Section: You'll need to add 1 row for each lesson. Each row needs to have a unique row id assigned.
- Language: Specify the Language Workday ID (WID) or the User\_Language\_ID. Run the Integration IDs report and select the User Language business object to find the list of User\_Language\_IDs.
- Workdrive Document Content: If you need to populate images previously uploaded by Drive, run View Reference IDs report for Workdrive Document Content to get the image's file ID. Then populate in the Workdrive Document Content field.
- Images: It can be challenging to populate new images in the EIB due

to Excel limitations and because the images must be base64 encoded. Below are steps to populate images within the EIB input file:

- Start by converting your image to base64. You can use any base64 encoder tool of your choice (Workday doesn't endorse any encoder tools, so proceed at your own risk).
- Note that Excel allows only 32,767 characters per cell. After you complete the above step, check the size of the encoded value. If it is over 32,000 characters, you'll need to select the appropriate option:
  - Option 1: Manually load the image with the user interface.
  - Option 2: You might be able to reduce the size of the image to get it small enough to place in the EIB input file. Example: by using a tool such as [ImageSmaller](#) (Note that Workday doesn't endorse this tool. Proceed at your own risk). Then after reducing the size of the image, encode it again and verify it's fewer than 32,767 characters.
  - Option 3: Before you load the input file, use an xml editor or text editor such as Notepad++ and edit the EIB input file. Then paste the encoded image value into the file. It might be a bit tedious, however, it would enable you to work around the Excel limitation.
  - Option 4: Look into using a custom integration (such as Studio integration) instead of using EIB.
- After loading the EIB input file, use report Manage Courses and Lessons to validate the load.

## Common Issues and Errors

Issue	Cause and Solution
<p>When loading a digital course, you receive this error:</p> <p><i>The entered information does not meet the restrictions defined for this field. (Media_Reference).</i></p>	<p>This error is security-related. Be sure to share the media on the Drive folder for the integration owner to access it.</p>
<p>You receive these errors when attempting to load a course where you specify the reference id value for an existing image:</p> <ul style="list-style-type: none"> <li>• <i>Element Content 'Image' is required, on internal element 'Learning Image Data'.</i></li> <li>• <i>Element Content 'File_Name' is required, on internal element 'Learning Image Data'.</i></li> <li>• <i>Element Content 'Content_Type' is required, on internal element 'Learning Image Data'.</i></li> </ul>	<p>We don't support a reference to an existing image at this time.</p>
<p>When loading a digital course, and specifying image information, you receive this message:</p> <p><i>Validation error occurred. Content Type not supported. An image is required..</i></p>	<p>The <i>Content Type</i> is case-sensitive. Make certain its lower case. Example: use <i>image/png</i> instead of <i>Image/png</i>.</p>
<p>EIB fails with error:</p> <p><i>You can only add a file from Drive as the media for a learning lesson if you're the owner of the file or it's shared with you.</i></p>	<p>This issue occurs if reference ID/WID value is incorrect for the file. You can:</p> <ol style="list-style-type: none"> <li>1. Edit EIB input file.</li> <li>2. Locate the Workday Drive Content field.</li> <li>3. Verify that you populated the correct Workday ID (WID) or Reference ID value.</li> </ol>
<p>EIB fails with error:</p> <p><i>Validation error occurred. Multiple Element Contents, including Learning Course Lesson Data/g/External Content Lesson Data [EL], contain data where only one is allowed by mutex Learning Course Lesson Data.</i></p>	<p>This issue occurs if you include multiple lesson types within the same row, within the EIB input file: Check your EIB input file to:</p> <ul style="list-style-type: none"> <li>• Verify that you're not populating more than 1 lesson type section in each row.</li> <li>• Also, verify that no extra fields are accidentally visible in the other lesson sections.</li> </ul>
<p>When updating an existing course, EIB fails with an error like this:</p> <p><i>Validation error occurred. Invalid instance 22699\$2 for Digital_Course_Secured_for_Web_Services--IS (15\$390633).</i></p>	<p>This issue occurs if attempting to update or inactivate an external learning course, which this EIB doesn't support. Options:</p> <ul style="list-style-type: none"> <li>• Manually update or deactivate the courses.</li> <li>• If the courses are Skillsoft courses, try clearing the courses in the Skillsoft Portal. After running a delta integration, they should become inactive in Workday Learning.</li> </ul>

## Business Processes

Manage Course.

## Use Cases and Guidelines for Recovering from a Bad Load

This web service enables you to add new entries or update existing entries. You can't delete entries, however you can set existing entries to inactive.

If you have inadvertently uploaded incorrect entries, there are a couple options to recover:

- OPTION 1: Use either Mass Rescind or Mass Cancel (depending on whether the business process event is complete or in progress). You can then select Business Processes Loaded by EIB to find the integration event that you wish to cancel or rescind. Note that this option won't completely remove the changes, but rather deactivate them.
- OPTION 2: Rerun the EIB with the entries you inadvertently added, and set the Inactive flag to Y. You might also want to add DNU to the course title.

For reference documentation for all web services including Manage Learning Course, see [Operation Directory](#).

### Sample EIB Input File

[Manage\\_Learning\\_Course-v40\\_0](#)

### Concept: Put Learning Enrollment EIB

#### Background

You can use this EIB to create, update, or rescind legacy enrollments.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

Task: Mass Enroll.

There are also similar EIBs related to learning enrollment. Consider these options as you determine what works best for you:

- Cancel Learning Enrollment: You can use this EIB to cancel learning enrollments with a cancel reason.
- Enroll in Learning Content: You can use this EIB to enroll in learning content using the Enroll in Content business process.

#### EIB Input File Guidelines

Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.

## Additional Input File Guidelines

- Verify you have the correct security configuration
  - You must have access to the *Reports: Learning Record* domain in the Learning Core functional area to run this EIB.
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- Additionally, as you populate the EIB input file, consider:
  - Learning Enrollment: For new enrollments, you can leave this field blank and enable Workday to assign a value. However, if you want to assign a value, make certain the value is a unique value. If updating an existing enrollment, you need to specify the `Learning_Enrollment_ID` for the enrollment. If updating existing enrollments, you might want to create a custom report using data source `Learning Enrollments` to help you find the reference IDs.
  - Learning Course: If a course has offerings, you would need to use reference ID `Learning_Course_Offering_ID`. Otherwise, you could use reference ID `Learning_Course`. (Note that a blended course requires an offering ID). You can look up the reference ID values for Learning Course and Learning Course Offering using View Reference IDs.
  - Learner: If you're adding enrollments for both employees and contingent workers, you might find it helpful to split the columns using the Separate Type Column option. By doing this, you can list both employees and contingent workers in the same EIB input file. For more information, see [Customize EIB Spreadsheet Template](#).
  - Learning Enrollment Completion Date: You can specify a date and time, or just specify a date. If you specify just a date, then it defaults to the time 12:00 am PT. Note that any times you provide are considered to be Pacific Time. If you're in another time zone, you might find it preferable to populate the input file using a UTC

offset to correctly load the time zone for completion date.

Examples showing the UTC format:

- Oct 25 at 8:00am CET is:  
2020-10-25T08:00:00+02:00
- Oct 25 at 8:15am EST is:  
2020-10-25T08:15:00-05:00
- Oct 25 at 8:15am EDT is:  
2020-10-25T08:15:00-04:00
- Expiration Date: If you populate this field and set the Manual Expiration Override to N, Workday uses the expiration settings defined on the learning content. If you set Manual Expiration Override flag to Y, Workday uses the expiration date defined in the EIB input file and overrides the expiration settings on the learning content.
- Rescind Enrollment: Set to Y to rescind the enrollment. Note that this field works only for enrollments loaded using the web service. If you loaded them using user interface (UI), then use the rescind functionality of the UI (which uses a business process event).

## Common Issues and Errors

Issue	Cause and Solution
The EIB fails with error: <i>Invalid Worker for Enrollment.</i>	This issue occurs if you're adding a new enrollment, but specifying a Learning Enrollment reference ID value that already exists. If you're creating a new learning enrollment, you can leave the Learning Enrollment field blank so that the Workday can assign a unique value.
The EIB fails with an error like this: <i>Validation error occurred. Invalid instance 17815\$1 for Learning_Registerable_Secured_by_Transactions--IS (15\$382741).</i>	This issue occurs if you're adding or updating enrollments for a course with offerings, yet you specify a <i>Learning_Course_ID</i> value in the Learning Course field. Instead, you would need to specify a <i>Learning_Course_Offering_ID</i> . Also, please note that if you're loading information for a blended course, then you must populate a course offering ID. Otherwise, you'll receive this error.
The EIB fails with an error like this: <i>Validation error occurred. Invalid ID value. 'xxx' is not a valid ID value for type = 'Learning_Course_Offering_ID'.</i>	This issue occurs if the EIB input file is using reference ID type <i>Learning_Course_Offering_ID</i> but you're adding enrollments for a course with no offerings.

Issue	Cause and Solution
	To resolve this, edit the EIB input file and change the reference ID type for Learning Content in cell E4 to <i>Learning_Course_ID</i> .

## Use Cases and Guidelines for Recovering from a Bad Load

This web service enables you to add, update, or delete learning enrollments.

If you have inadvertently uploaded incorrect entries, reload the entries and set the field Rescind Enrollment in the input file, to Y.

For reference documentation for all web services including Put Learning Enrollment, see [Operation Directory](#).

### Sample EIB Input File

[Put\\_Learning\\_Enrollment-v39](#)

### Concept: Put Learning Imported Content EIB

#### Background

You can use this EIB to create a shell of a course for noncatalog content. You can then load learning records for the course using these EIBs:

- Manage Learning Course
- Put Learning Imported Record

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### EIB Input File Guidelines

#### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration
  - You must have access to the *Set Up: Learning Catalog* domain in the Learning Core functional area to run this EIB.

#### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.

- Additionally, as you populate the EIB input file, consider:
  - This EIB has a *Generate Spreadsheet with Data* option. To use it:
    - From related actions of your EIB, select Template Model > View.
    - Select Edit Template with Data Options.
    - Set the filter to Condition Rule Filter.
    - Enter a rule condition that always evaluates to true. Example: *I=0 is blank*.
    - If you regenerate the template and select the *Generate Spreadsheet with Data* option, you can view all the existing entries.
  - If creating a new entry, populate the fields as follows:
    - Spreadsheet Key: Specify a unique value for each course.
    - Learning Imported Content: Leave this field blank.
    - ID: You have the option of entering a reference id value, or leaving the field blank so that the web service automatically populates the field.
    - Title: Specify a unique title for imported content.
    - Description: Description for imported content.
  - To update an existing entry, populate the fields as follows:
    - Spreadsheet Key: Specify a unique value for each course
    - Populate just 1 of the 2 following fields:
      - Learning Imported Content: Enter the Course Title and set cell C4 to *Learning\_Imported\_Content*. Another option is to specify the Workday ID (aka WID), and set cell C4 to value WID.
      - ID: If you don't populate *Learning\_Imported\_Content* field (above), then populate this field with the reference id value. To find the reference id value, you can run Integration IDs report and

select business object *Learning Imported Content*.

- Title: Specify a unique title for imported content.
- Description: Description for imported content.

## Common Issues and Errors

Issue	Cause and Solution
Unable to launch the EIB	Make certain you have Put access to domain security policy <i>Set Up: Learning Catalog</i> (you can find this information by running report View Security for Securable Item and selecting business object <i>Put Learning Imported Content</i> ).
EIB issues errors like this:  <i>Processing error occurred. Duplicate Value Found on Learning Imported Content-Title-Learning Imported Content, value=xxxxxx</i>	This issue will occur if you attempt to add a new entry that has the same Title as an existing entry. To resolve this issue: <ol style="list-style-type: none"> <li>1. If you want to add a new entry, you'll need to change the Title to make it unique.</li> <li>2. If your intention is to update an existing entry, specify the course name in the Learning Imported Content field.</li> </ol>

## Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new entries or update existing entries. You can't delete entries
- Since this EIB doesn't use a business process, there's no option to rescind or cancel. If you have inadvertently uploaded incorrect entries, you might want to update the entries and add *DNU* to the beginning of the title and description.

For reference documentation for all web services including Put Learning Imported Content, see [Operation Directory](#).

### Sample EIB Input File

[Put\\_Learning\\_Imported\\_Content-WD34](#)

### Concept: Put Learning Imported Record EIB

#### Background

You can use this EIB to load learning records for courses that you created using a Put Learning Imported Content EIB.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

When you load historical learning records with this EIB, the information only displays in the learning section of the career tab in the worker's profile (secured to the *Person Data: Learning* domain in the Learning Core functional area). The historical learning records don't display on any other dashboards and reports, except the *Learning Record*. report data source.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration
  - You must have access to the *Reports: Learning Record* domain in the Learning Core functional area to run this EIB.
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- As you populate the EIB input file, consider:
  - **Spreadsheet Key:** Specify a unique value for each learning record.
  - **Learning Imported Record:** If creating a new assignment, leave this field blank. If updating an existing assignment, we recommend populating the Workday ID (aka WID). You'll need to set cell C4 to value WID. See the [Sample EIB Input File](#) section below.
  - **ID:** Populate this field as follows:
    - If adding new content: You can leave this field blank. Or if you want to assign the reference id value, populate a value here (make certain that the value isn't already in use).
    - If updating an existing entry, you can enter the reference id here. Note that it's necessary only if you didn't populate the *Learning Imported Record* field (see above). You can identify the reference id value, by running the Integration IDs report and selecting business object *Learning Imported Record*.
  - **Learner:** Enter the reference id of the learner. If the learner is an employee, enter the employee ID. Most likely,

### Additional Input File Guidelines

you'll want to change cell E4 from *Academic\_Affiliate\_ID* to *Employee\_ID*.

- Learning Imported Content: Enter the title of the course that you're assigning to the learner. Note that you must specify a course that the Put Learning Imported Content web service created. To get a list of course titles, run the *Integration IDs* report and select business object *Learning Imported Content*.
- Start Date: You can specify a date and time, or just specify a date. If you specify just a date, then it will populate the time 12:00 am PT. Note that any times you provide are considered as Pacific Time. If you're in another time zone, you might find it preferable to populate the input file using a UTC offset to correctly load the time zone for start date. Examples showing the UTC format:
  - Feb 25 at 8:00am CET is 2020-02-25T08:00:00+02:00.
  - Feb 25 at 8:15am EST is 2020-02-25T08:15:00-05:00.
  - Feb 25 at 8:15am EDT is 2020-02-25T08:15:00-04:00.
- Completion Date: Enter completion date. You have the same date/time formatting options as available for the Start Date field (above).
- Learning Grade: To find the reference id value for the learning grade, run report *Integration IDs* and search business object *Learning Grade*.
- Overall Score: If entering a score, use format 99.999.
- Inactive: Enter Y to deactivate the learning record. If set to Y, the entry won't display in the worker's learning transcripts nor the report.

## Common Issues and Errors

Issue	Cause and Solution
Unable to launch the EIB	Make certain you have Put access to domain security policy <i>Reports: Learning Record</i> . You can find this information by running report <i>View Security for Securable Item</i> and selecting business object <i>Put Learning Imported Record</i> .
EIB issues an error like this:	Make certain that you're specifying the appropriate reference id type in cell E4 of the EIB

Issue	Cause and Solution
<i>Invalid ID value. '21289' isn't a valid ID value for type = 'Academic_Affiliate_ID'.</i>	input file. Example: If the learner is an employee, the reference id type would be Employee_ID.
EIB issues this error: <i>You can't update a person when updating a tracking record.</i>	If you're adding a new assignment, then make certain you don't populate a value in the <i>Learning Imported Record</i> field (column C) or the <i>ID</i> field (Column D).
Even though the EIB successfully loads the learning records, they don't display in the worker's learning transcript or in the report.	This issue will occur if the Inactive flag is set to Y in the EIB input file. If you inadvertently set the flag to Y, you can use the EIB to correct the entries.

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new entries or update existing entries. You can't delete entries.
- Since this EIB doesn't use a business process, there's no rescind option. If you have inadvertently uploaded incorrect entries, reload the entries and set the Inactive field to Y.

For reference documentation for all web services including Put Learning Imported Record, see [Operation Directory](#).

### Sample EIB Input File

[Put\\_Learning\\_Imported\\_Record-WD34](#)

## Payroll EIBs

### Concept: Assign Costing Allocation EIB

#### Background

You can use this EIB to add, update, or delete costing allocations (distributions) based on worker, position, earning, and position restrictions criteria. This EIB doesn't process earning-level costing overrides.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

Assign Costing Allocation.

#### EIB Input File Guidelines

[Web Service Version and Security Configuration Guidelines](#)

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.

- Verify you have the correct security configuration.
- You must have access to the *Assign Costing Allocation* business process type in the Core Payroll and Payroll Interface functional areas to run this EIB.
- You must also have access to the organizations that the costing allocation is associated with.

#### Guidelines for Modifying the EIB Template

You can modify your EIB template and use it for allocations that have more than 1 worktag.

1. From related actions of your EIB, select **Template Model > View**.
  - a. Select **Costing Allocation Detail Data +**.
  - b. Select the magnifying glass next to **Costing Override Worktag+**.
  - c. On the related actions menu of the magnifying glass, select **Template Model Column > Maintain Additional Columns**.
2. Add a row for each worktag that you want to use.

We recommend also applying these changes to prevent the FLSA Workweek Calendar column from displaying next to each worktag in your EIB input file:

1. From related actions of your EIB, select **Template Model > View**.
  - a. Select the magnifying glass next to **Costing Override Worktag+**.
  - b. On the related actions menu of the magnifying glass, select **Template Model Column > Maintain Additional Columns**.
2. Select **Costing Allocation Detail Data +**.
3. Select the magnifying glass next to **FLSA Workweek Calendar**.
4. On the related actions menu of the magnifying glass, select **Template Model > Edit Details > Hide**.

#### Additional Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.

If you want to update existing costing allocations, consider:

- Making a copy of the All Workers Costing Allocations standard report.

- Modifying it to include only the information you need to update or replace through the EIB.
- Using the report to help populate your EIB input file.

As you populate the EIB input file, consider:

- Spreadsheet Key: Specify a unique value for each costing allocation.
- Worker: Specify the ID of the employee or contingent worker. If you want to specify values for employees, you need to change the reference ID type in cell C4 from *Contingent\_Worker\_ID* to *Employee\_ID*.
- Position: Optional. You can specify a position level for the costing allocations.
- Earning Code: You can specify an earning level for the costing allocations.
- Position Element Effective As-of Date: Determines if the position restriction is valid: The position restriction must be available on the as-of-date. The position must be filled on the as-of date.
- Replace Existing Cost Allocation Intervals: If you set this to Y, it removes all existing costing allocation intervals for your selected criteria (Example: earning, worker, position) and replaces them with the newly submitted costing allocation interval data that you've specified in your EIB input file. Generally, you would only use this during initial implementation.
- Row ID (column I): Enter 1.
- Section: Costing Interval Update Key+ (All): If you want to update or delete existing costing allocations, specify these values in this section:
  - Row ID: Enter 1.
  - Delete: If you want to delete costing allocations, set to Y.
  - Costing Override ID Update Key: Leave blank. Populate the Start Date Update Key column instead.
  - Start Date Update Key: Specify the start date of the existing allocation.
  - Start Date: Specify the start date for the allocation.
  - End Date: Specify the end date for the allocation.
  - Row ID (Column Q) : Specify a unique value for each line within a given costing allocation.
  - Order: Orders the allocation details (Example: a, b, c, and so on). During general ledger costing, we use the last allocation

detail to reconcile any rounding issues resulting from the distributions.

- Default from Organization Assignment: Select Yes (Y) to indicate that you want to allocate the corresponding percentage using the worker's (or position's) default organizational assignments with no overrides. Workday detects if this request represents a subevent embedded within a higher-level business process, and if so, searches for a possible Assign Organization subevent containing relevant assignments.
- Costing Override Company: The overriding company for an allocation detail. Generally, you would use this for intercompany accounting.
- Worktag Section: Specify relevant worktags.
- FLSA Workweek Calendar: If this value displays in your EIB input file, leave it blank.
- Distribution Percent: The distribution percentage for a given allocation. We express this as a decimal value. Example: 0.5 is 50 percent.

## Common Issues and Errors

Issue	Cause and Solution
Although the EIB completes successfully, it seems that the data wasn't loaded.	<ul style="list-style-type: none"> <li>• Ensure that you've specified values for all relevant columns, especially for Costing Allocation Interval Data (column I in the EIB input file).</li> <li>• Verify that the event has successfully completed and isn't still in progress.</li> </ul>
<p>When updating or deleting an existing allocation, the EIB fails with this error:</p> <p>Validation error occurred. The Costing Allocation Interval Update Keys submitted don't correspond with an existing Costing Override.</p>	<p>Check these:</p> <ul style="list-style-type: none"> <li>• Verify that you've populated the row ID in the Costing Interval Update Key section.</li> <li>• Verify that the start date, populated in the Costing Interval Update Key section, matches the start date of the existing allocation.</li> <li>• Check the Position column. If there's a position assigned with the existing allocation, then you must populate the position field in the EIB input file.</li> </ul>
<p>EIB issues an error like this:</p> <p>Validation error occurred. Element Content 'Costing_Allocation_Data' is required, on the internal element 'Assign Costing Allocation Request.'</p>	<p>Verify that there are no rows with a missing spreadsheet key value.</p>
EIB issues an error like this:	Verify that the reference ID is set correctly in the Worker column of the EIB input file. If you want

Issue	Cause and Solution
Validation error occurred. Invalid ID value. '25735' isn't a valid ID value for type = 'Contingent_Worker_ID'	to load employees, change the value in cell C4 to <i>Employee_ID</i> .
EIB issues multiple errors like this:  Costing Allocation Interval date ranges must not overlap - the date range-submitted conflicts with another proposed Costing Allocation Interval.  Allocation percentage must total 100%.  A Start Date is required when adding a new Costing Allocation Interval.	Verify that the row ID is populated in column I of the Costing Interval Update Key+ (All)section.
EIB issues an error like this when updating existing allocations:  Multiple Element Contents, including Costing Interval Update Key/b/Costing Override ID Update Key [TX], contain data where only one is allowed by mutex Costing Interval Update Key.	This occurs if you populate both of these columns in the Costing Interval Update Key section of the EIB input file: <ul style="list-style-type: none"> <li>• Costing Override ID Update Key</li> <li>• Start Date Update Key</li> </ul> Only populate 1 of these columns.
Unable to launch the EIB	Verify you have the correct security configuration. Ensure that you are in the relevant security group and have access to the <i>Assign Costing Allocation</i> business process type in the Core Payroll and Payroll Interface functional areas.

## Business Processes

Assign Costing Allocation.

## Use Cases and Guidelines for Recovering from a Bad Load

This EIB enables you to add, update, or delete costing allocations. If you've uploaded incorrect entries, you can:

- Option 1: Create a new Assign Costing Allocation EIB to update the entries with the correct information or delete them.
- Option 2: Use either the Mass Cancel Business Processes task (if the event is still in progress) or Mass Rescind Business Processes task (if the event is complete). Both of these tasks are secured to the *Business Process Administrator* domain in the System functional area. You can then select Business Processes Loaded by EIB to find the integration event that you want to cancel or rescind. Alternatively, you can enter *Assign Costing Allocation* in the Business Process Types prompt and enter the date range that corresponds to when you ran the EIB.

For reference documentation for all web services including Assign Costing Allocation, see [Operation Directory](#).

## Sample EIB Input File

[Assign Costing Allocation v43.1](#)

## Concept: Assign Pay Group EIB

### Background

You can use this EIB to assign workers to pay groups.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

- EIBs:
  - Change Job
  - Edit Position
- Workday tasks:
  - [Assign Pay Group](#)

### EIB Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:

- Spreadsheet Key (Required): Specify a unique value for each pay group assignment.
- Assign Pay Group Event ID (Optional): If you want to assign a value to the event, you can specify it here. If you leave this field blank, the EIB will automatically assign an event ID.
- Worker (Required): Specify the ID of the employee.
- Pay Group (Required): Specify the reference ID of the pay group that you want to assign to the worker. You can find a list of reference ID values by running the View Reference IDs report and searching for the *Pay Group* business object.
- Position ID (Required): Specify the position ID of the worker. Consider creating a custom report to get the position ID.
- Effective Date (Required): Specify the effective date of the pay group assignment in this format: YYYY-MM-DD.

### Common Issues and Errors

Issue	Cause and Solution
Although the EIB completes successfully, it seems that the data wasn't loaded.	<p>This might occur if the business process events are still in progress.</p> <ul style="list-style-type: none"> <li>• Edit the EIB input file and verify that the processing instructions in the <i>Overview</i> tab are set to <i>Automatic Processing</i>.</li> <li>• Check the <i>Assign Pay Group</i> business process. If it contains any nonessential steps (apart from approval, review, or to-do steps), consider adding a condition rule for the EIB to skip them.</li> </ul>
EIB issues these errors:	<ul style="list-style-type: none"> <li>• Element Content 'Position_Reference' is required, on the internal element 'Assign Pay Group Event Data'.</li> </ul> <p>This occurs if the worker's position isn't populated in the EIB input file. To find the position ID, use the report outlined in section <a href="#">Tips for Populating the Input File</a>.</p>

Issue	Cause and Solution
<ul style="list-style-type: none"> <li>Position ID isn't valid as of the event's Effective Date. Specify a different Position or Effective Date.</li> </ul>	
The EIB isn't automatically populating the pay group even though automatic pay group assignment is configured.	This web service doesn't support automatic pay group assignment: if you need to use automatic pay group assignment, use the Edit Position or Change Job EIBs instead.
EIB issues an error like this:  Validation error occurred. You can't update an existing pay group assignment event. To create a new event, remove or change the Reference ID.	This occurs if you specify a value in the Assign Pay Group Event ID column that has already been used. To address this issue, you can update the EIB input file by: <ul style="list-style-type: none"> <li>Removing the value from the Assign Pay Group Event ID column and leaving the cell blank so that Workday can assign a unique value.</li> <li>Or, changing the value in the Assign Pay Group Event ID column to a unique value hasn't already been used.</li> </ul>
Unable to launch the EIB	Verify you have the correct security configuration.  Ensure that you are in the relevant security group and have access to the <i>Assign Pay Group</i> business process type in the Core Payroll and Payroll Interface functional areas.

## Business Processes

Assign Pay Group.

### Use Cases and Guidelines for Recovering from a Bad Load

- This EIB only adds new pay group assignments. You can't update or delete entries.
- If you've uploaded incorrect entries, you can use either the Mass Cancel Business Processes task (if the event is still in progress) or Mass Rescind Business Processes task (if the event is complete). Both of these tasks are secured to the *Business Process Administrator* domain in the System functional area. You can then select Business Processes Loaded by EIB to find the integration event that you want to cancel or rescind. Alternatively, you can enter *Assign Pay Group* in the Business Process Types prompt and enter the date range that corresponds to when you ran the EIB.

For API documentation for all web services including Assign Pay Group, see [Operation Directory](#).

### Sample EIB Input File

[Assign\\_Pay\\_Group-WD35](#)

### Concept: Import Payroll Input EIB

#### Background

You can use this EIB to create or update payroll input.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

## Equivalent Workday Task

Task: Add Payroll Input by Worker.

If you want to manage bulk payroll input using worksheets, see [Steps: Using Payroll Input Workbooks](#).

There are additional integrations and EIBs related to payroll functionality. Consider these options as you determine what works best for you:

- Import Payroll Off-Cycle Payment: You can use this EIB to load large volumes of off-cycle payments (Example: 1,000 or more).
- Put Payroll Off-Cycle Payment: You can use this EIB to create or update off-cycle payments.
- Put Payroll History Payment: You can use this EIB to create or update payroll history payments.
- Submit Payroll Input: You can use this EIB to create or update payroll input data.
- Worker Payroll Input Async: You can use this integration template to import files with worker payroll data from an external server into Workday. See [Steps: Set Up Integration for Worker Payroll Data Import](#).

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Worker Data: Payroll (Payroll Input)* domain in the Core Payroll functional area to run this EIB.

### Additional Input File Guidelines

- This EIB has a Generate Spreadsheet with Data option, which is very helpful when you aren't certain how to populate the input file. To use it:
  1. Manually enter a payroll input.
  2. From the related actions of the input, select Integration IDs > View IDs to get

- the Payroll\_Input\_IDweb service (you'll need this later on).
3. From the related actions of the EIB, select Template Model > View.
  4. Click Edit Template with Data Options.
  5. Set the filter to Reference ID Filter.
  6. Enter the ID from the first step.
  7. Generate a spreadsheet template and select Generate Spreadsheet with Data.
  8. You can now view the file with the payroll input you created.
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
  - As you populate the EIB input file, consider:
    - Header Key: This Import web service batches the payroll input entries into jobs and processes them asynchronously. The value of the header key determines how many entries get batched per job. We recommend you batch at least 1,000 payroll inputs per job (test in a nonproduction tenant first to find out what works best for you). This means that the first 1,000 entries have a header key value of 1, the next 1,000 entries have a header key value of 2, and so on.
    - Default Batch ID: Use this when you don't specify any batch IDs in the Payroll Input Data worksheet.
      - Note: You typically use the same batch ID for all entries. The batch ID is useful when you need to validate or delete the entries you loaded.
      - Line Key: Use a unique value for each payroll input entry within a header key.
      - Payroll Input ID: When you update an existing payroll input, you must specify the input ID for that payroll input. To find the ID, create a custom report using data source "Payroll Inputs" and then add field "Reference ID" to the report. For new entries, the web service will populate this value. If you opt to enter a value,

- make certain you specify a new ID.
- Related Calculation: Note that some Related Calculation codes are Workday owned, so be sure to specify the correct reference ID. Example: Related\_Calculation\_ID vs. Workday\_Related\_Calculation\_ID. See below for more details:
  - After loading the payroll input, you can use the Payroll Input by Batch ID report to view the entries.
  - You can't add attachments to the EIB, but you can with the Add Payroll Input by Worker task in Workday.

## Common Issues and Errors

Issue	Cause and Solution
The EIB successfully finishes but some, or all, of the payroll inputs are missing.	<p>A few possible causes:</p> <ul style="list-style-type: none"> <li>• Since this is an Import web service, Workday processes the data asynchronously. Though the EIB integration event has finished, the background job might still be running. Use the Payroll Input by Batch ID report to periodically monitor progress and verify that payroll inputs continue loading.</li> <li>• If you accidentally use the same line key value for all entries, each entry will wipe out the previous entry. Make certain that the line key is unique for each payroll input entry.</li> <li>• If you specified a Payroll Input ID in the EIB input file, it must have a unique value for each pay input entry. We recommend you leave it blank if adding new entries.</li> <li>• The performance will be very slow if you assign a separate header key value to each payroll input. Example: You upload 1,000 payroll inputs and assign each input a different header key value. Workday creates 1,000 background jobs that queue up and take a long time to process. There's no easy way to recover from this scenario other than to wait for all the jobs to complete their processing.</li> </ul>

Issue	Cause and Solution
	<ul style="list-style-type: none"> <li>Check if FLSA calendar needs extended as follows:           <ol style="list-style-type: none"> <li>Search and select the task View FLSA Work Period Calendar.</li> <li>Search and select your FLSA calendar in the FLSA Work Period Calendar prompt.</li> <li>Click OK.</li> <li>From the related actions, select FLSA Work Period Calendar &gt; Build Work Period Events.</li> <li>Set the Number of Work Periods as desired.</li> </ol> </li> </ul>
<p>You receive the message: <i>Changing the worker associated with a Payroll Input isn't allowed when updating an existing Payroll Input.</i></p>	<p>This error message indicates that you already used some of the payroll input IDs in the EIB input file. The web service is trying to update the entries, but is unable to because they're either complete or assigned to a different worker. When you add new payroll input and want to specify the payroll ID, you might want to preface the payroll input ID with a date (such as: 2018-06-12) to ensure that it's unique.</p>
<p>When populating a related calculation in the input file, you receive an error message such as: <i>Validation error occurred. Invalid ID value. 'W_NETGU isn't a valid ID value for type = 'Related_Calculation_ID'</i></p>	<p>You're specifying the incorrect reference ID type in the input file for the related calculation: Note that for related calculations, there's 1 reference ID type called Related_Calculation_ID and another called Workday_Related_Calculation_ID.</p> <p>If you aren't sure which ID to specify, run Integration IDs report to search the values. Example: for related calculations, search Related Calc in the business object prompt. Then select Related Calculation and Related Calculation (Workday Owned). This will list all related calculations and the reference ID type they're using. Then populate row 4 appropriately in your input file.</p>
<p>When using the Generate with Data option, it's not populating all the information in the EIB input file, such as hours.</p>	<p>Check the Related Calculation section of the EIB input file as some information is populated here.</p>

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new entries or update existing entries. You can't delete entries through the web service.
- If you inadvertently upload incorrect entries, access the Delete by Batch ID task to remove the entries by specifying the batch ID you used in the input file.
  - Note: You can't delete payroll inputs used in payroll results.

For reference documentation for all web services including Import Payroll Input, see [Operation Directory](#).

## Sample EIB Input File

[Import\\_Payroll\\_Input-WD30](#)

## Concept: Import Payroll Off-Cycle Payment EIB

### Background

You can use this EIB to add or update off-cycle payments (manual or on-demand payments).

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

On the related actions of the worker's profile, select Payroll >Manual Payment (for manual payments) or Payroll >On-Demand Payment (for on-demand payments).

There are additional EIBs related to payroll functionality. Consider these options as you determine what works best for you:

- Import Payroll Input: You can use this EIB to load large volumes of payroll input entries (Example: 1000 or more).
- Put Payroll Off-Cycle Payment: You can use this EIB to create or update smaller volumes of off-cycle payments (Example: less than 1000).
- Put Payroll History Payment: You can use this EIB to create or update payroll history payments.

### EIB Input File Guidelines

#### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Process: Off Cycle (On Demand)* and *Process: Off Cycle (Manual Payment)* domains in the Core Payroll functional area to run this EIB.

#### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider
- Refer to this documentation [Concept: Dates in Payroll Off-Cycle Payment EIB](#)

[Spreadsheets](#), which provides examples for this EIB.

- Use report Pay Calculation Off-Cycle Inputs for Group of Workers to help you validate the data you're loading. You can run this report for specific statuses and batch IDs.
- Notes for populating these fields in the input file:
  - Spreadsheet Key: Specify a unique value for each off-cycle payment
  - Payment ID: Required field. Enter a unique entry if creating a new off-cycle payment.
  - State Work and State Resident: If populating either of these fields, locate the reference ID using Integration IDs report and search Payroll State Authority.
  - Earning and Deduction Codes: Note that some earning and deduction codes are Workday owned. Be sure to specify the correct reference ID depending on whether it's Workday owned. Example: Deduction\_Code vs Workday\_Deduction\_Code. Update row 4 in the input file to indicate which reference ID you're using.
  - Related Calculations: note that some Related Calculation codes are Workday owned. Be sure you specify the correct reference ID Example: Related\_Calculation\_ID vs Workday\_Related\_Calculation\_ID)

## Common Issues and Errors

Issue	Cause and Solution
The EIB completes successfully, however, you don't see the off-cycle payments in the tenant.	When you load the off-cycle payments using the EIB, they get loaded as unprocessed. You would then need to run pay calculations to process them. To validate the data you loaded, use report Pay Calculation Off-Cycle Inputs for Group of Workers. You can run this report for specific statuses or batch IDs.
The EIB issues an error such as 1 of these errors: <ul style="list-style-type: none"> <li>• <i>Invalid ID value. W_TTWG isn't a valid ID value for type = Related_Calculation_ID</i></li> <li>• <i>Invalid ID value. W_OASER isn't a valid ID value for type = Deduction_Code</i></li> </ul>	You're using the wrong reference IDs in the input file for deduction or related calc. Note that for deductions, there's 1 reference ID called Deduction_Code and another called Workday_Deduction_Code. Also, for related calculation IDs, there's 1 reference ID called Related_Calculation_ID and another called Workday_Related_Calculation_ID.

Issue	Cause and Solution
	<p>If you aren't sure which ID to specify, run Integration IDs report to search the values.</p> <p>Example: for deductions:</p> <ol style="list-style-type: none"> <li>1. Search Deduction in the business object prompt.</li> <li>2. Select Deduction and Deduction (Workday Owned). This action will display a list of all deductions and the reference ID they're using.</li> <li>3. For related calculations, select Related Calculation and Related Calculation (Workday Owned).</li> <li>4. Populate row 4 appropriately in your input file.</li> </ol>
<p>The EIB issues the error:</p> <p><i>Validation error occurred. No eligible processing period exists for the period date.</i></p>	<p>There are multiple causes for this issue. If you receive this error, it might be helpful to test it in the user interface by entering the off-cycle payment using the same information you populated in the input file. You might find that you receive an error or can't enter the information you provided in the input file, as it isn't valid for the worker.</p> <ul style="list-style-type: none"> <li>• Previous Period isn't complete: You can't process payments in a given period until the previous period is complete.</li> <li>• The Period Date/Run Category/Pay Group that you provided isn't permitting the web service to find a period for processing: Note that the web service uses the Period Date to identify the target period for the off-cycle payment. If you populate Run Category, the web service will check for the period date within the run category you specified. If Run category blank, the web service will look for the period date in the regular run category. If you populate the pay group, it also assists in identifying the correct period. If the pay group is blank, then the web service looks for the pay group that the worker is in as of the period date.</li> </ul>
<p>My EIB input file looks different than the attached sample: it has 2 worksheets.</p>	<p>This web service underwent major changes starting with v36.2. Create a new EIB to make certain you're using v36.2 or higher.</p>
<p>Slow Performance</p>	<p>This issue will occur if you're using an EIB older than v36.2 and you've assigned a separate header key value to each off-cycle payment entry. Example: You upload 1,000 off-cycle payments and assign each payment a different header key value. The result is that it creates 1,000 background jobs, which queue up and take a long time to process. There's no easy way to recover from this scenario other than wait for all</p>

Issue	Cause and Solution
	the jobs to complete their processing. Create a new EIB to verify you're using v36.2 or higher.
EIB fails with error: <i>Net amount entered isn't correct</i>	<p>This issue can occur for 2 reasons:</p> <ul style="list-style-type: none"> <li>The net amount and earning/deduction amounts, specified in the EIB input file, don't balance out to \$0.</li> <li>Or spreadsheet key values and row id values aren't correct in the EIB input file.</li> </ul> <p>Take these steps to resolve the issue:</p> <ol style="list-style-type: none"> <li>Verify that the net amount and earnings and deduction amounts balance to \$0 for each payment in the EIB input file</li> <li>Check the spreadsheet key values and row id values for each off-cycle payment. Keep in mind that all entries for a given payment must use the same spreadsheet key value and payment id.</li> </ol>
<p>EIB fails with error:</p> <p><i>Validation error occurred. The entered information does not meet the restrictions defined for this field. (Position_Reference)</i></p>	Confirm that you've GET access to domain Worker Data: Payroll (Payroll Input).
<p>EIB fails with an error like this:</p> <p><i>Validation error occurred. Multiple Element Contents, including Payroll Off-cycle Payment Data/l2/Manual Payment Data [EL], contain data where only one is allowed by mutex Payroll Off-cycle Payment Data</i></p>	<p>This issue occurs if you populate both the On Demand Payment and Manual Payment sections of the EIB input file.</p> <p>Check the file and verify that you're populating only 1 section for each payment entry.</p>
EIB completes successfully but doesn't update the Pay to Balance Account field.	<p>Current functionality requires you to populate Pay Group field to properly update the Pay to Balance Account field</p> <p>We're investigating whether to change this behavior (internal ticket PAYWDCORE-42542). In the meantime, you need to populate the Pay Group field.</p>

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new entries or update existing entries. You can't delete entries nor can you rescind since this EIB doesn't use a business process.
- If you have inadvertently uploaded incorrect entries, you can use task Delete by Batch ID and then remove the entries by specifying the batch ID you used in the input file. Note: You can't delete entries used in completed payroll results.

For reference documentation for all web services including Import Payroll Off-Cycle Payment, see [Operation Directory](#).

### Sample EIB Input File

[Import\\_Payroll\\_Off-Cycle\\_Payment-WD36](#)

## Concept: Import Position Budget EIB

### Background

You can use this EIB to add or update position budget details.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Create Position Budget
- Create Position Budget Amendment

There's also a similar EIB - Import Budget - that you can use to create or update budgets for financial projects.

### EIB Input File Guidelines

#### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Process: Position Budget* domain in the Budgets functional area to run this EIB.

#### Guidelines for Adding Worktags to the EIB Template

1. From the related actions of your EIB, select Template Model > View.
2. On the left, click All for Position Budget Lines Replacement Data section.
3. On the right, locate Accounting Worktags.
4. From the related actions on the magnifying glass next to Accounting Worktags, select Template Model Column > Maintain Additional Columns.
5. Enter all worktags that you need to assign to the template.
  - Note: if you selected *Pay Component* on your Plan Structure, you'll be using Earning Code and Workday Deduction

## Additional Input File Guidelines

- Code when maintaining the additional columns on the EIB.
- You won't be adding Ledger Account here as there are separate columns:
6. After you've completed the previous steps, regenerate the spreadsheet template and add newly added worktags to the spreadsheet template.
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:
    - Before populating the EIB input file, you might want to first test populating a budget entry by using the User Interface, using Create Position Budget task. This action will help ensure that you can successfully add a budget line with the proper configuration.
    - Most likely, you'll need to make some changes to your EIB template to add all the worktags that you've assigned to the plan structure. If you aren't certain how to do this action, see [Guidelines for Adding Worktags to the EIB Template](#) section.
    - Worksheet#1 for Import Position Budget. As you populate this worksheet, consider:
      - There should be only 1 row in this worksheet (assuming you're loading information for just 1 budget).
      - Header Key: This field should have a value of 1.
      - Add Only: Selecting Yes will add new plan lines. Selecting No will enable updates to the existing budget.
      - Position Budget: This field remains blank for original budgets and you can populate the field if you're updating an existing position budget.
      - Row ID: Normally there's only 1 row populated with a 1.
      - AutoComplete: Set this field to Y if you wish for the business process event to automatically process and skip approval and to do steps.
      - Locked in Workday: Locked in Workday is a boolean flag controlling a user's ability to edit the transaction. If Workday sets the flag, the user can't edit, cancel, or change the transaction inside the Workday application,

- however the user can submit a draft transaction. You can only update the transaction from the web service.
- Submit: Submit for Approval, indicating the action of the transaction (submit or save in draft mode). If this flag value is *Y*, Workday submits the transaction, otherwise Workday saves the transaction in draft.
  - Position Budget Group: Workday requires this field for original position budget. Workday doesn't populate the field when loading Position Budget Amendments. To locate the Position Budget Group id, use the related actions of your Position Budget Group value, select Integration IDs > View IDs.
  - Budget Structure: To locate the Budget Structure id, use the related actions of your Plan Structure value, select Integration IDs -> View IDs.
  - Fiscal Year Number: Displays on the View Fiscal Year report.
  - Fiscal Time Interval: Workday sets this field to Fiscal\_Summary\_Interval\_ID with a line value representing Annual. Use the View Fiscal Summary Schedule report for Annual.
  - Position ID: for this header row of data.
  - Compensation Budget Total: This REQUIRED field represents the sum of the compensation lines from Worksheet #2 for this Position ID.
  - Business Plan Amendment Type: Workday only requires an Amendment Type when loading Position Budget Amendments. Reference Maintain Budget Amendment Types.
  - Worksheet#2 for Budget Lines Data. As you populate this worksheet, consider:
    - Header Key: This field should have a value of 1 for all entries (assuming you're loading information for just 1 budget).
    - Line Key: Each entry needs a unique value. We recommend you start with value 1 and increment by one for each additional entry.
    - Line Order If specified, lines will be sorted by this value when displayed.
    - Company on Budget Line: Used this field when you have included Company on your structured Dimensions on

- the Plan Structure. Otherwise leave it blank.
- Compensation Account: The ledger Account where Workday posts the compensation.
  - Account Set: The Account Set specified on the Plan Structure.
  - Fringe Account: The ledger Account where Workday posts the Fringe benefits.
  - Account Set: The Account Set specified on the Plan Structure.
  - Compensation Amount: Workday sums up the amounts entered here for a position (if there are multiple lines) and compares with the amount on Worksheet #1, column T.
  - Fringe Amount: If you're budgeting for Fringe, this amount will be the fringe benefits for the compensation on this line.
  - Account Worktags: Note that if you're budgeting for Spend Category, the Spend Category for Fringe Benefits will populate from the Plan Structure.
  - If your budget contains over 25,000 entries, we suggest you load 25,000 per EIB. You can add Multiple Loads to 1 Position Budget Group ID.

## Common Issues and Errors

Issue	Cause and Solution
<p>The EIB fails with the error:</p> <p><i>Job Families for Position Restriction are not Included on the Budget Structure</i></p>	<p>The Import Position Budget web service validates the Job Profile, Job Family or, Job Family Group with the respective value on the Position Restriction.</p> <p>You'll need to validate that all Position Restrictions have a valid value for the Structured Dimension configured on the Plan Structure.</p>
<p>The EIB fails with the error:</p> <p><i>One or more budget lines have matching Company, Ledger Account Summaries/Ledger Accounts and Accounting Worktags with another line</i></p>	<p>If you encounter this error, take these steps to resolve the issue:</p> <ul style="list-style-type: none"> <li>• First, check for duplicate entries in the input file: when you compare the ledger account and all the worktags within each position, each line should be unique.</li> <li>• Check that the Template Model hasn't had columns added or deleted.</li> </ul>
<p>The EIB fails with the error:</p> <p><i>Budget Period does not exist for Budget</i></p>	<p>This issue indicates that you've not specified the correct Year or Fiscal Time Interval. Check the instructions in the <i>Tips for Populating the Input File</i></p>

Issue	Cause and Solution
	section above, on how to populate the year and fiscal time interval.
<p>The EIB fails with the error:  <i>Worktag is not valid for the Budget Line</i></p>	<p>There are multiple causes of this issue. If you encounter this error, you can test whether you can enter the information by the user interface using Create Position Budget. Performing this test would help determine whether it's a configuration issue or an issue with how you're populating the EIB input file:</p> <ul style="list-style-type: none"> <li>• This issue can occur if you've specified an inactive worktag,</li> <li>• Another cause is if you haven't configured the worktag in the structure dimension. Or you've configured the worktag in the structure dimension but it doesn't include all members.</li> </ul>
There's no option to launch the integration	<p>This issue will occur if you don't have the proper access to the Position Budget Group Event business process security policy. Try these actions:</p> <ul style="list-style-type: none"> <li>• Check the Position Budget Group Event business process security policy and make certain you have access to Initiating Action Import Position Budget (WS Background Process).</li> <li>• Activate the change.</li> </ul>

## Business Processes

Position Budget Group Event.

### Use Cases and Guidelines for Recovering from a Bad Load

Position Budgets does have Cancel functionality. The ability to cancel a Position Budget added either from an EIB or by the User Interface gets secured to the domains Process: Cancel Position Budget and Process: Position Budgets Amendments. If the business process hasn't been completed, then the cancel button is visible on the approval page. If the business process is complete, the cancel functionality is available through a related action on the business process.

To update the budget, use the amend functionality.

For reference documentation for all web services including Import Position Budget, see [Operation Directory](#).

### Sample EIB Input Files

[Import\\_Position\\_Budget-WD32-Example1-Original Budget](#)

[Import\\_Position\\_Budget-WD32-Example2-Budget Amendment](#)

## Concept: Put Payroll History Payment EIB

### Background

You can use this EIB to add or update payroll history payments.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

Task: Run History Payment for Worker.

### EIB Input File Guidelines

#### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration
  - You must have access to the *Process: Load, Calculate, Cancel, Complete History* domain in the Core Payroll functional area to run this EIB.

#### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- As you populate the EIB input file, consider:
  - Spreadsheet Key: Enter a unique value for each Payroll History Payment.
  - This EIB has a Generate Spreadsheet with Data option, which is very helpful to use when you aren't certain how to populate the input file. To use it:
    - Verify that your EIB is using the latest web service version. If you're not certain what version you're using, create a new EIB,

which will uptake the latest version.

- From related actions of your EIB, select Template Model > View.
- Select Edit Template with Data Options.
- Set the filter to Condition Rule Filter.
- Select a rule condition to retrieve specified history payments. Example: You could select a payment date greater than or equal to a specified date.
- If you regenerate the template and select the Generate Spreadsheet with Data option, you can view how the file populates for the payroll history payments that you selected.

## Common Issues and Errors

Issue	Cause and Solution
The EIB completes successfully but there are no entries loaded or updated.	You need to use Run History Payment for Worker or Run History Pay Calculation to complete the transactions.
After you upload your payroll history and execute Run Pay History Calculation, some of the pay history might still be unprocessed.	Use the Payroll Input Not Processed report to do your balancing against your input files and against any of the delivered payroll registers.

## Use Cases and Guidelines for Recovering from a Bad Load

This web service enables you to add new payroll history payments or update existing payroll history payments. You can't delete entries through the EIB nor can you rescind since this EIB doesn't use a business process.

If you have inadvertently uploaded incorrect entries, below are some options to consider:

- If you've not yet run history payment, you can
  - Use Delete by batch ID and specify the batch ID you entered in the input file when you originally loaded the entries.
  - Select Delete Off-Cycle Payment and enter the batch ID.
  - Remove the entries.
- If you've already run the history payment, use Run History Pay Cancel.
- Another option would be to reload the entries with corrected information.

For reference documentation for all web services including Put Payroll History Payment, see [Operation Directory](#).

## Sample EIB Input File

[Put\\_Payroll\\_History\\_Payment-WD30](#)

## Concept: Put Payroll Involuntary Withholding Order EIB

### Background

You can use this EIB to add or update withholding orders.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

Any information that you submit with this EIB replaces and overwrites the information currently in Workday.

To avoid data loss, include all existing withholding orders and any new withholding orders in your EIB input file. You can do this by generating your EIB spreadsheet with data. See: [Example: Generate EIB Spreadsheet Template with Data](#) on page 64.

If you use ADP SmartConnect to manage your garnishments, consider consulting with ADP first to determine their bandwidth for the changes you want to make.

### Equivalent Workday Task

Task: Record US Withholding Order for Worker.

You can also use these integrations to update information related to Withholding Orders:

- Electronic Income Withholding Order Inbound: An integration template to import electronic income withholding orders into Workday from the Federal Office of Child Support Enforcement (OCSE) portal. See [Steps: Set Up Inbound Electronic Income Withholding Order Integration](#) for more information.
- Put Canada Income Withholding Order: This web service adds or updates all types of income Withholding Orders for Canada.
- Put Withholding Order Local Minimum Wage Rate: This web service will load Withholding Order Local Minimum Wage(s) for existing Withholding Orders.

### EIB Input File Guidelines

#### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Worker Data: Payroll (Income Withholding Orders)* domain in the Core Payroll functional area to run this EIB

#### Guidelines for Modifying the EIB Template

If you're planning to update existing withholding orders, you should modify the EIB template, configure the EIB to generate with data, and then generate the template with data. Note that if you don't modify the template, when you generate with

data, there will most likely be some fields without data. Example: In situations where the default reference id type, used by the template, is different than the reference id type used by your withholding orders.

- From the related actions of your EIB, select Template Model > View.
- On the left, click Payroll Involuntary Withholding Order .
- On the right, click Edit Template Model Sheet . You'll need to wait a few seconds before information displays.
- Scroll down and locate the template model area with the label Payroll Involuntary Withholding Order Data:.
- Locate the row with Employee\* label and select the check the box for Separate Type Column.
- Locate the row with the Issued in\* label and select the check box for Separate Type Column.
- Go to the Template Model Area and locate the row with the label Non Resident State: and select the check box for Separate Type Column.
- Click OK.
- From the related actions of your EIB, select Template Model > View.
- Click Edit Template with Data Options.
- Select Condition Rule Filter in the Filter section.
- Build the rule conditions. Note: It might not be possible to refine the conditions to extract the specific withholding orders that you plan to update. If that is the case, relax the conditions and then you can edit the EIB input file after it's built and remove any nonrelevant orders.
- Regenerate the EIB and select the Generate Spreadsheet with Data check box.
- There are a few items to be aware of:
  - The Payroll Involuntary Withholding Order filed in column D is empty. You'll need to populate this field. You can copy the filed values in the last column (Withholding Order ID) to column D. After you make this change, the values in column D and the last column should be the same.
  - For the fields where you changed the template to use the Separate Type Column option, you'll see that

#### Configure the EIB to Generate with Data

## Additional Input File Guidelines

there are now 2 columns in the EIB input file for each of these fields. The first column (ID Type) displays the reference id type and the second column (ID Value) displays the value. These columns enable you to easily include multiple reference id types in your EIB input file.

- NOTE: When using the EIB to update existing withholding orders, the EIB input file must include all existing field values. If you don't include the existing field values, the EIB will remove the values from the withholding order. For this reason, you'll want to use the generate with data option if updating existing withholding orders.
- Be sure to thoroughly test in Sandbox before using the EIB in your production tenant.
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- As you populate the EIB input file, consider:
  - To prevent data loss, we recommend that you generate your spreadsheet with data for the Put Payroll Involuntary Withholding Order EIB. See: [Example: Generate EIB Spreadsheet Template with Data](#) on page 64.
  - Spreadsheet Key: Specify a unique value for each withholding order
  - Add Only: Set to Y if adding a new withholding order. Set to N if updating existing withholding orders.
  - Payroll Involuntary Withholding Order (column D): Leave blank if creating a new withholding order. If updating an existing withholding order, the field needs populated with the reference id value for the withholding order that you're updating. Note that if you generated the template with data, you can merely copy the value from the very last column (*Withholding Order ID*) into this field.
  - Withholding Order Case\*: If updating an existing order, this field must contain the reference id of the existing case order
  - Case Number: If updating an existing order, this field must be blank. If

- adding a new withholding order, this field must have a value.
- Withholding Order ID (in very last column): If you're creating a new withholding order, you can either leave the field blank, or populate it if you want to assign your own reference id value. If you're updating an existing order, this field should contain the same value as the Payroll Involuntary Withholding Order field in column D.

## Common Issues and Errors

Issue	Cause and Solution
The EIB issues this error:  <i>Element Content Case_Number Required Mutex error Payroll Involuntary Withholding Order Data</i>	This issue will occur if you try to change a case# for an existing withholding order. You can't update the Case Number. Instead, you'll need to end the existing withholding order and set up a new one.
The EIB issues this error:  <i>Validation error occurred. Withholding Order Case Reference is not valid when adding a new Withholding Order for any Withholding Order type except Support Order. Use Case Number instead.</i>	This issue can occur if you're attempting to update an existing withholding order but don't populate the Withholding_Order_ID value in column D. Note that if you generated the template with data, you can copy the value from the very last column (Withholding Order ID) into this field.
When updating existing withholding orders, the EIB completes successfully but data is missing from the withholding orders	This EIB requires that you populate the EIB input file with all existing data. If you don't populate existing data in the EIB input file, the web service removes it.

## Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new withholding orders or update existing withholding orders. You can't delete withholding orders; however, you can deactivate them.
- This web service doesn't use a business process. There's no rescind/cancel option to use if you inadvertently created incorrect withholding orders or accidentally overwrote existing data. Below are recovery options to consider:
  - Rerun the EIB and update the withholding orders with correct information. Or you could deactivate any faulty withholding orders and then load new ones.
  - If data was overwritten, possibly you can recover the data from a nonproduction tenant such as Sandbox, by generating a spreadsheet with data. Then use the EIB to reload the data to production.

For reference documentation for all web services including Put Payroll Involuntary Withholding Order, see [Operation Directory](#).

## Sample EIB Input File

[Put\\_Payroll\\_Involuntary\\_Withholding\\_Order-WD34\\_2](#)

## Concept: Put Payroll Off-Cycle Payment EIB

### Background

You can use this EIB to add or update off-cycle payroll payments.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

On the related actions of the worker's profile, select Payroll > Manual Payment (for manual payments) or Payroll > On-Demand Payment (for on-demand payments).

There are also similar EIBs related to payroll. Consider these options as you determine what works best for you:

- Import Payroll Off-Cycle Payment: You can use this EIB to add or update large volumes of off-cycle payments (Example: 1000 or more entries).
- Import Payroll Input: You can use this EIB to load large volumes of payroll input entries (Example: 1000 or more).
- Put Payroll History Payment: You can use this EIB to create or update payroll history payments.

### EIB Input File Guidelines

#### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Process: Off Cycle (On Demand)* domain in the Core Payroll functional area to run this EIB

#### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.

- As you populate the EIB input file, consider:
  - See [Concept: Dates in Payroll Off-Cycle Payment EIB Spreadsheets](#), which provides examples for this EIB.
  - Spreadsheet Key: Each off-cycle payment needs a unique spreadsheet key.
  - Row ID: The Row ID can be tricky to populate, especially if an off-cycle payment has multiple earnings/ deductions or multiple related calculations. Refer to the attached example to better understand how to populate the row ID.
  - Payment ID: Workday requires this field. Enter a unique entry if creating a new off-cycle payment.
  - State Work and State Resident: If populating either of these fields, locate the reference ID using Integration IDs report and search Payroll State Authority.
  - Earning and Deduction Codes: Note that some earning and deduction codes are Workday owned. Be sure to specify the correct reference ID depending on whether it's Workday owned (Example: Deduction\_Code vs Workday\_Deduction\_Code). You'll need to update row 4, in the input file, to indicate which reference ID you're using.
  - Related Calculations: Note that some Related Calculation codes are Workday owned. So be sure you specify the correct reference ID (Example: Related\_Calculation\_ID vs Workday\_Related\_Calculation\_ID)

## Common Issues and Errors

Issue	Cause and Solution
The EIB completes successfully but you don't see the off-cycle payments in the tenant.	When you load the off-cycle payments using the EIB, they get loaded as unprocessed. You'll need to run pay calculations to process. To validate the data you loaded, use the Pay Calculation Off-Cycle Inputs for Group of Workers report. You can run this report for specific statuses or batch IDs.
The EIB issues an error such as: <ul style="list-style-type: none"> <li><i>Invalid ID value. W_TTWG isn't a valid ID value for type =Related_Calculation_ID</i></li> </ul>	You're using the wrong reference IDs in the input file for deduction or related calculation. Note that for deductions, there's 1 reference ID called Deduction_Code and another called Workday_Deduction_Code. Also, for related

Issue	Cause and Solution
<ul style="list-style-type: none"> <li>Invalid ID value. W_OASER isn't a valid ID value for type =Deduction_Code</li> </ul>	<p>calculation IDs, there's 1 reference ID called Related_Calculation_ID - and another called Workday_Related_Calculation_ID.</p> <p>If you're unsure which ID to specify, run Integration IDs report to search the values. Example: For deductions, search Deduction in the business object prompt. Then select Deduction and Deduction (Workday Owned). You'll see a list of all deductions and the reference ID they're using.</p> <p>For related calculations, select Related Calculation and Related Calculation (Workday Owned). Then populate row 4 appropriately in your input file.</p>
<p>The EIB issues error:</p> <p><i>Validation error occurred. No eligible processing period exists for the period date.</i></p>	<p>There are multiple causes for this issue. If you receive this error, you can test in the user interface by entering the off-cycle payment using the same information you populated in the input file. You might find that you receive an error and can't enter the information you provided in the input file, as it isn't valid for the worker.</p> <ul style="list-style-type: none"> <li>Previous Period isn't complete: You can't process payments in a given period until the previous period is complete.</li> <li>The Period Date/Run Category/Pay Group that you provided isn't allowing the web service to find a period for processing. Note that the web service uses the Period Date to identify the target period for the off-cycle payment. If you populate Run Category, the web service will check for the period date within the run category you specified. If Run category remains blank, the web service will look for the period date in the regular run category. If you populate the pay group, it assists in identifying the correct period. If the pay group remains blank, then the web service looks for the pay group that the worker is in as of the period date</li> </ul>
<p>EIB fails with an error like this:</p> <p><i>Validation error occurred. Invalid ID value. 'I' isn't a valid ID value for type = 'Payment_ID'</i></p>	<p>Make certain you're populating the payment ID in column E (Payment ID) with a unique value. Don't populate the ID in column C or you'll receive this error.</p>
<p>EIB fails with error:</p> <p><i>Net amount entered isn't correct.</i></p>	<p>This issue can occur for 2 reasons:</p> <ul style="list-style-type: none"> <li>The net amount and earning/deduction amounts, specified in the EIB input file, don't balance out to \$0.</li> <li>Or spreadsheet key values and/or row id values, aren't correct in the EIB input file.</li> </ul> <p>To resolve the issue:</p>

Issue	Cause and Solution
	<ol style="list-style-type: none"> <li>1. Verify that the net amount and earnings and deduction amounts balance to \$0 for each payment in the EIB input file</li> <li>2. Check the spreadsheet key values and row ID values for each off-cycle payment. Keep in mind that all entries for a given payment must use the same spreadsheet key value and payment ID.</li> </ol>
EIB fails with this error: <i>Validation error occurred. The entered information does not meet the restrictions defined for this field. (Position_Reference)</i>	Confirm that you've GET access to domain Worker Data: Payroll (Payroll Input).
EIB fails with an error like this: <i>Validation error occurred. Multiple Element Contents, including Payroll Off-cycle Payment Data/l2/Manual Payment Data [EL], contain data where only one is allowed by mutex Payroll Off-cycle Payment Data</i>	This issue occurs if you populate both the On Demand Payment and Manual Payment sections of the EIB input file. Check the file and verify that you're populating only 1 section for each payment entry.
EIB completes successfully but ignores the Pay to Balance Account field.	Current functionality requires you to populate Pay Group field to properly update the Pay to Balance Account field

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new entries or update existing entries. You can't delete entries nor can you rescind since this EIB doesn't use a business process.
- If you have inadvertently uploaded incorrect entries, an option would be to use task Delete by Batch ID and then remove the entries by specifying the batch ID you used in the input file. Note: You can't delete entries used in payroll results.

For API documentation for all web services including Put Payroll Off-Cycle Payment, see [Operation Directory](#).

### Sample EIB Input File

[Put\\_Payroll\\_Off-cycle\\_Payment-WD32](#)

### Concept: Put Payroll USA State and Local Tax Election EIB

#### Background

You can use this EIB to create worker USA tax elections for state and local tax authorities.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

Task: Add Worker US Tax Elections.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Worker Data: Payroll (Company Specific) - USA* domain in the USA Payroll functional area to run this EIB

### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:
- As you populate the EIB input file, consider:
  - Proceed with great caution when using this EIB, as there's no mass rescind option nor is there a way to mass update or mass delete tax elections. Be certain you thoroughly test in a Sandbox tenant
  - You might want to create a custom report if you need to review existing tax election information for employees. The tax election information is

- available from the Worker Business Object.
- The EIB input file contains sections for this information:
  - General Applies to all types of elections
  - State (Column G to BC)
  - SUTA (Column BD to BE)
  - County (Column BF to BJ)
  - City (Column BK to BZ)
  - School District (Column CA to CF)
  - Other (Column CG to CK)
- Details about the various sections with information for the more commonly used fields.
  - General (Column A to F): The fields in this section should always have a value, regardless of the type of tax elections you're loading:
    - Spreadsheet Key: Specify a different value for each unique combination of Worker/Company/State/Effective Date.
    - Company: The company to which the worker for this tax election belongs. If left blank, it populates with the company of the worker's primary position as of the effective date provided. To find the reference ID value for the company, run the View Reference IDs report and select business object *Company*.
    - Worker: Typically you would specify employee IDs, and set cell D4 to Employee\_ID. If you want to add information for both employees and contingent workers, split the columns using the Separate Type Column option as described in: [Customize EIB Spreadsheet Template](#). By using this option, you can list both employees

- and contingent workers in the same input file. (Note that this is optional, and the attached sample EIB input file isn't using this option).
- Effective Date: Enter effective date of tax election in format YYYY-MM-DD.
  - Payroll State Authority: The Payroll State Authority to which these elections apply. To find the reference ID value, run the Integration IDs report and select business object *Payroll State Authority*.
  - State (Column G to BC): Populate this section if loading State elections
    - Effective Date: Leave blank.
    - Payroll Withholding Status: To find the reference ID value, run the Integration IDs report and select business object *Payroll Withholding Status*.
    - Number of Allowances: Enter integer value for the number of allowances.
  - City (Column BK to BZ)
    - Tax Address Type: Tax Address Type of Home, Work or Both that denotes whether this local tax election applies to the worker's home or work tax authority or both.
    - Payroll Local City Authority: To find the reference ID value, run the Integration IDs report and select business object *Payroll Local City Authority*.

## Common Issues and Errors

Issue	Cause and Solution
EIB issues an error such as:	Remove the effective date value from column G.

Issue	Cause and Solution
<i>Validation error occurred. Attribute not supported by California Tax Authority. Valid Attributes are: Additional Amount, Copy Mode, Estimated Deductions, Exempt Indicator, Lock In Letter, MSRR Exempt, No Wage No Tax Indicator, Number of Allowances, and Tax Authority Not in Proposed Company.</i>	
<i>Although the EIB completes successfully, I don't see any updates.</i>	<p>You can:</p> <ol style="list-style-type: none"> <li>1. Edit EIB input file.</li> <li>2. Verify that you populated the Row ID value in the section you're updating.</li> </ol>
<p>EIB issues an error like this: <i>Error: Other Tax Authority Reference doesn't share the same County Region as the State Tax Authority.</i></p>	<p>Add the Payroll State Authority in Column F of the EIB spreadsheet. This task is to ensure that the selected authority matches up correctly to the selected state.</p>
<p>EIB fails with this error: <i>The Company specified is not valid for the Worker.</i></p>	<p>Populate SLE in EIB input file, if applicable. Alternatively, use the EIB and manually enter 1 of the entries that's failing. This test will verify that the user interface allows the company you're trying to load with the EIB.</p>
<i>Unable to launch the EIB.</i>	<p>This issue is most likely security-related. See <i>EIB Input File Guidelines</i> section for details on configuring security.</p>

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new entries. You can't update existing entries or delete entries.
- There's no option to cancel or rescind since the EIB doesn't use a business process
- If you inadvertently loaded incorrect data, below are options to consider:
  - You can manually update or delete the tax elections.
  - You could correct the tax election information in the EIB input file and then resubmit. (This correction won't update the previously loaded entry, but it will add a new entry with the correct information.)
  - You could also set the Inactivate flag to Y in the EIB input file and then reload the data. Again, it won't remove the previously loaded entry, but it adds a new entry to indicate that the election is now inactive.

For reference documentation for all web services including Put Payroll USA State and Local Tax Election, see [Operation Directory](#).

### Sample EIB Input File

[Put\\_Payroll\\_USA\\_State\\_and\\_Local\\_Tax\\_Election-v39](#)

### Concept: Put Period Schedule EIB

#### Background

You can use this EIB to add or update period schedules.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

## Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Create Period Schedule
- Edit Period Schedule

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the:
    - *Set Up: Payroll - Pay Group Specific* domain in the Core Payroll functional area to run this EIB.
    - *Set Up: Time Off (Calculations - Absence Specific)* domain in the Time Off and Leave function area to run this EIB.
    - *Set Up: Payroll Interface* domain in the Payroll Interface functional area to run this EIB.
    - *Set Up: Period Schedule* domain in the Project Tracking functional area to run this EIB.

### Configure the EIB to Generate with Data

- From the related actions of your EIB, select Template Model > View.
- Click Edit Template with Data Options.
- Select Condition Rule Filter in the Filter section.
- Add a rule condition.
- Click OK.
- Regenerate the template and select the Generate Spreadsheet with Data check box.

### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.

- To prevent data loss, we recommend that you generate your spreadsheet with data for the Put Period Schedule EIB. See: [Example: Generate EIB Spreadsheet Template with Data](#) on page 64.
- If you're extending an existing period schedule, it's not necessary to populate section Period Data+ (All > Period Schedule Data) with the existing period start/end dates but rather you can just add the new period start and end dates.
- You might find it easiest to use the Generate Spreadsheet with Data option to help determine how to populate the fields. If you're creating a new period schedule, we suggest you manually create it and add 1 or 2 periods. Then you can generate with data and have a helpful template to use to add remaining periods.
- As you populate the EIB input file, consider:
  - Section All:
    - Spreadsheet Key: Specify a unique value for each Period Schedule.
    - Add Only: Set to Y only if adding new schedules.
    - Period Schedule ID (column D): This field should remain blank.
  - Section Period Schedule Data (All):
    - Period Schedule ID (column E):
      - If updating an existing schedule, place the period schedule's reference id value in this field.
      - If you're creating a new schedule, populate the field with the reference id value you wish to assign or else leave the field blank, and the Workday will assign a value.
    - Period Schedule Name: Name of the period schedule.
    - Frequency: Schedule frequency. To find the reference id value, run the View Reference IDs report and select business object *Frequency*.
    - Usage: Enter all usages that apply to the schedule. Each usage needs to be on a new row. To find the reference ID values, run the Integration IDs

report and select business object *Period Schedule Usage*.

- Section Period Data+ (All > Period Schedule Data):
  - Row ID: Enter a unique Row ID value for each Period Start/End Date.
  - Period Start Date: Enter the period start date in format YYYYMMDD. You can also specify time if you wish. Sample field values: 2021-02-01T00:00:00 or 2021-02-01. If you're extending an existing period schedule, you might find it helpful to use this [method from Microsoft](#) to populate the dates:
  - Period End Date: Enter the period end date in format YYYYMMDD. You can also specify time if you wish. Sample field values: 2021-02-01T00:00:00 or 2021-02-01.
  - Payroll Payment Date: This field is only for Workday Payroll and Workday Payroll interface usage. Enter the payroll payment date in format YYYYMMDD. You can also specify time if you wish.
  - Period ID:
    - If updating an existing period, specify the reference id value of the period.
    - If creating a new period, you can either populate the field with the reference id value you wish to assign, or else leave the field blank and the Workday will assign a value. Be very careful not to specify a reference id value that is already in use as it will overwrite an existing period. To find values currently in use, run the *Reference IDs report* and select business object *Period*.

## Common Issues and Errors

Issue	Cause and Solution
EIB issues <i>Error - The load contains a duplicate key '</i>	Check your EIB input file and verify that the spreadsheet key is present for each entry.
<p>EIB fails with this error:  <i>Payroll Payment Date can only be entered if period schedule usage includes Payroll. Payroll Payment Date is required if period schedule usage includes Payroll.</i></p>	<p>This issue occurs when loading a period schedule for Absence and omitting the Usage Type. To resolve:</p> <ol style="list-style-type: none"> <li>1. Edit EIB input file.</li> <li>2. Set Usage+ field to: <i>Usage_Absence</i>.</li> </ol>
<p>When adding new periods to an existing schedule, the EIB completes successfully but you observe 1 of these issues:</p> <ul style="list-style-type: none"> <li>• It didn't load some of the entries.</li> <li>• You might notice that some existing data was overwritten.</li> </ul>	<p>This issue occurs if the EIB input file isn't specifying a new value for Period ID but rather it's using a reference id value that's already in use. When adding new periods, you should leave the Period ID value blank (or else specify a value that isn't yet used).</p> <p>There are 2 options to resolve this issue with option 1 being the easiest and safest:</p> <ol style="list-style-type: none"> <li>1. Leave the Period ID value blank for new entries that you're adding. The web service will treat this as a new entry and assign a reference id value that isn't yet in use</li> <li>2. The other option would be to assign a more meaningful reference id value so that you're certain it isn't in use. Example: You could assign a reference ID = to name of the schedule + period begin date. Example UK-Annual-2021-02-01.</li> </ol> <p>If data was overwritten:</p> <ol style="list-style-type: none"> <li>1. Use the Generate Spreadsheet with Data option in a tenant such as sandbox, where the data is still intact</li> <li>2. Then use the spreadsheet to reload the data.</li> </ol>
I uploaded an EIB for Period Schedule and after successfully uploading it, I noticed it removed some values from the schedule.	<p>This issue can occur if you update an existing schedule but don't populate all the usage types used by the schedule. If this occurs, do this:</p> <ol style="list-style-type: none"> <li>1. To recover the data, you could use the Generate Spreadsheet with Data option in a tenant such as sandbox, where the data is still intact.</li> <li>2. Use the above spreadsheet to reload the data.</li> </ol>
Unable to launch the EIB.	Check your security. See the <i>EIB Input File Guidelines</i> section.
When I load the EIB, it's creating new period schedules for each individual line in the EIB instead of adding to the existing period schedule.	Make certain you specify the Period ID field in the EIB input file.

Issue	Cause and Solution
	There isn't a way to remove the incorrect entries. You can update them and add zDNU to the beginning of the period schedule names.
When loading a new value for Override Accounting Date, it's ignored.	This issue will occur if changing the date for a payroll period that's in progress or complete. In this situation, Workday ignores the date value.

## Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new entries or update existing entries. You can't delete entries.
- This EIB doesn't use a business process. There's no option to rescind or cancel. If you inadvertently uploaded incorrect entries, consider:
  - If you need to correct existing entries, reload the entries with correct information. If you need to restore the original values, you can find another tenant, such as a sandbox or implementation tenant, that still has the correct period schedule. Then use Generate Spreadsheet with Data in that tenant to build an EIB input file to load into the tenant with incorrect period schedule information.
  - You can't delete period schedules. If you inadvertently loaded schedules you want to remove, you can change the names of the schedules and add zDNU to the beginning of the schedule name. Adding this prefix will drop the schedules down to the bottom of the list and make them less visible.

For reference documentation for all web services including Put Period Schedule, see [Operation Directory](#).

## Sample EIB Input Files

[Put\\_Period\\_Schedule-Example1-Create-New-Absence-Schedule](#)

[Put\\_Period\\_Schedule-Example2-Add-Entries-to-Existing-Absence-Schedule](#)

[Put\\_Period\\_Schedule-Example3-Add-Entries-to-Existing-Schedule-with-all-Usages](#)

## Concept: Submit Payroll Input EIB

### Background

You can use this EIB to create or update payroll input.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

Task: Add Payroll Input by Worker.

If you want to manage bulk payroll input using worksheets, see [Steps: Using Payroll Input Workbooks](#).

There are additional integrations and EIBs related to payroll functionality. Consider these options as you determine what works best for you:

- Import Payroll Off-Cycle Payment: You can use this EIB to load large volumes of off-cycle payments (Example: 1000 or more).
- Put Payroll Off-Cycle Payment: You can use this EIB to create or update off-cycle payments.
- Put Payroll History Payment: You can use this EIB to create or update payroll history payments.
- Worker Payroll Input Async: You can use this integration template to import files with worker payroll data from an external server into Workday. See [Steps: Set Up Integration for Worker Payroll Data Import](#).

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Worker Data: Payroll (Payroll Input)* domain in the Core Payroll functional area to run this EIB.

### Configure the EIB to Generate with Data

- This EIB has a Generate Spreadsheet with Data option. Use this option when you aren't certain how to populate the input file. To use it:
  - Manually enter a payroll input like the inputs that you wish to load.
  - From related actions of the input, select Integration IDs > ViewIDs to get the Payroll\_Input\_ID (you'll need this ID later on).
  - From related actions of your EIB, select Template Model > View .
  - Click Edit Template with Data Options.
  - Set filter to Reference ID Filter.
  - Enter the Payroll Input ID from a previous step.
  - If you regenerate the template and click the Generate Spreadsheet with Data option, you can view how the file gets populated for the payroll input you manually created.

### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.

- As you populate the EIB input file, consider
    - Spreadsheet Key: Use a unique value for each payroll input entry.
    - Row ID: Typically is a value of 1 for each entry, unless you have multiple row entries for 1 payroll input.
    - Payroll Input ID: If you're updating an existing payroll input, you need to specify the input ID for that payroll input. To find the ID, create a custom report using data source *Payroll Inputs* and then add field Reference ID to the report. For new entries, you can leave this value blank and the web service will populate it. Or if you choose to populate it, make certain you're using a unique ID.
    - Related Calculation: Note that some Related Calculation codes are Workday owned. Be sure to specify the correct reference ID. Example: Related\_Calculation\_ID vs. Workday\_Related\_Calculation\_ID.
    - After loading the payroll input, you can use Payroll Input by Batch ID to view the loaded entries.
- :

### Common Issues and Errors

Issue	Cause and Solution
The EIB completes successfully, but there are no entries loaded or updated.	<ul style="list-style-type: none"> <li>• This issue can occur if you fail to populate the row ID in the input file.</li> <li>• When updating an existing payroll input and once payroll input is used in a result, then you're restricted to updating only certain fields such as Company and End Date. If you attempt to update other fields such as Amount, the web service will ignore it. To troubleshoot this issue, manually enter a payroll input using the same information as what you specified in the input file. Then you can validate whether it's allowed.</li> <li>• Also, if you specified a Payroll Input ID in the EIB input file, it must have a unique value for each pay input entry. We recommend you leave it blank if adding new entries</li> </ul>

Issue	Cause and Solution
	<ul style="list-style-type: none"> <li>Check if FLSA calendar needs extended as follows: <ul style="list-style-type: none"> <li>Search and select the task <i>View FLSA Work Period Calendar</i>.</li> <li>Search and select your FLSA calendar in the FLSA Work Period Calendar prompt.</li> <li>Click OK.</li> <li>From the related actions, select FLSA Work Period Calendar &gt; Build Work Period Events.</li> <li>Set the Number of Work Periods as desired.</li> </ul> </li> </ul>
<p>You receive the message:</p> <p><i>Changing the worker associated with a Payroll Input isn't allowed when updating an existing Payroll Input.</i></p>	<p>This error message indicates that some of the payroll input IDs specified in the EIB input file are duplicated. Therefore, it's trying to update the existing entries, but it's unable to as they're either completed or assigned to a different worker. If you're adding new payroll input, and want to specify the payroll ID, you might want to prefix the payroll input ID with a date (Example: 2018-06-12) or something to ensure that it's unique.</p>
<p>When populating a related calculation in the input file, you receive an error message such as:</p> <p><i>Validation error occurred. Invalid ID value. 'W_NETGU isn't a valid ID value for type = 'Related_Calculation_ID'</i></p>	<p>You're specifying the incorrect reference ID type in the input file for the related calculation: Note that for related calculations, there's 1 reference ID type called <i>Related_Calculation_ID</i> and another called <i>Workday_Related_Calculation_ID</i>.</p> <p>If you aren't sure which ID to specify, run Integration IDs report to search the values.</p> <p>Example:</p> <ol style="list-style-type: none"> <li>For related calculations, search <i>Related Calc</i> in the business object prompt.</li> <li>Select Related Calculation and Related Calculation (Workday Owned). You'll see all the related calculations and the reference ID type they're using.</li> <li>Populate row 4 appropriately in your input file.</li> </ol>
<p>When using the Generate Spreadsheet with Data option, it's not populating all the information in the EIB input file, such as hours.</p>	<p>Check the Related Calculation section (far right) of the EIB input file as it populates some information here.</p>

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new entries or update existing entries. You can't delete entries.
- If you have inadvertently uploaded incorrect entries, an option would be to use task Delete by Batch ID and then remove the entries by specifying the batch ID you used in the input file (note that you can't delete payroll inputs used in payroll results).

For reference documentation for all web services including Submit Payroll Input, see [Operation Directory](#).

## Sample EIB Input File

[Submit\\_Payroll\\_Input-WD32](#)

## Performance Management EIBs

### Concept: Import Employee Reviews EIB

#### Background

You can use this EIB to import employee reviews from an external system. You can load reviews for employees, contingent workers, and terminated workers.

Note: This EIB discards all reviews if a single review fails to load. If you want to avoid this scenario, consider using the Load Employee Reviews EIB instead.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Start Performance Review for Employee.
- Start Development Plan for Employee.
- Start Disciplinary Action for Employee.
- Start Performance Improvement Plan for Employee.
- Start Performance Review for Organization.

There are also similar EIBs that you can use for employee reviews. Consider these options as you determine what works best for you:

- Manage Goals: You can use this EIB to add new worker goals and edit existing goals for a worker.
- Start Performance Review: You can use this EIB to create in-progress or completed performance reviews for an employee.
- Update Employee Review Rating: You can use this EIB to update employee reviews. You can update the manager's overall ratings and comments along with the item and section ratings.

#### EIB Input File Guidelines

##### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Set Up: Employee Reviews* domain in the

## Additional Input File Guidelines

Performance Enablement functional area to run this EIB.

- This EIB has a Generate Spreadsheet with Data option, which is very helpful when you aren't certain how to populate the input file. To use it:
  1. Manually complete a performance review (in your Sandbox tenant) on the user interface, and enter the same information that you want the EIB to load.
  2. Open the performance review and from related actions, select Integration IDs > View IDs. This option enables you to find the reference ID value for Employee\_Review\_ID.
  3. Copy the value to clipboard.
  4. Go to the EIB, and from related actions, select Template Model > View.
  5. Click Edit Template with Data Options.
  6. Set the filter to Reference ID Filter.
  7. Enter the Employee Review ID value for the performance review that you manually completed.
  8. Generate a spreadsheet template and select Generate Spreadsheet with Data.
  9. You can now view the template to see what the EIB is expecting. Use this template as a starting point when creating a performance review for another employee. Note that you'll need to make some changes to the input file such as removing the Employee Review ID and changing the worker ID. Also, the Generate with Data file does always populate all fields, but it should be helpful in getting started.

Refer to [Customize EIB Spreadsheet Template](#) for more details.

- There are hundreds of fields available in the EIB input file and it isn't possible to describe every field in detail. To help you get started, here's some general information:
  - Manually complete a performance review and enter the same information that you want the EIB to load. This information helps you determine what fields to populate.
  - Always use the Generate Spreadsheet with Data option. Although the

Generate Spreadsheet with Data option might not populate every field, you can go to the performance review you manually created and use the related actions option to find the reference ID of fields you populated.

- We recommend that you review Concept: EIB Spreadsheet Data Entry Guidelines on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:
  - As you populate the EIB input file, consider:
    - Import Employee Reviews worksheet in the EIB Input File
      - Header Key: Any Import web service, such as this one, batches the input file entries into jobs and processes them asynchronously. The value of the header key determines how many entries get batched per job. We recommend you batch at least 1,000 reviews per job (test in a nonproduction tenant first to find out what works best for you). As a result, the first 1,000+ reviews have a header key value of 1, the next 1,000+ reviews have a header key value of 2, and so on. So you'll likely have just 1 entry in this worksheet with value 1.
      - Employee Review Data worksheet in the EIB Input File
        - Header Key: As noted above, the value would typically be 1 for all entries (unless you have a very large number of performance reviews)
        - Line Key: Use a unique value for each performance review.
        - Employee Review ID: Leave this value blank and the web service will assign it.
        - Review Completed: Set to:
          - Y if you want to complete the review after running the EIB.
          - N if you want the web service to launch the event and then use the business process definition to determine

- who to route the next step to. Note that if you set this field to N, you can't populate the evaluation data in the EIB input file.
- Worker: Enter the employee ID. If you're updating contingent workers, change cell F4 to Contingent\_Worker\_ID. If you're loading both employees and contingent workers, you can configure the *separate type column* option so that you can load both types of workers using the same EIB input file. [Change Emergency Contacts EIB - Inbound](#) is for another EIB, but provides more details about configuring the *separate type column*.
  - Supporting Documents: Although the EIB input file has a section to specify file attachments, it's typically not possible to load attachments using an EIB due to the size limitations of Excel. Currently, Excel supports a maximum of 32,767 characters per cell. Most documents would be much larger than 32,767 characters (especially after encoding in base 64, which Excel requires when uploading a document using a web service). If you need to load attachments, you might want to consider developing a custom integration.
  - A few more guidelines specific to loading reviews with multiple Goals sections:
    - You can't load a combination of Workday-delivered and custom sections when you use multiple sections. Use all custom (tenanted) sections if there are multiple sections.
    - The integration IDs for the sections must come from the [Maintain Employee Review Section Types](#) entries. To view the integration IDs, use the related action off of each entry.
    - Set Section\_Type\_Tenanted\_ID as the column header format for Goals

- Review Section Data+ (All) > Section Type (column DE).
- Increment the Goals Review Section Data > Row ID (column BI) field by 1 for each section.
  - Add the section Integration ID for each row.

## Common Issues and Errors

Issue	Cause and Solution
EIB fails with the error: <i>Section Type is invalid for an Overall Section</i>	Make certain column HP, in the EIB input file, has a value of OVERALL.
The EIB successfully completes, however when viewing the review from the worker profile, there are no ratings.	Although this EIB doesn't fully adhere to the business process framework, it does need these steps to exist in the <i>Start Performance Review</i> business process definition if you wish to load employee review ratings or manager review ratings: <ul style="list-style-type: none"> <li>• Step: Complete Self-Evaluation</li> <li>• Step: Complete Manager Evaluation</li> </ul>
Unable to launch the EIB	This issue is security-related. Refer to <i>Web Service Version and Security Configuration Guidelines</i> .
Unable to generate template with data with this error:  <i>Integration Failed.</i> <i>com.capeclear.mediation.MediationException:</i> <i>application=assemblyGenerateSpreadsheetE2 - Error code : 1 The following error occurred when getting data for the template: Processing error occurred. The task submitted is not authorized. See the consolidated report for further details.</i>	This issue is security-related. Refer to <i>Web Service Version and Security Configuration Guidelines</i> .
EIB fails with errors such as: <ul style="list-style-type: none"> <li>• <i>Evaluation data is only allowed for reviews where Review Completed is true.</i></li> <li>• <i>Overall Evaluation Data can only be included on completed reviews.</i></li> </ul>	If you wish to load evaluation data, you must change the Review Completed flag in the EIB input file to Y.
The EIB completes with errors for just some of the reviews that loaded. However, you find that none of the reviews loaded (even the reviews where no errors appeared).	This issue occurs for this Import web service since a background process loads the data. Address all errors before you load the reviews.  If you want the EIB to load all reviews except the ones that don't pass validation, then use EIB Load Employee Reviews instead.
EIB fails with the error:  <i>An Employee Review already exists for this employee Jane Doe, review type, and date range.</i>	There are a couple of reasons this error can occur: <ol style="list-style-type: none"> <li>1. You're loading a review for an employee that already has a review, because you're trying to update the review. Note that you</li> </ol>

Issue	Cause and Solution
	<p>can't update an existing review. Instead, cancel or rescind the existing review and then reload it.</p> <p>2. There's an issue with the EIB input file and there are 2 entries for the same worker with different line IDs. Verify that the line ID value is the same for all entries that belong to 1 worker.</p>
I want to change the Review Date values but am unable to do so	<p>There isn't a way to change review dates on an in-progress or completed review with the web service or in the user interface. You could cancel the reviews and start over. You would also have to create a new review template when the template includes specified review period dates. This solution might not be ideal, but that is the only option to change the dates currently.</p>
<p>EIB fails with the error:</p> <p><i>The worksheet 'Employee Review Data' contains identifying key values 'null' for which there is no corresponding row in the parent sheet 'Import Employee Reviews'</i></p>	<p>This issue occurs if you don't populate the Header Key value in the EIB input file. Make sure that all entries have a header key value. The value will most likely be 1.</p>
<p>EIB fails with an error like this:</p> <p><i>Missing Required Parm Employee_Review_Section_Type__Mixed__IS (1\$7804) XpressO Call Stack Trace= 86\$69757:null</i></p>	<p>This issue indicates that the EIB input file is missing a value for section type. Make certain that the section type field populated for all sections within the EIB input file, where data is present. To find the reference ID values for section type, you can run the Integration IDs report and search business object Employee Review Section Type.</p>
<p>EIB fails with an error like this:</p> <p><i>com.workday.index.DuplicateIndexException: Duplicate insert on index: Employee Review-ID-Employee Review ID (95\$3516), value: DEVELOPMENT_PLAN-1-4, new instance: id=2489\$5 wid=4b778a4d53f00125ce7640a30b001905 disp=2489\$5, existing: id=2489\$4 wid=4b778a4d53f0018d489362730a004f04 disp=2489\$4</i></p>	<p>This issue can occur if the EIB input file contains a value for <i>Employee Review ID</i>. Leave this field blank so that the web service can assign a unique value.</p>
<p>EIB fails with an error like this:</p> <p><i>Invalid Rich Text internal syntax: Unexpected char in markup at 839</i></p>	<p>This error is common when the EIB input file contains characters in the comments that cause issues when the integration tries to transform the EIB input file into XML. XML uses certain tags (like &amp;, &lt;, &gt;) and XML considers these characters as reserved characters. If the comments contain these characters, it causes a problem when translating the input file into web service requests. Check for comments with the reserved characters and then replace them. Example: for &lt;, replace it with less than or with an escape character.</p>

Issue	Cause and Solution
	<p>Examples of some of the reserved characters, along with their escape characters.</p> <p>&amp; - &amp;amp;</p> <p>&lt; - &amp;lt;</p> <p>&gt; - &amp;gt;</p> <p>" - &amp;quot;</p> <p>' - &amp;apos;</p>
<p>I accidentally canceled or rescinded the performance reviews. Can I reload them using an EIB?</p>	<p>Be aware there are 2 EIBs to load Performance Data:</p> <ol style="list-style-type: none"> <li>1. Start Performance Review</li> <li>2. Import Employee Reviews</li> </ol> <p>The ability to use these EIBs to reload the data depends on the type of information loaded to the performance reviews and whether they are in progress or completed.</p> <p>The Start Performance EIB only supports the importing of the overall rating.</p> <p>The Import Employee Reviews EIB works for completed reviews (if the review is still in progress, then you can't load the evaluation data with this EIB).</p> <p>Depending on the state of the review and the data you need to load, you might be able to use one of the EIBs. However, if the EIBs don't meet your need, then consider:</p> <ol style="list-style-type: none"> <li>1. If the review data exists in a nonproduction tenant, you might be able to gather it from that tenant and reenter it to your Production tenant after relaunching the reviews. Or you might be able to extract it from the nonproduction tenant using the Generate With Data option for the Import Employee Reviews EIB. Then load it back to the Production tenant using the EIB. However, this action works only for completed reviews.</li> <li>2. Reviewing the information from the full process event of the canceled or rescinded reviews, and reenter it.</li> <li>3. Using the Start Performance Review web service to load the overall ratings, but the employees would then need to reenter other missing information.</li> <li>4. Creating a report to provide to employees with the information they need to reenter, using the <i>Employee Reviews Indexed</i> data source.</li> </ol>

Issue	Cause and Solution
	5. As a last resort, restoring the Production tenant to a time before the cancel or rescind. But you'll lose any data entered after the restore time.

## Business Processes

Depending on the type of review template that you use, this EIB uses these business processes:

- Start Performance Review: For performance reviews.
- Start Development Plan: For development plans.
- Start Performance Improvement Plan: For performance improvement plans.

This EIB doesn't check condition rules in the business process definition and automatically skips steps with insufficient information.

## Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to create new performance reviews. You can't delete reviews. You can't update existing reviews except for 1 exception: you can use EIB *Update Employee Review Rating* to update the manager's overall ratings/comments along with the item and section ratings.
- If you have inadvertently uploaded incorrect entries, use Mass Rescind or Mass Cancel (depending on whether the business process event is complete or in progress). Note that there isn't an option to specify the EIB when canceling or rescinding for Import Employee Reviews. Instead, you can enter:
  1. *Start Performance Review* (or the applicable business process event) at the Business Process Types prompt.
  2. The date and time range that you submitted the EIB.

Note: Proceed with Caution because if you inadvertently cancel or rescind the wrong events, you can't undo the cancel or rescind.

For reference documentation for all web services including Import Employee Reviews, see [Operation Directory](#).

## Sample EIB Input File

[Import\\_Employee\\_Reviews-WD33\\_0](#)

## Concept: Manage Goals EIB

### Background

You can use this EIB to add or edit goals for a worker.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

## Equivalent Workday Tasks

See Talent > Edit Goals from the related actions of the worker's profile.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Manage Goals* business process in the Performance Enablement functional area.

### Guidelines for Modifying the EIB Template

If you want to add more than one type of tag that the goals relate to (competencies, development items, feedback, or flex teams), modify the template to add a separate column for the ID type for Relates To+ before generating the template.

1. Click the related action from your *Manage Goals* EIB.
  2. Select Template Model, then select View.
  3. Select Edit Template Model Sheet.
  4. In the Worker Goal Detail Data+ Template Model Area, select the check box for Separate Type Column for Relates To+.
  5. Save and generate the EIB template.
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
  - As you populate the EIB input file, consider:
    - Spreadsheet Key: Specify a unique value for each worker.
    - Worker: Most likely, you'll need to change the reference id type, in row 4, from Contingent\_Worker\_ID to Employee\_ID.
    - Row ID (in column #4): Specify a unique row ID for each goal for a given worker.
    - This EIB does a Replace All. If you're updating existing goals, include all existing fields in EIB input file, to prevent the EIB from removing the fields. You might find it helpful to

### Additional Input File Guidelines

create a custom report to help you populate the EIB input file.

## Common Issues and Errors

Issue	Cause and Solution
Can't find a field in the EIB to make the goal not editable.	The editable option isn't available on the EIB. Therefore, by default, any goals you load by the EIB will be editable. You'll need to manually edit the goal to make it not editable.
<p>The EIB issues an error similar to this:</p> <p><i>Validation error occurred. Invalid Rich Text internal syntax: Unexpected char in markup at 22.</i></p>	<p>The use of the character &lt; outside of rich text tags creates this error: Check your input file for the &lt;character in the goal name or description.</p> <p>To work around this issue, you can either:</p> <ul style="list-style-type: none"> <li>• Replace &lt; with the words less than, or</li> <li>• Replace &lt; with escape expressions. For &lt;, you would use &amp;lt;. Example, if the description contains &lt;150 days , you would use &amp;lt; 150 days instead.</li> </ul>
<p>The EIB fails with error:</p> <p><i>Error parsing Excel file. Make sure the spreadsheet is in Excel XML or XLSX format. Other Excel formats (e.g. xls) are not supported.</i></p>	<p>The error typically occurs if there are some entries in the EIB input file with rich text. Perhaps you copied and pasted information from another tool that allowed these characters. You can:</p> <ol style="list-style-type: none"> <li>1. Make a copy of the EIB input file.</li> <li>2. Then start loading chunks of it at a time, until you encounter the error.</li> <li>3. Copy and paste the field from the EIB input file into a text editor such as Notepad.</li> </ol> <p>Most likely the Description field has odd characters.</p>
There's no option to choose the EIB when launching the integration.	This issue will occur if you don't have the proper access to the Manage Goals business process security policy. Make certain you have access to Initiating Action Manage Goals (Web Service).
The EIB completes successfully, but you don't find the goals you loaded.	Most likely the business process events are still in progress as a step didn't complete due to the EIB input file and business process definition being out of alignment. If this occurs, you can run a mass cancel to cancel the in progress manage goals events. Make any necessary changes to the business process definition and then reload the EIB.
<i>The EIB issues error: Validation error occurred. A goal must have a name.</i>	If updating an existing goal, it's still necessary to include the goal name as well as any other existing information for the goal. If you don't populate it in the input file, the EIB removes it.
Some of the goal information is missing after using the EIB to update an existing goal.	If updating an existing goal, you must include all existing information for the goal: if you don't populate it in the input file, the EIB removes it.

Issue	Cause and Solution
	If this occurs, rescind the business process events for the EIB. Then populate the EIB input file with all existing information that you wish to retain, before resubmitting
<p>The EIB issues error:</p> <p><i>Validation error occurred. You must set the Track By for goal targets and actuals to Percent.</i></p>	<p>This issue will occur if the EIB input field doesn't properly populate the field Goal Target and Annual Track By. Populate the Workday ID (aka WID) value in this field.</p> <p>To get the WID, you can:</p> <ol style="list-style-type: none"> <li>1. Run Integration IDs Report.</li> <li>2. In the Business Object prompt select: <ul style="list-style-type: none"> <li>• Goal Target And Actual Track By (Metadata).</li> <li>• Goal Target And Actual Track By (Tenanted).</li> </ul> </li> <li>3. The Workday ID (WID) value displays.</li> </ol>

## Business Processes

Manage Goals.

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new entries or update existing entries. You can't delete entries.
- If you have inadvertently uploaded incorrect entries, use task Mass Cancel Business Processes or Mass Rescind Business Processes. What you use depends on whether the business process event is complete or in progress. You can then select Business Processes Loaded by EIB to find the integration event that you wish to cancel or rescind. The other option is to enter Manage Goals at the Business Process Types prompt.

For reference documentation for all web services including Manage Goals, see [Operation Directory](#).

### Sample EIB Input File

[Manage\\_Goals-WD32](#)

### Concept: Start Performance Review EIB

#### Background

You can use this EIB to create in-progress or completed performance reviews for an employee.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Start Performance Review for Employee
- Start Development Plan for Employee
- Start Disciplinary Action for Employee
- Start Performance Improvement Plan for Employee

- Start Performance Review for Organization

There are also similar EIBs that you can use for employee reviews. Consider these options as you determine what works best for you:

- Manage Goals: You can use this EIB to add new worker goals and edit existing goals for a worker.
- Put Organization Goal: You can edit a new or existing Goal for an organization.
- Import Employee Reviews: You can use this EIB to import employee reviews from an external system.
- Update Employee Review Rating: You can use this EIB to update employee reviews. You can update the manager's overall ratings and comments along with the item and section ratings.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Start Performance Review* business process in the Performance Enablement functional area to run this EIB.

### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- It's very important to make certain that everything aligns between the EIB input file and Start Performance Review Business Process Definition and Employee Review Template. Example:
  - Start Performance Review business process definition: If you don't want to process a step such as the *Complete Self Evaluation* step, add a condition rule to the step such as External Load isn't blank. Or you can populate the Overview section of the EIB input file to skip the step if it's marked as optional in the business process definition.
  - Employee Review Template: The fields you need to populate in the EIB input file depend on the configuration of the template. Example: If you don't

populate the period start and end dates in the Employee Review Template, then you need to populate these dates in the EIB input file.

- We suggest you start by testing the EIB load for 2 or 3 performance reviews in your Sandbox tenant. You can then make certain that the information is populating properly and the business process event is landing on the desired step.
- As you populate the EIB input file, consider:
  - Overview worksheet in the EIB input file:
    - For sections where you want to load data, and have it automatically processed by the EIB:
      - Set processing instructions to *Automatic Processing*.
      - Populate all required data in the corresponding worksheet for this section.
    - For sections where you want someone to manually process the data:
      - Set processing instructions to *Manual Processing*.
      - Don't populate any data in the corresponding worksheet for this section, except for the Complete Manager Evaluation worksheet. Populate the spreadsheet key at a minimum if you want this step processed.
    - For sections that you aren't using:
      - Set processing instructions to *Skip Processing when Step is marked Optional*.
      - Then edit the *Start Performance Review* business process definition and you can either mark the corresponding step as Optional or else add a condition rule to the step such as *External Load is not blank*.
    - Notifications: Notifications aren't submitted when using processing instructions *Automatic Processing*. Also,

- Workday skips to do steps, approval, and review steps.
- Start Performance Review worksheet in the EIB input file:
    - Spreadsheet Key: Specify a unique value for each worker
    - Employee ID: Specify the employee's ID. Note that this web service doesn't support contingent workers. Use EIB Import Employee Reviews instead.
    - Review Template: To find the reference ID value, you can run the Integration IDs report and select business object *Employee Review Template*. Or you can use View Employee Review Template and from related actions, select Integration IDs > View IDs. Also, note that the review template must be of type: Performance Review. Load other types of review templates using the EIB Import Employee Reviews.
    - Period Start Date and Period End Date: Specify these values only you're not providing a start and end date in the Employee Review Template. Note that you're unable to change these dates once the review has started, so make certain to properly populate the dates.
  - Complete Manager Evaluation worksheet in the EIB input file:
    - If you want to manually complete the *Complete Manager Evaluation* step by the manager, then populate only the Spreadsheet Key value and leave all other fields blank.
    - Manager: If you're populating this field, most likely you'll need to change cell C4 from *Contingent\_Worker\_ID* to *Employee\_ID*.
    - Rating: To find the reference id, go to the Employee Review Template to identify the rating scale that it uses. You can then view the rating scale to check the Review Rating values. From the related action of the Review Ratings, select Integration IDs > View IDs.

## Common Issues and Errors

Issue	Cause and Solution
I accidentally canceled or rescinded the performance reviews. Can I reload them using the EIB?	<p>Note that there are 2 EIBs to load performance data:</p> <ol style="list-style-type: none"> <li>1. Start Performance Review</li> <li>2. Import Employee Reviews</li> </ol> <p>Based on the type of information loaded to the performance reviews and based on whether they're in progress or completed, you might or might not be able to use 1 of the above EIBs to reload the data. Review the information below to help you determine options.</p> <p>Note that Start Performance EIB only allows the importing of the overall rating.</p> <p>The Import Employee Reviews EIB supports completed reviews. If the review is still in progress, then you can't load the evaluation data with this EIB.</p> <p>Depending on the state of the review, and depending on the data you need to load, you might be able to use one of the EIBs. However, if the EIBs don't meet your need, then consider:</p> <ol style="list-style-type: none"> <li>1. If the review data exists in a nonproduction tenant, you might be able to gather it from that tenant and reenter it to your production tenant after relaunching the reviews. Or you might be able to extract it from the nonproduction tenant using the Generate Spreadsheet with Data option for the Import Employee Reviews EIB. Then load it back to the production tenant using the EIB. However, this option will work only for completed reviews.</li> <li>2. You might be able to review the information from the full process event of the canceled or rescinded reviews, and reenter it.</li> <li>3. You could use the Start Performance Review web service to load the overall ratings, but the employees would then need to reenter other missing information.</li> <li>4. You could create a report, using data source Employee Reviews Indexed, to provide to employees with the information they need to reenter.</li> <li>5. As a last resort, you could restore the production tenant to a time prior to the cancel or rescind, but you'll lose any data entered after the restore time.</li> </ol>
The EIB fails with error:	The integration is expecting information for the manager evaluation. If you want to complete

Issue	Cause and Solution
<i>Validation error occurred. Element Content 'Manager_Reference' is required, on internal element 'Complete Manager Evaluation Sub Business Process'.</i>	this step manually, then update the EIB input file and populate only the Spreadsheet Key value in the Complete Manager Evaluation tab.
<p>The EIB fails with error:</p> <p><i>Validation error occurred. Invalid ID value. '99999' is not a valid ID value for type = 'Employee_ID'.</i></p>	<p>Check to:</p> <ul style="list-style-type: none"> <li>• Make certain the employee ID is valid.</li> <li>• Make certain you aren't specifying a contingent worker. This EIB doesn't support contingent workers.</li> </ul>
<p>I want to change the Review Date values but am unable to do so.</p>	There isn't a way to change review dates on an in-progress or completed review. You can't do this in the web service or user interface. Note that you could cancel the reviews and start over. You would also have to create a new review template if you specified the review period dates in the template. Most likely, you wouldn't want to do this, but that is the only option to change the dates at this time.
<p>The EIB fails with error:</p> <p><i>Period Start Date cannot be populated when the &lt;name of your template&gt; Review Template doesn't contain a Period End Date. Please remove the Period End Date from the request, or change the Review Template to a be a Review Template that allows for Period End Date to be entered.</i></p>	The issue occurs because you're populating the start and end date in the EIB input file, even though you've already specified this information in the template. To resolve the issue, remove the start and end date from the EIB input file.
<p>The notifications aren't firing.</p>	Check the processing instructions. Note that if the processing instructions are Automatic Processing, then Workday suppresses notifications (and also skips approval steps, review steps and to do steps). You'll need to switch the processing instructions to manual processing if you need notifications.
<p>The EIB fails with error:</p> <p><i>The entered information does not meet the restrictions defined for this field. (Employee_Reference).</i></p>	<p>Check to:</p> <ul style="list-style-type: none"> <li>• Make certain the employee isn't terminated. This EIB doesn't support terminated workers. Use Import Employee Reviews EIB instead.</li> <li>• Check the business process security policy for Start Performance Review and make certain you have unconstrained access to initiating action Start Performance Review (Web Service). If you make any changes to the policy, activate the changes before retesting the EIB.</li> </ul>
<p>The EIB fails with an error like this:</p> <p><i>The ABC Development Plan Template is not for the category of performance review. Please review a Template that is for performance reviews.</i></p>	This EIB only supports the loading of Reviews where review type is Performance Review. If you need to load any reviews with a type other than Performance Review, consider using the Import Employee Reviews EIB.

Issue	Cause and Solution
EIB isn't following Business Process steps resulting in unexpected results such as event remaining in progress when you expect it to complete. Or event completes when you expect it to remain in progress.	This issue will occur if using a rule-based business process configuration as we don't yet support rule-based definitions when using the EIB. In the meantime, configure the default definition to support the EIB steps.

## Business Processes

Start Performance Review.

### Use Cases and Guidelines for Recovering from a Bad Load

This web service enables you to create new performance reviews. You can't delete reviews. You can't update existing reviews except for 1 exception: you can use EIB *Update Employee Review Rating* to update the manager's overall ratings/comments along with the item and section ratings.

If you've inadvertently uploaded incorrect entries, use task Mass Rescind or Mass Cancel (depending on whether the business process event was completed or in progress). Note that there isn't an option to specify the EIB when canceling/rescinding for Start Performance Review. So instead, you can enter Start Performance Review on the Business Process Types prompt and enter the date and time range that you submitted the EIB. Proceed with caution because if you inadvertently cancel or rescind the wrong events, you can't undo the cancel or rescind.

For reference documentation for all web services including Start Performance Review, see [Operation Directory](#).

### Sample EIB Input Files

[Start\\_Performance\\_Review-WD33-Example1](#)

[Start\\_Performance\\_Review-WD33-Example2](#)

[Start\\_Performance\\_Review-WD33-Example3](#)

### Concept: Update Employee Review Rating EIB

#### Background

You can use this EIB to update employee reviews.

Note:

- You can only update manager ratings, you can't update employee evaluation information.
- You can only add rating information to existing sections and items, you can't add new sections or items.
- We recommend that you use the EIB only after you complete the manager evaluation in Workday.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

See Business Process > Correct on the related actions menu of a manager evaluation event.

There are also similar EIBs that you can use for employee reviews. Consider these options as you determine what works best for you:

- Import Employee Reviews: You can use this EIB to import employee reviews from an external system.

- Start Performance Review: You can use this EIB to create in-progress or completed performance reviews for an employee.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- This web service underwent major changes for v35.0, so you'll want to make certain your EIB is using a recent web service version. To check the version:
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- You must have access to *Process: Employee Reviews* domain in the Performance Enablement functional area.

### Guidelines for Modifying the EIB Template

Prepare the EIB to generate with data.

- From the related actions of your EIB, select Template Model > View.
- Click Edit Template Model Sheet.
- Locate the Review Section Evaluation Data+ section.
- Select the Separate Type Column check box for Manager Section Rating.
- Locate the Review Component Data+ section.
- Select the Separate Type Column check box for Manager Item Rating.
- Click OK.

### Additional Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.

To prevent data loss, we recommend that you generate your spreadsheet with data for the Update Employee Review Rating EIB. See: [Example: Generate EIB Spreadsheet Template with Data](#) on page 64.

It's easiest to generate the template with data. Then you can merely update the template with any ratings, comments, and so on, that need revising. There's no need to remove the sections or items of the review that you don't need to update: instead, you can just leave them in the EIB input file as is.

If you're not prepopulating the EIB input file by using the Generate Spreadsheet with Data option, it might

be challenging to find reference id values. One possible option would be to review the employee review template and get the reference id values from related actions of the fields within the template.

If populating any data in a given section, include existing values to prevent the web service from removing the data.

- Primary Section

- Spreadsheet Key: Specify a unique value for each individual review.
- Employee (Required): Enter Employee ID or Contingent Worker ID.
- Review Type (Required): To find the reference id value, you can run the Integration IDs report and select business object *Review Type*.
- Period Start Date and Period End Date (Required): Be sure to select the dates that match the review you need to update (you can specify just the date, or you can specify the date and time).
- Rating: The overall rating assigned to the review.
- Override Overall Rating: Specify whether to override the rating for the section. The web service ignores the value if you haven't enabled the Rating with Overrides option.
- Manual Override: Overall rating assigned to the review if manually overriding. (Only applies to configurations with manual override.)
- Comment: Overall Manager Comment. You can use html markup, if desired

- Review Section Evaluation Data

- Row ID: Enter a unique row id value for each different section within a given employee review.
- Section ID: The Reference ID of a Review Section. You can't add new sections to the review.
- Manager Section Rating: The manager's rating of the section, if permitted in the employee review template. Updating this field implies you're attempting to override the current rating. You can enter a reference id value for either the proficiency rating or the review rating, depending on what you configured for the section. In the attached sample EIB input file, we used the Separate Type Column option so that you can

populate both the reference id type and the reference id value. This option is helpful as it allows you to easily populate rating and proficiency scales within a single EIB input file. Refer to *Guidelines for Modifying the EIB Template* section on how to modify the template to separate the rating column so that you can specify both the reference id type and reference id value.

- **Override Section Rating:** Applies if you configured a section with override.
- **Manager Section Comment:** Manager Comment for the section. You can use html markup, if desired.
- **Review Component Data (Items for each Section)**
  - Row ID: Enter a unique row id value for each individual item within a given section.
  - Item ID: The Reference ID value of an Item. You can't add new items to the review.
  - Item Name: The name of the item. This field is informational only and you can leave it blank if you wish.
  - Weight: Enter value if applicable and if permitted for the item.
  - Manager Item Rating: The manager's rating of the item. Updating this field implies you're attempting to override the current rating. You can enter a value for either the proficiency rating or the review rating, depending on what you configured for the item. In the attached sample EIB input file, it uses the Separate Type Column option so that you can populate both the reference id type and the reference id value. This option is helpful as it allows you to easily populate either rating or proficiency scales within a single EIB input file. See *Guidelines to Modifying the EIB Template* section on how to modify the template to separate the columns.
  - Manager Item Comments: Manager Comments for the item. You can use html markup, if desired.

## Common Issues and Errors

Issue	Cause and Solution
Unable to launch the EIB.	When running report View Security for Securable Items, you'll see that you need "Put" access to domain security policy Process Employee Reviews to run this EIB. Add the access and activate the change. Then retest.
<p>The EIB issues errors like these:</p> <ul style="list-style-type: none"> <li>• <i>Rating Reference is not allowed unless the employee review uses a template with an overall rating method of "Prompt for Overall Rating" or "Calculated Rating with overrides". These are the only 2 rating methods that allow for a Rating Reference to be entered.</i></li> <li>• <i>Review Rating is not valid for the rating scale used for this review.</i></li> <li>• <i>A manager evaluation does not exist for the following information provided: Employee: Review Type: Annual Performance Review Start Date: 2019 01 01 End Date: 2019 01 02</i></li> </ul>	This issue will occur if the EIB can't find an existing review that matches the review type and the period start/end date that you selected. If you receive this error, verify you've entered the correct start and end date and that the reference id, for the review type, is correct.
My EIB input file has fewer columns than the attached sample EIB input file.	<p>There are 2 things to check:</p> <ol style="list-style-type: none"> <li>1. Make certain you're using version v35.0 or newer as this version includes several new fields. If you're not certain what version you're using, create a new EIB, which will uptake the latest version</li> <li>2. The attached EIB input file uses the Separate Type Column option for some fields so that you can specify both the reference id type and value to use. To use this option, see <i>Guidelines for Modifying the EIB Template</i> section on how to modify the template to separate the columns.</li> </ol>
<p>The EIB issues this error:</p> <p><i>Validation error occurred. A manager evaluation does not exist for the following information provided: Employee: Review Type: Annual Performance Review Start Date: 2019 01 01 End Date: 2019 12 31.</i></p>	This error might occur if the review is still in progress. Note that the review event must have already reached or gone past the Complete Manager Evaluation step.
The EIB completes successfully but didn't update all the ratings.	<p>Note that:</p> <ul style="list-style-type: none"> <li>• Values entered in the Section or Overall rating fields are ignored for configurations other than Calculated with Overrides.</li> <li>• If you configured the Employee Review Template to calculate with overrides, then check the EIB input file and verify that fields Override Overall Rating and Override Section Rating are set to Y.</li> </ul>
After the EIB completes, some of the existing information, such as comments, are removed.	The web service does a <i>replace all</i> for each section. If populating any data in a given section,

Issue	Cause and Solution
	include existing values to prevent the web service from removing the data.
<p>EIB fails with an error like this:</p> <p><i>You cannot change the name of a review component.</i></p>	<p>This issue occurs if the Item Name you specified in the EIB input file is different than the Item Name used by the review.</p> <p>To resolve this issue:</p> <ul style="list-style-type: none"> <li>• Use the Generate Spreadsheet with Data option to create the EIB input file. This option should populate the correct item name in the EIB input file.</li> <li>• Another option is to remove the Item Name value from the EIB input file since it's a read-only value</li> </ul>

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to update or remove rating information.
- There's no rescind option. If you have inadvertently uploaded incorrect entries, just correct the ratings in the EIB input file and resubmit it. If you need to remove a rating, use value {empty} in the EIB input file (refer to attached sample file for an example)

For reference documentation for all web services including Update Employee Review Rating, see [Operation Directory](#).

### Sample EIB Input Files

[Update\\_Employee\\_Review\\_Rating-WD35\\_0](#)

[Update\\_Employee\\_Review\\_Rating-v40](#)

## Recruiting EIBs

### Concept: Create Evergreen Requisition EIB

#### Background

You can use this EIB to create new evergreen job requisitions.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

Task: Create Evergreen Requisition.

There are also similar EIBs that you can use for job requisitions. Consider these options as you determine what works best for you:

For evergreen job requisitions:

- Close Evergreen Requisition
- Edit Evergreen Requisition

For non-evergreen job requisitions:

- Close Job Requisition
- Create Job Requisition

- Edit Job Requisition

## EIB Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.

Ensure that the steps in your *Evergreen Requisition* business process definition in Workday align with the information that you populate in the EIB input file. Example: If the *Evergreen Requisition* business process has a Post Job step, either populate the post job information in the EIB input file or add a condition rule to the *Evergreen Requisition* business process to skip the step. Example: Add a condition rule where External Load = N.

As you populate the EIB input file, consider:

- Spreadsheet Key: Specify a unique value for each evergreen requisition.
- Job Description: You can use HTML to add rich text formatting, such as bold, italics, and bullets to any field.

## Common Issues and Errors

Issue	Cause and Solution
The EIB completes successfully but evergreen requisitions don't load.	<p>This can occur if the information in the EIB input file doesn't align with the steps in your <i>Evergreen Requisition</i> business process definition in Workday.</p> <ol style="list-style-type: none"> <li>1. Run the Mass Cancel Business Processes task (secured to the <i>Business Process Administrator</i> domain in the System functional area) to cancel any in progress <i>Evergreen Requisition</i> events.</li> <li>2. Update the information in your EIB input file to align with the steps in your <i>Evergreen Requisition</i> business process definition.</li> <li>3. (Optional) In Workday, consider updating the business process definition by: <ul style="list-style-type: none"> <li>• Marking any unnecessary steps as optional and then setting the processing instructions in the EIB input file to <i>Skip Processing</i> for optional steps.</li> <li>• Adding condition rules on steps to skip them in the business process if needed. Example: Add a condition rule where External Load = N.</li> </ul> </li> <li>4. Rerun the EIB.</li> </ol> <p>You can use the Business Processes tab in the EIB integration event to view and identify the business processes that are still in progress.</p>
The EIB displays an error message such as: <i>Invalid ID value. Regular is not a valid ID value for type = Contingent_Worker_Type_ID.</i>	In the Worker Sub-Type field, specify employee ID values instead of contingent worker ID values.

Issue	Cause and Solution
<p>The EIB displays an error message such as:  <i>Invalid ID value. P-00017 is not a valid ID value for type = Academic_Affiliate_ID.</i></p>	<p>In the Academic Affiliate ID fields on the Assign Organization Roles tab, specify position ID values instead of academic affiliate ID values.</p>

## Business Processes

Evergreen Requisition.

### Use Cases and Guidelines for Recovering from a Bad Load

This EIB only enables you to add new evergreen requisitions. If you want to update existing requisitions, consider using the Edit Evergreen Requisition EIB.

If you've uploaded incorrect entries, you can use either the Mass Cancel Business Processes task (if the event is still in progress) or Mass Rescind Business Processes task (if the event is complete). Both of these tasks are secured to the *Business Process Administrator* domain in the System functional area. You can then select Business Processes Loaded by EIB to find the integration event that you want to cancel or rescind.

For reference documentation for all web services including Create Evergreen Requisition, see [Operation Directory](#).

### Sample EIB Input File

[Create\\_Evergreen\\_Requisition-WD31](#)

### Concept: Create Job Requisition EIB

#### Background

You can use this EIB to create new job requisitions.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

Task: Create Job Requisition.

There are also similar EIBs that you can use for job requisitions. Consider these options as you determine what works best for you:

- Close Job Requisition
- Edit Job Requisition

For evergreen job requisitions:

- Close Evergreen Requisition
- Create Evergreen Requisition
- Edit Evergreen Requisition

For posting and unposting jobs:

- Post Job
- Unpost Job
- Update Job Posting

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Job Requisition* business process type in the Pre-Hire Process functional area to run this EIB.

### Additional Input File Guidelines

We recommend that you:

- Review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- Ensure that the steps in your *Job Requisition* business process definition in Workday align with the information that you populate in the EIB input file. Example: If the *Job Requisition* business process has a Request Requisition Compensation step, either populate the compensation information in the EIB input file or add a condition rule to the *Job Requisition* business process to skip the step. Example: Add a condition rule where External Load = N.

As you populate the Overview tab of the EIB input file, consider:

- We recommend that you set the Create Requisition processing instructions to *Run Now with Automatic Processing*. This ensures that all job requisition information is ready when the Post Job step runs.

As you populate the Create Requisition tab of the EIB input file, consider:

- **Spreadsheet Key:** Specify a unique value for each job requisition.
- **Position Restriction:** Specify the position ID. Only populate if the position already exists. The position must be in a position-management organization.

- Supervisory Organization: Only populate if the position hasn't been created yet.
- Create Job Requisition Reason: You can find a list of reference ID values by running the View Reference IDs report, searching for the *General Event Subcategory* business object and then filtering the Business Object Instance field for *Create Job Requisition*.
- Attachment Section: We recommend that you avoid adding attachments to this EIB to prevent data processing issues.
- Job Description: You can use HTML to add rich text formatting, such as bold, italics, and bullets to any field.

On the Post Job tab (Optional) of the EIB input file, consider:

- If you prefer, you can post jobs later using a Post Job EIB instead.
- Job Posting Site: You can find a list of reference ID values by running the View Reference IDs report and searching for the *Job Posting Site* business object.

On the Assign Organization Roles tab (Optional) of the EIB input file, consider:

- If you prefer, you can assign roles later using a Assign Roles EIB.
- Effective Date: We recommend that you leave this field blank.
- Organization Role: Specify the type of role. Example: Primary Recruiter.
- Row ID: Specify a unique value for each role for a given job requisition.
- Role Assignee++: Specify the person assigned to the role. Change the reference ID type in cell C4 to *Position\_ID*.

On the Request Requisition Compensation tab (Optional) of the EIB input file, consider:

- Compensation Grade, Compensation Grade Profile, Compensation Package: These values might populate automatically in Workday based on your eligibility rules configuration. For more details, see [FAQ: Compensation Defaulting](#).

## Common Issues and Errors

Issue	Cause and Solution
Although the EIB completes successfully, no job requisitions are loaded or some information is missing.	This can occur if the information in the EIB input file doesn't align with the steps in your <i>Job Requisition</i> business process definition in Workday.

Issue	Cause and Solution
	<p>1. Run the Mass Cancel Business Processes task (secured to the <i>Business Process Administrator</i> domain in the System functional area) to cancel any in progress <i>Job Requisition</i> events.</p> <p>2. Update the information in your EIB input file to align with the steps in your <i>Job Requisition</i> business process definition.</p> <p>3. (Optional) In Workday, consider updating the business process definition by:</p> <ul style="list-style-type: none"> <li>• Marking any unnecessary steps as optional and then setting the processing instructions in the EIB input file to <i>Skip Processing</i> for optional steps.</li> <li>• Adding condition rules on steps to skip them in the business process if needed. Example: Add a condition rule where External Load = N.</li> </ul> <p>4. Rerun the EIB.</p> <p>You can use the Business Processes tab in the EIB integration event to view and identify the business processes that are still in progress.</p>
EIB completes successfully but doesn't post the job to the career site. Or the job is posted but the description is missing.	<p>Check these:</p> <ul style="list-style-type: none"> <li>• Check the business process event for one of the job requisitions and verify that the posting step was processed. If not, verify that the posting step is in the business process definition and isn't being skipped due to a condition rule.</li> <li>• Check the Overview tab of the EIB input file and verify that processing instructions are set to <i>Run Now with Automatic Processing</i> for the <i>Create Requisition</i> business process. This will ensure that job requisition information is ready at the Post step.</li> <li>• Wait 1-2 hours as it might take some time for the indexing job to complete.</li> </ul>
<p>EIB issues this error:</p> <p><i>Invalid ID value. 'Regular' is not a valid ID value for type = 'Contingent_Worker_Type_ID'.</i></p>	<p>Change the reference ID type in cell C4 to <i>Position_ID</i>.</p>
<p>EIB issues this error:</p> <p><i>Error parsing Excel file. Make sure the spreadsheet is in Excel XML or XLSX format. Other Excel formats (e.g. xls) are not supported.</i></p>	<p>Ensure that your EIB input file doesn't contain any special characters. Example: &amp;.</p>
<p>EIB issues an error similar to this:</p> <p><i>Invalid ID value. 'P-00017' isn't a valid ID value for type = 'Academic_Affiliate_ID'.</i></p>	<p>In the Academic Affiliate ID fields on the Assign Organization Roles tab, specify position ID values instead of academic affiliate ID values.</p>

Issue	Cause and Solution
<p>EIB issues an error like this:</p> <p><i>Validation error occurred. Multiple Element Contents, including Create Job Requisition Data/a1/Supervisory Organization from Position Group [WS], contain data where only one is allowed by mutex Create Job Requisition Data.</i></p>	<p>This can occur if you attempt to populate the EIB input file with both a supervisory organization and a position.</p> <p>In this scenario, the position is already associated with a supervisory organization so the integration gets confused by the redundant information supplied in the input file.</p> <p>Remove the value for supervisory organization.</p>
<p>Unable to launch the EIB</p>	<p>This is most likely security-related.</p> <p>Verify you have the correct security configuration.</p> <p>Ensure that you are in the relevant security group and have access to the <i>Job Requisition</i> business process type in the Pre-Hire Process functional area.</p>

## Business Processes

Job Requisition.

## Use Cases and Guidelines for Recovering from a Bad Load

This EIB only enables you to add new job requisitions.

If you want to update existing requisitions, consider using the Edit Job Requisition EIB.

If you've uploaded incorrect entries, you can use either the Mass Cancel Business Processes task (if the event is still in progress) or Mass Rescind Business Processes task (if the event is complete). Both of these tasks are secured to the *Business Process Administrator* domain in the System functional area. You can then select Business Processes Loaded by EIB to find the integration event that you want to cancel or rescind.

For reference documentation for all web services including Create Job Requisition, see [Operation Directory](#).

## Sample EIB Input File

[Create\\_Job\\_Requisition-v39](#)

## Concept: Edit Job Requisition EIB

### Background

You can use this EIB to edit existing job requisitions. You can only edit open job requisitions.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

Task: Edit Job Requisition.

There are also similar EIBs that you can use to update job requisitions. Consider these options as you determine what works best for you:

- Create Job Requisition: You can use this EIB to create job requisitions (nonevergreen).
- Manage Job Requisition Freeze: You can use this EIB to freeze or unfreeze a job requisition.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Job Requisition Change* business process type in the Pre-Hire Process functional area to run this EIB.

### Additional Input File Guidelines

- Ensure that the steps in the Job Requisition Change business process definition align with what you're populating in the EIB input file. Example: if the business process definition includes an Assign Roles step, then you need to perform one of these actions:
  - To assign a role, populate the role assignments in the EIB input file. Also, in the Overview tab of the EIB input file, set the processing instructions to Automatic Processing for Assign Organization Roles.
  - If you don't want to assign roles, you can add a condition rule to skip the step in the business process definition (Example: add condition rule External Load = N).
  - Or modify the business process definition and mark the step as optional. Then in the EIB input file, set the processing instructions to Skip Processing when Step is optional.
- If you're populating a subprocess within the EIB input file, ensure that the Job Requisition Change business process definition has a step for this process. Example: if you're populating Compensation in the EIB input file, then the Job Requisition Change business process definition needs to include the Request Requisition Compensation step.
- Perform these checks for each step in the Job Requisition Change business process definition. Ensure that the business

process definition and the EIB input file align. Otherwise you might encounter situations where the EIB doesn't load information, or the Job Requisition Change event remains In Progress, after the EIB load completes.

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:
- As you populate the EIB input file, consider
  - Spreadsheet Key: Specify a unique value for each job requisition
  - Edit Job Requisition Reason: Workday requires this field. If you need to view the list of reference ID values, you can run the Integration IDs report and search business object General Event Subcategory
- Referring to the attached EIB input files to see examples of how other fields are populated.

## Common Issues and Errors

Issue	Cause and Solution
EIB issues errors related to posting the job requisitions.	In some cases, it's necessary to unpost the job requisitions before reposting them through the Edit Job Requisition EIB. To unpost the jobs, run the Unpost Job EIB.
The EIB issues error: <i>Questionnaires for Job Requisition can't be modified once a Candidate has applied to a Job Posting for the Job Requisition.</i>	<p>This issue can occur if using an older web service version or if the tenant configuration doesn't permit updates to questionnaires. Verify this configuration:</p> <ul style="list-style-type: none"> <li>• First, go to Edit Tenant Setup – HCM and make certain that you've set Enable questionnaire removal or replacement on evergreen and job requisitions.</li> <li>• Also, make certain that your Edit Job Requisition EIB is using the latest web service version. If you aren't sure, create a new EIB, which will ensure that the EIB uses the latest version.</li> </ul>
The EIB issues this error: <i>Element Content 'Job_Requisition_Data' is required, on internal element 'Edit Job Requisition Event Data'</i>	Make certain that the Row ID in column F has a value.
The EIB completes successfully. Some changes display correctly in Workday, but other changes are missing.	Most likely the business process definition has condition rules causing some steps to get skipped. If you supply information in the input file, Workday ignores the information if:

Issue	Cause and Solution
	<ul style="list-style-type: none"> <li>• The business process step has a condition rule that evaluates to False.</li> <li>• The business process definition is missing the step.</li> </ul> <p>To check for these types of issues, view the full process record of the business process event and look for steps that the record displays as not required. Change the condition rules on these steps, if needed. After you make corrections, run the Mass Cancel Business Processes or Mass Rescind Business Processes task (depending on whether the events have completed). Then, rerun the EIB.</p>
The EIB completes successfully but Workday didn't make the changes.	<p>This issue occurs when business process events are still in progress. The underlying cause is that 1 of the steps didn't complete due to the EIB input file and business process definition being out of alignment. If this misalignment occurs, use the Mass Cancel Business Processes task to cancel the job requisition changes that are in-progress. Then correct the problem, and rerun the EIB.</p> <p>Also note that there's a Business Processes tab that displays in the EIB integration event after the EIB successfully completes. This tab enables you quickly to view all business process events that the EIB loaded. You can determine whether the events completed or are still in progress. To view details about any of the job requisition events, you can view the full process record from the related action of the event.</p>
Can't launch the EIB.	<p>This issue is most likely security-related. See the <i>Web Service Version and Security Configuration Guidelines</i> section of this topic.</p>

## Business Processes

Job Requisition Change.

### Use Cases and Guidelines for Recovering from a Bad Load

This web service enables you to edit only. If you wish to add new entries, you can use the Create Job Requisition web service.

If you have inadvertently uploaded incorrect entries, use either the Mass Cancel Business Processes task or the Mass Rescind Business Processes task. You can then select Business Processes Loaded by EIB to find the integration event that you wish to cancel or rescind. Or the other option is to enter Job Requisition Change at the Business Process Types prompt.

For reference documentation for all web services including Edit Job Requisition, see [Operation Directory](#).

## Sample EIB Input Files

[Edit\\_Job\\_Requisition-WD34-Example1-Misc-Changes](#)

## [Edit\\_Job\\_Requisition-WD34-Example2-Compensation-and-Role-Assignments\\_1](#)

### Concept: Edit Position EIB

#### Background

You can use this EIB to edit a filled position.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

Task: Edit Position.

There are also similar EIBs that you can use for positions and jobs. Consider these options as you determine what works best for you:

- Change Job: You can use this EIB to perform a job change on an employee or contingent worker.
- Create Job Requisition: You can use this EIB to create new job requisitions for a position.
- Edit Position: You can use this EIB to edit a filled position.
- Hire Employee: You can use this EIB to hire a pre-hire (new or existing) into an employee position.
- Import Edit Position: You can use this EIB to edit large volumes of positions (Example: 1000 or more). If you need to edit large volumes of positions, consider testing in your sandbox tenant to determine which EIB performs better for your use case.

#### EIB Input File Guidelines

##### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Edit Position* business process type in the Staffing functional area to run this EIB.

##### Additional Input File Guidelines

- You might find it helpful to start by manually editing a position and making the same type of changes you want to load using the EIB. By making these changes, you can verify which fields Workday requires. Manually editing a position might also be helpful when populating Reference ID values in the input file. You can then identify the Reference ID values by viewing the position that you manually updated. Then, go to each field,

and from related actions, select Integration IDs -> View IDs

- Ensure that the steps in the *Edit Position* business process definition align to what you are populating in the EIB input file. Example: if the *Edit Position* business process has an *Assign Pay Group* step, then perform 1 of these actions:
  - To update the pay group field, populate the pay group information in the EIB input file. Then, in the *Overview* tab of the input file, set the processing instructions to *Automatic Processing for Assign Pay Group*.
  - If you don't want to update the pay group field, you can add a condition rule to skip the step in the *Edit Position* business process definition. Example: add condition rule *External Load = N*.
  - Modify the *Edit Position* business process definition and mark the step as optional. Then, in the EIB input file, set the processing instructions to *Skip Processing when Step is marked optional*.

If you're populating a subprocess within the EIB input file, ensure that the *Edit Position* business process definition has a step for this process. Example: if you're populating default compensation in the EIB input file, then the *Edit Position* business process definition needs to have the *Request Default Compensation for Position Event* step.

Perform these checks for each step in the *Edit Position* business process definition. If the business process definition and the EIB input file don't align, then you might encounter these situations:

- The EIB doesn't load information into Workday.
- The *Edit Position* event displays as still in progress after the EIB load completes.
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:
  - **Spreadsheet Key:** Specify a unique value for each Position.
  - **Worker and Position:** You can enter just the worker reference if the worker has only 1 position that you can edit. If the worker has more than one

accessible position, you must specify the position.

- Effective Date: Enter the effective date of the change. If the position has more recent effective date changes than what you specify in the input file, then the current position information won't reflect the change.
- Additional Job Classifications: the web service operation performs a *replace all* for this field. Therefore, you must list all relevant job classifications in the EIB input file (one per row). Those classification entries will replace the current job classification values assigned to the position. To remove existing job classifications, and not replace the classifications with new values, then enter value *{empty}*.

## Common Issues and Errors

Issue	Cause and Solution
<p>EIB issues this error: <i>Validation error occurred. Element Content 'Filled_Position_Edit_Details_Data' is required, on internal element 'Edit Position Event Data'</i>.</p>	<p>Populate at least 1 field in the <i>Position Details</i> sections of the EIB. If you encounter this error, populate field Position ID (column G), as populating this field satisfies the requirement of populating at least 1 <i>detail</i> field</p>
<p>The EIB completes successfully and makes some changes in Workday, but other changes are missing.</p>	<p>This issue typically occurs for 1 of 2 reasons:</p> <ul style="list-style-type: none"> <li>• You entered an older effective date, and made other changes to the position, with a newer effective date. Therefore, the changes in the EIB input file don't match the current position information. To resolve this problem, specify a more recent effective date in the input file. Then, mass-rescind the edit position events that you loaded, and reload the EIB file.</li> <li>• The other cause of this issue is that the business process events are still <i>in progress</i>. This issue occurs because one of the steps didn't complete due to the EIB input file and business process definition being out of alignment. If this issue occurs, you can run Mass Rescind Business Process to cancel the <i>in progress</i> edit position events. Then correct the problem, and rerun the EIB.</li> </ul> <p>Also, note that there's a Business Processes Loaded tab that displays in the EIB integration event, after the EIB successfully completes. This tab enables you to view all business process events that the EIB loaded. From here, you can</p>

Issue	Cause and Solution
	determine whether the events have completed or are still in progress. To view details about the position events, view the full process record from the related action of the event.
The EIB completes successfully but the changes don't display in Workday.	<p>Most likely, the business process definition has condition rules causing the EIB to skip some of the steps. Even if you supply information in the input file, the EIB ignores the information if</p> <ul style="list-style-type: none"> <li>The business process step has a condition rule that evaluates to false.</li> <li>The business process definition is missing the step.</li> </ul> <p>To check for these types of issues, view the full process record of the business process event and look for steps that are <i>not required</i>. Change the condition rules on these steps, if needed. After making corrections, you can run a <i>mass cancel</i> or <i>mass rescind</i> (depending on whether or not the events complete). Then you can rerun the EIB.</p>
When using the <i>Request Compensation Change</i> subprocess, the subprocess removes or adds plans that aren't in the EIB input file.	When editing the position (either manually or using EIB), the EIB uses default compensation from the position as a source to populate compensation attributes automatically. If default compensation isn't available, then the EIB uses eligibility rules to populate compensation attributes. If you need to edit compensation for a filled position and don't want to use any default values, then you might want to consider using the Request Compensation Change EIB instead. See <a href="#">FAQ: Compensation Defaulting</a> .
When using Request Compensation Change subprocess and populating only the plan name, the web service sets amount to \$0 individual target, instead of using the default values for the plan.	Submitting plans with no value counts as \$0 for this web service. Workaround is to populate the amount, frequency, and currency.

## Business Processes

Edit Position.

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to edit positions. You can't add or delete positions using this web service.
- If you have inadvertently uploaded incorrect entries, use either the Mass Rescind Business Processes or the Mass Cancel Business Processes tasks. You can then select *Business Processes Loaded by EIB* to find the integration event that you wish to cancel or rescind. Another option is to enter *Edit Position* at the *Business Process Types* prompt and then enter the data range when the EIB ran.

For reference documentation for all web services including Edit Position, see [Operation Directory](#).

## Sample EIB Input Files

- [Edit\\_Position-WD31-Example1-Change-Pay-Group](#)
- [Edit\\_Position-WD31-Example2-Change-Position-Details](#)
- [Edit\\_Position-WD31-Example3-Change-Location](#)
- [Edit\\_Position-WD31-Example4-Add-Default-Compensation](#)

## Concept: Manage Job Requisition Freeze EIB

### Background

You can use this EIB to freeze or unfreeze job requisitions. Don't file or close the requisition.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Tasks

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Manage Job Requisition Freeze.
- Mass Action on Job Requisitions. See [Steps: Set Up Mass Actions on Job Requisitions](#) for more information.

There are also similar EIBs that you can use for job requisitions. Consider these options as you determine what works best for you:

- Close Job Requisition
- Create Job Requisition
- Edit Job Requisition

For evergreen job requisitions:

- Close Evergreen Requisition
- Create Evergreen Requisition
- Edit Evergreen Requisition

For posting and unposting jobs:

- Post Job
- Unpost Job
- Update Job Posting

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.

- Verify you have the correct security configuration.
- You must have access to the *Manage Job Requisition Freeze* business process in the Pre-Hire Process functional area.
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- As you populate the EIB input file, consider:
  - **Spreadsheet Key:** Specify a unique value for each job requisition.
  - **Job Requisition:** Enter the job requisition id.
  - **Freeze Unfreeze Reason:** Workday requires this field. To find the reference id values for the reasons, you can use the View Reference IDs report and select business object *General Event Subcategory*. Then you can filter the business object instance column by *freeze* to view the appropriate entries.
  - **Freeze Unfreeze Date:** Enter the freeze or unfreeze date in format YYYY-MM-DD.
  - **Frozen:** Enter Y or N.

## Additional Input File Guidelines

### Common Issues and Errors

Issue	Cause and Solution
<p>EIB issues this error when attempting to unfreeze a job requisition:</p> <p><i>Validation error occurred. Cannot unpost job when unfreezing a job requisition</i></p>	<p>Workday delivered a fix in 2020R2 (internal ticket HRJOBREQ-4833), to address this issue. If you still encounter this error, create a new EIB to uptake the latest web service version. Then, retest. If you still experience the issue, you can:</p> <ul style="list-style-type: none"> <li>• Create a new EIB that you'll use specifically for unfreezing job requisitions. You might want to name it <i>Manage Job Requisition Unfreeze</i>.</li> <li>• From the related actions of the EIB, select <b>Template Model &gt; View</b>.</li> <li>• At the bottom of the page, you'll see a <b>Business Process Tab</b> listing each step.</li> <li>• Click <b>Edit Business Process for Template</b>.</li> <li>• Check the <i>Hidden</i> check box on the <i>Unpost Job Sub Business Process</i> entry.</li> <li>• Click <b>OK</b>.</li> <li>• Regenerate the template.</li> </ul>

Issue	Cause and Solution
	<ul style="list-style-type: none"> <li>• Repopulate the data in the new template and retest.</li> </ul>
<p>EIB issues this error when attempting to freeze a job requisition:</p> <p><i>Validation error occurred. Cannot post job when freezing a job requisition.</i></p>	<p>To resolve the error, you can:</p> <ul style="list-style-type: none"> <li>• Edit the EIB input file.</li> <li>• Go to the <i>Overview</i> tab.</li> <li>• Set the processing instructions to <i>Automatic Processing</i> for Post Job.</li> <li>• Go to the <i>Post Job</i> tab. In Column B, enter the same spreadsheet key value that matches corresponding entry in the Manage Job Requisition Freeze tab</li> </ul>

## Business Processes

Freeze Job Requisition.

## Use Cases and Guidelines for Recovering from a Bad Load

If you have inadvertently uploaded incorrect entries:

- Use task Mass Cancel Business Processes or Mass Rescind Business Processes (depending whether the business process event is complete or in progress).
- You can then either:
  - Select *Business Processes Loaded by EIB* to find the integration event that you wish to cancel or rescind.
  - Enter *Freeze Job Requisition* at the Business Process Types prompt and enter a date range that you ran the EIB.

For reference documentation for all web services including Manage Job Requisition Freeze, see [Operation Directory](#).

## Sample EIB Input Files

[Manage\\_Job\\_Requisition\\_Freeze-WD34-FREEZE](#)

[Manage\\_Job\\_Requisition-Freeze-WD34-UNFREEZE](#)

## Concept: Move Candidate EIB

### Background

You can use this EIB to move a candidate from any recruiting stage to the next possible stage or to a disposition stage.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

See Job Application > Move Candidate from the related actions menu of the candidate's profile. For more information, see [../../../../human-capital-management/recruiting/recruiting-setup/bml1563928837942.dita](#).

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration
  - You must have access to the *Move Candidate* domain in the Recruiting functional area.
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- Please test thoroughly in a nonproduction tenant for these reasons:
  - You can't undo dispositions if they're incorrectly updated using the EIB.
  - If the notifications aren't properly disabled prior to launching the EIB, you can't stop the email delivery of the notifications after initiating the EIB.
- As you populate the fields in the EIB input file, consider:
  - **Spreadsheet Key:** Specify a unique value for each job application
  - You need to populate just 1 of these 3 fields depending on whether you want to disposition the candidate or move them to a step or a parallel step. To find the reference ID value for these fields, refer to instructions in section [How to find the reference id for a disposition stage or next step](#):
    - Next Step
    - Disposition Stage
    - Start Parallel Stage
  - **Row ID:** Specify a unique row ID value for each entry within a given spreadsheet key value.
  - To indicate which candidate to move, you need to populate one of these

### Additional Input File Guidelines

## Find the Reference ID for a Disposition Stage or Next Step

fields, but don't populate both sets of fields. To find the reference ID value for these fields, refer to instructions in section [How to find reference ids for candidate, job requisition, and job application](#):

- Job Application
- Candidate and Requisition

To populate the *Disposition Step*, *Next Step* or *Parallel* fields in the EIB input file:

1. Display the *Job Application* business process definition and go the appropriate subtab.
2. From the related actions of the step you're moving the candidate to select Integration IDs > View ID's.

## Disable Notifications

There are several options to disable notifications for the candidates you're updating. Test the EIB for a few candidates in a non-Production tenant to verify that the emails aren't firing.

- Option 1
  - Disable notifications in the Job Application business process and any relevant subprocesses. Example: If you're moving all candidates to a specific disposition, you can disable the notification for that disposition.
  - If you select this option, run *Maintain Business Process Definition Selection* and verify that you enabled the Dynamic Business Process Effective Date option for the Job Application business process and subprocesses.
- Option 2
  - Add a condition rule that evaluates to false to any notifications that you don't wish to fire. You might want to consider adding a condition to exclude the user running the EIB. Example *Current user not in selection list UserABC*.
  - As noted in option 1, run task *Maintain Business Process Definition Selection* to verify that you enabled the Dynamic Business Process Effective Date option for the Job Application business process and subprocesses.

- Option 3

- Temporarily disable all notifications in the tenant using task *Edit Tenant Setup - Notifications*.
- If you select this option, it disables ALL notifications in the tenant. If you elect this option, you might wish to run the EIB when there's very little activity in the tenant.

## Common Issues and Errors

Issue	Cause and Solution
<p>EIB issues error:</p> <p><i>Validation error occurred. The next step, parallel step, or disposition chosen is invalid for the job application process.</i></p>	<p>This issue will occur if:</p> <ul style="list-style-type: none"> <li>• The disposition step, populated in the EIB, isn't valid for the job application.</li> <li>• The EIB requires a condition step on the disposition step.</li> </ul> <p>If you don't see any issues with the above configuration, you can try manually moving 1 of the candidates to the disposition, just to verify it's truly valid.</p>
<p>Unable to launch the EIB</p>	<p>This issue is most likely security-related. When running report <i>View Security for Securable Item</i> for securable item <i>Move Candidate (Web Service)</i>, you'll see that you need Put access to domain security policy <i>Move Candidate</i>. To change the security, you can:</p> <ol style="list-style-type: none"> <li>1. Edit the domain security policy for <i>Move Candidate</i>.</li> <li>2. Make certain you are in a security group that has <i>Put</i> access. Ideally, you should be in an unconstrained security group so that you can move any candidate using the web service.</li> <li>3. Activate the security change.</li> </ol>
<p>EIB issues an error like this:</p> <p><i>Validation error occurred. Multiple Element Contents, including Dynamic Business Process Parameters/a1/ Recruiting Next Workflow Step Singular [WS], contain data where only one is allowed by mutex Dynamic Business Process Parameters</i></p>	<p>This error will occur if the EIB input file contains conflicting information. Make sure that you're populating only one of these 3 fields:</p> <ol style="list-style-type: none"> <li>1. Next Step</li> <li>2. Disposition Step</li> <li>3. Start Parallel Stage</li> </ol>
<p>EIB issues an error like this:</p> <p><i>Validation error occurred. Multiple Element Contents, including Move Candidate Data/c/Move Candidate Criteria [EL], contain data where only one is allowed by mutex Move Candidate Data</i></p>	<p>This issue will occur if the EIB input file contains overlapping information regarding the candidate you're moving. Make sure you populate only the job application -OR- the candidate/job requisition.</p>

Issue	Cause and Solution
Notifications are firing even though I disabled them.	See <i>Disable Notifications</i> section for instructions to properly disable notifications.

## Business Processes

The business process that this EIB uses depends on the step you move the candidate to. These include:

- Assess Candidate
- Interview
- Review Candidate

## Use Cases and Guidelines for Recovering from a Bad Load

- Although the EIB uses a business process, there's no rescind option.
- If you have inadvertently declined job applications, it is not possible to undo this action. Instead, you would need to start a new job application.
- If you inadvertently moved candidates to the wrong step, you might possibly be able to rerun the EIB and move them to the correct step. Or other option is to manually undo the move.

For reference documentation for all web services including Move Candidate, see [Operation Directory](#).

## Sample EIB Input File

[Move\\_Candidate-WD34\\_0](#)

## Concept: Offer EIB

### Background

You can use this EIB to initiate an offer for a job application. The job application must be in a step before the offer, and the offer must be a next possible stage for the job application.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

## Equivalent Workday Task

See [../..../human-capital-management/recruiting/offers/san1462472397084.dita](#).

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Ensure that your EIB uses the most recent web service version for the latest enhancements and fixes. If you aren't certain what version you're using, follow these steps:
  1. From related actions of the EIB, select Template Model > View.
  2. You can view the version on this page. Verify you're using a newer version.
  3. If using an older web service version, you can create a new EIB to get the latest version

## Additional Input File Guidelines

- Verify you have the correct security configuration.
  - You must have access to the *Offer* business process in the Recruiting functional area to run this EIB.
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- To use this EIB, the job application must be in a stage before offer. The offer must be a next possible stage for the application.
- The Offer EIB will populate compensation as described in [FAQ: Compensation Defaulting](#).
- As you populate these fields in the EIB input file, consider:
  - Spreadsheet Key: Specify a unique value for each Job Application.
  - Next Step: This field is optional. Populate it only if you intend for the EIB to fully complete the offer and move the candidate to the next stage. If populating this field, refer to the screenshot below for assistance in determining the reference ID value to use.
  - Disposition Step: This field is optional. Populate it only if you intend for the EIB to fully complete the offer and then you wish to disposition the candidate. If populating this field, refer to the screenshot below for assistance in determining the reference ID value to use.
  - There are a few different options, outlined below, to specify the job application information. The attached EIB input file includes an example for each option.
    - Option 1: Populate the Candidate and Requisition (columns K and L).
    - Option 2: Populate the Workday ID (WID) of the Job Application Event (column I). You'll also need to change cell I4 from IID to WID.
    - Option 3: Populate the Job Application (column J). If selecting this option, create a custom report from data source

- All Job Applications, to get the reference ID value.
- Auto Complete: This field is available for each separate section of the EIB, such as the offer process. It's also available for subprocesses, like compensation and one-time payment. Enter Y if you wish for the section to autocomplete and to skip approvals, to-dos, and notifications.
  - Refer to the attached EIB input file for examples of how the EIB populates other fields.

## Common Issues and Errors

Issue	Cause and Solution
<p>EIB issues an error like this:</p> <p><i>Validation error occurred. The next step, parallel step, or disposition chosen is invalid for the job application process.</i></p>	<p>This error indicates that the EIB input file populated an invalid next step or disposition. Refer to the screenshot in Step 2 to identify the reference ID value. If you continue to experience issues:</p> <ul style="list-style-type: none"> <li>• Try manually populating the job offer for one of the offers where you receive the error, and</li> <li>• Verify that you can use the same next step or disposition that you're populating in the EIB input file.</li> </ul>
<p>Unable to launch the EIB</p>	<p>This error is most likely security-related. Refer to Step 1 above.</p>
<p>The initiation step of the Offer business process doesn't evaluate the conditions, even when disabling the auto-complete flag.</p>	<p>This functionality is working as intended: The initiation step doesn't evaluate the conditions since the offer is part of a dynamic business process.</p>

## Business Processes

Offer.

## Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to initiate the offer. You can't update or delete an existing offer
- Although this EIB uses a business process, there would be no option to rescind or cancel the business process. If you inadvertently loaded incorrect offer data, consider these scenarios:
  - If the offer events successfully completed, you could resubmit the offer, provided there's an option to move to offer stage from the job application' current stage.
  - If the offer event is still in progress, you could:
    - Manually correct it, or
    - Consider using [Move Candidate](#) to move the job application to a stage from which you can then reinitiate the offer EIB.

For reference documentation for all web services including Offer, see [Operation Directory](#).

## Sample EIB Input File

Offer-v37

### Concept: Put Applicant EIB

#### Background

You can use this EIB to add or update pre-hires.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

Task: Create Pre-Hire.

There are also similar EIBs that you can use for pre-hires. Consider these options as you determine what works best for you:

- Import Applicant: You can use this EIB to load large volumes of pre-hires (Example: 1000 or more). If you need to load large volumes of pre-hires, consider testing in your sandbox tenant to determine which EIB performs better for your use case.
- Hire Employee: You can use this EIB if you want to upload the applicant and then immediately proceed with the hire event.

#### EIB Input File Guidelines

##### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Manage Pre-Hire Process: Manage Pre-Hires* domain in the Pre-Hire Process functional area to run this EIB

##### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- To prevent data loss, we recommend that you generate your spreadsheet with data for the Put Applicant EIB. See: [Example: Generate EIB Spreadsheet Template with Data](#) on page 64.

- As you populate the EIB input file, consider:
  - Spreadsheet Key: Specify a unique value for each pre-hire.
  - Add Only: Y/N field to indicate whether this pre-hire is new or existing.
  - Applicant: If updating an existing pre-hire, enter the reference ID here.
  - Applicant ID: If adding a new applicant, you can enter the reference ID value here, or leave field blank for the web service to autoassign. If specifying your own ID, verify it isn't already in use.

## Common Issues and Errors

Issue	Cause and Solution
<p>EIB issues errors such as:</p> <p><i>E1: Gender is not tracked for the specified Location Context. The Location Context is derived from the Country of the Location for the Position.</i></p> <p><i>E2: The field Date of Birth is not tracked for the specified Location Context. The Location Context is derived from the Country of the Location for the Position.</i></p>	<p>Fields, such as Gender, Date of Birth, Ethnicity, and Race are localized fields. That means that only for certain countries track these fields. The country of the position associated with the pre-hire determines what fields Workday tracks. If you don't populate a value in the Positions Considered For field, or if the position is associated with a country that doesn't allow the localized field value, you'll receive 1 of these errors. Consider these workarounds:</p> <ul style="list-style-type: none"> <li>• Add a position in the input file, in the Positions Considered For field. You don't need to ultimately assign the pre-hire to this position. Rather, you could just reference a position belonging to the location that you could hire them for.</li> <li>• Update the localized information later in the process when the pre-hire has an associated position. Example: If you'll eventually run a hire EIB for these applicants, then you could enter the information at that time.</li> </ul>
<p>EIB loads successfully but is missing information such as address, email, and phone#</p>	<p>Verify that no row IDs are missing in the sections of the EIB where you populated the contact information.</p>
<p>EIB issues an error like this:</p> <p><i>Validation error occurred. At least 1 email address, phone number or address is required to create a new applicant.</i></p>	<p>Verify that no row IDs are missing in the sections of the EIB where you populated the contact information.</p>
<p>I want to update rehire eligibility</p>	<p>You can update the rehire eligibility using this EIB. Refer to example in the sample EIB input file.</p>
<p>Unable to launch the EIB</p>	<p>This issue is most likely security-related. Refer to EIB Input File Guidelines section above.</p>

Issue	Cause and Solution
Can I update the reference ID of an existing pre-hire?	Yes, you could also update the EIB using the Put Reference EIB.

## Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new pre-hires or update existing pre-hires. You can't delete pre-hires.
- Since this EIB doesn't use a business process, there's no option to rescind or cancel. If you've inadvertently uploaded incorrect entries, consider:
  - If you want to retain the pre-hires, you could get the applicant IDs, and then reload the pre-hires with correct information
  - If you need to remove the pre-hires, consider using the [Delete Pre-Hires](#) task.

For reference documentation for all web services including Put Applicant, see [Operation Directory](#).

### Sample EIB Input File

[Put\\_Applicant-WD37](#)

### Concept: Put Candidate EIB

#### Background

You can use this EIB to add or update a candidate (a person associated with a job requisition) or a prospect (a person with no job requisition).

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

Avoid using this EIB for pre-hires. We recommend that you use the Put Applicant EIB for pre-hires.

This EIB supports placing candidates into the initial job application stage, but it doesn't support updates to the job application process. If you need to disposition a candidate for an existing job application process, avoid using this EIB. Consider using the Move Candidate EIB instead.

### Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Create Prospect
- Create Job Application (if you want to create a candidate and immediately initiate a job application)

### EIB Input File Guidelines

#### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.

## Additional Input File Guidelines

- Verify you have the correct security configuration.
  - You must have access to the *Candidate Data: Job Application* domain in the Recruiting functional area to run this EIB
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:
  - This EIB has a *Generate Spreadsheet With Data* option. It's very helpful to use when you aren't certain how to populate the EIB input file. This EIB doesn't support using conditional rules to extract candidate data. However, you can extract single candidates as follows:
    - Manually create a prospect or candidate like one that you wish to load.
    - From related actions of the candidate, select Integration IDs > View IDs to get the *Candidate ID* (you'll need this ID in a later step).
    - From related actions of your EIB, select Template Model > View.
    - Go to bottom of page and select Edit Template with Data Options.
    - Set filter to *Reference ID Filter*.
    - Then enter the Candidate ID from a previous step.
    - If you regenerate the template and select the *Generate Spreadsheet with Data* option, you can view how the data populates in the input file for the candidate that you manually created.
  - As you populate these fields in the input file, consider:
    - Spreadsheet Key: Specify a unique value for each Candidate or Prospect.
    - Candidate ID: Populate this field if updating an existing candidate or prospect.
    - Candidate Tag: If you need to load multiple candidate tags, you can:
      - On the related action of your EIB, select Template Model > View.
      - In left windowpane, scroll to the bottom of the list of fields on the template to *Candidate Data*

(which is the section that stores Candidate Tags) and select it.

- In the Area Details section within the right windowpane, select the Action menu for Candidate Tag + and select Template Model Column > Maintain Additional Columns.
- Create the number of rows that you want and name the column header label.
- In Reference Type ID, search for *Candidate Tag*.
- Click OK and Done.
- Generate a new template and you'll see your new columns.
- Refer to the attached sample input file to review how other fields are populated

## Common Issues and Errors

Issue	Cause and Solution
When using the EIB to add a new job application for an existing candidate, the EIB wipes out some of the existing candidate information such as education, skills, job history, resume.	This EIB doesn't fully support incremental updates: therefore the EIB input file needs to include all existing candidate information that you wish to retain.
<p>The EIB issues error:</p> <p><i>You have entered Personal Information for this Candidate, however none of the jobs applied for are in locations where Personal Information is captured.</i></p>	<p>The EIB validates personal information by checking the configuration of the localization settings. This error message indicates that there's invalid personal information for the given candidate's location. To address this error, you can:</p> <ul style="list-style-type: none"> <li>• Use task Maintain Localization Settings and enter <i>Personal Information</i> at the prompt for Area.</li> <li>• Filter the resulting list by <i>Applies to Person Type</i> and select <i>Candidate</i>.</li> <li>• For any localized field that you plan on populating in the web service, verify: <ul style="list-style-type: none"> <li>• In the <i>Allow for Countries</i> section, add any applicable countries.</li> <li>• Check the <i>Active</i> field.</li> </ul> </li> </ul>
Unable to launch the EIB	<p>Add <i>put</i> access to both of these domain security policies. Then activate the change:</p> <ul style="list-style-type: none"> <li>• Prospects</li> <li>• Candidate Data: Job Application</li> </ul>

## Business Processes

The business process that this EIB uses depends on the type of information you load.

- For job application data, the EIB uses the *Job Application* business process.
- For creating or updating prospects, the EIB doesn't use a business process.

## Use Cases and Guidelines for Recovering from a Bad Load

This web service enables you to add new entries or update existing entries. You can't delete entries.

If you have inadvertently uploaded incorrect entries that are associated with a job application, then you can remove the candidate and job application as follows:

- Use task Mass Cancel Business Processes.
- Enter *Job Application* at the business process type prompt.
- Select a date range for when you loaded the EIB.
- If you have inadvertently uploaded incorrect entries for a prospect (that is, you didn't use a business process event), you cannot delete the prospect. However, you could reload the data with the corrected information. To reload the data, you need to make certain that the input file includes the candidate id for the prospects that you incorrectly loaded.

For reference documentation for all web services including Put Candidate, see [Operation Directory](#).

## Sample EIB Input File

[Put-Candidate-v44.2-Final](#)

## Concept: Put Interview EIB

### Background

You can use this EIB to submit interview data for the Schedule Interview task. The job requisition must be in the interview step when you submit the EIB. See [Steps: Manage Interviews](#) for more information.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Candidate Data: Interview Schedule* domain in the Recruiting functional area to run this EIB.

### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page

56, which provides a general overview for populating EIB files.

- As you populate the EIB input file, consider:

- Spreadsheet Key: Specify a unique value for each job application.
- Populate 1 of the 3 following groups of fields. Don't populate more than 1:
  - Candidate Data and Requisition
  - Job Application
  - Interview Event
- Interviewers: Most likely, you'll need to change the reference ID in cell K4 from *Contingent\_Worker\_ID* to *Employee\_ID*.
- Interview Start Time and Interview End Time: Use the format YYYY-MM-DD-HH:MM:SS. Example: 2022-01-20T09:00:00.
- Interview Location: To find reference ID values, run the View Reference IDs report and select the *Location* business object.
- Interview Type: To find reference ID values, run the View Reference IDs report and select the *Interview Type* business object.
- Time Zone: To find list of reference ID values, run the Integration IDs report and select the *Time Zone* business object.

## Common Issues and Errors

Issue	Cause and Solution
<p>EIB issues 1 or both of these errors:</p> <ul style="list-style-type: none"> <li><i>The Interview Event must be In Progress to create an Interview Team.</i></li> <li><i>You aren't authorized to schedule an interview for this candidate and job requisition because the interview event isn't awaiting your action.</i></li> </ul>	<p>This issue will occur if:</p> <ul style="list-style-type: none"> <li>The person running the EIB doesn't have the permission to schedule the interview.</li> <li>Or if the job application isn't at the Schedule Interview Step.</li> </ul> <p>To resolve this issue, you can:</p> <ul style="list-style-type: none"> <li>Confirm that the Schedule Interview step is awaiting action.</li> <li>Confirm that the person who's running the EIB is in a security group permitted to schedule interviews. Consider creating a Service Center Representative and adding them to Schedule Interview step. Then, run the EIB as the Service Center Representative.</li> </ul>

Issue	Cause and Solution
<p>EIB issues an error like:</p> <p><i>Validation error occurred. Invalid ID value. '21105' is not a valid ID value for type = 'Contingent_Worker_ID'.</i></p>	<p>This issue occurs if you're populating the EIB input file with an employee ID, but the reference ID type is <i>Contingent_Worker_ID</i>.</p> <p>Change the reference ID in cell K4 from <i>Contingent_Worker_ID</i> to <i>Employee_ID</i>.</p>
<p>EIB issues an error like:</p> <p><i>Validation error occurred. Invalid format for date text=2022-01-19T9:00:00 on attr Interview Start Time.</i></p>	<p>The date/time format needs to be: YYYY-MM-DDThh:mm:ss.</p> <p>In this example, the error occurred because the time is 9:00:00 instead of 09:00:00.</p>
<p>EIB issues an error like:</p> <p><i>Validation error occurred. Multiple Element Contents, including Interview Data/ac/Move Candidate Criteria [EL], contain data where only one is allowed by mutex Interview Data.</i></p>	<p>This issue will occur if you're overpopulating the information for the job application. Make certain you're populating only 1 of these fields:</p> <ul style="list-style-type: none"> <li>• Interview Event</li> <li>• Job Application</li> <li>• Candidate and Requisition</li> </ul>
<p>EIB issues an error like:</p> <p><i>The entered information does not meet the restrictions defined for this field. (Interview_Questionnaires_Reference).</i></p>	<p>To include questionnaires on the interview, you need GET permission to Questionnaire Creation and Distribution policy.</p>
<p>Unable to launch the EIB.</p>	<p>This issue is most likely security-related. See the <i>EIB Input File Guidelines</i> section.</p>

## Business Processes

Interview subprocess of the Job Application Event.

## Use Cases and Guidelines for Recovering from a Bad Load

If you inadvertently loaded incorrect data, consider using the *Move Candidate EIB* to move candidates forward to a step that schedules another interview, if that is available in your Job Application Event.

For reference documentation for all web services including Put Interview, see [Operation Directory](#).

## Sample EIB Input File

[Put\\_Interview-v38](#)

## Concept: Unpost Job EIB

### Background

You can use this EIB to unpost jobs.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

Task: Unpost Job.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Unpost Job* business process in the Recruiting functional area to run this EIB.

### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:
- When populating the EIB input file, you should use one of the 2 combinations below. Note that if you populate more than what the EIB requires, the EIB issues an error because it detects redundant data:
  - Combination 1: Populate just the Spreadsheet Key and Job Posting.
  - Combination 2: Populate the Spreadsheet Key, Job Requisition, and then either Job Posting Site Name or Job Posting Site.

## Common Issues and Errors

Issue	Cause and Solution
<p>The EIB fails with this error:</p> <p><i>Validation error occurred. Multiple Element Contents, including Unpost Job Business Process Data/a2/Job Posting Reference Data [EL], contain data where only one is allowed by mutex Unpost Job Business Process Data.</i></p>	<p>This issue typically occurs if you're overpopulating fields within the EIB input file. You need to populate a specific combination of fields. See <a href="#">Additional Input File Guidelines</a> section for the field combination.</p>

## Business Processes

Update Job Posting.

## Use Cases and Guidelines for Recovering from a Bad Load

If you have inadvertently unposted the wrong jobs, use task Mass Cancel Business Processes (or Mass Rescind Business Processes if the business process event completed). You can then select *Business Processes Loaded by EIB* to find the integration event that you wish to cancel or rescind. Or the other option is to enter *Update Job Posting* at the *Business Process Types* prompt.

For reference documentation for all web services including Unpost Job, see [Operation Directory](#).

### Sample EIB Input File

[Unpost\\_Job-WD31](#)

## Resource Management EIBs

### Concept: Import Supplier Invoice EIB

#### Background

You can use this EIB to add or update supplier invoices with a large number of lines. Example: Invoices with 300 lines or more. If you want to load invoices with fewer lines, consider using the Submit Supplier Invoice EIB.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

Task: Create Supplier Invoice.

There are additional integrations and EIBs related to supplier invoices. Consider these options as you determine what works best for you:

- Submit Supplier Invoice: You can use this EIB to load many invoices with a small number of lines. Example: 1000 supplier invoices with 5 lines each. If you try to use this EIB to load a supplier invoice with more than 5000 lines, the EIB will fail.
- Supplier Network Connector – Procurement Punchout Purchase Order and Invoicing: You can use this integration template to manage supplier invoices. See [Steps: Set Up Supplier Invoicing Integration](#).

#### EIB Input File Guidelines

##### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Supplier Invoice Event* business process type in

## Guidelines for Adding Worktags to the EIB Template

the Supplier Accounts functional area to run this EIB.

You can specify more than 1 worktag for any of the student charges.

From the related actions of your EIB, select Template Model > View..

1. On the left, click the second occurrence of All for Invoice Line Replacement Data. On the right, locate Worktags.
2. From the related actions on the magnifying glass next to Worktags, select Template Model Column > Maintain Additional Columns.
3. Enter all worktags that you need to assign to the template.
4. (Optional): Modify the template to use a Separate Type Column option for both the Purchase Order Line and the Supplier Contract Line.
5. Regenerate the spreadsheet template and add newly added worktags to the spreadsheet template.

## Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:
- This EIB doesn't have a generate with data option. However, the Submit Supplier Invoice EIB does have the generate with data option. If you're encountering issues with populating the EIB template, you can test with the Submit Supplier Invoice EIB to get a better idea of how to populate the EIB input file.
- If you're updating existing supplier invoices, you must include all existing lines; this web service will first delete all the existing lines and then recreate everything using fields in the EIB input file.
- Import Supplier Invoice worksheet in the EIB Input File. As you populate this worksheet, consider:
  - Header Key: Specify a unique value for each Supplier Invoice.
  - Supplier Invoice ID (column H): Populate this field if updating an existing supplier invoice or if you want to assign your own supplier invoice ID.
  - Auto Complete: Set to Y to bypass all approval steps, review steps and to do

steps. This selection also suppresses notifications.

- Invoice Number (column K): Populate this field if updating an existing supplier invoice or if you want to assign your own supplier invoice ID.
- Submit: Set to Y to submit the Invoice. If set to N, it will stay in draft status.
- Locked in Workday: If set to Y, you can make modifications to the invoice only by the EIB or web service.
- Company: Workday requires this field. To find the value, you can use the reference IDs report and search for business object *Company*.
- Supplier ID and Contingent Worker fields: Supply a value for either Supplier ID -or- Contingent Worker. But don't populate a value for both fields.
- Ship-To Address: As of v35.0, Workday populates the header ship-to-address from the company you provide.
- Supplier Contract: Enter supplier contract ID if you're referencing a contract.
- Attachment Data: Although you can add or update attachments using this EIB, there are some challenges in loading document content by EIB. If you need to add attachments using an integration, refer to the EIB Input File Guidelines section in [Concept: Import Supplier Invoice EIB](#). Although it's a different web service, the same information applies to Import Supplier Invoice regarding populating attachments. You can also use the [Put Procurement Document Attachment](#) web service to add attachments.
- Taxes: The EIB populates header information (including tax information onto taxable documents). If you don't want the tax fields to populate, you need to explicitly enter {empty} in the field.

- Invoice Line Replacement Data worksheet in the EIB Input File. As you populate this worksheet, consider:
  - Header Key: Use same header key value specified in the *Import Supplier Invoice* worksheet for this invoice
  - Line Key: Enter a unique value for each line item for a given invoice.
  - Purchase Order Line: If you're referencing a purchase order, be sure to:
    - Modify the template to use a Separate Type Column option for the Purchase Order Line.
    - Update the EIB input file and change the reference ID type for the Parent ID Value to *Document\_Number* (cell L4 in the attached sample file). See the sample input file, which demonstrates how to populate the PO number and line in the Purchase Order Line section (starting in column I in the example).
    - (Optional): Modify the template to use a Separate Type Column option for both the Purchase Order Line and the Supplier Contract Line.
    - (Optional): Modify the template to use a Separate Type Column option for both the Purchase Order Line and the Supplier Contract Line.
  - Supplier Contract Line: If you're referencing a contract line, be sure to:
    - Modify the template to use a Separate Type Column option for the Supplier Contract Line.
    - Update the EIB input file and change the reference ID type for the Parent ID Value to *Supplier\_Contract\_ID* (cell P4 in the attached sample file). See the sample input file, which demonstrates how to populate the Contract number and line in the Supplier Contract Line (starting in column M in the example).
  - Worktags: If you're using multiple worktags, be sure to follow the instructions in Step #2 above to add all relevant worktag columns to the EIB template. Also, note that there's no

need to populate the related worktags as they'll automatically populate. If needed, you can configure worktag type precedence. See [Configure Worktag Defaulting](#) for more details.

- External Supplier Invoice Source: Originating system of the supplier contract. Populate this field only if using the Supplier Contract ID External field on the spreadsheet to reference a supplier contract.
- Invoice Split Line Item Data: If you need to specify details for split lines, enter this data in the Supplier Invoice Split Line Data section, which starts in column BP in the attached sample input file. If you're referencing a PO that has split items, the EIB automatically brings this information into the invoice and doesn't need populating in the EIB input file, unless you wish to change it to be different than the PO.

## Common Issues and Errors

Issue	Cause and Solution
<p>The EIB issues this error:</p> <p><i>The total extended amount of all lines must be greater than zero.</i></p>	<p>Make certain that your EIB is using v34.0 or higher. This version of the web service started supporting \$0 amounts. Create a new EIB to ensure you're on the latest web service version.</p>
<p>Performance is slow.</p>	<p>Below are items to check:</p> <ul style="list-style-type: none"> <li>• A high number of custom validations can degrade performance.</li> <li>• Evaluate which web service to use: if most of the invoices have very few line items, use Submit Supplier Invoice. But if the invoices have a larger number of line items, test using Import Supplier Invoice instead.</li> </ul>
<p>The EIB issues errors such as</p> <p><i>Task submitted isn't authorized.</i></p> <p>-or-</p> <p><i>The entered information doesn't meet the restrictions defined for this field. (Supplier_Reference)</i></p>	<p>Check the business process security policy for Supplier Invoice Event and make certain you have access to Initiating Action <i>Import Supplier Invoice (WS Background Process)</i>. If you're loading supplier invoices across all organizations, you should have unconstrained access to the business process security policy.</p>
<p>When attempting to attach the EIB input file, you receive an error like this:</p> <p><i>The size of the file 'xxxx' is greater than the maximum permitted file size (30,720KB). Please select a different file or reduce the size of this file.</i></p>	<p>The size of the EIB input file, for supplier invoices, can be quite large due to the amount of data associated with each supplier invoice. Unfortunately, there isn't a way to increase the file limitations when attaching EIB input files. But below are a couple suggestions that might help.</p>

Issue	Cause and Solution
	<ul style="list-style-type: none"> <li>If you have an SFTP server, you can load your EIB input file to the SFTP site, and then configure your EIB with a retrieval step that pulls the file from the SFTP site. Do this task instead of manually attaching the file from your browser and you can load a file up to 1 gig.</li> <li>If you're using an XML input file, consider switching to XLSX format as the file size will be smaller.</li> </ul>
<p>The EIB doesn't populate the <i>Withholding Tax Code</i> on the invoice line in these situations:</p> <ul style="list-style-type: none"> <li>When the invoice header level contains <i>Default Withholding Tax Code</i>.</li> <li>When the Supplier has a default Withholding Tax Code.</li> </ul>	<p>In general, the web service doesn't populate values because we don't know if the value should be blank or populated. However, for this field, you can use the feature <i>Withholding Tax Rule for Country</i>. When configuring this rule, the user interface and web service will populate the value to the line.</p>
<p>When loading load invoices with split lines, the EIB completes successfully however doesn't liquidate the PO.</p>	<p>This issue occurs if the EIB doesn't populate the <i>Line Split Allocation</i> value in the <i>Supplier Invoice Split Line Data</i> section.</p> <p>When the EIB doesn't populate the value, the web service is unable to match the split information against the PO line splits, and doesn't properly liquidate the PO.</p> <p>To resolve this issue, you can:</p> <p>Populate Workday ID (WID) of PO line splits in the <i>Line Split Allocation</i> field of the EIB input file.</p> <ul style="list-style-type: none"> <li>Or, if none of the line split information is changing, you can remove all the data from the <i>Supplier Invoice Split Line Data</i> section.</li> </ul>
<p>When using the EIB to update an existing invoice and add new lines, it removes any existing lines.</p>	<p>When updating an existing invoice, the EIB will remove all the existing lines and then add the lines from the EIB input file. So you must include all lines in the EIB input file.</p>
<p>I can't find a <i>hold removal</i> option using the EIB.</p>	<p>The web service currently doesn't support this functionality.</p>

## Business Processes

Supplier Invoice Event.

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new supplier invoices or update existing supplier invoices. You can't delete or rescind supplier invoices.
- If you've inadvertently uploaded an incorrect supplier invoice, check if one of these options will work for your situation:
  - Rerun the EIB and update the invoices with correct information.
  - Use the Cancel Supplier Invoice EIB.

For reference documentation for all web services including Import Supplier Invoice, see [Operation Directory](#).

## Sample EIB Input File

[Import\\_Supplier\\_Invoice-v39](#)

## Concept: Put Assign Supplier to Contingent Worker EIB

### Background

You can use this EIB to assign suppliers to contingent workers. You can make new assignments or update existing assignments.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

Task: Assign Supplier to Contingent Worker.

### EIB Input File Guidelines

Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Set Up: Assign Contingent Worker* domain in the Suppliers functional area.

Guidelines for Modifying the EIB Template

Prepare the EIB to generate with data.

1. From the related actions of your EIB, select Template Model > View.
2. On the left, click Contingent Worker Data.
3. Click Edit Template Model Area.
4. Modify the Reference ID Type to *Supplier ID* for the Supplier Row.
5. Click OK.

Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- To prevent data loss, we recommend that you generate your spreadsheet with data for

the Put External Disability Self Identification Record EIB. See: [Example: Generate EIB Spreadsheet Template with Data](#) on page 64.

- As you populate the EIB input file, consider:
  - Spreadsheet Key: (Required): Specify a unique value for each Contingent Worker
  - Contingent Worker ID: (Required): Enter the contingent worker's id. To find the values, you could create a custom report using a report data source such as *Indexed All Workers*.
  - Contingent Worker: (Optional): Contingent Worker's Name. This field is informational only.
  - Supplier: (Required): Most likely, you'll want to set cell E4 to value *Supplier\_ID*, if it doesn't already have this value. To get a list of supplier id's, you can run the *Find Suppliers* report.

## Common Issues and Errors

Issue	Cause and Solution
EIB issues an error like this: <i>Validation error occurred. Element Content 'Supplier_Reference' is required, on internal element 'Contingent Workers Data'</i>	Verify that the Supplier ID value is present in your EIB input file (you can't remove a supplier assignment by leaving this field empty or by using the <i>{empty}</i> value).
EIB issues an error like this: <i>Validation error occurred. Invalid ID value. 'S-0016' is not a valid ID value for type = 'Scout_ID'</i>	The supplier ID reference id type defaults to <i>Scout_ID</i> . To modify it, you can: <ol style="list-style-type: none"> <li>1. Edit the EIB Input File</li> <li>2. Change the value in cell E4 from <i>Scout_ID</i> to <i>Supplier_ID</i></li> </ol>
Unable to launch the EIB	This issue is most likely security-related. When running report <i>View Security for Securable Item</i> for securable item <i>Put Assign Supplier to Contingent Worker (Web Service)</i> , you'll see that you need access to <i>Set Up: Assign Contingent Worker</i> . To change the security: <ol style="list-style-type: none"> <li>1. Edit the domain security policy for <i>Set Up: Assign Contingent Worker</i></li> <li>2. Make certain you have <i>Put</i> access (ideally you should have access through an unconstrained security group so that you can assign suppliers to any contingent worker.)</li> <li>3. Activate the security change</li> </ol>

## Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add supplier assignments or update existing assignments. You can't remove existing assignments.
- Since this EIB doesn't use a business process, there's no option to rescind or cancel. If you have inadvertently uploaded incorrect entries, reload the EIB with the correct supplier assignments

For reference documentation for all web services including Put Assign Supplier to Contingent Worker, see [Operation Directory](#).

### Sample EIB Input File

[Put\\_Assign\\_Supplier\\_to\\_Contingent\\_Worker-WD35\\_0](#)

### Concept: Put Expense Company Default EIB

#### Background

You can use this EIB to add or update a default company on expense reports.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

Task: Edit Expense Company Defaults.

### EIB Input File Guidelines

#### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Set Up: Expenses Processing* domain in the Expenses functional area to run this EIB.

#### Guidelines for Modifying the EIB Template

Prepare the EIB to generate with data.

1. From the related actions of your EIB, select Template Model > View.
2. On the left, click Expense Company Default Data.
3. Click Edit Template Model Area.
4. Select the Separate Type Column check box for the Worker row.

## Additional Input File Guidelines

### 5. Click OK.

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- To prevent data loss, we recommend that you generate your spreadsheet with data for the *Put Expense Company Default EIB*. See: [Example: Generate EIB Spreadsheet Template with Data](#) on page 64.
- As you populate these fields in the EIB input file, consider:
  - Spreadsheet Key: Specify a unique value for each company
  - Company: To find the reference id value for the company, run the *View Reference IDs* report and select business object Company.
  - Worker: Depending on whether you modified the EIB template, you might have just 1 column for worker or 2 columns.
    - If there's just 1 column, then populate cell D4 with either *Employee\_ID* or *Contingent\_Worker\_ID* (depending on type of worker) and populate the worker id values accordingly
    - If there are 2 columns, then populate the ID type column (Column D) with the type of worker. Example: *Employee\_ID* or *Contingent\_Worker\_ID*. Then populate the ID value column (Column E) with the worker's id value

## Common Issues and Errors

Issue	Cause and Solution
Even though I populated the EIB with multiple workers, only 1 worker is updated	This issue will occur if you use a different spreadsheet key value for each assignment. To resolve this issue, edit the EIB input file and set the Spreadsheet Key field to the same value for all the workers for a given company
The EIB loads all the workers, however the previously assigned workers no longer display.	This EIB removes all existing assignments for a given company. So you must include both new and existing assignments in the EIB input file each time you load data for a given company. Use the

Issue	Cause and Solution
	<i>generate with data</i> option to prepopulate the EIB input file with existing assignments.
The EIB issues these errors:  <i>A processing fault occurred generating the spreadsheet.</i>  <i>The worksheet 'Expense Company Default' has 3 columns but should have 4 columns. Choose Template Model-&gt;Generate Default Template Model from related action of the EIB to create a new spreadsheet template. Then re-populate the input data using the newly generated spreadsheet template.</i>	This issue can occur if you modify your template but don't select the Separate Type Column check box for the Worker row.  Ensure you select the check box if you modify your template.
Unable to launch the EIB	This issue is most likely security-related.

### Use Cases and Guidelines for Recovering from a Bad Load

- Each time you want to add or remove entries, you can do so by reloading all the workers who you want assigned to the company.
- Since this EIB doesn't use a business process, there's no option to rescind or cancel. If you inadvertently upload incorrect entries, we suggest you reload the correct entries through the EIB. If you need to restore the original values, you can:
  - Find another tenant such as a sandbox or an implementation tenant that still has the correct information.
  - Then use *Generate Spreadsheet with Data* option in that tenant to build an EIB input file to load into the tenant that has incorrect information.

For reference documentation for all web services including Put Expense Company Default, see [Operation Directory](#).

### Sample EIB Input File

[Put\\_Expense\\_Company\\_Default-WD35](#)

### Concept: Put Purchase Item EIB

#### Background

You can use this EIB to add or update purchase items (goods and services that you've purchased from suppliers).

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Create Purchase Item
- Edit Purchase Item

You can also mass update purchase items using worksheets. See [Reference: Mass Maintain and Request Purchase Items with Worksheets](#) for more information.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. These options enable you to check the version of your EIB:
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Set Up: Purchase Item* domain in the Procurement functional area to run this EIB.

### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- This web service doesn't support incremental updates. When updating existing purchase items, you need to populate all existing information in the EIB input file to avoid the web service removing the data. If you're updating existing purchase items, we strongly recommend that you use the Generate Spreadsheet with Data option to avoid losing information.
- As you populate the EIB input file, consider:
  - Updating Existing Purchase Items: This EIB doesn't fully support incremental updates. If you're updating existing purchase items, we recommend you use the Generate With Data option to prevent loss of existing purchase item data.
  - Creating New Purchase Items: If creating new purchase items, you might find it helpful to manually create a purchase item like the ones you want to load. Then use the Generate Spreadsheet with Data option to determine how to populate the EIB input file.
  - Images: Although you can add images using this EIB, we don't recommend it, as there are some challenges in loading document content through EIB. If you need to add images

through an integration, you might find it helpful to refer to the Populating File Attachments for the EIB section in [Future: Concept: Put Worker Document EIB](#). This is a different web service, but the same information applies to *Put Purchase Item* in regard to populating attachments.

- Worktags: If using worktags, see the EIB Input File Guidelines section for tips on changing the template.

## Common Issues and Errors

Issue	Cause and Solution
<p>EIB issues an error like this when generating a spreadsheet with data:</p> <p><i>Response Message.</i></p> <p><i>Integration Failed.</i></p> <pre>com.capeclear.mediation.MediationException: application=assemblyGenerateSpreadsheetE2 - Custom step ID=GenerateWhenSplit, ref=SpreadsheetGenerationBean_EIBWXF - Error while invoking bean, reason: One or more of the columns in your template model includes file-based (base64) data that will be cut off due to a spreadsheet cell limit of 32,767. To fix this, go to the template model and hide the related file-based data columns. Root Cause: java.lang.Exception: One or more of the columns in your template model includes file-based (base64) data that will be cut off due to a spreadsheet cell limit of 32,767. To fix this, go to the template model and hide the related file-based data columns. See the consolidated report for further details.</pre>	<p>This issue can occur if you're generating data for purchase items with images. To avoid this error, hide the images. See the EIB Input File Guidelines section.</p>
<p>After using the EIB to update existing purchase items, some information is missing, such as commodity code and supplier information</p>	<p>This EIB doesn't fully support incremental updates. If you update existing purchase items and don't include the existing information in the EIB input file, you might lose data. If you lost data in Production, to recover:</p> <ol style="list-style-type: none"> <li>1. Find a non-Production tenant that still has the data.</li> <li>2. Generate with data in the non-Production tenant.</li> <li>3. Then load the file to Production.</li> </ol>
<p>After loading purchase items, we display them in the Find Purchase Item report but not in search catalog when creating a requisition.</p>	<p>We run an indexing job periodically to make the purchase items searchable. Wait 4 hours and check again.</p>
<p>Unable to launch the EIB</p>	<p>This issue is most likely security-related. See the EIB Input File Guidelines section.</p>

## Use Cases and Guidelines for Recovering From a Bad Load

- This web service enables you to add new purchase items or update existing purchase items. You can't delete purchase items.
- Since this EIB doesn't use a business process, there's no option to rescind or cancel. If you inadvertently upload incorrect entries, you can either:
  - Rerun the EIB to update the purchase item with correct information
  - Rerun the EIB and update the purchase items with Inactive flag enabled. You could also add *DNU* to the beginning of the purchase item name.
- If you need to restore the original values, 1 option would be to find another tenant such as a Sandbox or an Implementation tenant, that still has the correct information. Then use Generate Spreadsheet with Data in that tenant to build an EIB input file to load into the tenant where information needs corrected.

For reference documentation for all web services including *Put Purchase Item*, see [Operation Directory](#).

## Sample EIB Input File

[Put\\_Purchase\\_Item-v39](#)

## Concept: Submit Requisition EIB

### Background

You can use this EIB to add or update procurement requisitions.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

For job requisitions, consider using either a Create Job Requisition or an Edit Job Requisition EIB.

### Equivalent Workday Task

Task: Create Requisition.

You can also perform mass procurement requisition changes through:

- Mass Cancel Procurement Documents
- Mass Close Procurement Documents
- Mass Reopen Procurement Documents

### EIB Input File Guidelines

Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.

- Verify you have the correct security configuration.
- You must have access to the *Submit Requisition* business process in the Procurement functional area to run this EIB.

#### Guidelines for Adding Worktags to the EIB Template

If you're populating more than 1 worktag for the requisition goods lines or service lines, then add extra worktags to the template.

- From the related actions of your EIB, select Template Model > View.
- On the left click Item Request Line Data+.
- On the right, locate Worktags+.
- From the related actions on the magnifying glass next to Worktags+, select Template Model Column > Maintain Additional Columns.
- Enter all worktags that you need to assign to the template.
- Click OK.
- (Optional): If you wish to add worktags to Service Lines, select Service Request Line Data+ in the left panel and follow the same steps.
- Regenerate the spreadsheet template.
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- As you populate the EIB input file, consider:
  - Spreadsheet Key: Specify a unique value for each requisition.
  - Requisition: Populate this field if updating existing requisition. Change cell D4 to *Requisition\_Number*. If updating an existing requisition, include all existing lines and other information to prevent it from removal.
  - Auto Complete: Set to Y to automatically complete approvals, reviews, and To Do steps in business process and to suppress notifications
  - Worker: If populating this field, most likely, you'll want to change the

#### Additional Input File Guidelines

reference ID type, in cell H4, from *Contingent\_Worker\_ID* to *Employee\_ID*.

- Submit: Set to Y to submit business process. If set to N, the requisition loads in Draft Status
- Requisition Type: You can find the reference ID values by running the View Reference IDs report for business object *Requisition Type*.
- Ship-To Address: Change the reference ID type (on or near cell W4), from *IID* to *WID*. You can use a custom report to get the Workday ID (*WID*) of the Ship-To Address. The custom report that you use will depend on whether you want a location address or company address.
- Item Request Line Data+ Section: This section starts at around column AU (column location might vary based on web service version you're using and any customizations): Enter the goods lines in this section. Enter a unique row ID for each goods line.
- Service Request Line Data+ Section: This section starts at around column DN (column location might vary based on web service version you're using and any customizations): Enter the service lines in this section. Enter a unique row ID for each service line.
- Worktags both the goods lines and service lines, have a section where you can populate worktags. If you wish to populate 2 or more worktags in the EIB input file to add extra worktags to the EIB input file, follow the steps in *Guidelines for Adding Worktags to the EIB Template* section. Workday automatically assigns worktags to the requisition and it isn't necessary to populate them in the EIB input file.

## Common Issues and Errors

Issue	Cause and Solution
EIB issues an error like this: <i>Validation error occurred. Instance ID cannot be parsed.</i>	This issue occurs if the Ship-To Address field is using reference ID type <i>IID</i> instead of <i>WID</i> . Change the reference ID type in cell W4 to <i>WID</i> .
Unable to launch the EIB	This issue is most likely security-related. Follow the steps in <i>Web Service Version and Security Configuration Guidelines</i> section.

## Business Processes

Requisition Event.

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new requisitions or update existing requisitions that are still in progress. You can't delete, close, or cancel requisitions through this web service.
- Although this web service uses a business process, there's no option to cancel or rescind. So if you've inadvertently uploaded incorrect entries, consider using the Cancel Requisition web service to back out the requisitions if they're still in progress. Or run 1 of these tasks:
  - Mass Cancel Procurement Documents
  - Mass Close Procurement Documents
  - Mass Reopen Procurement Documents

For documentation for all web services including Submit Requisition, see [Operation Directory](#).

### Sample EIB Input File

[Submit\\_Requisition-WD37](#)

### Concept: Submit Supplier Contact Information EIB

#### Background

You can use this EIB to create or update supplier contact information. The supplier must be in an Approved state.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

Any information that you submit with this EIB replaces and overwrites the information currently in Workday.

To avoid data loss, include all existing supplier contact information and any new supplier contact information that you want to add in your EIB input file.

#### Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Change Supplier Contact Information.
- On the supplier in Workday, select Overview > Contact and edit the contact details.

#### EIB Input File Guidelines

Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.

## Additional Input File Guidelines

- Verify you have the correct security configuration.
  - You must have access to the *Submit Supplier Contact Information* business process in the Suppliers functional area to run this EIB.
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:
  - As you populate the EIB input file, consider:
    - If you're updating or removing any contact information, you might find it helpful to create a custom report, using a data source such as Suppliers to help you populate the EIB input file. Refer to end of this document for an example of a custom report you could create.
    - If you need to remove entries (such as remove a phone number or remove an email address), there are 2 approaches you can use. There are also examples in the attached input file. Be sure to test in a nonproduction tenant to verify you're not inadvertently removing any contact information that you intended to keep:
      - If you want to remove an entry and don't want to replace it with another entry, then set the Do Not Replace All flag to 'Y', set the delete flag to Y, and specify the reference id for the item you wish to remove.
      - If you want to remove all the entries (Example: all entries for email) and replace with another entry, set Do Not Replace All flag to 'N'. (No need to populate reference id of items you wish to delete, for this scenario).
    - If adding or updating phone numbers, note:
      - Country\_Code: Workday requires this field. You can get a list of country codes by running the Integration ids report and

- searching for business object *Country Phone Code*.
- Complete Phone Number:  
If you've configured phone validations (in edit tenant setup – global), then this field should contain numbers only. Also, don't include the country code

## Common Issues and Errors

Issue	Cause and Solution
There's no option to launch the integration	<p>This issue will occur if you've not yet created the business process and if you don't have the proper access to the Supplier Contact Info Change Event business process security policy. To resolve:</p> <ul style="list-style-type: none"> <li>• Check if the business process exists. If not, use Create Business Process Definition to create it.</li> <li>• Check the business process security policy and make certain you have access to Initiating Action Submit Supplier Contact Information (Web Service)</li> <li>• Activate the change.</li> </ul>
Can't delete Primary Address / Email Address / Phone	<p>You can't delete using Web Service a Primary Address / Email Address / Phone as it is Required to have a Primary Address / Email Address / Phone. However, you can update the instance by:</p> <ul style="list-style-type: none"> <li>• Referencing the Primary Address / Email Address / Phone.</li> <li>• Setting Do Not Replace All flag as True.</li> <li>• Populating the items that you wish to update.</li> </ul>
<p>Receive this error when attempting to delete an email:   <i>E1: Email Reference is required when you delete an email address.</i></p>	<ol style="list-style-type: none"> <li>1. Don't specify existing email address. It isn't needed when deleting an email.</li> <li>2. Be sure to specify the <code>email_id</code> you wish to delete.</li> </ol> <p>Refer to the example in the attached input file that displays how to remove an email address</p>
<p>Receive this error when attempting to delete an address:   <i>Validation error occurred. Address deletion is not supported in this web service request.</i></p>	<p>At the moment, this Web Service doesn't support deleting addresses.</p>

## Business Processes

Supplier Contact Info Change Event.

## Use Cases and Guidelines for Recovering from a Bad Load

This web service enables you to add, update, or delete existing entries.

Although Workday uses a business process to add/update/delete the supplier contact information, there isn't an option to cancel or rescind the event. If you've inadvertently uploaded incorrect entries, you would need to reload the entries with the corrected information.

For reference documentation for all web services including Submit Supplier Contact Information, see [Operation Directory](#).

### Sample EIB Input File

[Submit\\_Supplier\\_Contact\\_Information-v39](#)

### Concept: Submit Supplier EIB

#### Background

You can use this EIB to add or update a supplier.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

Workday provides 2 web service operations:

- *Submit Supplier* supports operations for up to 1,000 suppliers.
- *Bulk Import Submit Supplier* supports operations for more than 1,000 suppliers. *Bulk Import Submit Supplier* doesn't support the Generate Spreadsheet With Data option. If you want to use *Bulk Import Submit Supplier*, but you aren't certain how to populate the fields, use *Submit Supplier* first. Then, copy generated data into your EIB Input file for *Bulk Import Submit Supplier*.

Before loading a large volume of suppliers, test EIBs based on both web service operations in a nonproduction tenant to determine what performs best for your data.

### Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Create Supplier: You can use this task to create a new supplier.
- Find Suppliers: You can use this task to update an existing supplier. On the related actions of the supplier, select Supplier > Create Supplier Change.

### EIB Input File Guidelines

#### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.

- Verify you have the correct security configuration.
  - You must have access to the *Submit Supplier* business process in the Suppliers functional area to run this EIB.
  - In addition, if you wish to use the Generate Spreadsheet with Data option, you'll need access to the *Reports: Supplier* domain in the Suppliers functional area.

## Additional Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.

To prevent data loss, we recommend that you generate your spreadsheet with data for the Put External Disability Self Identification Record EIB. See: [Example: Generate EIB Spreadsheet Template with Data](#) on page 64.

- When updating existing suppliers, best practice is to populate the EIB input file with all existing field values.
- If you're updating existing suppliers, then you can use the Generate Spreadsheet with Data option to help you populate the EIB input file. But in addition, below are a couple other tips:
  - You could also create a custom report using a report data source such as *Suppliers*.
  - Copy the standard report *Find Suppliers* then modify and add or remove fields to suit your needs.
  - After loading the data, you might find it helpful to run the Supplier Change History report and spot check the changes for a few suppliers to verify that the data loaded as expected. This report is secured by domain security policy Supplier Change History.

As you populate the EIB input file, consider:

- Spreadsheet Key : Specify a unique value for each Supplier.
- Auto Complete: Set to Y if you want to bypass all approvals, reviews, to-dos, and notifications.
- Supplier and Supplier ID: If you're updating an existing supplier, populate these columns (Column D and Column H) with the supplier ID. (The Find Suppliers report lists the Supplier ID values).

- Supplier Name (required): Specify the supplier name. Note that the value in this field must match the value in the Business Entity Name field.
- Restricted to Companies: If you've selected to restrict Supplier to certain companies, list each company on a separate line.
- Submit: Set to Y if you want to automatically submit the supplier event. If you set it to N, it will remain in Draft status.
- Supplier Category (required): Enter the reference ID for the supplier category. To find valid IDs, you can run the View Reference ID report and search for business object *Supplier Category*.
- Payment Types Accepted (required): Enter the reference ID for the payment type. If there are multiple payment types that apply, enter each payment type on a separate line. To find the reference ID values, you can run the View Reference ID report and search for business object *Payment Type*.
- Default Payment Type (required): Enter the reference ID for the payment type. To find the reference ID values, you can run the View Reference ID report and search for business object *Payment Type*.
- Business Entity Name (required): Specify the supplier name. Note that the value in this field must match the value in the Supplier Name field.
- Status: If you wish to deactivate the Supplier, enter INACTIVE here.
- Worktags: Worktag information can be a bit tricky to populate. If you need to make mass changes to the supplier worktags, you can:
  - From the related actions of your EIB, select Template Model > View.
  - On left panel, edit sections Related Worktags by Type Data and Allowed Worktag Data.
  - In the right section, locate the worktag and select Separate Type Column.
  - Save your changes.
  - Manually add the worktags to 1 supplier
  - Use the Generate Spreadsheet with Data option for the above supplier and it will display how to populate the worktags in the EIB input file.

## Common Issues and Errors

Issue	Cause and Solution
<p>When updating an existing supplier, you can receive one or more of the errors below:</p> <ul style="list-style-type: none"> <li><i>Element Content 'Supplier_Name' is required, on internal element 'Supplier Data'</i></li> <li><i>Business Entity Data is required.</i></li> <li><i>Default Payment Type Reference is required.</i></li> <li><i>Payment Types Accepted Reference is required.</i></li> <li><i>Supplier Category Reference is required.</i></li> <li><i>Supplier Name must match Business Entity Name</i></li> </ul>	<p>There's a validation process in this web service that requires certain fields to be populated (even if you aren't updating these fields). See <i>Additional Input File Guidelines</i> section for the required fields. Also, the best practice is to always populate all existing field values when updating through a web service. If you choose not to do this, then make certain no existing Supplier fields are removed after running the EIB.</p>
<p>When updating an existing supplier, you receive one or more of the errors below:</p> <ul style="list-style-type: none"> <li><i>When Do Not Replace All is False for all phone elements, you can't pass a Phone Reference.</i></li> <li><i>When Do Not Replace All is False for all email elements, you can't pass an Email Reference.</i></li> <li><i>When Do Not Replace All is False for all Instant Messenger elements, you can't pass an Instant Messenger Reference.</i></li> <li><i>When Do Not Replace All is False for all web address elements, you can't pass a Web Address Reference.</i></li> </ul>	<p>Update the EIB input file and set the Do Not Replace All fields to Y.</p>
<p>When updating existing suppliers, the web service wipes out some of the existing fields such as 1099 status, default spend category and other fields</p>	<p>Before v37.0, this web service didn't support incremental updates for some fields. Make certain you're using v37.0 or higher to take advantage of incremental updates. Refer to <i>Web Service Version and Security Configuration Guidelines</i> section for instructions on how to check your EIB's version.</p>
<p>EIB issues this error: <i>Business Entity Tax ID cannot be used as tax ID for Supplier.</i></p>	<p>This issue occurs if you populate the same TAX ID in both Tax_ID_Text and Business_Entity_Tax_ID fields in the EIB input file. To resolve, test by removing the ID from Business_Entity_Tax_ID. Verify that this eliminates the error and that the information properly loads.</p>
<p>I'm not able to change the value for the Supplier Reference ID.</p>	<p>You can't change the supplier reference ID using this EIB. However, you can do this using the Put Reference EIB.</p>
<p>When running the Generate Spreadsheet with Data option, Workday doesn't create a spreadsheet template.  And if I check the background process that created the template, it displays an error that includes the message <i>Task Submitted is not Authorized.</i></p>	<p>This issue is a security-related error. Note that <i>Get Suppliers</i> web service is used to generate the template with data. Therefore, you must have access to this web service. To resolve this issue, make certain that you have get access to domain security policy <i>Reports: Supplier</i>.</p>
<p>Even though I set the Auto Complete and Submit fields to Y in my EIB input file, the Suppliers</p>	<p>This issue can occur if you have configured custom validations and the suppliers that you're</p>

Issue	Cause and Solution
that I uploaded weren't submitted and are still in progress.	<p>updating are failing to pass the validation check. To address this issue:</p> <ol style="list-style-type: none"> <li>1. Use EIB Cancel Pending Supplier Change to undo the updates that you loaded.</li> <li>2. Review the custom validations and either modify them or temporarily disable them.</li> <li>3. Resubmit the EIB.</li> </ol>
<p>EIB issues this error when adding a secondary email address.</p> <p><i>One and only one business email address must be marked as primary.</i></p>	<p>This issue will occur if adding a secondary email address but omitting the primary address from the EIB input file.</p> <p>If adding a secondary email address, you must also populate the existing primary address. Consider using Generate with Data option to populate existing supplier data in the EIB input file.</p>
When submitting the EIB, the default value configured for the Tax Applicability, doesn't get populated. However when processing the same in the User Interface (UI) the default works as expected.	<p>The Tax Applicability relies on a value being submitted for the Ship-To Address.</p> <p>Include <i>Ship-To Address</i> in the EIB input file, for the tax applicability to properly populate.</p>
I'm unable to launch the EIB	In the Supplier Event business process security policy, add access to the initiating action Submit Supplier (Web Service).

## Business Processes

This EIB uses 2 different business processes depending on the scenario:

- If you create new suppliers, this EIB uses the Supplier Event business process.
- If you update existing suppliers, this EIB uses the Supplier Change Event business process.

## Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new Suppliers or update existing Suppliers. You can't delete Suppliers; however, you can use the EIB to set them to an Inactive status.
- Although this web service uses a business process, there are no cancel or rescind options. If you have inadvertently uploaded incorrect entries, you might want to consider taking 1 of these actions:
  - Run the EIB again and update the Supplier with the correct data. If existing data was overwritten and you no longer have access to the correct values, check if they're still available in a nonproduction tenant such as Sandbox.
  - If you inadvertently created Suppliers that you don't want to keep, you can run the EIB again and set them to inactive. And you might also want to add DNU to the beginning of the supplier name.
  - If you uploaded Supplier changes that are still in progress, you can use EIB Cancel Pending Supplier Change to cancel the changes and then resubmit the corrected data.

For reference documentation for all web services including Submit Supplier, see [Operation Directory](#).

## Sample EIB Input Files

[Submit\\_Supplier-v39](#)

## [Bulk\\_Import\\_Submit\\_Supplier-v39\\_0](#)

### Concept: Submit Supplier Invoice EIB

#### Background

You can use this EIB to add or update supplier invoices.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

Task: Create Supplier Invoice.

There are additional integrations and EIBs related to supplier invoices. Consider these options as you determine what works best for you:

- Import Supplier Invoice: You can use this EIB to add or update supplier invoices with a large number of lines. Example: Invoices with 300 lines or more.
- Supplier Network Connector – Procurement Punchout Purchase Order and Invoicing: You can use this integration template to process supplier invoices. See [Steps: Set Up Supplier Invoicing Integration](#) for more information.

#### EIB Input File Guidelines

##### Web Service Version and Security Configuration Guidelines

- Workday frequently updates and enhances the Submit Supplier Invoice web service. Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Submit Supplier Invoice* business process in the Supplier Accounts functional area to run this EIB.

##### Guidelines for Adding Worktags to the EIB Template

If you need to populate multiple worktags for your supplier invoice, you'll want to add additional worktag fields to your spreadsheet for each worktag you use.

- From the related actions of your EIB, select Template Model > View.
- On the left, click Invoice Line Replacement Data+. If there are 2 entries titled Invoice Line Replacement Data+, select the second one. If

## Modify the EIB Template

you need to add worktags for split lines, then click Supplier Invoice Split Line Data+.

- Locate the Worktags+ label in the right pane.
- From the related actions of the magnifying glass next to Worktags+, select Template Model Column > Maintain Additional Columns.
- Add a row for each worktag type that you might specify in your EIB input file. You don't need to populate worktag values for all the worktags you specify.
- Regenerate the spreadsheet template and add newly added worktags to the spreadsheet.
- From the related actions of your EIB, select Template Model > View.
- On the left, click Invoice Line Replacement Data+. If there are 2 entries titled Invoice Line Replacement Data+, select the first one.
- Click Edit Template Model Area.
- Select the Separate Type Column check box for both the Purchase Order Line and the Supplier Contract Line. If you never reference POs or Contracts, it's not necessary to do select the check box. However, it does no harm to make this change.
- (Optional): Change the Reference ID type for the Purchase Item from *Catalog Item ID* to *Purchase Item ID* or *Supplier Item ID*.
- Click OK.

## Configure the EIB to Generate with Data

This EIB has a Generate Spreadsheet with Data option. Use this option when you aren't certain how to populate the input file. To use it:

- You might find it helpful to start by manually creating a supplier invoice like the invoices that you plan on loading by EIB.
- From the related actions of your EIB, select Integration IDs > View IDs.
- Copy either the Supplier\_Invoice\_Reference\_ID value or the WID value to the clipboard as you'll need 1 of these values in a later step.
- From the related actions of your EIB, select Template Model > View.
- Click Edit Template with Data Options.
- Paste in either the Supplier\_Invoice\_Reference\_ID value or the WID value from the supplier invoice ID. If you use the WID value, change the ID Type from *Supplier Invoice Reference ID* to *WID*.
- You can regenerate the template and click the Generate Spreadsheet with Data option.

## Additional Input File Guidelines

Note that this option populates all data even derived data. You might need to clean it up and remove unnecessary field values before you can use it.

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.

To prevent data loss, we recommend that you generate your spreadsheet with data for the Submit Supplier Invoice EIB. See: [Example: Generate EIB Spreadsheet Template with Data](#) on page 64.

As you populate the EIB input file, consider:

- **Spreadsheet Key:** Specify a unique value for each supplier invoice.
- **Supplier Invoice (column D):** Populate this field if updating an existing supplier invoice or if you want to assign your own supplier invoice id.
- **Auto Complete:** If set to Y, Workday skips all approval steps, review steps and to do steps and suppresses notifications.
- **Supplier Invoice ID (column H):** Populate this field if updating an existing supplier invoice or if you want to assign your own supplier invoice id.
- **Submit:** Set to Y to submit the Invoice. If set to N, it will stay in draft status.
- **Locked in Workday:** If set to Y, you can make modifications to the invoice only by the EIB or web service.
- **Company:** Workday requires this field. To find the value, you can use the Reference IDs report and search for business object *Company*.
- **Supplier ID and Contingent Worker fields:** Supply a value for either Supplier ID -or- Contingent Worker. But don't populate a value for both fields.
- **Ship-To Address:** As of v35.0, the header ship-to-address populates from the company that you provide.
- **Attachment Data:** Although you can add or update attachments using this EIB, it isn't recommended as there are some challenges in loading document content through EIB. You can also use the *Put Procurement Document Attachment* web service to add attachments.
- **Taxes:** The EIB defaults header information (including tax information onto taxable documents). If you don't want the tax fields to

populate, you need to explicitly enter {empty} in the field.

- **Invoice Line Item Data:** The invoice line data displays in the Invoice Line Replacement Data section, which starts in column DH in the attached sample input file. Below are additional details for some of the more commonly used fields:
  - Row ID (Column DH): Enter a unique row id value for each line item.
  - Purchase Order Line: If you're referencing a purchase order, be sure to follow the instructions in *Modify the EIB Template* section on how to change the template to use a separate type column for the purchase order line. You'll also need to update the EIB input file and change the Reference ID Type for the Parent ID Value to *Document\_Number* (cell DQ4 in the attached sample file). Refer to the sample input file, which displays how you populate the PO number and line in the Purchase Order Line section (starting in column DL in the example).
  - Supplier Contract Line: If you're referencing a contract line, be sure to follow the instructions in *Modify the EIB Template* section on how to change the template to use a separate type column for the supplier contract line. You'll also need to update the EIB input file and change the Reference ID Type for the Parent ID Value to *Supplier\_Contract\_ID* (cell DU4 in the attached sample file). Refer to the sample input file, which displays how you populate the Contract number and line in the Supplier Contract Line section (starting in column DR in the example).
  - Worktags: If you're using multiple worktags, be sure to follow the instructions in *Guidelines for Adding Worktags to the EIB Template* section to add all relevant worktag columns to the EIB template. Also, note that there's no need to populate the related tags as they'll automatically populate. If needed, you can configure worktag type precedence. See [Configure Worktag Defaulting](#) for more details.
  - External Supplier Invoice Source: Originating system of the supplier contract. Populate this field only if

using the Supplier Contract ID External field on the spreadsheet to reference a supplier contract.

- Invoice Split Line Item Data: if you need to specify details for split lines, enter this data in the Supplier Invoice Split Line Data section, which starts in column FX in the attached sample input file. Note that if you're referencing a PO that has split items, Workday automatically brings in this information into the invoice, and doesn't need to be populated in the EIB input file, unless you wish to change it to be different than the PO.

## Common Issues and Errors

Issue	Cause and Solution
<p>The EIB issues this error:</p> <p><i>The total extended amount of all lines must be greater than zero.</i></p>	<p>Make certain that your EIB is using v34.0 or higher as this version is when the web service started supporting \$0 amounts. Create a new EIB to ensure you are on the latest web service version.</p>
<p>Performance is slow.</p>	<ul style="list-style-type: none"> <li>• If you have a lot of custom validations, it can degrade performance.</li> <li>• Evaluate which web service to use: if most of the invoices have very few line items, use Submit Supplier Invoice. But if the invoices have a larger number of line items, test using Import Supplier Invoice instead.</li> </ul>
<p>The EIB issues errors such as</p> <p><i>Task submitted isn't authorized</i></p> <p>-or-</p> <p><i>The entered information doesn't meet the restrictions defined for this field. (Supplier_Reference)</i></p>	<p>Check the business process security policy for Supplier Invoice Event and make certain you have access to Initiating Action <i>Submit Supplier Invoice (Web Service)</i>. If you're loading supplier invoices across all organizations, you should have unconstrained access to the business process security policy.</p>
<p>When attempting to attach the EIB input file, you receive an error like this:</p> <p><i>The size of the file 'xxxx' is greater than the maximum permitted file size (30,720KB). Please select a different file or reduce the size of this file.</i></p>	<p>The size of the EIB input file, for supplier invoices, can be quite large due to the amount of data associated with each supplier invoice. Unfortunately, there isn't a way to increase the file limitations when attaching EIB input files. But below are a couple suggestions that might help.</p> <ul style="list-style-type: none"> <li>• If you have an SFTP server, 1 option would be to load your EIB input file to the SFTP site, and then configure your EIB with a retrieval step that pulls the file from the SFTP site (instead of manually attaching the file from your browser). If you do this step, you can load a file up to 1 gig.</li> </ul>

Issue	Cause and Solution
	<ul style="list-style-type: none"> <li>If you're using an XML input file, consider switching to XLSX format as the file size will be smaller.</li> </ul>
<p>The Withholding Tax Code isn't populated on the invoice line in these situations:</p> <ul style="list-style-type: none"> <li>When a Default Withholding Tax Code is populated on the invoice header level.</li> <li>When the Supplier has a Default Withholding Tax Code.</li> </ul>	<p>In general, the web service doesn't populate values because we don't know if the value was intended to be blank or defaulted. However, for this field, you can use the Withholding Tax Rule for Country feature. When configuring this rule, the user interface and web service will populate the value to the line.</p>
<p>When loading load invoices with split lines, the EIB completes successfully however doesn't liquidate the PO.</p>	<p>This issue occurs if the Line Split Allocation value isn't populated in the <i>Supplier Invoice Split Line Data</i> section. When the value isn't populated, the web service is unable to match the split information against the PO line splits, and doesn't properly liquidate the PO.</p> <p>To resolve this, you can:</p> <ul style="list-style-type: none"> <li>Populate Workday ID (WID) of PO line splits in the Line Split Allocation field of the EIB input file</li> <li>Or, if none of the line split information is changing, then you can remove all the data from the <i>Supplier Invoice Split Line Data</i> section.</li> </ul>
<p>When using the EIB to update an existing invoice and add new lines, it removes any existing lines.</p>	<p>When updating an existing invoice, the EIB will remove all the existing lines and then add the lines from the EIB input file. So you must include all lines in the EIB input file.</p>
<p>I can't find a hold removal option using the EIB.</p>	<p>The web service currently doesn't support this functionality.</p>

## Business Processes

Supplier Invoice Event.

## Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new supplier invoices or update existing supplier invoices. You can't delete or rescind supplier invoices.
- If you have inadvertently uploaded incorrect supplier invoices, check if 1 of these options will work for your situation:
  - Rerun the EIB and update the invoices with correct information. (You could create a custom report using a data source such as *Supplier Invoices* to help identify the supplier invoice reference id values, and invoice numbers that need populated in the EIB input file to update the existing invoices.)
  - Use the Cancel Supplier Invoice EIB to cancel the erroneous invoices.

For reference documentation for all web services including Submit Supplier Invoice, see [Operation Directory](#).

## Sample EIB Input File

[Submit\\_Supplier\\_Invoice-v39](#)

## Staffing EIBs

### Concept: Assign Organization EIB

#### Background

You can use this EIB to assign company, cost center, region, fund, grant, business unit, program, and custom organizations configured for staffing usage to a staffing position.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

Note: When you run this EIB, it replaces all existing organization assignments data for a worker or position with the information that you specify in the EIB input file. We recommend using the Change Organization Assignments EIB for your organization assignments instead.

#### Equivalent Workday Task

There are similar EIBs and tasks that you can use to assign organizations. Examples include:

- Change Organization Assignments: We recommend that you use this EIB to assign members to organizations.
- On the related actions menu of a worker profile, select Organization > Change Organization Assignments.
- Workday tasks that enable you to mass-assign organizations to workers, such as:
  - Move Workers (Supervisory)
  - Move Workers (by Organization)

#### EIB Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:

- This EIB replaces all existing organization assignments data for a worker or position with the information that you specify on the sheet.
- Include all organizations that are already assigned to a worker or position, as well as any organizations that you want to add. If you don't include the existing organization assignments, the EIB will overwrite and replace them when you run it.

#### Business Processes

Change Organization Assignments for Worker.

#### Use Cases and Guidelines for Recovering from a Bad Load

This EIB replaces all existing organization assignments data for a worker or position with the information that you specify in the EIB input file.

If you've uploaded incorrect entries, you can use either the Mass Cancel Business Processes task (if the event is still in progress) or Mass Rescind Business Processes task (if the event is complete). Both of these tasks are secured to the *Business Process Administrator* domain in the System functional area. You can then select Business Processes Loaded by EIB to find the integration event that you want to cancel or rescind.

For reference documentation for all web services including Assign Organization, see [Operation Directory](#).

## Sample EIB Input File

Assign\_Organization-WD31

### Concept: Assign Roles EIB

#### Background

You can use this EIB to assign roles to positions, workers, or eligible investigators. For more information on eligible investigators, see [../../../../education-and-government/grants-management/grants-management-role-assignments/concept--eligible-investigators.dita](#).

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

Role assignment changes aren't rescindable. We recommend that you exercise extreme caution and review and finalize any role assignment changes before you submit them.

#### Equivalent Workday Task

See Assign Roles from the related actions menu of the worker profile.

#### EIB Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:

- Academic Affiliate: You can change this to the reference ID type of the position, worker, or eligible investigator instance that you want to assign to or remove from a role assignment. Example: To assign a role to an eligible investigator, change *Academic Affiliate* to *Eligible Investigator Reference ID* on the *Assignees to Add+* column.
- Academic Division Configuration ID: You can change this to the reference ID type of the object on which you want to assign the role. Example: To assign a role on an award, change *Academic Division Configuration ID* to *Award Reference ID* on the *Role Assigner* column.
- Effective Date: To make the role assignment effective immediately, leave this field blank to default to today's date. You can also specify a future date. Avoid using a date in the past; we don't recommend backdating role assignments.
- Event Target Assignee: Specify the position or worker that you want to assign to a role.
- Remove All Role Assignments for Event Target Assignee: Removes all role assignments for an assignee if you specify TRUE ALL - including role assignments with a future-dated effective date. Role assignment changes aren't rescindable. We recommend that you review and finalize any role assignment changes before you submit them.
- Update Later Dated Assignments: Workday recommends that you set this field to Y so that assignees don't lose their role assignments in the future. If you set it to N, Workday might drop the role assignment if there are any future-dated assignments for the role.
- Assignees to Add+: Specify the position, worker, or eligible investigator that you want to assign a role to.
- Remove Existing Assignees for Assignable Role on Role Assigner: You can set this to Y if you want to remove all role assignments for a given role and organization. Role assignment changes aren't rescindable. We recommend that you exercise extreme caution and review and finalize any role assignment changes before you submit them.

Select the *Edit* check box.

## Common Issues and Errors

Issue	Cause and Solution
The EIB completes successfully, but you don't see the new role assignments.	<ul style="list-style-type: none"> <li>You might have specified an older effective date in the input file. Role assignments with the most recent effective dates take precedence and immediately override older role assignment.</li> <li>Ensure you've populated the Assignees to Add+ field.</li> </ul>
There's no option to launch the integration.	<p>Verify you have the correct security configuration. Ensure that you are in the relevant security group and have access to the <i>Assign Roles</i> business process type in the Organizations and Roles functional areas.</p>
Performance is slow.	<ul style="list-style-type: none"> <li>The Effective Date in the EIB input file might be before today's date. Avoid backdating the effective date.</li> </ul>
<p>The EIB issues these errors:</p> <ul style="list-style-type: none"> <li><i>Assignable Role isn't valid</i></li> <li><i>The entered information doesn't meet the restrictions defined for this field (Assignable_Role_Reference)</i></li> </ul>	<p>Access the Maintain Assignable Roles task and ensure that there's a value in the <i>Assigned by Security Groups</i> field for the role in question.</p>
<p>The EIB fails with this error: <i>Validation error occurred. "Role Assignees to Add" can't contain existing assignee as of effective date specified.</i></p>	<p>This occurs if you try to remove all role assignments and then add them back in the same request. If you want to remove all assignees and then add them back, submit separate requests.</p>
The EIB partially loads roles and uses the assignee location for the role assignment time zone.	<p>If a tenant is configured to use the assignee location for the role assignment time zone, then Workday assumes the effective date that you specify in the EIB input file is Pacific time. If you then try to load multiple roles for the same organization using separate spreadsheet key values, they might use different effective dates/times - which causes some roles to be immediately outdated.</p> <p>If you want to assign multiple positions to the same role/organization, we recommend grouping them together using the same spreadsheet key value so that they all have the same effective date/time.</p>
<p>EIB fails with these errors when you specify <i>WorkdayUserName</i> in the EIB Input File.</p> <ul style="list-style-type: none"> <li><i>E1: The provided Role Assignee is not valid as an Event Target Role Assignee.</i></li> <li><i>E2: The entered information does not meet the restrictions defined for this field. (Assignees_to_Add_Reference).</i></li> </ul>	<p>This EIB currently doesn't support the <i>WorkdayUserName</i> identifier. We only support this identifier for the Assign Roles web service, not the Assign Roles EIB.</p>

## Business Processes

Assign Roles.

### Guidelines for Recovering from a Bad Load

You can't rescind this EIB. If you've uploaded incorrect entries, rerun the EIB to update the role assignments. You can also use the Role Assignment Snapshots for Role Assignee report to help identify role assignments you might have changed or removed.

For reference documentation for all web services including Assign Roles, see [Operation Directory](#).

### Sample EIB Input Files

[Assign\\_Roles-v39-Example1-General](#)

[Assign\\_Roles-v39-Example2-Gifts](#)

[Assign\\_Roles-v39-Example3-Account-Certification](#)

### Concept: Change Job EIB

#### Background

You can use this EIB to perform a job change on an employee or contingent worker. This can include changing worker-related information such as organization assignments, compensation changes, pay groups and locations.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

For a similar EIB, consider the Import Change Job EIB. You can use the Import Change Job EIB to load large volumes of job changes (Example: 1000 or more). If you need to load large volumes of job changes, consider testing in your sandbox tenant to determine whether the Change Job or Import Change Job EIB performs better for your use case.

You can also perform mass change jobs through:

- Worksheets: See [../../../../human-capital-management/staffing/Change-Job/new-change-job/khr1644514585754.dita](#).
- Org Studio: See [Org Studio and Mass Actions](#).

### EIB Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:

- Ensure that the steps in your *Change Job* business process definition in Workday align with the information that you populate in the EIB input file. Example: If the *Change Job* business process has an Assign Pay Group step, then:
  - If you want to update the pay group field, populate the pay group information in the EIB input file.
  - If you don't want to update the pay group field, edit the *Change Job* business process definition in Workday and mark the step as optional. Then in the EIB input file, set the processing instructions to *Skip Processing* for optional steps. You can also add condition rules on steps to skip them in the business process if needed. Example: Add a condition rule where External Load = N.
  - If the business process definition doesn't align with the EIB input file, then the EIB might fail to complete or load with incomplete information.

- If you populate a subprocess in the EIB input file, ensure that the *Change Job* business process definition in Workday has a step for that subprocess.
  - Example: If you're populate role assignments in the EIB input file, ensure that the *Change Job* business process definition in Workday has an Assign Roles step.
- The Reason field in the EIB input file is required. As you populate the Reason field, consider:
  - Specify the reference id type as *Change\_Job\_Subcategory\_ID* on row 4 in the input file.
  - You can find a list of reference ID values by running the Integration IDs report and searching for the *Change Job Subcategory* business object.

## Common Issues and Errors

Issue	Cause and Solution
The EIB completes successfully but you don't find the change job events you loaded.	<p>This can occur if the information in your EIB input file doesn't align with the steps in your <i>Change Job</i> business process definition in Workday.</p> <ol style="list-style-type: none"> <li>1. Run the Mass Cancel Business Processes task (secured to the <i>Business Process Administrator</i> domain in the System functional area) to cancel any in progress <i>Change Job</i> events.</li> <li>2. Update the information in your EIB input file to align with the steps in your <i>Change Job</i> business process definition.</li> <li>3. (Optional) In Workday, consider updating the business process definition by:           <ul style="list-style-type: none"> <li>• Marking any unnecessary steps as optional and then setting the processing instructions in the EIB input file to <i>Skip Processing</i> for optional steps.</li> <li>• Adding condition rules on steps to skip them in the business process if needed. Example: Add a condition rule where External Load = N.</li> </ul> </li> <li>4. Rerun the EIB.</li> </ol> <p>You can use the Business Processes tab in the EIB integration event to view and identify the business processes that are still in progress.</p>
The EIB completes successfully and some changes are made but others are missing.	<p>The business process definition might have condition rules that skip some of the steps.</p> <p><a href="#">View the business process event</a> and look for steps that are marked as not required. Change the condition rules on the steps as needed.</p> <p>The input file might also be missing a row ID.</p> <p>When you populate a section of an EIB input file that contains a row ID, you must specify a row ID value or the section is skipped automatically.</p>

Issue	Cause and Solution
	After you adjust the business process definition or input file, you can mass cancel or mass rescind the previous EIB and then rerun the updated EIB.
<p>EIB issues this error: <i>Validation error occurred. Either the Proposed Position Restriction is required or Create Position needs to be true.</i></p>	<p>If you want to move an employee to a new supervisory organization, then you need to either specify a new position or move the position restriction from the old organization to the new organization.</p> <p>To move the position restriction, specify <i>MOVE</i> in the Headcount Option field.</p> <p>To create a new position, specify <i>Y</i> in the Create Position field in the EIB input file.</p>
<p>Role assignments are missing after the Change job event completes.</p>	<p>Role assignments are associated with the position, not the employee.</p> <p>If an employee is promoted to a new position, they lose their existing role assignments on the effective date of the promotion and pick up any role assignments that are assigned to their new position.</p> <p>If the new position doesn't have any role assignments associated with it, you can either:</p> <ul style="list-style-type: none"> <li>• Specify the new role assignments in the Change Job EIB.</li> <li>• Create a separate Assign Roles EIB to assign the relevant roles to the new position.</li> </ul>
<p>Unexpected changes to the worker's organization assignments.</p>	<p>If a worker moves to a new position or supervisory organization, the organization assignments might change based on the configuration of the new assignments.</p> <p>See <a href="#">Reference: Default Organization Assignments</a> for more information.</p>

## Business Processes

Change Job.

### View Change Job Event Details

For the enhanced user interface, when you view a change job event created by the EIB, the event displays based on your configuration on the Change Job template with the Change Job initiating action.

### Use Cases and Guidelines for Recovering from a Bad Load

This EIB only enables you to add new change job events. You can't update or delete existing change job events with this EIB.

If you've uploaded incorrect entries, you can use either the Mass Cancel Business Processes task (if the event is still in progress) or Mass Rescind Business Processes task (if the event is complete). Both of these tasks are secured to the *Business Process Administrator* domain in the System functional area. You

can then select Business Processes Loaded by EIB to find the integration event that you want to cancel or rescind.

For reference documentation for all web services including Change Job, see [Operation Directory](#).

## **Sample EIB Input Files**

[Change\\_Job-WD31-Example1-Position-Changes](#)

[Change\\_Job-WD31-Example2-Add Roles and Organizations](#)

[Change\\_Job-WD31-Example3-Move-Manager-and-Team](#)

[Change\\_Job-WD31-Example4-Change-Pay-Group](#)

[Change\\_Job-WD31-Example5-Change-Location](#)

## **Concept: Change Organization Assignments EIB**

### **Background**

You can use this EIB to assign organizations to worker positions. You can assign organizations to a filled position or position restriction.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### **Equivalent Workday Task**

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Change Organization Assignments
- On the related actions menu of the worker profile, select Organization > Change Organization Assignments.

There are also similar EIBs that you can use to assign organizations. Consider these options as you determine what works best for you:

- Assign Members to Custom Organization: You can use this EIB to assign and unassign worker positions as members of a custom organization. This functionality is also supported by the Change Organization Assignments EIB.
- Import Assign Matrix Organization: You can use this EIB to assign members to matrix organizations.
- Import Change Organization Assignments: You can use this EIB to load large volumes of organization assignments (Example: 1000 or more). If you need to load large volumes of organization assignments, consider testing in your sandbox tenant to determine whether the Change Organization Assignments or Import Change Organization Assignments EIB performs better for your use case.
- Import Remove Matrix Organization: You can use this EIB to remove members from matrix organizations.

You can also perform mass organization changes through:

- Move Workers (Supervisory) task
- Move Workers (by Organization) task
- Workbooks: See [Initiate Change Organization Assignments in Mass Action Workbooks](#).
- Org Studio: See [Org Studio and Mass Actions](#).

## EIB Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:

- **Spreadsheet Key:** Specify a unique value for each position.
- **Position (Required):** Specify the position ID for the worker. Consider creating a custom report with the *All Workers* data source to get the position ID.

## Common Issues and Errors

Issue	Cause and Solution
Unable to launch the EIB	<p>This is most likely security-related.</p> <p>Verify you have the correct security configuration.</p> <p>Ensure that you are in the relevant security group and have access to the <i>Change Organization Assignments for Worker</i> business process type in the Organizations and Roles functional area.</p>
<p>EIB issues one of these two errors:</p> <ul style="list-style-type: none"> <li>• <i>Validation error occurred. One of the Custom Organizations is not allowed because its type is not allowed for positions.</i></li> <li>• <i>Validation error occurred. The custom organization(s) xxxxx does not exist on this worker and cannot be deleted.</i></li> </ul>	<p>Select the Show Change Organization Assignments and Job Requisitions checkbox for the organization type you want to assign or remove:</p> <ol style="list-style-type: none"> <li>1. Access the Maintain Organization Types task.             <ol style="list-style-type: none"> <li>a. Security: Set Up: Organization domain in the Organization and Roles functional area.</li> </ol> </li> <li>2. On the Custom tab, locate the organization type you want to assign or remove.</li> <li>3. Click the Edit button.</li> <li>4. Select the Show Change Organization Assignments and Job Requisitions checkbox for the organization type you want to assign or remove.</li> </ol> <p>You should then be able to successfully run the Change Organization Assignments EIB. When you're done, you can use the same steps to unselect the checkbox if you want.</p>
<p>EIB issues the following errors:</p> <ul style="list-style-type: none"> <li>• <i>The Company is required based on the position assignment details settings for the company organization type.</i></li> <li>• <i>The Cost Center is required based on the position assignment details settings for the organization type.</i></li> <li>• <i>Element Content Position_Reference is required, on internal element Change Organization Assignments Data.</i></li> </ul>	Populate the position field in the EIB input file.
<p>EIB issues this error: <i>Validation error occurred. You cannot initiate this action because there are other</i></p>	Check these:

Issue	Cause and Solution
<i>pending or completed organization actions for P00001 (Position Vacate:12/31/2018) that conflict with this one.</i>	<ul style="list-style-type: none"> <li>• If you want to assign a future dated termination, ensure you're using the latest web service version for your EIB. This functionality isn't available for older web service versions.</li> <li>• If you're not attempting to assign to a future dated termination: <ul style="list-style-type: none"> <li>• Check historical org assignments for the worker.</li> <li>• Ensure they're prior to the effective date used in the EIB input file.</li> <li>• Verify there are no pending organization assignments for the worker.</li> <li>• If you need to make out-of-order organization assignments, see <a href="#">Set Up Out of Order Insertion and Correction for Organization Assignments</a>.</li> </ul> </li> </ul>
<i>EIB issues an error like this: Validation error occurred. Invalid instance 247\$5174 for Staffing_Interface_for_Assign_Organization_Secured-IS (15\$34955).</i>	<p>This can occur if you specify an employee ID instead of a position ID in the Position column in the EIB input file.</p> <p>Ensure that you specify a position ID in the EIB input file.</p>
<i>EIB issues an error like this: Validation error occurred. At least one of the Custom organization types is required based on the position assignment details settings but has no entries.</i>	<p>This can occur if you don't include all required custom organization assignments in the EIB input file:</p> <ol style="list-style-type: none"> <li>1. Access the Maintain Organization Types task.</li> <li>2. On the Custom tab, identify all organization types where Position Assignment Required = Yes.</li> <li>3. Edit EIB input file and add all required organizations.</li> </ol>

## Business Processes

Change Organization Assignments for Worker.

## Use Cases and Guidelines for Recovering from a Bad Load

This EIB enables you to add new organization assignments, replace existing assignments and delete assignments.

If you've uploaded incorrect entries, you can use either the Mass Cancel Business Processes task (if the event is still in progress) or Mass Rescind Business Processes task (if the event is complete). Both of these tasks are secured to the *Business Process Administrator* domain in the System functional area. You can then select Business Processes Loaded by EIB to find the integration event that you want to cancel or rescind.

For reference documentation for all web services including Change Organization Assignments, see [Operation Directory](#).

## Sample EIB Input File

[Change\\_Organization\\_Assignments-WD31\\_0](#)

## Concept: Contract Contingent Worker EIB

### Background

You can use this EIB to add new contracts for pre-hires in a contingent worker position.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

Task: Contract Contingent Worker.

There are also similar EIBs that you can use to update contracts and contingent worker information. Consider these options as you determine what works best for you:

- Correct Contingent Worker: You can use this EIB to correct the contract start date and conversion start date.
- End Contingent Worker Contract: You can use this EIB to end a contingent worker's contract.
- Import Contract Contingent Worker: You can use this EIB to load a large volume of contingent worker contracts (Example: 1000 or more).
- Maintain Employee Contracts: You can use this EIB to load contracts for an employee.
- Put Applicant: Creates pre-hires.
  - You can also create pre-hires with the Contract Contingent Worker EIB. If you prefer to create the pre-hires before running the Contract Contingent Worker EIB, you can use the Put Applicant EIB.
- Put Assign Supplier to Contingent Worker: You can use this EIB to add or update a supplier for an existing contingent worker.

### EIB Input File Guidelines

#### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Contract Contingent Worker* business process type in the Staffing functional area to run this EIB.

#### Additional Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating

EIB files. Additionally, as you populate the EIB input file, consider:

- Spreadsheet Key: Specify a unique value for each contingent worker.
- Applicant: This field performs the same function as specifying an existing pre-hire when hiring in Workday. Leave this field blank if you want to create the pre-hire within the EIB.
- Position: Populate this field if you want to add a new contract for a worker from an open position. If you populate the Position field, don't populate the Job Requisition field.
- Job Requisition: Populate this field if you want to add a new contract for a worker from an open job requisition. If you populate the Job Requisition field, don't populate the Position field.
- Position ID: Leave blank unless you want to add a new contract for a worker in a headcount group or job management organization and you know that a new position will be created for them.
- Contract Worker Reason: You can find a list of reference ID values by running the View Reference IDs report, searching for the *General Event Subcategory* business object and then filtering the Business Object Instance field for *Contract Contingent Worker*.
- Create Purchase Order: Set to *True* if you use Workday Procurement and you want to create a purchase order for the contingent worker.
  - If you set this field to *True*, it initiates the *Create Purchase Order for Contingent Worker* subprocess. The subprocess only initiates if it's defined as part of the supervisory organization's business process definition. You also need to manually finish the process manually online to activate the purchase order. Setting the field to *True* also makes the Contract End Date field required and will require currency and frequency (hourly) values if you specify a pay rate.
  - Supplier: If the worker isn't an independent contingent worker, specify the reference ID for the supplier.

## Common Issues and Errors

Issue	Cause and Solution
Although the EIB completes successfully, it seems that the data wasn't loaded.	<p>This can occur if the information in your EIB input file doesn't align with the steps in your <i>Contract Contingent Worker</i> business process definition in Workday.</p> <ol style="list-style-type: none"> <li>1. Run the Mass Cancel Business Processes task (secured to the <i>Business Process Administrator</i> domain in the System functional area) to cancel any in progress <i>Contract Contingent Worker</i> events.</li> <li>2. Update the information in your EIB input file to align with the steps in your <i>Contract Contingent Worker</i> business process definition.</li> <li>3. (Optional) In Workday, consider updating the business process definition by: <ul style="list-style-type: none"> <li>• Marking any unnecessary steps as optional and then setting the processing instructions in the EIB input file to <i>Skip Processing</i> for optional steps.</li> <li>• Adding condition rules on steps to skip them in the business process if needed. Example: Add a condition rule where External Load = N.</li> </ul> </li> <li>4. Rerun the EIB.</li> </ol> <p>You can use the Business Processes tab in the EIB integration event to view and identify the business processes that are still in progress.</p>
I need to mass update existing contracts to change the start date.	<p>Consider:</p> <ul style="list-style-type: none"> <li>• Using a Correct Contingent Worker EIB to correct the contract start date and conversion start date.</li> <li>• Manually updating the dates in Workday.</li> <li>• Running the Mass Rescind Business Processes task (secured to the <i>Business Process Administrator</i> domain in the System functional area) for the contingent worker contracts and then reloading them with the corrected date.</li> </ul>
Can I mass update any contract information using this EIB?	This EIB only enables you to add new contracts. You can't update existing contingent worker contracts.
Can I convert employee to contingent or the other way around, using this EIB?	This EIB doesn't support this functionality. As a workaround, you can terminate the worker in their current position and then hire them into their new position.

Issue	Cause and Solution
The EIB isn't creating the Workday account, even though the user information is populated in the EIB input file.	<p>There are 2 different Create Workday Account steps that you can configure in the <i>Contract Contingent Worker</i> business process. One is a Service step, and the other is an Action step:</p> <ul style="list-style-type: none"> <li>• If you're using the Service step: The business process event automatically initiates the step and creates the Workday account based on the naming conventions specified through the Maintain User Name Rules and Maintain Password Rules tasks (secured to the <i>System Administrator</i> domain in the Customer Central and System functional areas). The EIB then ignores any Workday account information populated in the EIB input file.</li> <li>• If you're using the Action step: The event uses the information supplied in the EIB input file to create the Workday account.</li> </ul> <p>To address this issue, check the <i>Contract Contingent Worker</i> business process definition and verify that the Create Workday Account step is an Action step.</p>
<p>EIB issues an error like this:</p> <p><i>Validation error occurred. Multiple Element Contents—including Contract Contingent Worker Business Process Data/a3/Create Applicant Data [EL]—contain data where only one is allowed by mutex Contract Contingent Worker Business Process Data.</i></p>	<p>If you specify an applicant ID (that is, a pre-hire ID) or a former worker ID in the EIB input file, then you can't populate any other data associated with the applicant or former worker, such as name, country, email, phone, or addresses.</p> <p>This information is redundant, and the EIB issues an error so that you don't overwrite existing information.</p> <p>To resolve this error, remove all applicant/former worker information from the input file—including any sections in the EIB input file with description containing applicant/former worker data—and specify only the applicant ID or former worker ID.</p> <p>If you need to update information for the applicant or former worker, you can either:</p> <ul style="list-style-type: none"> <li>• Update it within a subprocess of the EIB (the <i>Change Personal Information</i> business process, secured to the <i>Personal Information Change</i> domain in the Personal Data functional area).</li> <li>• Run another integration after the Contract Contingent Worker EIB to update the applicant/former worker information (Examples: Change Home Contact Information, Put Applicant, and so on).</li> </ul>
EIB performs slowly	Consider these:

Issue	Cause and Solution
	<ul style="list-style-type: none"> <li>If you want to load a large volume of contingent worker contracts (Example: 1000 or more), consider using the Import Contract Contingent Worker EIB for your use case.</li> <li>If you're attempting to load a large volume of workers to the same supervisory organization, we advise loading no more than 1000-2000 at a time to avoid data congestion.</li> </ul>
Unable to launch the EIB	<p>This is most likely security-related.</p> <p>Verify you have the correct security configuration.</p> <p>Ensure that you are in the relevant security group and have access to the <i>Contract Contingent Worker</i> business process type in the Staffing functional area.</p>

## Business Processes

Contract Contingent Worker.

### Use Cases and Guidelines for Recovering from a Bad Load

This EIB only enables you to add new contracts. You can't delete or update existing contracts.

If you've uploaded incorrect entries, you can use either the Mass Cancel Business Processes task (if the event is still in progress) or Mass Rescind Business Processes task (if the event is complete). Both of these tasks are secured to the *Business Process Administrator* domain in the System functional area. You can then select Business Processes Loaded by EIB to find the integration event that you want to cancel or rescind. Alternatively, you can enter *Add Vaccination* in the Business Process Types prompt and enter the date range that corresponds to when you ran the EIB.

For reference documentation for all web services including Contract Contingent Worker, see [Operation Directory](#).

### Sample EIB Input File

[Contract\\_Contingent\\_Worker-v38](#)

### Concept: Delete Worker Document EIB

#### Background

You can use this EIB to delete worker documents.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

Maintain Worker Documents.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.

You must have access to the *Worker Data: Edit and Delete Worker Documents* domain in the Personal Data functional area to run this EIB.

### Additional Input File Guidelines

- Proceed with great caution when using this web service as you can't recover the documents once the EIB deletes them.
- To help you populate the EIB input file, you can create a custom report using the All Workers report data source. As you define the custom report and filters:
  - Add columns with values from the Worker Documents related business object. Ensure that 1 field is Reference ID. Use the Reference ID value returned by the report for the ID field in the EIB input file.
  - In the Filter tab, define a filter *And / Worker Documents / is not empty*, along with any other filter criteria for your business use case.
  - Add a
  - In the Subfilter tab, define a filter on the Worker Documents related business object *And / Business Process / is empty*.
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:
  - **Spreadsheet Key:** Specify a unique value for each worker.
  - **Worker:** If deleting documents for employees, you'll need to change the reference ID type in Row #4

- from Contingent\_Worker\_ID to Employee\_ID.
- Row ID: This field is typically a value 1 for each entry, unless you have multiple row entries for the same worker.
  - Worker Document: This field is the reference ID for the document. Use the above report to find this value from the Reference ID field.

## Common Issues and Errors

Issue	Cause and Solution
Unable to Launch the Integration	This issue occurs if you don't have proper security access. Make sure you have Put access to domain security policy Worker Data: Edit and Delete Worker Documents.
The EIB issues an error like: Validation error occurred. Invalid instance 13230\$3 for Delete_Worker_Document__Singular--IS (15\$406825)	The File_ID specified in the input file isn't the proper reference ID type. Use the above custom report to get the correct file ID.
EIB issues error: <i>Validation error occurred. You can't delete a worker document that's attached to a business process. To remove the worker document, correct the business process event.</i>	You can't use this EIB to delete worker documents that are part of a business process event. Instead, you must correct the business process event to remove the document (or use the task Manage Attachments, see <a href="#">Concept: Business Process Step AttachmentsandSteps: Enable Attachments on an Individual Business Process</a> ).
EIB issues error: Validation error occurred. Invalid ID value. 'xxxxx' is not a valid ID value for type = 'Contingent_Worker_ID'	Make sure you specified the correct reference ID type for the worker. If you're removing a document for an employee, you need to change the reference ID type (cell C4) from Contingent_Worker_ID to Employee_ID.
EIB issues one of these 2 errors: <ol style="list-style-type: none"> <li>1. Validation error occurred. Invalid ID value. 'xxxx' is not a valid ID value for type = 'File_ID'</li> <li>2. Validation error occurred. Worker document is not valid for the specified worker.</li> </ol>	The File_ID that you specified for the worker isn't correct. Verify the File_ID you entered by using the above report to identify the correct file ID.

## Use Cases and Guidelines for Recovering from a Bad Load

This web service enables you to remove documents only. If you need to add or update documents, use Put Worker Document.

You can't recover the documents once the EIB deletes them. If you have inadvertently removed the wrong documents, check if the documents are still available from another tenant (Example: Sandbox). Then retrieve the documents from the other tenant and upload the documents to Production.

Note: you can't upload worker documents using EIB, as there are limitations on the size of files that EIB can upload. To upload documents, create a custom integration or load the documents manually using the Workday UI.

For reference documentation for all web services including Delete Worker Document, see [Operation Directory](#).

### Sample EIB Input File

[Delete\\_Worker\\_Document-WD32](#)

### Concept: Edit Worker Additional Data EIB

#### Background

You can use this EIB to update effective dated custom objects for a worker.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

From the related actions menu of the worker profile, select Additional Data > Edit Effective-Dated Custom Object.

There are additional EIBs related to custom objects. Consider these options as you determine what works best for you:

- Edit Job Requisition Additional Data
- Edit Position Restrictions Additional Data

#### EIB Input File Guidelines

##### Security Configuration Guidelines

Verify you have access to the *Edit Worker Additional Data Event* business process type in the Staffing functional area.

##### Additional Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.

As you populate the EIB input file, consider:

- Spreadsheet Key: Specify a unique value for each worker.
- Effective Date: Workday requires this field.
- Worker: The spreadsheet requires this section. Update the reference in row 4 from *Contingent\_Worker\_ID* to *Employee\_ID*.
- WID: If the first column for your custom object has a field with format *WID*, don't populate it. This field displays for multi-instance custom objects where there was no reference ID when you created the custom object. The *WID* makes the custom object unique. However, the web service will populate it and maintain it.
- To update existing custom object values, you might want to create a custom report, and use it to help you populate the EIB input file. When you generate the EIB template, it includes all effective-dated Worker custom

objects configured in your tenant. However, you need to populate only the fields for custom objects that you wish to load.

- Ensure that the *Edit Worker Additional Data Event* business process definition contains a step for any custom objects that the EIB is updating. If the business process definition contains steps for custom objects that the EIB isn't uploading, remove the steps or add a condition rule to prevent step execution. (Example: External Load is blank).

## Common Issues and Errors

Issue	Cause and Solution
Workday displays this error: <i>Validation error occurred.</i>	<ul style="list-style-type: none"> <li>• If populating an employee ID, verify that the reference ID type, specified in cell D4, is Employee_ID instead of Contingent_Worker_ID.</li> <li>• If populating amount or number fields, verify that they contain no special characters such as commas.</li> </ul>
There's no option to select the EIB when launching the integration.	<p>This issue occurs if you don't have the proper access to the <i>Edit Worker Additional Data Event</i> business process security policy. Ensure that you have access to the Initiating Action for <i>Edit Worker Additional Data (Web Service)</i>.</p>
After the EIB loads data to a multi-instance custom object, the EIB removed some of the previous entries.	<p>When you update custom objects that enable multiple instances, you must include data for existing instances in the EIB input file. Otherwise, the EIB removes the instances. If this issue occurs, use the Mass Rescind Business Processes task to rescind the business process events, and then reload all entries. You might want to create a custom report to help identify the existing entries.</p>
The EIB completes successfully but you don't find the custom object you loaded.	<p>This issue can occur if the business process events are still <i>in progress</i> as one of the steps didn't complete. This issue occurs when:</p> <ul style="list-style-type: none"> <li>• The EIB input file and business process definition don't align.</li> <li>• Processing instructions don't have the proper settings in the EIB input file.</li> </ul> <p>You can run the Mass Cancel Business Processes task to cancel the <i>in progress</i> business process events, and rerun the EIB after you address the problem.</p> <p>Also, this issue can occur if you don't load the custom objects in chronological order.</p>

Issue	Cause and Solution
EIB issues an error similar to this message: <i>Validation error occurred. Current System User does not have permission to edit 7574\$4 for 247\$1</i>	This issue occurs if you don't have access to the domain security policy that secures the custom object. Use View Custom Object to check which domain secures your custom object. Then give the appropriate security groups <i>Put</i> access to that domain.
<b>EIB issues this error:</b> <i>The entered information does not meet the restrictions defined for this field. (Worker_Reference)</i>	This issue occurs when you don't have sufficient access to the <i>Edit Worker Additional Data Event</i> business process security policy. Ensure you have unconstrained access to Initiating Action for <i>Edit Worker Additional Data (Web Service)</i> . If you have constrained access instead of unconstrained access, then you might not be able to update custom objects for all workers.
EIB issues an error similar to this message, when updating a multi-instance custom object: <i>Processing error occurred. The 9613\$184 business object has custom data with duplicate value: ABC, for reference ID field: xxx.</i>	If you assigned a reference ID when you created the custom object, Workday uses the reference ID to determine whether each instance is unique. Ensure that each entry in the input file (for a given worker) has a unique value for the field that you configured as the reference ID. You can't remove or change the reference ID after you activate the custom object. If the configuration of the custom object doesn't work for you, create a new custom object.
<b>EIB issues error</b> <i>Validation error occurred. One or more of the custom objects submitted is not configured in the business process definition.</i>	<ol style="list-style-type: none"> <li>1. Ensure that you aren't using a rule-based business process definition for the <i>Edit Worker Additional Data</i>. The web service doesn't support rule-based business process definitions.</li> <li>2. Ensure that you configured a step in the <i>Edit Worker Additional Data Event</i> business process definition for the custom object you're loading. Example: To load information for the custom object <i>Drug Tested</i>, you need to have this step in the business process definition: <ul style="list-style-type: none"> <li>• Type: Edit Additional Data</li> <li>• Specify: Drug Tested</li> </ul> </li> </ol>
<p>The EIB is adding extra decimal places to numbers and causing an error such as this:</p> <p><i>Validation error occurred. value 1121.84999999999 must be limited to 3 decimal places</i></p>	<p>This issue can occur due to an Excel limitation with storing decimals when using xml files. See <a href="#">Numeric precision issue in Excel 2007 when saving as XML</a> to learn why it happens and why it occurs only for certain decimals.</p> <p>We recommend that you generate the template using <i>xlsx</i> instead of <i>xml</i> to avoid these problems.</p> <p>If you wish to use an <i>XML</i> input file, you can work around this issue by converting the numbers to text before adding to the EIB input file:</p> <ol style="list-style-type: none"> <li>1. Place the numbers in an Excel file.</li> </ol>

Issue	Cause and Solution
	<ol style="list-style-type: none"> <li>2. Then use a formula to convert them. Ex: <code>=text(a1,"0.00")</code>.</li> <li>3. Paste Special from Excel to the EIB input file</li> </ol>
<p>The EIB issues an error similar to this message:  <i>Invalid instance with ID: 247\$8 for field xxxx  (7576\$30)</i></p>	<p>Ensure that you aren't placing a value in the field with <i>Reference</i> appended to the end. Example: in the attached sample EIB input file, field <code>petsAllowedInOfficeReference</code> should remain blank.</p>

### Use Cases and Guidelines for Recovering from a Bad Load

This EIB enables you to add new entries or update existing entries. You can't delete entries. If you have inadvertently uploaded incorrect entries, use the Mass Rescind Business Processes or Mass Cancel Business Processes tasks. Select the applicable task depending on whether the business process event completes or is still in progress. Then, select *Business Processes Loaded by EIB* to find the integration event that you wish to cancel or rescind. Alternately, you can enter *Edit Worker Additional Data Event* at the Business Process Types prompt.

You can't delete entries with this EIB. To delete a large number of instances for an effective dated custom object, you have these options:

- Rescind the business process events that you originally used to add the custom object data. You might be able to use the Mass Rescind Business Process Events task, if you're able to identify the events to rescind, based on a date range. You can also use the Rescind Business Process EIB.
- If you can risk removing the historical custom object data, and want to ensure that the current data as of today is correct, reload the data. Use an effective date that is newer than previous data that you loaded, and populate the EIB with the current information. If the worker should no longer have any custom object information assigned, you can load a *blank* custom object entry. You can load a blank entry only if the custom object has no reference ID assigned. Also, you must configure the custom object fields as optional.
- As a last resort, create a new custom object and load all relevant information to that custom object. Then retire the old custom object.

### Sample EIB Input Files

[Edit\\_Worker\\_Additional\\_Data-WD31-Example1-SingleInstance](#)

[Edit\\_Worker\\_Additional\\_Data-WD31-Example2-MultiInstance](#)

### Concept: Hire Employee EIB

#### Background

You can use this EIB to hire a pre-hire (new or existing) into an employee position.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

Hire Employee.

There are also similar EIBs that you can use for hiring employees. You can use the *Import Hire Employee* EIB to load large volumes of new hires (Example: 1000 or more). If you need to load large volumes of new hires, consider testing in your sandbox tenant to determine which EIB performs better for your use case.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Hire* business process type in the Staffing functional area to run this EIB.

### Additional Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.

You might find it helpful to enter data manually and make note of all the information when you hire an employee. You'll then know what information you need to populate in the EIB input file.

Make certain that the steps in the Hire business process align with what you populate in the input file. Example: if the Hire business process has an Assign Pay Group step, then you need to populate the pay group information in the EIB input file. Alternately, add a condition rule to skip the step in the Hire business process. Example: Add condition rule External Load = N.

As you populate the EIB input file, consider:

- **Spreadsheet Key:** Use a unique value for each employee.
- **Applicant:** This field equates to specifying an existing pre-hire when hiring in Workday. Leave this field blank if you want to create the pre-hire within the Hire EIB.

## Common Issues and Errors

Issue	Cause and Solution
The EIB completes successfully, but you don't find the hires you loaded.	The business process events are still in progress due to the misalignment of the EIB input file and the business process definition. Use the Mass Cancel task to cancel the in-progress hire events, and start over.

Issue	Cause and Solution
<p>When you include an existing applicant ID (that is, pre-hire) or former worker ID in the EIB input file, the EIB fails with one of these errors:</p> <ul style="list-style-type: none"> <li>Validation error occurred. Multiple Element Contents, including Hire Employee Business Process Data/a1/Applicant/CL] contain data where only one is allowed by mutex Hire Employee Business Process Data.</li> <li>Validation error occurred. Multiple Element Contents, including Hire Employee Business Process Data/a2/Former Worker [CL], contain data where only one is allowed by mutex Hire Employee Business Process Data</li> </ul>	<p>If you populate an applicant ID (pre-hire ID) or a former worker ID, you can't populate any other data associated with the applicant or former worker. Examples: name, country, email, phone, addresses. This information is redundant, and the EIB issues an error so that you don't overwrite existing applicant information. To resolve this error, remove all applicant information from the input file, including any sections in the EIB input file with description containing applicant data. Then specify only the applicant ID or former worker ID.</p> <p>If there's information that you need to update for the applicant or former worker that you're hiring, the options are:</p> <ol style="list-style-type: none"> <li>1) Update it within a subprocess of the hire EIB (that is, Change Personal Information)</li> <li>2) Or run another integration after the hire to update applicant information (that is, Change Home Contact Information, Put Applicant, and so on).</li> </ol>
<p>The EIB issues this error: <i>Validation error occurred. Enter a unique Employee ID. The ID is already in use by xxx.</i></p>	<p>If you hire employees but rescind their offers, the input file can contain an employee ID that you already used. To resolve the issue, you could:</p> <ul style="list-style-type: none"> <li>Change the reference IDs for the hires you previously loaded through the Put Reference EIB. See the tips and tricks for the Put Reference EIB for an example.</li> <li>Use different employee IDs.</li> <li>Reload the hire and specify the pre-hire ID (the applicant ID) in the input file. You'll also need to remove all information for the pre-hire from the input file, including their name.</li> </ul>
<p>The EIB issues errors stating that localized information is missing. Example: <i>Gender isn't tracked</i> or <i>Marital status doesn't exist</i>.</p>	<p>These fields support specific countries and the web service can't find the country to check against. To resolve this issue:</p> <ol style="list-style-type: none"> <li>1. Bring up the location associated with the position of the worker.</li> <li>2. Go to the Contact Information tab and click Edit.</li> <li>3. Change the effective date to an earlier date such as 01/01/1900.</li> </ol>
<p>The EIB issues the error: <i>Validation error occurred. Multiple Element Contents, including Hire Employee Business Process Data/d1/Job Requisition for Fill WWS Events Secured by Transactions [WS]*ST, contain data where only one is allowed by mutex Hire Employee Business Process Data.</i></p>	<p>This issue occurs when you populate both the position and job requisition.</p>

Issue	Cause and Solution
<p>Even though the Create Workday Account section gets completed in the EIB input file, the EIB doesn't use the User Name populated in the template.</p>	<p>There are two different Create Workday Account steps that can get configured in the Hire business process. One has a type of Service and the other has a type of Action:</p> <ul style="list-style-type: none"> <li>• If using Service step: The Hire event automatically launches the step and creates the Workday account. It creates the account based on the naming conventions configured on the Maintain User Name Rules and Maintain Password Rules tasks. The EIB ignores any Workday account information populated in the EIB input file.</li> <li>• If using Action step: The event uses the information supplied in the EIB input file to create the Workday account.</li> </ul> <p>To address this issue, check the Hire business process definition and verify that the Workday Account step is type Action.</p>
<p>Even though you entered personal information, such as gender and birth date, in the EIB input file, it isn't loading.</p>	<p>This issue typically occurs if the row ID field is blank. For information such as gender, verify that you populated a row ID in sections:</p> <ul style="list-style-type: none"> <li>• Personal Information</li> <li>• Personal Information for Country Data, and</li> <li>• Country Personal Information Data.</li> </ul> <p>Also, verify that you have Put access to the domain security policies for pre-hire personal data.</p>

## Business Processes

Hire.

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add only. You can't change, correct, or delete the hire through the EIB.
- If you have inadvertently uploaded incorrect entries, run the mass rescind or mass cancel, depending on whether the business process event completes or is still in progress. You can then select Business Processes Loaded by EIB to find the integration event that you wish to cancel or rescind.

For reference documentation for all web services including Hire Employee, see [Operation Directory](#).

### Sample EIB Input File

[Hire\\_Employee-WD35\\_0\\_1](#)

### Concept: Import Assign Matrix Organization EIB

#### Background

You can use this EIB to assign members to matrix organizations.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

## Equivalent Workday Task

The equivalent task in Workday depends on the type of organization that you're creating or updating. Examples of equivalent Workday tasks include:

- Assign Matrix Member.
- Assign Matrix Organization.
- On the related actions menu of the worker profile, select Organization > Assign Matrix Organization.
- On the related actions menu of the matrix organization, select Organization > Assign Matrix Member.

If you want to remove members from a matrix organization, you can use an Import Remove Matrix Organization EIB.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Assign Matrix Organization* business process type in the Organizations and Roles functional area to run this EIB.

### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- Worksheet#1 for Import Assign Matrix Organization. As you populate this worksheet, consider:
  - You would typically have just 1 entry in this worksheet with *Header Key* value set to *1*. The only exception to this rule would be if you have a very large volume of assignments (Example: 10,000+), in which case you might test in a nonproduction tenant to see if the integration runs more efficiently if

- breaking the assignments into multiple header key values.
- Header Key: Enter a value of *1*.
- Worksheet#2 for Assign Matrix Organization Info. As you populate this worksheet, consider:
  - Header Key: Enter a value of *1*.
  - Line Key: Enter a unique value for each assignment.
  - Autocomplete: Set to *Y* to skip approval steps, to do steps and notifications.
  - Worker: The EIB requires this value (in column N). Most likely you'll need to change the reference id, in row 4, from *Contingent\_Worker\_ID* to *Employee\_ID*.
  - Position: Workday requires this field.
  - Effective Date: Effective Date of the Assignment.
  - Matrix Organization: To find the matrix organization values, run the View Reference ID report and enter Matrix Organization at the Business Object prompt

## Common Issues and Errors

Issue	Cause and Solution
There's no option to launch the EIB.	<p>This issue can occur if you don't have proper access to the Assign Matrix Organization business process security policy. To resolve this issue:</p> <ol style="list-style-type: none"> <li>1. Edit the business process security policy for Assign Matrix Organization.</li> <li>2. Go to the <i>Initiating Action</i> section for <i>Import Assign Matrix Organization (WS Background Process)</i>.</li> <li>3. Add a security group that you're a member of.</li> <li>4. Activate the change.</li> </ol>
The EIB issues error <i>Invalid ID value. 'xxxx' is not a valid ID value for type = 'Contingent_Worker_ID'</i>	<p>This issue can occur when the reference ID type is Contingent Worker instead of Employee ID. If you're attempting to assign employees to the matrix organization, then check the value in cell N4 and verify that it's Employee_ID</p>
<i>The EIB issues an error like this message: The position isn't valid for this Worker as of the effective date. Worker: xxx Position xxx: MM/DD/YYYY</i>	<ol style="list-style-type: none"> <li>1. Make certain that the worker isn't already a member of the matrix organization</li> <li>2. Make certain that you entered the correct position for the worker in the EIB input file</li> </ol>

## Business Processes

Assign Matrix Organization.

## Use Cases and Guidelines for Recovering from a Bad Load

This web service enables you to assign members only. To remove members, use the Import Remove Matrix Organization web service.

If you have inadvertently uploaded incorrect entries, you can use these tasks to remove the entries:

- Mass Rescind Business Processes
- Mass Cancel Business Processes (if the events are still in progress).

There's no *Business Processes Loaded by EIB* option when using the mass cancel or mass rescind tasks. Instead, go to the *Business Process Types* prompt and enter *Assign Matrix Organization*. Then select the date range in which the EIB ran to find the events you need to cancel or rescind.

For reference documentation for all web services including Import Assign Matrix Organization, see [Operation Directory](#).

### Sample EIB Input File

[Import\\_Assign\\_Matrix\\_Organization-WD32](#)

### Concept: Import Remove Matrix Organization EIB

#### Background

You can use this EIB to remove members from matrix organizations.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Remove Matrix Member.
- Remove from Matrix Organization.
- On the related actions menu of the worker profile, select Organization > Remove from Matrix Organization.
- On the related actions menu of the matrix organization, select Organization > Remove Matrix Member.

If you want to assign members to a matrix organization, you can use an Import Assign Matrix Organization EIB.

#### EIB Input File Guidelines

##### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:

1. From the related actions of the EIB, select Template Model > View.
2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
3. If you're using an older web service version, you can create a new EIB to get the latest version.

## Additional Input File Guidelines

- Verify you have the correct security configuration:
  - You must have access to the *Remove from Matrix Organization* business process type in the Organizations and Roles functional area to run this EIB.
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider
  - **Worksheet#1 for Import Remove Matrix Organization:** As you populate this worksheet, consider:
    - You would typically have just 1 entry in this worksheet with Header Key value *I*: the only exception to this rule would be if you have a very large volume of assignments you are removing (Example: 10,000+), in which case you might want to test in a nonproduction tenant to see if the integration runs more efficiently if breaking the removals into multiple header key values.
    - Header Key: Enter a value of *I*
  - **Worksheet#2 for Remove Matrix Organization Info:** As you populate the worksheet, consider:
    - Header Key: Enter a value of *I*
    - Line Key: Enter a unique value for each removal
    - Autocomplete: Set to *Y* to skip approval steps, to do steps and notifications
    - Worker: The EIB requires this value (in column N). Most likely you'll need to change the reference id, in row 4, from *Contingent\_Worker\_ID* to *Employee\_ID*
    - Position: Workday requires this field
    - Effective Date: Effective Date of the Removal from the Matrix Organization
    - Matrix Organization: To find the matrix organization values, run the View Reference ID report and enter Matrix Organization at the Business Object prompt
    - You might find it helpful to create a custom report to help you populate the EIB input file. Add a filter to check *Matrix Organizations is not empty* along with any other appropriate filters for your use case.

## Common Issues and Errors

Issue	Cause and Solution
There's no option to launch the EIB	<p>This error will occur if you don't have proper access to the Remove from Matrix Organization business process security policy. To resolve this issue:</p> <ul style="list-style-type: none"> <li>• Edit the business process security policy for Remove from Matrix Organization</li> <li>• Go to the <i>Initiating Action</i> section for <i>Import Remove Matrix Organization (WS Background Process)</i></li> <li>• Add a security group that you're a member of</li> <li>• Activate the change</li> </ul>
<p>The EIB issues the error: <i>Invalid ID value. 'xxxx' is not a valid ID value for type = 'Contingent_Worker_ID'</i></p>	<p>This issue can occur when the reference id type is Contingent Worker instead of Employee ID. If you're attempting to remove employees from the matrix organization, then check value in cell N4 and verify that its' Employee_ID</p>
<p>The EIB issues an error like this: <i>The position isn't valid for this Worker as of the effective date. Worker: xxx Position xxx: 01/25/2019</i></p>	<p>Check to make certain that:</p> <ol style="list-style-type: none"> <li>1. The worker displays as assigned to the matrix organization</li> <li>2. You entered the correct position for the worker in the EIB input file</li> </ol>

## Business Processes

Remove from Matrix Organization.

## Use Cases and Guidelines for Recovering from a Bad Load

This web service enables you to remove members only. If you need to assign members, use web service Import Assign Matrix Organization.

If you've inadvertently uploaded incorrect entries and the events are still in progress, you might want to use task Mass Rescind Business Processes or Mass Cancel Business Processes to remove the entries. There's no *Business Processes Loaded by EIB* option when using the mass cancel or mass rescind tasks. Instead, you can:

1. Go to the *Business Process Types* prompt and select *Remove from Matrix Organization*.
2. Select the date range of the EIB and find the events you need to cancel or rescind.

For reference documentation for all web services including Import Remove Matrix Organization, see [Operation Directory](#).

## Sample EIB Input File

[Import\\_Remove\\_Matrix\\_Organization-WD32](#)

## Concept: Put Worker Document EIB

### Background

You can use this EIB to add or update a worker document. This EIB doesn't support reviewed documents.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

We recommend using this EIB to change the document category for an existing worker document.

Note: If you want to add or update the contents of a worker document using this EIB, the attachment files must be base-64 encoded. This is extremely challenging to do in the input file for this EIB. For this reason, consider creating a custom Studio integration instead.

## Equivalent Workday Task

Task: Maintain Worker Documents.

You can use the Delete Worker Document EIB to delete worker documents.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Worker Data: Add Worker Documents* domain in the Personal Data functional area to run this EIB.

### Populating File Attachments for the EIB

It can be a bit tricky loading documents using EIB, for 2 reasons:

1. You need to base-64 encode the documents and then populate the base-64 value in the EIB input file
2. Excel has a limitation of 32,767 characters per cell. After encoding the document, it needs to be fewer than 32,767 characters.

For the above reasons, customers often opt to use a custom integration when it's necessary to load attachments. If you need to upload file attachments, you might want to check these Community Posts for alternatives to loading worker documents to your tenant:

- Here's a solution to mass upload Worker Documents using Studio: <https://collaborate.workday.com/t5/-/m-p/1248315>
- Here's a solution to mass upload Worker Documents using Microsoft.NET: <https://collaborate.workday.com/t5/-/m-p/1252983>

If you wish to go forward with using the EIB, below are some suggestions for populating attachments:

- You'll need a tool to base 64 encode your file. There are many free tools available to base 64 encode files. (Such as Notepad++ for which you'll need to install the MIME Tools plug-in).
- After you encode the document, the size needs to be under 32,767 characters to be able to paste it into Excel. If it's larger, there are a couple options:
  - If the document is an image, you could make it smaller using a third-party tool such as Image Optimizer available at [www.imageoptimizer.net](http://www.imageoptimizer.net). Note that this tool isn't Workday endorsed. Proceed at your own risk.
  - You could edit the EIB input file with a text editor such as Notepad++ (instead of opening it with Excel) and paste in the encoded value. This action removes the restriction of 32,767 characters.

#### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- Proceed with great caution when updating existing documents using this EIB as you can't easily recover the original documents after you update them.
- There's an option to generate the spreadsheet with data. However, we don't advise using this functionality for this particular EIB, for these reasons:
  1. The template generation includes the content of the worker document files (base 64-encoded), which results in a very large template file that you might have issues opening using Excel.
  2. Even if you're able to open the spreadsheet template generated by the EIB, be aware that Excel has a limitation of 32,767 characters per cell. For this reason, when you open the template using Excel, the document contents might be truncated. If you attempt to reload the generated template (with truncated file contents), it could corrupt the documents.
- If you plan on updating or adding file content, see the *Populating File Attachments for the EIB* section.

- If you're updating existing entries, consider:
  - If you aren't updating the file content, then it's not necessary to include the existing file content in the EIB input file. Example: If you merely need to update the document category, then you don't need to include the existing file content of the document in the EIB input file. However, do note that at a minimum, you must populate these fields: Spreadsheet Key, ID, File Name, Worker, and Document Category.
  - You might find it useful to create a custom report to help you populate the EIB input file.
- As you populate these fields in the input file, consider:
  - Spreadsheet Key: Specify a unique value for each document.
  - ID: The reference id for the document.
  - Filename: Name of file. Workday requires this field even if updating an existing document.
  - File: Provide the base-64 encoded file content. See *Populating File Attachments for the EIB* section for details on how to populate this field. Note that if you're updating an existing entry, you need to populate this field only if you want to replace the existing file content.
  - Document Category: If you aren't specifying a Workday owned document category, you'll need to change the reference id type in Row#4, from *Document\_Category\_\_Workday\_Owned\_ID* to *Document\_Category\_ID*. To get a list of all reference id's, run the Integration IDs report and search business objects Document Category and Document Category (Workday Owned)
  - Worker: If adding or updating documents for employees, you'll need to change the reference id type, in Row #4, from *Contingent\_Worker\_ID* to *Employee\_ID*. If you need to update worker documents for both employees and contingent workers, you might find it helpful to split the columns using the *Separate Type Column* option as described in [Customize EIB Spreadsheet Template](#). By splitting the columns you can populate document information for both employees and

- contingent workers in the same EIB input file.
- Content Type: An optional field. To find reference id values, run the Integration IDs report and search for business object *Mime Type*.

## Common Issues and Errors

Issue	Cause and Solution
<p>Unable to view files that uploaded using the EIB. You receive an error such as <i>unable to load</i> or <i>failed to load</i> or <i>string length must be a multiple of 4 or not a supported file</i>.</p> <p>Or the document loads, but doesn't properly display.</p>	<p>Most likely there was an issue with the base 64 encoding or the encoded file was larger than Excel's limit of 32,767 characters.</p> <p>See <i>Populating File Attachments for the EIB</i> section for details on how to encode the file.</p>

## Use Cases and Guidelines for Recovering from a Bad Load

This web service enables you to add or update Worker Documents. If you need to remove documents, use Delete Worker Document.

This EIB doesn't use a business process event. If you made mistakes when adding or updating documents, it might be difficult to recover, since you can't rescind. Consider these options:

- If you added new documents, and need to remove them, use Delete Worker Document.
- If you didn't change the contents of the document but rather made errors changing an attribute such as document category, then you should be able to update the existing documents using the EIB (after correcting information in the EIB input file).
- If you changed the contents of the documents and there were errors, then an option would be to check if the documents are still available from another tenant such as Sandbox and retrieve them from that tenant and reupload to Production. But note that this isn't something you could easily do using the EIB due to limitations on the size of files that EIB can upload.

For reference documentation for all web services including Put Worker Document, see [Operation Directory](#).

## Sample EIB Input File

[Put\\_Worker\\_Document-WD32](#)

## Concept: Terminate Employee EIB

### Background

You can use this EIB to terminate employees.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

Task: Terminate Employee.

You can also perform mass termination changes through the Mass Operation Management task. See [Steps: Automate Initiation of Termination](#) for more information.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Terminate Employee* business process in the Staffing functional area to run this EIB.
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:
  - You might find it helpful to start by manually terminating an employee and entering the same type of information you want to load using the EIB. By doing this, you can verify which fields are required fields.
  - Make certain that the steps in the Termination business process definition are aligned to what you are populating in the EIB input file. Example: If the Termination business process definition includes a *Review COBRA Eligibility* step, then you need to do one of the following:
    - If you wish to provide COBRA information, then populate the COBRA eligibility information in the EIB input file. Also, in the *Overview* tab of the EIB input file, set the processing instructions to *Automatic Processing* for Review COBRA Eligibility.
    - If you don't want to provide COBRA information, then you can add a condition rule to skip the step in the Termination business process definition. Example: add condition rule of "External Load = N".
    - Or modify the Termination business process definition and mark the step as optional. Then in the EIB input file, set the processing instructions to *Skip Processing when Step is marked optional*.

### Additional Input File Guidelines

- If you're populating a subprocess within the EIB input file, you need to make certain that the Termination business process definition has a step for this process. Example: If you're populating Service Dates in the EIB input file, then the Termination business process definition needs to include the *Edit Service Dates* step.
- You'll need to go through the above checks for each step in the Termination business process definition. If the business process definition and the EIB input file aren't aligned, then you'll run into situations where information isn't loaded and the Termination event is still in progress, after the EIB load completes.
- As you populate these fields in the input file, consider:
  - Spreadsheet Key: Specify a unique value for each employee.
  - Primary Reason: To find the Reference ID values for this field, use the Integration IDs report and search business object *Termination Subcategory*

## Common Issues and Errors

Issue	Cause and Solution
The EIB completes successfully with some of the changes but others are missing.	Most likely the business process definition has condition rules causing Workday to skip some of the steps. Even if you supply information in the input file, Workday will ignore it if the business process step has a condition rule that evaluates to false (or if the business process definition is missing the step). To check for these types of issues, view the full process record of the business process event and look for steps marked as <i>not required</i> . Change the condition rules on these steps, if needed. After making corrections, you can run task Mass Cancel Business Processes (or Mass Rescind Business Processes if the event completed). Then you can rerun the EIB.
The EIB completes successfully but the changes weren't made	This issue typically occurs because the business process events are still <i>in progress</i> as one of the steps didn't complete due to the EIB input file and business process definition being out of alignment. See <i>Additional Input File Guidelines</i> section on how to get the business process definition and input file aligned. If this issue occurs, you can run Mass Cancel Business Processes to cancel the <i>in progress</i> termination

Issue	Cause and Solution
	<p>events. Then correct the problem, and rerun the EIB.</p> <p>Also, note that there's a Business Processes tab that displays in the EIB integration event, after the EIB successfully completes. This tab enables you to quickly view all loaded business process events. From here, you can determine whether the events are still in progress or if they completed. If you want to take a closer look at any of the termination events, you can view the full process record from the related action of the event.</p>
<p>When attempting to use this EIB to update Regrettable Status field for previously terminated employees, it fails with these errors:</p> <ul style="list-style-type: none"> <li><i>The date entered must be on or after the day the position was last updated.</i></li> <li><i>The worker cannot be terminated because there are future approved staffing actions for this worker.</i></li> </ul>	<p>You can't use this EIB to update or correct existing terminations: you can only use this EIB to terminate employees who you haven't yet terminated.</p> <p>If you want to go back and add the "regrettable status" for previously terminated employees, the only options are to:</p> <ul style="list-style-type: none"> <li>Manually correct the termination event for each terminated employee, and add the regrettable status.</li> <li>Mass rescind the termination events. Then reload the terminations and include the regrettable status in the EIB input file. (If using this option, test in Sandbox first).</li> </ul>
Even though the Regrettable field value is present in the EIB input file, it isn't being loaded	Make certain you're using the latest web service version as there were recent changes made to the regrettable field. If you aren't certain what web service version you're using, create a new EIB and it will pick up the latest web service version.

## Business Processes

Termination.

### Use Cases and Guidelines for Recovering from a Bad Load

This web service enables you to create new termination events. You can't modify or delete an existing termination event.

If you've inadvertently uploaded incorrect entries, use task Mass Cancel Business Processes (or Mass Rescind Business Processes if the business process event is in progress). You can then select *Business Processes Loaded by EIB* to find the integration event that you wish to cancel or rescind. Or the other method is to enter *Termination* at the Business Process Types prompt, then enter the date range that you ran the EIB.

For reference documentation for all web services including Terminate Employee, see [Operation Directory](#).

### Sample EIB Input Files

[Terminate\\_Employee-WD31-Example1-Initiation-Step-Only](#)

[Terminate\\_Employee-WD31-Example2-Include-Cobra](#)

## Student Finance EIBs

### Concept: Import Charges for Students EIB

#### Background

You can use this EIB to apply a charge to a student or adjust an existing charge.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

- For a new charge: Apply Student Charge.
- For adjusting an existing charge: On the student's profile, access the Account Transactions in the Student Financials section. On the related actions menu of the transaction, select Student Charge > Adjust.

#### EIB Input File Guidelines

##### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Student Charge Event* business process type in the Student Financials functional area to run this EIB.

##### Guidelines for Adding Worktags to the EIB Template

You can specify more than 1 worktag for any of the student charges.

1. From the related actions of your EIB, select Template Model > View.
2. On the left, click Apply Student Change Data +. On the right, locate Worktags.
3. From the related actions on the magnifying glass next to Worktags, select Template Model Column > Maintain Additional Columns.
4. Enter all worktags that you need to assign to the template.
5. After you've completed the previous steps, regenerate the spreadsheet template

## Additional Input File Guidelines

and add newly added worktags to the spreadsheet template.

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:
  - Spreadsheet Key: Specify a unique value for each student charge.
  - ID: If adjusting an existing charge, enter the reference ID value of the original charge. You can create a custom report with data source *Student Charges* to find reference ID value. Refer to the example below:
  - Section for Apply Student Charge: Populate this section if creating a new student charge.
    - Row ID: Typically a value of 1 for each entry.
    - Student: Reference ID value of the Student. Note that the reference ID type populates as Academic\_Person\_ID. If you wish to use a different reference ID type such as Student\_ID, change it in cell E4.
    - Institution Academic Unit: To find reference ID values, run the *View Reference IDs* report and search business object Academic Unit.
    - Transaction Date: Student Charge Transaction Date. Enter date using format YYYY-MM-DD.
    - Due Date: Student Charge Due Date. Enter date using format YYYY-MM-DD.
    - Academic Period: To find reference ID values, run the *View Reference IDs* report and search business object Academic Period.
    - Student Charge Item: To find reference ID values, run the *View Reference IDs* report and search business object Student Charge Item.
    - Worktags: If adding worktags, modify the template and select worktag types that you need to populate. See the Guidelines

for Adding Worktags to the EIB Template section above.

- Section for Adjust Student Charge: Populate this section if adjusting an existing student charge:

- Row ID: Typically a value of 1 for each entry.

Amount: The new adjusted charge amount. Enter \$0 to back out charge.

- Student Charge Adjustment Reason: To find reference ID values, run the *Integration IDs* report and search business object Student Charge Adjustment Reason.

## Common Issues and Errors

Issue	Cause and Solution
Performance is slow.	<p>This web service runs background jobs to process accounting information for student charges. The background processes can run slowly if using an older version of the web service and populating multiple header key values. If performance is slow:</p> <ol style="list-style-type: none"> <li>1. Verify you're using the latest web service version of <i>Import Charges for Students</i>. If you're using an EIB input file that includes a Header Key column, this column indicates that you're using an older web service version. Performance can be slow.</li> <li>2. To prevent further performance issues, create a new EIB to uptake the latest web service version.</li> </ol>
My EIB input template doesn't match sample attachment: it has extra worksheets.	Workday made major changes to this spreadsheet with WWS v36.0. Create a new EIB if you're using an older web service version.
Unable to launch the EIB	This issue is most likely security-related. See the <i>Performance is slow</i> issue.

## Business Processes

Student Charge Event.

## Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new student charges or adjust existing student charges. You can't delete or cancel charges.

- If you've inadvertently uploaded incorrect entries, there are options to correct the entries:
  - If the business process is still in progress, use task Mass Cancel Business Processes to cancel the student charge events.
  - You can't rescind this business process. If the student charge events complete, you can either:
    - Rerun the EIB and adjust the student charges with correct amount/due date.
    - Cancel the entries using the EIB for web service Import Mass Cancel Student Charges.. Then reload the correct entries.

For reference documentation for all web services including Import Charges for Students, see [Operation Directory](#).

### **Sample EIB Input File**

[Import\\_Charges\\_for\\_Students-WD36](#)

## **Talent EIBs**

### **Concept: Manage Certifications EIB**

#### **Background**

You can use this EIB to add, update, or delete certifications for a worker.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### **Equivalent Workday Task**

See Career > Certifications from the related actions of the worker's profile.

#### **EIB Input File Guidelines**

##### **Web Service Version and Security Configuration Guidelines**

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Manage Certifications* business process type in the Worker Profile and Skills functional area to run this EIB.

##### **Guidelines for Creating a Custom Report for the EIB Input File**

This web service does a replace all when updating existing worker certifications. Therefore it's very important to populate the EIB input file with all existing information that you need to retain. You

## Additional Input File Guidelines

can create a custom report to help populate the EIB input file with existing data. You can also use the *Skill Reference ID* field in the custom report to get the reference ID value that you'll need if removing worker certifications.

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- As you populate the EIB input file, consider:
  - **Spreadsheet Key:** Specify a unique value for each person that you're loading certifications for.
  - **Role:** Enter the reference ID of the person assigned to the certification. It will likely be a value for Employee\_ID. If entering a value other than employee ID, change the reference ID type in cell C4 accordingly.

**Row ID (column E):** Workday requires this field. The value should always be 1 unless you're loading more than 1 certification for a given person.

- **Certification:** (column F): If updating or deleting a worker's existing certification, supply the reference ID value here. Use the report from the Guidelines for Creating a Custom Report for the EIB Input File section to determine the value to use (use the Skill Reference ID value from the report).
- **Row ID (column G):** Enter value 1.
- **Certification ID (column H):** This field is optional. You can assign a value if you're adding a new certification and wish to assign the reference ID value. (If left blank, the web service will autoassign the reference ID value)
- **Remove Certification:** Enter Y to remove an existing worker certification.
- **Certification (column J):** The worker's assigned certification. For a list of reference ID values, run the *View Reference IDs* report for business object Certification.
- **Worker Document Data:** Although you can add attachments using this EIB, we don't recommended it, as there are some challenges in loading document content through EIB. If you need to add attachments through an integration, see the [EIB Input File Guidelines](#)

section in Future: Concept: Put Worker Document EIB . It's a different web service, but the same information applies to this EIB in regard to the method for populating attachments. If you're updating existing certifications with existing attachments, include the attachments in the EIB input file, or the EIB removes them.

## Common Issues and Errors

Issue	Cause and Solution
Although the EIB completes successfully, the data didn't load.	<p>This issue might be a result of a missing row ID value. Edit the EIB input file:</p> <ul style="list-style-type: none"> <li>• Spreadsheet Key value must have a unique value for each person that you're loading certifications for.</li> <li>• The row ID, in column E, must contain a value.</li> </ul>
When updating existing certifications, the EIB successfully completes the update, however some of the existing certification information gets removed, including any attachments.	<p>This web service does a replace all when updating existing worker certifications. Therefore, you must make certain you populate the EIB input file with all information you wish to keep. Use the report from the Guidelines for Creating a Custom Report for the EIB Input File section above to help identify existing information.</p>
EIB issues an error like this:  <i>Element Content 'Certification_Data' is required, on internal element 'Certification Achievement'.</i>	<p>This issue will occur if you don't populate the row ID in the Certification Data section. Verify that the Row ID value is present in column G.</p>
EIB issues an error like this:  <i>Validation error occurred. This certification is already in use.</i>	<p>Check:</p> <ul style="list-style-type: none"> <li>• If you're updating existing certifications, make sure you've specified the correct reference ID in column F.</li> <li>• If adding new certifications, column F should be empty.</li> <li>• The spreadsheet key is unique for each worker listed in the EIB input file.</li> </ul>
EIB issues an error like this:  <i>Validation error occurred. Invalid ID value. '22666' isn't a valid ID value for type = 'Employee_ID'.</i>	<p>Review EIB input file and verify that cell C4 specifies the correct reference ID type for the people you're assigning certificates to. Example: For a contingent worker, use <i>Contingent_Worker_ID</i>. For an employee, use <i>Employee_ID</i>.</p>
Unable to launch the EIB.	<p>This issue is most likely security-related. See the EIB Input File Guidelines section above for details on how to configure security.</p>
I want to remove fields from existing certifications such as Expiration Date.	<p>Since the EIB does a replace all, you can do just leave the field blank in the EIB input file.</p>

## Business Processes

Manage Certifications.

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add, update, or delete certifications.
- If you've inadvertently uploaded incorrect entries, use task Mass Cancel Business Processes or Mass Rescind Business Processes. What you use depends on whether the business process event is complete or in progress. You can then select *Business Processes Loaded by EIB* to find the integration event that you wish to cancel or rescind. Your other option is to enter *Manage Certifications* at the Business Process Types prompt and enter a date range that you ran the EIB.

For reference documentation for all web services including Manage Certifications, see [Operation Directory](#).

### Sample EIB Input File

[Manage\\_Certifications-WD35](#)

### Concept: Manage Professional Affiliations EIB

#### Background

You can use this EIB to add, update, and delete professional affiliations for a role, such as employee, contingent worker, or student.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

See [Careers > Professional Affiliations](#) from the related actions of the worker's profile.

#### EIB Input File Guidelines

##### Web Service Version and Security Configuration Guidelines

- It's important that your EIB uses the most recent web service version, so that you have all the latest enhancements and fixes. If you aren't certain what version you're using, follow these steps:
  - From related actions of the EIB, select Template Model > View.
  - You can view the version on this page. Verify you're using a newer version.
  - If you're using an older web service version, you can create a new EIB to get the latest version
- Verify you have the correct security configuration.
  - You must have access to the Manage Professional Affiliations business process in the Worker Profile and Skills functional area.

##### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page

56, which provides a general overview for populating EIB files.

- When updating existing affiliation assignments, populate all existing fields in the EIB input file, as the web service doesn't support incremental updates. Therefore, if existing fields remain blank the web service removes the field in the EIB input file
- As you populate these fields in the EIB input file, consider:
  - Spreadsheet Key: Specify a unique value for each Person.
  - Role: Enter the reference ID of the person that you're assigning the professional affiliation to. Most likely, you'll want to change the reference ID, in cell C4, from Academic\_Affiliate\_ID to Employee\_ID
  - Row ID (column E): Enter a unique row ID for each person
  - Row ID (column G): Enter a unique row ID for each professional affiliation assigned to a given person
  - Professional Affiliation ID(column H):
    - If updating or removing an existing professional affiliation assignment, enter the reference ID value in this field. You can use a custom report such as the example below, to find the reference ID value.
    - If adding a new professional affiliation assignment, you can leave the field blank and the web service will automatically assign a value. Or you can populate a value that you haven't used yet.
  - Remove: Enter Y to remove a professional affiliation
  - Professional Affiliation (column J): Enter the reference ID of the professional affiliation. To find values, run the *View Reference IDs* report and specify business object Professional Affiliation. If you want to populate a professional affiliation that you haven't yet set up in your tenant using Maintain Professional Affiliations task, then leave this column blank and populate Professional Affiliation field in column K.
  - Professional Affiliation (column K): If assigning a new professional affiliation in the tenant using Maintain

Professional Affiliations task, enter value here. This action is the same as checking the box labeled *If you can't find affiliation, click here* when manually assigning an affiliation.

## Common Issues and Errors

Issue	Cause and Solution
Although the EIB completes successfully, it displays that the data wasn't loaded	<ol style="list-style-type: none"> <li>1. Confirm that you've populated the row ids in columns E and G.</li> <li>2. Confirm that the business process completed successfully: it might still be in progress. If it's still in progress, mass cancel the events. Then change processing instructions to automatic processing and relaunch EIB.</li> </ol>
EIB issues an error like this: <i>Validation error occurred. Invalid ID value. '21001' is not a valid ID value for type = 'Academic_Affiliate_ID'</i>	Check the Role column and confirm that you're specifying the correct reference ID type based on the type of person you're assigning the professional affiliation to. Example: If assigning to an employee, change cell C4 from Academic_Affiliate_ID to Employee_ID.
EIB issues an error like this: <i>Validation error occurred. Invalid ID value. 'PROFESSIONAL_AFFILIATION_xxxx' is not a valid ID value for type = 'Job_History_Company_ID'</i>	Verify that you've specified the correct reference ID type for the Affiliation value in row J. Most likely, cell J4 needs to change from Job_History_Company_ID to Professional_Affiliation_ID.
Unable to launch the EIB	This issue is most likely security-related. Refer to the EIB Input File Guidelines section above.

## Business Processes

Manage Professional Affiliations.

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add, update, and remove professional affiliation assignments.
- If you've inadvertently uploaded incorrect entries, use task Mass Cancel Business Processes or Mass Rescind Business Processes. What you use depends on whether the business process event is complete or in progress. You can select *Business Processes Loaded by EIB* to find the integration event that you wish to cancel or rescind. Your other option is to enter *Manage Professional Affiliations* at the Business Process Types prompt and enter a date range that you ran the EIB.

For reference documentation for all web services including Manage Professional Affiliations, see [Operation Directory](#).

### Sample EIB Input File

[Manage\\_Professional\\_Affiliations-WD37\\_0](#)

## Concept: Put Talent Pool EIB

### Background

You can use this EIB to add or update talent pools and membership information.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Create Talent Pool
- Edit Talent Pool
- On the Find Workers report, you can use the Add to Pool button.

### EIB Input File Guidelines

#### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Set Up: Talent* domain in the Talent Pipeline functional area to run this EIB

#### Configure the EIB to Generate with Data

This EIB has a Generate Spreadsheet with Data option. To use it:

- From the related actions of your EIB, select Template Model > View.
- Click Edit Template with Data Options.
- Select Condition Rule Filter in the Filter section.
- Build the rule conditions. Example: if you want to return all data, select a rule such as *Name is not blank*.
- Generate a spreadsheet template and select the Generate Spreadsheet with Data check box.
- You can now view the template populated with all the existing talent pools.

## Additional Input File Guidelines

- See [Customize EIB Spreadsheet Template](#) for more details on generating spreadsheet templates:
- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- It's very important to test in a non-Production tenant before running the EIB in Production for these reasons:
  - This EIB doesn't use a business process event. Thus, you can't cancel or rescind if you make an error.
  - If you don't properly populate the EIB input file, it might create a talent pool for each entry. And you can't remove the talent pools.
- Note that there's currently a 5,000-member limit for static talent pools. So, if you have more than 5,000 members, you will need to break it up into two or more talent pools.
- As you populate these fields in the EIB input file, consider:
  - **Spreadsheet Key:** The best practice is to use the same value for all entries for a given pool, as it will provide optimum performance. However, if you're troubleshooting an error, you might want to assign a separate value to each spreadsheet key as this will help you identify the specific entry that is causing the error. Refer to the sample spreadsheets as there's an example for using a single spreadsheet key value compared to multiple spreadsheet key values for a talent pool.
  - **Add Only:** If you're only adding new entries, you can set this value to Y.
  - **Static Talent Pool:** Don't populate this field.
  - **Replace All:** Set to Y if you want to remove all the existing memberships and replace with the memberships in the EIB input file.
  - **ID:** If you're making modifications to an existing Talent Pool, then use this field to populate the reference id of the talent pool. To find the reference id, you can run the Talent Pools report and then from related actions of the talent pool, select Integration IDs > View IDs. Note that if you're creating a

new talent pool, you can either leave this field blank, or enter an unused value.

- Name: Name of the Talent Pool. Workday requires this field.
- Row ID: Specify a unique row id value for each worker that you're assigning to the pool.
- Delete: Enter Y to remove a worker from the pool.
- Worker: Enter the employee id. If you're updating contingent workers, change cell N4 to Contingent\_Worker\_ID. If you're loading both employees and contingent workers, you might want to configure the Separate Type Column option so you can load both types of workers using the same EIB input file. See [Future: Concept: Change Emergency Contacts EIB](#) for more details about configuration the separate type column. Note: it's for another EIB but still applicable.

## Common Issues and Errors

Issue	Cause and Solution
The EIB successfully completes, however it has created a separate talent pool for each entry in the EIB input file	<p>This issue will occur if you didn't populate the reference id of the talent pool, in column F. To resolve this issue:</p> <ul style="list-style-type: none"> <li>• Bring up the talent pool that you're attempting to update.</li> <li>• From related actions, select Integration IDs &gt; View IDs to get the reference id value.</li> <li>• Place the value from the above step in column F</li> <li>• Note that there isn't a way to delete the talent pools that the EIB inadvertently created. But you can deactivate and rename them. Refer to the section below, on how to recover from a bad load, for instructions.</li> </ul>
The EIB successfully completes however it didn't load the employees to the talent pool.	<p>Check to ensure:</p> <ul style="list-style-type: none"> <li>• Make certain you didn't run the EIB in validation mode.</li> <li>• Chances are that the EIB did add the members, but it might have created another talent pool and added the members there. This will happen if you don't have the correct reference id value in column F. Check Talent Pools report to see if the EIB added a duplicate Talent Pool. If this is</li> </ul>

Issue	Cause and Solution
	<p>what happened, see the above issue for details on how to address the issue.</p> <ul style="list-style-type: none"> <li>• Make certain you're updating a static pool. This EIB won't load members to pools with dynamic membership.</li> </ul>
Unable to launch the EIB	<p>When running report View Security for Securable Items, you'll see that you need Put access to domain security policy Set Up: Talent to run this EIB for Put Talent Pool. Add the access and activate the change. Then retest.</p>
<p>EIB fails with an error such as: <i>Validation error occurred. Invalid ID value. '21081' is not a valid ID value for type = 'Employee_ID'.</i></p>	<p>Validate that the employee_id is correct. Also, if it's a contingent worker, the EIB input file needs to specify Contingent_Worker_ID in cell N4</p>
Poor performance	<p>You might experience slow performance if using a different spreadsheet key value for each entry in the EIB input file. Use the same spreadsheet key value for all entries for a given talent pool.</p>
<p>EIB fails with error: <i>Validation error occurred. Element Content 'Name' is required, on internal element 'Talent Pool Data'.</i></p>	<p>Be sure to populate a name value in column G</p>
<p>EIB fails with error: <i>Validation error occurred. The entered information does not meet the restrictions defined for this field. (Worker_Reference).</i></p>	<p>This issue is a security-related error. Make certain you have unconstrained security access to the EIB. Also, verify you have access to the worker (they might be in an organization that has restricted access). If the above doesn't help, try manually assigning the worker to a pool: this might result in an error that yields more clues as to the cause of the problem.</p>

### Use Cases and Guidelines for Recovering from a Bad Load

- This EIB enables you to create and update talent pool and membership information. You can't remove talent pools.
- Since the EIB doesn't use a business process, there's no option to rescind or cancel. There are a few options to review in the event that you've inadvertently loaded incorrect data
  - If you inadvertently created talent pools that you're not going to use, there's no option to delete them. However, you can deactivate the pools as follows:
    - Use the Generate Spreadsheet with Data option to populate the existing talent pools in the EIB input file.
    - Edit the EIB file created by the above step and remove all the entries for all talent pools except the ones you want to deactivate.
    - Set the Inactive flag to Y for the entries in the EIB input file.
    - You might also want to add *\_DNU* to the beginning of the Pool Name so that it's obvious not to use the entries and they display at the bottom of the list when viewing talent pool reports.
    - Now run the EIB.

- If you've inadvertently assigned the wrong members to the pool, you can:
  - Edit the EIB input file and set Replace All to Y.
  - Then add the members who you want to assign to the Pool.
  - Note that if you want to get the pool members back to what they were before the EIB load, you can go to another tenant where the proper memberships are still intact and use the Generate Spreadsheet with Data option to build the EIB file. You can then use that EIB file to reload the previous memberships to production.
- For reference documentation for all web services including Put Talent Pool, see [Operation Directory](#).

## Sample EIB Input Files

[Put\\_Talent\\_Pool-WD33-Example1](#)

[Put\\_Talent\\_Pool-WD33-Example2](#)

## Tenant Data Translation EIBs

### Concept: Put Translatable Tenant Data Public EIB

#### Background

You can use this EIB to add or update translatable data.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Business Object Translations.
- Translations Hub. See [Concept: Translations](#) for more information.
- See Translation > Translate Instance on the related actions of the object that you want to translate.

#### EIB Input File Guidelines

##### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by

- From related actions of the EIB, select Template Model > View.
- On the View Template Model page, check the Version field to verify you're using the latest web service version.
- If you're using an older web service version, you can create a new EIB to get the latest version.

- Verify you have the correct security configuration.

- You must have access to the *Data Translation* domain in the System functional area to run this EIB.

##### Guidelines for Modifying the EIB Template

- From the related actions of your EIB, select Template Model > View.

## Configure the EIB to Generate with Data

- On the left, click Translated Value for Instance....
- On the right, locate the row with Instance\* label and click the magnifying glass.
- From the related actions of the Instance\* row, select Template Model Column > Edit Details.
- Remove the value *WID* from the Reference ID Type field and select the Reference ID Type as Separate Column check box.
- From the related actions of your EIB, select Template Model > View.
- Click Edit Template with Data Options.
- Select Reference ID Filter in the Filter section.
- Enter the Workday ID(also known as WID) values of 1 or more classes that you want to translate. You can get these values from the custom report. Note: Currently there aren't any other filtering options, other than classes. Therefore, you can't select just 1 target language for example.
- Regenerate the EIB and select the Generate Spreadsheet with Data check box.
- The spreadsheet that generates displays data first by User Language, then by other attributes. There isn't a way to control how the information gets sorted.

## Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- We suggest you create a custom report, using All Translatable Tenant Data report data source to help identify the class and Workday ID (also known as WID) needed to populate the EIB input file. This custom report will also help in configuring the EIB to generate with data.
- To prevent data loss, we recommend that you generate your spreadsheet with data for the Put Translatable Tenant Data Public EIB. See: [Example: Generate EIB Spreadsheet Template with Data](#) on page 64.
- As you populate the EIB input file, consider:
  - Spreadsheet Key: Specify a unique value for each combination of User Language, Class Name, and Name.
  - Row ID (column C): Set value to 1.
  - User Language: Enter the reference ID for the Target language that you're translating to. You can identify the value by manually initiating a

translation (Example: use Business Object Translations). Then from related actions of the language, select Integration IDs -> View IDs.

- Class Name: If you generate the spreadsheet with data, the Class Name values will populate in the EIB input file. You can also check the report in the Guidelines for Creating a Custom Report for the EIB Input File section above to identify the values for this field.
- Name: If you generate the spreadsheet with data, the values will populate in the EIB input file. Another way to identify the values is to manually initiate a translation. (Example: Use Business Object Translations). Then check the Attribute column for values that are you wish to use.
- Namespace URI: Leave this field blank.
- Row ID: (Column H): Increment the value for each entry for a given spreadsheet key value.
- Instance: See the Guidelines for Modifying the EIB Template section above for information on splitting the column so that there's column for ID Type and ID Value. Then enter the reference ID type and value for the object that you're translating.  
Example: For job profile, the ID Type would be Job\_Profile\_ID and ID Value would be the reference ID value of the job profile you're translating. To populate these values, you can use the reference ids report and enter the business object (Example: Job Profile) that you're translating.
- Parent ID: There's typically no need to populate this field.
- Base Value: The base value for a plain text field. The field is *display only* and the web service ignores it. (If you need to add or update base values, you need to edit the actual object. Example: Edit Job Profile).
- Translated Value: if you're translating a plain text value, enter it here.
- Rich Base: The base value for a rich text field. The field is *display only* and the web service ignores this field. If you need to add or update base

- values, you need to edit the actual object. Example: Edit Job Profile.
- Translated Rich Value if you're translating a rich text value, place the value here. Note: the web service performs some high-level validation checks of any html tags used within the value. However, it doesn't perform a complete validation as there are many ways to construct html. There would be significant overhead in attempting to validate that the html markup abides by what the Workday rich text editor permits. For this reason, it's very important to ensure that you're using proper html markup in the EIB input file. In addition, note that when you load an invalid html markup, Workday won't detect it until you edit the instance where the markup is present. At that time, Workday's rich text editor will identify the issue and might alter the text when attempting to correct the html markup. So, after editing the instance for the first time, the appearance of the field might change.
  - Effective Date Enter the effective date of the translation.

## Common Issues and Errors

Issue	Cause and Solution
Even though the EIB completes successfully, Workday didn't update some of the data.	<p>A few different scenarios can cause this situation:</p> <ol style="list-style-type: none"> <li>The base values in the EIB input file don't get loaded as they're display-only fields. If you want to update the base values, you must do it in the object. Example: For job profiles, you need to update the job profile.</li> <li>This situation will also occur if you're loading a translated value for an item that currently has no base value. Example: If a job profile has no value for Job Description, then you can't add a translated value for the Job Description.</li> <li>Make certain that you're specifying an effective date in the EIB input file that is after the effective date of the item you're translating. Example: If a job profile has an effective date of 1/1/2020, load the translation with an effective date after 1/1/2020.</li> </ol>

Issue	Cause and Solution
	If the above doesn't explain why the data remained unchanged, try manually adding a translation for 1 of the values that the EIB didn't update to determine if it's allowed. This task might provide some clues as to what is going wrong.
<p>This error displays when you attempt to generate the spreadsheet with data:</p> <p><i>Integration Failed. com.capeclear.mediation.MediationException: application=assemblyGenerateSpreadsheetE2 - Error code: 1 The following error occurred when getting data for the template: Processing error occurred. The task submitted isn't authorized. See the consolidated report for further details.</i></p>	<p>This issue will occur if you don't have the security needed to access the translation data. You can:</p> <ol style="list-style-type: none"> <li>1. Edit the domain security policy for Data Translation.</li> <li>2. Make certain you're in a security group that has Put access.</li> <li>3. Activate the Security Change.</li> </ol>

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new translation values or update existing translation values. You can't delete entries.
- If you have inadvertently uploaded incorrect entries, there isn't an option to remove them. Instead, you should run the EIB again with the corrected translation values. If you've accidentally added a translation for a language that you didn't intend to translate, you could edit the EIB input file and copy and paste the value of the base language into the translation value.

For reference documentation for all web services including Put Translatable Data, see [Operation Directory](#).

### Sample EIB Input File

[Put\\_Translatable\\_Tenant\\_Data\\_Public-WD34](#)

## Time Tracking EIBs

### Concept: Assign Work Schedule EIB

#### Background

You can use this EIB to assign work schedule assignments to workers. You can assign predefined work schedule calendars or create work schedule calendar assignments based on patterns specific to a worker.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

The equivalent task in Workday depends on your configuration. Examples of equivalent Workday tasks include:

- Assign Work Schedule
- Assign Custom Work Schedule

You can also use the Import Ad Hoc Schedules web service to load large batches of schedule blocks (Example: 1000 or more) on an infrequent basis. Example: you could use it to import schedules from a third-party scheduling vendor into Workday Time Tracking.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Assign Work Schedule* business process type in the Time off and Leave, Time Tracking and Workday Scheduling functional areas to run this EIB.

### Additional Input File Guidelines

We recommend that you review Concept: [EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:

- Spreadsheet Key: Specify a unique value for each worker's assignment.
- Worker: Specify the reference ID of the person. Change the reference ID type value in cell C4 from Contingent\_Worker\_ID to Employee\_ID if you want to enter employees instead of contingent workers.
- Start Date and End Date: Use format YYYY-MM-DD.
- Work Schedule Calendar: If you want to assign a predefined work schedule calendar, specify it here. You can find a list of reference ID values by running the View Reference IDs report and searching for the *Work Schedule Calendar* business object.
- Only populate these fields if you want to create a worker-specific pattern schedule:
  - Number of Weeks: Specify the number of weeks for the work schedule calendar.
  - Row ID: (Column H): You can use this field to group days of the week together as a schedule pattern and assign them a row ID value. Example: if the worker's start and end time is 8am-5pm for Monday to Thursday, then group the Monday, Tuesday,

Wednesday, and Thursday entries together under row ID 1. If the worker starts and ends at 9am-12pm on Friday, add another entry with row ID 2.

- Week Number: Specify the relevant week number.
- Day of the Week: You can find a list of reference ID values by running the Integration IDs report and searching for the *Day of the Week* business object.
- Start Time and End Time: Use format HH:MM.
- Row ID: (Column O): Specify a unique value for each lunch break for a given start and end time.
- Meal In and Meal Out: Use format HH:MM.

## Common Issues and Errors

Issue	Cause and Solution
Although the EIB completes successfully, it seems that the data wasn't loaded.	<p>Check and address these issues:</p> <ul style="list-style-type: none"> <li>• Check the status of the business process event. If it's still in progress, consider mass canceling all in-progress events, making any needed changes to the EIB and rerunning it.</li> <li>• Check if a worker has multiple work schedules that affect the same date. Workday prioritizes the changes in this order to determine the schedule for that date:           <ol style="list-style-type: none"> <li>1. Changes that the worker's manager makes using the My Team's Schedule report.</li> <li>2. One-time changes that the worker makes.</li> <li>3. Recurring changes that the worker makes.</li> <li>4. New work schedule calendar assignments.</li> <li>5. Workers' default work schedule calendar assignments and any changes an administrator makes to those calendars.</li> </ol> </li> </ul> <p>Refer to the <a href="#">work schedule calendar assignment precedence</a>.</p> <p>If multiple assignments contain overlapping dates, Workday prioritizes the most recent assignment. If the most recent assignment has</p>

Issue	Cause and Solution
	an end date, Workday prioritizes the most recent assignment without an end date.
EIB fails with this message: Validation error occurred. Invalid ID value. '21289' isn't a valid ID value for type = 'Contingent_Worker_ID'	Verify that the reference ID type in cell C4 is correct. Change the reference ID type value in cell C4 from Contingent_Worker_ID to Employee_ID if you want to enter employees instead of contingent workers.
EIB issues with this error: The entered information doesn't meet the restrictions defined for this field. (Worker_Reference).	Check these issues: <ul style="list-style-type: none"> <li>• Verify that the worker isn't terminated.</li> <li>• Verify that you have unconstrained access to the <i>Assign Work Schedule</i> business process type in the Time off and Leave, Time Tracking and Workday Scheduling functional areas.</li> </ul>
Unable to launch the EIB	This is most likely security-related. Verify you have the correct security configuration. Ensure that you are in the relevant security group and have access to the <i>Assign Work Schedule</i> business process type in the Time off and Leave, Time Tracking and Workday Scheduling functional areas.

## Business Processes

Assign Work Schedule.

## Use Cases and Guidelines for Recovering from a Bad Load

This EIB only enables you to add new work schedules.

If you've uploaded incorrect entries, you can use either the Mass Cancel Business Processes task (if the event is still in progress) or Mass Rescind Business Processes task (if the event is complete). Both of these tasks are secured to the *Business Process Administrator* domain in the System functional area. You can then select Business Processes Loaded by EIB to find the integration event that you want to cancel or rescind. Alternatively, you can enter *Assign Work Schedule* in the Business Process Types prompt and enter the date range that corresponds to when you ran the EIB.

For reference documentation for all web services including Assign Work Schedule, see [Operation Directory](#).

## Sample EIB Input File

[Assign\\_Work\\_Schedule-v38](#)

## Concept: Import Ad Hoc Schedules EIB

### Background

You can use this EIB to load large batches of schedule blocks on an infrequent basis. For more details, see: [Concept: Importing Work Schedules](#).

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

## Equivalent Workday Task

My Team's Schedule

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Worker Data: Work Schedule* domain in the Time Tracking functional area to run this EIB.

### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.
- Header Key: This web service is an Import web service, which means it batches the schedule entries into jobs and processes the jobs asynchronously. The header key tells the web service which entries to batch together in each job. All entries with the same header key value will batch into 1 job. We recommend you batch together 1,000 schedule entries per job (tip: test in your nonproduction tenant first). In this case, the first 1,000 entries would have a header key value 1, the next 1,000 entries would have header key value 2, and so on.
  - The first tab of the input file lists the header key values that you're using. If you have <1,000 entries, there will be 1 entry with value 1. If you have ~2,000 entries, you'll have 2 entries. See screenshot below for reference.
- Line Key: This value should be unique for each schedule entry (within a header key).
- Ad Hoc Schedule ID: Populate this field even if you're adding new entries. Each schedule entry needs to have a unique value. To make each value unique, consider appending

- the employee ID, date, and an incremental number.
- Employee: Enter the value for the employee or contingent worker ID. If populating values for employee IDs, change the reference ID type (located in row 4 of the input file) from *Contingent\_Worker\_ID* to *Employee\_ID*. If you're updating schedules for both employees and contingent workers, split the columns using the *Separate Type Column* field (as described in [Customize EIB Spreadsheet Template](#)). By splitting the columns, you can list both employees and contingent workers in the same input file.
  - Position ID: If an employee has multiple positions, populate the position ID. Otherwise, you can leave this field blank.
  - Schedule Start Date Time and Schedule End Date Time: base these dates and times on the worker's local time zone.
  - Meal ID: If supplying a meal ID, the value needs to be unique.

## Common Issues and Errors

Issue	Cause and Solution
The EIB issues the <i>Time Entry Code cannot be Hours Only</i> error.	Check the default time entry code for the time entry template that the employee is using. The code should be in/out only instead of hours only.
The EIB issues the <i>xxxx: Worker xxxx(99999) must be active on the Schedule Start Date</i> error.	<p>There are 2 causes for this error:</p> <ul style="list-style-type: none"> <li>The employee isn't active on the start date that you specified in the input file.</li> <li>Worker isn't Time Tracking Eligible or you don't have the Time Tracking SKU. Time Tracking Eligible requires these conditions, which you can check in the View Worker's Time Eligibility report:           <ul style="list-style-type: none"> <li>Work Schedule Calendar</li> <li>Period Schedule</li> <li>Time Entry Template</li> </ul> </li> </ul>
<p>After running the EIB, you're unable to edit or add new events using the user interface. When attempting to add events for a date that the EIB updated, Workday returns this error:</p> <p><i>You cannot update your work schedule for YYYY-MM-DD because there is an existing imported schedule change. Please review the dates for your schedule change.</i></p>	<p>Workday doesn't enable you to perform this action. Imported schedules take precedence over any other schedule in Workday. After you update the schedule using the EIB, you have read-only access to that information in the user interface. If you try to add or edit events for a date that the EIB updated, you'll receive the error.</p> <p>To resolve this issue, either:</p> <ul style="list-style-type: none"> <li>Use the EIB to make your adjustments.</li> <li>Rerun the EIB and delete the entries that you previously updated. After deleting the</li> </ul>

Issue	Cause and Solution
	entries, you can make the adjustments in the Workday user interface.

## Use Cases and Guidelines for Recovering from a Bad Load

This web service enables you to add, update, or delete schedule entries.

If you have inadvertently uploaded incorrect entries, you can reload the same EIB input file. Set the Delete flag to Y to undo the entries and revert back to the original schedule.

For reference documentation for all web services including *Import Ad Hoc Schedules*, see [Operation Directory](#).

### Sample EIB Input File

[Import\\_Ad\\_Hoc\\_Schedules-WD31](#)

### Concept: Import Reported Time Blocks EIB

#### Background

You can use this EIB to load large batches of time blocks. Example: Holiday time blocks.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

Task: Enter Time for Worker.

#### EIB Input File Guidelines

##### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Process: Import Time Blocks* domain in the Time Tracking and Time Tracking Hub functional areas to run this EIB.

##### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider

- This web service doesn't automatically pull in related worktags; you must specify the related worktags in the EIB input file.
- Spreadsheet Key: Specify a unique value for each time block
- Worker: The EIB requires this value. Most likely you'll need to change the reference ID in row 4 from *Contingent\_Worker\_ID* to *Employee\_ID*
- Worker Time Block: Enter a value here only if you're updating or deleting an existing time block. To identify the reference ID value, you might find it helpful to make a copy of standard report Time Block Audit, then add field *Reference ID* (the field you need to populate in the *Worker Time Block* field). You might also want to add field *Is Deleted* to the report.
- ID: Enter a value here if adding a new time block and you want to assign the reference ID value. If you leave it blank, Workday will autoassign a reference ID value.
- Delete Time Block: Enter Y if you need to delete an existing time block. Note that you'll also need to specify a Worker Time Block value for the time block you wish to delete.
- In Date Time and Out Date Time: Keep in mind that when populating In Date Time and Out Date Time, Workday is assuming the times are in PT. You might find it preferable to populate the input file using a UTC offset to correctly load the time zone for each time block.

Examples showing the UTC format:

- Oct 25 at 8:00am CET is  
2021-10-25T08:00:00+02:00
- Oct 25 at 8:15am EST is:  
2021-10-25T08:15:00-05:00
- Oct 25 at 8:15am EDT is  
2021-10-25T08:15:00-04:00

## Common Issues and Errors

Issue	Cause and Solution
Even though the EIB successfully finishes, some time block entries are missing.	<p>This error can occur for multiple reasons.</p> <ol style="list-style-type: none"> <li>1. This EIB is an import web service that processes the data asynchronously. Therefore, even though the EIB Integration Event has completed, the background job</li> </ol>

Issue	Cause and Solution
	<p>might still be running. So you might need to give it more time to complete.</p> <p>This error could occur if you haven't configured the EIB business process in your tenant.</p> <ul style="list-style-type: none"> <li>a. Use task Create Business Process Definition</li> <li>b. Search for business process type <i>Reported Time Batch Event</i>. If it comes up, it indicates that you haven't yet configured it in your tenant so go ahead and create it. You'll also need to configure the business process security policy with the appropriate security groups then activate the changes</li> </ul> <p>2. Lastly, note that if you submit the same request multiple times, the EIB ignores it: that is, if the time block already exists, the EIB won't reload it.</p>
My EIB input file looks different than the attached sample: it has 2 worksheets.	This web service underwent major changes starting with v36.2. Create a new EIB to make certain you're using v36.2 or higher.
The Time Block Entries are taking hours to display up in the tenant.	<p>This error will occur if you're using an EIB older than v36.2 and you've assigned a separate header key value to each time block entry.</p> <p>Example: You upload 1,000 time blocks and assign each time block a different header key value. The result is that Workday creates 1,000 background jobs, thus they queue up and take a long time to process. There's no easy way to recover from this scenario, other than wait for all the jobs to complete their processing.</p>
<p>EIB issues the error: .</p> <p><i>Invalid ID value. 'xxxxx' isn't a valid ID value for type = 'Contingent_Worker_ID'</i></p>	This issue can occur when the reference id type is Contingent Worker instead of Employee ID. If you're attempting to add time blocks for employees, check the value in cell D4 and make certain it's Employee_ID.
The Worker Time Block and Delete Time Block fields aren't in the EIB input file.	Workday introduced these fields in Workday 32. If you don't see the fields, create a new EIB (which will use the latest web service version available in your tenant), then regenerate your template.
<p>EIB issues an error such as:</p> <p><i>These related worktag types are required: ABC</i></p>	This web service doesn't automatically pull in related worktags; you must specify the related worktags in the EIB input file.
EIB issues an error like this when updating an existing time block:	When updating a time block that specifies in and out times, also populate the Out Reason in the EIB input file.

Issue	Cause and Solution
<i>Out type is not valid for the ~worker~, Logan McNeil (Mgr 4000), for the date 2020 05 08.</i>	
<p>EIB issues an error like this when attempting to import project time for a worker:</p> <p><i>[worker] cannot use the project, [project], to report the time on [date].</i></p>	<p>You need to enter a time entry code ID and a project task ID ONLY. Don't add the project code as well.</p>
<p>The time blocks load with a Not Submitted status.</p>	<p>This result is expected behavior. If you need to mass submit the unsubmitted time blocks loaded using the web service, you can use the Mass Submit Time Task. (If the Enter Time business process includes an approval step, then the tasks also need approved).</p> <p>You can also use the Auto Submit Time task to create schedules to submit time automatically when you don't want to create separate schedules to mass submit time for each period.</p>

## Business Processes

Reported Time Batch Event.

### Use Cases and Guidelines for Recovering from a Bad Load

This web service enables you to Add, Update, and Delete time blocks. Note that Workday added the Delete and Edit features with Workday 32. If you need to edit or delete, make certain your EIB integration is using version v32, or higher (tip: create a new EIB to pick up the latest web service version).

If you have inadvertently uploaded incorrect entries, 1 option would be to use the Mass Rescind task. You'll find the entries you uploaded by searching for business process *Reported Time Batch Event* for the period of time the EIB entries. To view the batch event associated with a worker, make a copy of the report Time Block Audit, then add the field *Batch Events*.

For reference documentation for all web services including Import Reported Time Blocks, see [Operation Directory](#).

### Sample EIB Input File

[Import\\_Reported\\_Time\\_Blocks-v39](#)

### Concept: Import Time Clock Events EIB

#### Background

You can use this EIB to load large batches of time clock events (Example: 1,000 or more) on an infrequent basis.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

See Time and Leave > Add Time Clock Event from the related actions of the worker's profile.

If you want to load smaller batches of time clock events (Example: less than 150) on a frequent basis, consider using the Put Time Clock Events EIB.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  1. From the related actions of the EIB, select Template Model > View.
  2. On the View Template Model page, check the Version field to verify you're using the latest web service version.
  3. If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Process: Time Clock Integration* domain in the Time Tracking functional area to run this EIB.

### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:
  - Header Key: The time clock events load in *batches* and the header key indicates the batch number. We suggest adding at least 1,000 time clocks per batch (test in a nonproduction tenant to determine what works best for you). The first 1,000+ rows in your EIB input file would use header key value 1. The next 1,000+ entries would use spreadsheet key value 2, and so on.
  - Line Key: if there are multiple time clock events for the same worker, then the line key needs to be unique for each of those time clock events.
  - Time Clock Event ID: Workday assigns this unique ID to each time clock event. When adding new time clocks, you can leave the field blank (or assign another unique value). If updating or deleting an existing time clock, be sure to populate the time clock event ID for the existing time clock.
  - There's a report definition below, that you can use to identify the Time Clock Event IDs: See section Details about Add/Update/Delete Capabilities for

- this EIB and how to recover from Bad Load.
- Time Clock Event Date Time: See [FAQ: Time Entry](#) for details on how Workday handles time zones.
  - Time Entry Code: The *out punch* doesn't have a time entry code associated with it. When you load the *out punch*, the value doesn't need populated.

## Common Issues and Errors

Issue	Cause and Solution
The EIB has completed successfully, however, the time clocks aren't visible	<p>If you see this behavior, remember that Workday initially loads and saves the time clocks with a status of Unprocessed.</p> <p>Although the EIB completed, it might not have processed all the entries. Normally, the EIB immediately processes the first <i>batch</i> of time clock events when the EIB loads the time clocks. The first <i>batch</i> would be the time clock entries with header key value 1. There's a background job called TCE Sweeper that runs every 15 minutes to look for unprocessed entries. This sweeper processes just 1 <i>batch</i> at a time. If you have multiple header key values in the input file, the sweeper immediately processes the entries with header key value 1. The TCE Sweeper job processes the entries with value 2 when it runs 15 minutes later. The TCE Sweeper runs again in 15 minutes and processes the entries with spreadsheet key value 3, and so on.</p> <p>This delay is why it's important to load at least 1,000 time clocks per batch (or header key value). If you have a separate header key assigned to each time clock event, then it will take a very long time for the processing to complete. Below are some tools that you can use to monitor the loading of the time clock events:</p> <ul style="list-style-type: none"> <li>• Report Unprocessed Time Clock Events: If you see the entries here, it tells us they loaded but haven't processed yet.</li> <li>• Task Maintain Invalid Time Clock Events: This task will identify if there are any errors for the time clock events you loaded.</li> <li>• You could also create a custom report from data source All Time Clock Events that checks the TCE Status and use it to monitor the load.</li> </ul>
Some time clock events are loading as unmatched	Suggestions to avoid unmatched time clock events:

Issue	Cause and Solution
	<ul style="list-style-type: none"> <li>Submit the time punches in chronological order from oldest to newest</li> <li>If loading multiple check-ins at the same time for the same worker, then follow every Check-in with a Check-Out</li> <li>Try to avoid matching IN and OUT timestamps (example Check-out for worker at 12:34pm and then Check-in for break at 12:34pm. Instead, use a check in of 12:34:01 if possible)</li> <li>Verify that you're not loading time clock events to a locked or closed period: if you need to load time clocks to locked period, EIB user needs Put access to domain Time Tracking: Exempt from Lockout.</li> </ul>
EIB didn't load Worktags even though they're present in the EIB input file.	<p>Be aware that:</p> <ul style="list-style-type: none"> <li>Worktag won't populate for Out time clock events. This rule applies for both the web service and the user interface. Both In and Out events must have the same worktag values.</li> <li>If you're populating Worktag data for an In-time clock event and it doesn't load, then check if the entry process completed or if there was a validation error. See issue <i>EIB has completed successfully, however the time clocks aren't visible</i> for more information.</li> </ul>

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add, update, and delete time clocks.
- If you have inadvertently uploaded incorrect entries, you can either:
  - Reload the input file and set Delete Time Clock Event to Y. You'll need to be sure to populate the Time Clock Event ID values to delete the entries.
  - Or you can reload the file and update the existing entries to correct them. You'll need to be sure to populate the Time Clock Event ID values to update the entries.

For reference documentation for all web services including Import Time Clock Events, see [Operation Directory](#).

### Sample EIB Input File

[Import\\_Time\\_Clock\\_Events-WD32](#)

### Concept: Put Time Clock Events EIB

#### Background

You can use this EIB to add time clock events from a third party vendor.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

## Equivalent Workday Task

See Time and Leave > Add Time Clock Event from the related actions of the worker's profile.

If you want to load batches of more than 1,000 time clock events on an infrequent basis, use the Import Time Clock Events EIB.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Process: Time Clock Integration* domain in the Time Tracking functional area to run this EIB.

### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. Additionally, as you populate the EIB input file, consider:
- As you populate the EIB input file, consider:
  - Spreadsheet Key: Note that Workday loads the time clock events in batches and the spreadsheet key indicates the batch number. We suggest adding a maximum of 150 time clocks per batch (test in a nonproduction tenant to determine what works best for you). So, the first 150 rows in your input file would use spreadsheet key value 1. The next 150 entries would use spreadsheet key value 2, and so on.
  - Row ID: If there are multiple time clock events for the same worker, then the row ID must be unique for each of those time clock events.
  - Time Clock Event ID: A unique ID assigned to each time clock event. If adding new time clocks, you can leave this field blank, or assign a unique value. If updating or deleting an existing time clock, be sure to populate

the time clock event ID for the existing time clock.

- Time Clock Event Date Time: See [FAQ: Time Entry](#) for details on how Workday handles time zones.
- Time Entry Code: Note that the out punch doesn't have a time entry code associated with it. So, when you load the out punch, the value doesn't need populated.

## Common Issues and Errors

Web services Put Time Clock Events and Import Time Clock Events are very similar and issue the same type of error messages. See [Concept: Import Time Clock Events EIB](#) on page 508 for information on the issues and errors for both of the web services.

## Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add, update, and delete time clocks.
- If you have inadvertently uploaded incorrect entries, you can either:
  - Reload the input file and set Delete Time Clock Event toY. You'll also need to be sure to populate the Time Clock Event ID values for the entries you wish to delete.
  - Or reload the file and update the existing entries to correct them. You'll also need to be sure to populate the Time Clock Event ID values for the entries you wish to update.

For reference documentation for all web services including Put Time Clock Events, see [Operation Directory](#).

## Sample EIB Input File

[Put\\_Time\\_Clock\\_Events-WD30](#)

## Concept: Put Time Requests EIB

### Background

You can use this EIB to load large batches of time requests. For more information on time requests, see [Concept: Time Requests](#).

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

### Equivalent Workday Task

Click New Request from the Time Requests or My Team's Time Requests report.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB:
  - From the related actions, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Process: Import Time Requests* domain in the Time Tracking functional area to run this EIB.

### Additional Input File Guidelines

- We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files. As you populate the EIB input file, consider:
  - Spreadsheet Key: Specify a unique value for each worker's time request.
  - User Time Request Block: Only enter a value if you're updating or deleting an existing time request.
  - ID: If you're adding a new time block and want to assign the reference ID value, enter a value. If you leave this field blank, Workday will autoassign a reference ID value.
  - Worker: Specify the reference ID of the person.
  - Time Request Code: Specify the time request code for the request.
  - Delete Time Request: Enter Y if you need to delete an existing time request. Note that you'll also need to specify a User Time Request Block for the time request you want to delete.
  - Start Date and End Date: Use format YYYY-MM-DD.
  - Start Time and End Time: Use format HH:MM.
  - Total Hours: Use positive whole or partial numbers.
  - Comment: Specify a comment to add context to the time request.

- Additionally, as you populate the EIB input file, consider:
  - IDs are evaluated in the order on the input file. If the same ID is used in multiple places in the file, the first instance creates the time request, and the second updates it.
  - Custom IDs aren't supported for in/out requests that span multiple days, even though they're created through 1 submission. After submission, Workday handles them as individual time requests.

## Common Issues and Errors

Issue	Cause and Solution
<i>The EIB issues the Specify a time request code that the worker is eligible for during the specified date range error.</i>	The worker isn't eligible for the specified time request code in the specified date range. Specify a time request code for which the worker is eligible.
<i>The EIB issues the Specify an end date that is after or the same as the start date error.</i>	The end date is before the start date.
<i>The EIB issues the Specify either the total hours or both the start and end times of the time request error.</i>	There are values in the Total Hours field, and both the Start Time and End Time fields of the time request. Specify either a number of total hours, or both start and end times.
<i>The EIB issues an error such as The [Worktag Type] is not available on [name] Time Request Code .</i>	Specify a valid worktag for the specified time request code.
<i>The EIB issues an error such as The [Worktag Type] is required on [name] Time Request Code .</i>	Specify a worktag for the specified time request code.
<i>The EIB issues an error such as The [name] Time Request Code does not support start and end times.</i>	The entry method for the specified time request code is <i>Hours Only</i> . Specify a number of total hours instead of start and end times.
<i>The EIB issues an error such as The [name] Time Request Code does not support hours.</i>	The entry method for the specified time request code is <i>In/Out Only</i> . Specify both start and end times instead of total hours.

## Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add, update, and delete time requests.
- If you have inadvertently uploaded incorrect entries, you can either:
  - Reload the input file and set Delete Time Requests to Y. You'll also need to specify values for the entries you want to delete in the Time Requests ID field .
  - Reload the file and update the existing entries to correct them. You'll also need to specify values for the entries you want to update in the Time Requests ID field.

For reference documentation for all web services, including Put Time Requests, see [Operation Directory](#).

## Sample EIB Input File

[Put\\_Time\\_Requests-v45](#)

## Workday Connect EIBs

### Concept: Submit Connect Campaign EIB

#### Background

You can use this EIB to create or update a campaign and related items and reminders.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

#### Equivalent Workday Task

Task: Create Campaign.

#### EIB Input File Guidelines

##### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by
  - From related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Submit Connect Campaign* business process in the System functional area to run this EIB.
  - If you're using the Generate Spreadsheet with Data functionality, you'll also need Get access to the Administer Campaigns domain in the Learning Core functional area.

##### Guidelines for Modifying the EIB Template

This EIB has a Generate Spreadsheet with Data option, which is helpful if you're not sure how to populate the EIB input file. This option is also handy if editing existing campaigns so that you can prepopulate all existing data. Before using the Generate Spreadsheet with Data option, we suggest you modify the template so that the template generation properly populates the content field and audience field:

- From the related actions of your EIB, select Template Model > View.

- On the left, click Campaign Item Data+.
- Locate the Content row.
- From the related actions of the magnifying glass next to Content, select Template Model Column > Edit Details.
- Select the Reference ID Type as Separate Column check box.
- Click OK.
- View the EIB template again and:
  - Click Connect Campaign Data.
  - In right pane, locate Audience.
  - From the related actions of the magnifying glass select Template Model Column > Edit Details.
  - Change the reference id type to what is appropriate for your organization. Most likely you'll want to change it from *App Audience ID* to *Audience ID*.

## Additional Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56, which provides a general overview for populating EIB files.

To prevent data loss, we recommend that you generate your spreadsheet with data for the Submit Connect Campaign EIB. See: [Example: Generate EIB Spreadsheet Template with Data](#) on page 64.

- There's a Generate Spreadsheet with Data option for this EIB, which helps determine the fields that you need to populate and the reference ID values that you can use:
  - If you're adding new campaigns, you can start by manually creating a campaign, like the campaigns you're loading. Then complete the steps in the *Guidelines for Modifying the EIB Template* section so you can see how the EIB input file populates.
  - If updating existing campaigns, complete the guidelines above to get all existing information for the campaign. Then make any necessary modifications. Note that the web service does a Replace All so it's important to populate all existing information.

- Additional details for some of the fields.
  - Spreadsheet Key: Specify a unique value for each Campaign
  - Connect Campaign: If updating existing campaign, enter the reference ID here. The Generate with Data tool doesn't populate this field. To find the value, you can create a custom report from data source campaigns and include report field Reference ID Value.
  - Campaign Title: Enter the desired title for your campaign
  - Campaign Type: To find reference ID value for campaign type, run the Integration IDs report and search business object *Connect Campaign Type*.
  - Campaign Category: If you want to enter a campaign category, run the Integration IDs report and search business object *Campaign Category (All)* to get a list of the campaign categories and their corresponding reference ID values.
  - Audience: Most likely, you'll want to change the reference ID type in cell G4 from *App\_Audience\_ID* to *Audience\_ID*. To find the ID, run the Integration IDs report and search business object *Connect Audience (Framework)*.
  - Content Type: To find reference ID value for Content Type, run the Integration IDs report and search business object *Connect Campaign Item Type*.
  - Row ID (Section Campaign Item Data +): Enter a unique row ID value for each Campaign Item.
    - Campaign Item: If updating existing campaign item, enter the reference ID here. To find the reference ID value, run the Integration IDs report and search business object *Connect Campaign Step*.
    - Campaign Item Title: Enter desired Campaign Item Title.
    - Content: We recommend that you configure Reference ID type as a Separate Column option for this field. See *Guidelines for Modifying the EIB Template* section. After modifying the template, you'll

have 2 columns in your EIB input file, for Content. Enter the reference ID type in the first column and reference ID value in the second column. Refer to attached Sample EIB Input file for examples.

- Channels: To find reference ID value for channels, run the Integration IDs report and search business object *Notification Channel Group*.
- Message Template: If you want to supply a message template, run the Integration IDs report and search for the *Message Template* business object to get a list of the templates and their corresponding reference ID values.
- Row ID (Section Campaign Item Reminder Data): Enter a unique row ID value for each Reminder.

## Common Issues and Errors

Issue	Cause and Solution
<p>When attempting to generate a spreadsheet with data, it fails with an error like this:</p> <p><i>Integration Failed.</i></p> <p><i>com.capeclear.mediation.MediationException: application=assemblyGenerateSpreadsheetE2 - Error code: 1 The following error occurred when getting data for the template: Validation error occurred. The entered information does not meet the restrictions defined for this field.</i></p>	<p>This issue can occur if there are campaigns in your tenant that you've saved but haven't submitted. Add a condition to your filter to check <i>Campaign Event is Not Empty</i>.</p>
<p>When attempting to generate spreadsheet with data, it fails with error:</p> <p><i>Processing error occurred. The task submitted is not authorized.</i></p>	<p>This issue is most likely security-related. See <i>Additional Input File Guidelines</i> section.</p>
<p>Unable to launch the EIB.</p>	<p>This issue is most likely security-related. See <i>Additional Input File Guidelines</i> section.</p>
<p>Even though the EIB completed successfully, it didn't assign users the campaign items.</p>	<p>The EIB only submits the campaign event. Launch the campaign event to assign the items.</p>
<p>EIB fails with error, when loading campaigns with reminders:</p> <p><i>You must configure Email Configuration Data to use Email as a channel.</i></p>	<p>In some situations, such as when configuring reminders, you must include text for Email Subject and Body fields in the EIB input file. Use the Generate Spreadsheet with Data functionality to help populate this information.</p>

Issue	Cause and Solution
<p>EIB fails with error:</p> <p><i>Validation error occurred. Audience is not valid for Category and Type</i></p>	<p>This issue occurs if the audience category doesn't match the Campaign Category entered in the EIB input file. Run Edit Audience task to check the category for Audience. Then verify that the EIB input file uses the same value.</p>
<p>After updating an existing Campaign, some of the campaign items are missing</p>	<p>Perform a Replace All when updating campaigns. Use the Generate Spreadsheet with Data option so that EIB input file has all existing data.</p> <p>If you inadvertently lost information, rescind the campaign event that the EIB updated to restore data.</p>

## Business Processes

Campaign Event.

## Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to add new campaigns or update existing campaigns.
- If you've inadvertently uploaded incorrect entries, use task Mass Cancel Business Processes or Mass Rescind Business Processes. What you use depends on whether the business process event is complete or in progress. This web service doesn't allow you to specify the EIB event when canceling or rescinding. Instead, select *Campaign Event* at the Business Process Types prompt and enter a date range that you ran the EIB.

For reference documentation for all web services including Submit Connect Campaign, see [Operation Directory](#).

## Sample EIB Input File

## Concept: Submit Engagement Builder EIB

### Background

You can use this EIB to create or update engagements used in the Engagement Builder report.

This topic provides details on how to fill out the spreadsheet template for this EIB. To use this topic, you must create this EIB in your tenant, then generate a spreadsheet from that EIB.

## Equivalent Workday Task

Engagement Builder report.

## EIB Input File Guidelines

### Web Service Version and Security Configuration Guidelines

- Workday recommends using the latest web service version for your EIB. You can check the version of your EIB by:
  - From the related actions of the EIB, select Template Model > View.
  - On the View Template Model page, check the Version field to verify you're using the latest web service version.
  - If you're using an older web service version, you can create a new EIB to get the latest version.
- Verify you have the correct security configuration.
  - You must have access to the *Campaign Event* business process type in the System functional area to run this EIB. Configure the Initiating Action section for *Submit Engagement Builder (Web Service)*.

### Guidelines for Modifying the EIB Template

This EIB has a *Generate Spreadsheet with Data* option, which is helpful if you're not sure how to populate the EIB input file. This option is also handy if editing existing campaigns so that you can prepopulate all existing data. Before using the *Generate Spreadsheet with Data* option, we suggest you modify the template so that the template generation properly populates the content field and audience field:

- From the related actions of your EIB, select Template Model > View.
- On the left, click Engagement Item Data+.
- Locate the Content row.
- From the related actions on the Content row, select Template Model Column > Edit Details.
- Select the Reference ID Type as Separate Column check box.
- Click OK.
- View the EIB template again and click Engagement Data.
- Locate the Audience row.
- From the related actions on the Audience row, select Template Model Column > Edit Details.
- Change the reference ID type to what is appropriate for your organization.

### Additional Input File Guidelines

We recommend that you review [Concept: EIB Spreadsheet Data Entry Guidelines](#), which provides a general overview for populating EIB files.

To prevent data loss, we recommend that you generate your spreadsheet with data for the Submit Engagement Builder EIB. See [Example: Generate EIB Spreadsheet Template with Data](#).

- There's a *Generate Spreadsheet with Data* option for this EIB, which helps determine the fields that you need to populate and the reference ID values that you can use:
  - If you're adding new engagements, you can start by manually creating an engagement, like the engagements you're loading. Then complete the steps in the *Guidelines for Modifying the EIB Template* section so you can see how the EIB input file populates.
  - If updating existing engagements, complete the guidelines above to get all existing information for the engagement. Then make any necessary modifications. Note that the web service does a Replace All so it's important to populate all existing information.
- Additional details for some of the fields:
  - Spreadsheet Key: Specify a unique value for each engagement.
  - Engagement: If updating an existing engagement, enter the reference ID here. The Generate with Data tool doesn't populate this field. To find the value, you can create a custom report from data source engagements and include the report field Reference ID Value.
  - Engagement Title: Enter the title for your engagement.
  - Engagement Type: To find reference ID value for engagement type, run the Integration IDs report and search business object *Connect Campaign Type*.
  - Engagement Category: If you want to enter an engagement category, run the Integration IDs report and search business object *Campaign Category (All)* to get a list of the engagement categories and their corresponding reference ID values.
  - Audience: You might consider changing the reference ID type from *App\_Audience\_ID* to *Audience\_ID*. To find the ID, run the Integration IDs

- report and search business object *Connect Audience (Framework)*.
- Content Type: To find reference ID value for Content Type, run the Integration IDs report and search business object *Connect Campaign Item Type*.
  - Row ID (Section Engagement Item Data+): Enter a unique row ID value for each engagement item.
    - Engagement Item: If updating an existing engagement item, enter the reference ID here. To find the reference ID value, run the Integration IDs report and search business object *Connect Campaign Step*.
    - Engagement Item Title: Enter your engagement item title.
    - Content: We recommend that you configure *Reference ID type as a Separate Column* option for this field. See *Guidelines for Modifying the EIB Template* section. After modifying the template, you'll have 2 columns in your EIB input file for Content. Enter the reference ID type in the first column and reference ID value in the second column. Refer to attached Sample EIB Input file for examples.
    - Channels+: To find reference ID value for channels, run the Integration IDs report and search business object *Notification Channel Group*.
  - Row ID (Section Engagement Item Reminder Data+): Enter a unique row ID value for each reminder.
    - Reminder: If updating an existing reminder, enter the reference ID here. To find the reference ID value, run the Integration IDs report and search business object *Reminder*.
    - Reminder Title: Enter your reminder title.
    - Reminder Channels+: To find reference ID value for channels, run the Integration IDs report and search business object *Notification Channel Group*.

## Business Processes

*Campaign Event.*

### Use Cases and Guidelines for Recovering from a Bad Load

- This web service enables you to create or update engagements used in the Engagement Builder report.
- For reference documentation for all web services including *Submit Engagement Builder*, see [Operation Directory](#).

# Getting Started with Workday Connectors

## Browse Connector Templates

### Prerequisites

Security: *Integration Build* and *Integration Reports* domains in the Integration functional area.

### Context

To determine which Connector templates best meet your needs, use the Integration Template Catalog report. The report displays a complete list of Connector templates delivered by Workday. The report doesn't display deprecated or retired templates.

### Steps

1. Access the Integration Template Catalog report.
2. (Optional) To view details about the services, attributes, and maps associated with a template in the list, select View Details for that template.

## Concept: Workday Connectors

Workday Connectors are prebuilt integration templates that extend Workday functionality to external endpoints for Human Capital Management (HCM), Payroll, Payroll Interface, Financial Management, and Student. Workday hosts and maintains all integrations.

Workday provides 2 types of Connectors:

- *End-to-end Connectors* support a specific named third-party application or service. When you deploy a Connector, the Connector supports the third-party application with no additional coding required.
- *Connectors* are prebuilt integrations that address most of the integration effort required to connect to third-party end points. These integrations import and export data in a Workday-defined file format.

Note: All Connectors require some level of tenant configuration and testing. Each customer can have specific mapping requirements and different endpoint configurations. Workday integration templates and mapping capabilities can accommodate these differences in customer configurations.

Each integration template provides a framework for Workday to communicate with an external endpoint. Each integration template contains a set of integration services, comprised of integration attributes and

maps, that define specific connection points. To reduce complexity, many integration templates have factory settings for common definitions and requirements.

Workday Connectors are currently available for:

- Benefits
- HCM
- Workday Payroll
- Third-Party Payroll
- Financials
- Student

### Audit Reports and Extracts

Workday commonly attaches audit reports to integration events that provide additional details about the integration. Audit reports support human use only and can aid in the troubleshooting of failures and data. Output, format, and accessibility are subject to change at any time. Never use audit files within Integration processing or logic.

## Reference: Benefits Connectors Catalog

Workday supports and maintains the connectors to meet the required file formats and specifications of each benefit provider. For any worker enrolled in a Workday HCM benefit plan, Workday sends the HCM indicative data for the benefit provider, as well as any changes in benefit enrollments. Benefits Connectors enable you to integrate with a wide range of benefit providers in these categories:

- Medical
- Dental
- Vision
- Life and Disability
- Flexible Spending Accounts
- COBRA Administration
- Retirement Savings

The Workday Community lists offerings in each category at <https://community-content.workday.com/content/workday-community/en-us/reference/products/human-capital-management/cloud-connect-for-benefits/ccb-products.html>.

Workday also provides a generic Benefits Connector to enable you to create a benefits integration to a vendor not supported by our catalog. It gives you the tools to export a benefits-related subset of HR, compensation, and benefits deduction data to the benefits provider of your choice. Benefits Connector provides:

- A configurable output file
- A choice of change detection options
- Flexible launch parameters
- Built-in audit reports

## Reference: Financials Connectors Catalog

Connector	Description
<a href="#">Accounting Journal Connector</a>	Imports accounting journal data from external endpoints into Workday. This integration requires

Connector	Description
	transformation of accounting journal data into a Workday-defined format.
Ad Hoc Bank Transaction Connector	Imports ad hoc bank transaction data from external endpoints into Workday. This integration requires transformation of bank transaction data into a Workday-defined format.
AMEX Remittance	Generates and exports American Express Remittance files from the credit card secure environment.
Bank Fee Statement Connectors	Imports bank fee statements from your financial institutions for analysis and reporting purposes in these formats: <ul style="list-style-type: none"> <li>ASC X12 EDI 822</li> <li>ISO 20022 <i>camt.86 V1</i></li> <li>ISO 20022 <i>camt.86 V2</i></li> <li>Workday-defined XML format.</li> </ul>
Bank Statement Load Integrations	Imports bank statements of any type into Workday. For formats other than BAI2, BTRS, ISO 20022, and MT940/942, requires transformation of bank statement files into a Workday-defined format.
Currency Exchange Rate Connector	This integration can import currency exchange rates into Workday. Files must be in a Workday-defined file format.
Customer Credit Card Payments	Connects Workday to <i>CyberSource</i> for authorization and processing of payments for customer credit cards.
Customer Payment Lockbox	Imports Bank Administration Institute (BAI) lockbox data files into Workday. Files must be in a Workday-defined file format.
DAS2 Integration	Generates DAS2 audit files from accounting entries to present to French tax authorities.
EDI Supplier Integrations	Exchanges data with external suppliers in American Standards Committee (ASC) EDI X12 810, 850, 855, and 856 formats.
Electronic Payments	Connects Workday to the financial institution that your company uses for inbound and outbound payment processing.
Electronic Invoice Connector	Exports electronic invoicing data in XML format.
Expense Credit Card Transactions	Imports credit card data into Workday for use in expense reports. Workday provides integration templates for these formats: <ul style="list-style-type: none"> <li>American Express</li> <li>Citibank Commercial Format (CCF for VISA and MasterCard)</li> </ul>

Connector	Description
	<ul style="list-style-type: none"> <li>• Bank of America VISA credit card transactions</li> <li>• MasterCard Common Data Format 3 (CDF3 Release 15_01_00_00) credit cards and credit card transactions</li> <li>• Visa Commercial Data Format 4.4 R1 (VCF4.4) credit cards and credit card transactions.</li> </ul>
<a href="#">FEC Integration</a>	Generates FEC audit files from accounting entries to present to French tax authorities.
<a href="#">Financial Management Connector for Salesforce</a>	Exchanges sales data between Salesforce.com and Workday. Download this app from the Salesforce.com <i>AppExchange</i> .
<a href="#">GoBD Integration</a>	Generates audit files that you can submit to German tax authorities in compliance with GoBD tax regulations.
<a href="#">Inventory Label Data Integrations</a>	These integrations export inventory label data in a Workday-defined file format for use by an external label printing service or application.
<a href="#">Payment Acknowledgment</a>	<p>This integration can import payment acknowledgment files in ISO 20022 format so that you can:</p> <ul style="list-style-type: none"> <li>• View payment status.</li> <li>• Complete successful payments.</li> <li>• Cancel or reprocess rejected payments.</li> </ul>
<a href="#">SAF-T Integrations</a>	Generates audit files that you can submit to tax authorities in compliance with OECD SAF-T requirements.
<a href="#">Supplier Punchout</a>	Connects Workday to external suppliers for procurement.
<a href="#">Tax ID Integration</a>	Checks the validity of tax IDs using the European VAT Information Exchange System (VIES) external service.
<a href="#">Third-Party Payments Integration</a>	Generates audit files containing information about payments and payees. This integration enables you to create declarations of payments to third parties and submit them to tax authorities.
<a href="#">Travel Booking Inbound Connector</a>	Imports travel booking records from your third-party travel providers into Workday. This integration gives you a unified view of corporate travel booking records from your third-party travel providers against your actual expense report.

## Reference: HCM Connectors Catalog

Connector	Description
<a href="#">Account Provisioning Integration</a>	Sends worker profiles and provisioning group assignments to an account provisioning application. This integration exports data in System for Cross-domain Identity Management (SCIM) file format.
<a href="#">Account Provisioning Connector</a>	Sends worker profiles and provisioning group assignments to an account provisioning application. This integration exports data in Workday XML format.
<a href="#">Affordable Care Act (ACA) Connectors</a>	Connects Workday to the Internal Revenue Service (IRS). Enables you to submit IRS Form 1094-C and 1095-C data for the Affordable Care Act.
<a href="#">AngelPoints</a>	Connects Workday to <i>AngelPoints</i> . Enables you to create, modify, and delete accounts in <i>AngelPoints</i> as worker status changes in Workday.
<a href="#">Assign Organizations Inbound Connector</a>	Imports organization assignment data from an external server into Workday.
<a href="#">Core Connector: Background Check Order Inbound</a>	Imports information for background checks on a person from an external server.
<a href="#">Core Connector: Background Check Order Outbound</a>	Exports requests for background checks on a person to an external server.
<a href="#">Core Connector: Competency Model</a>	Detects new and changed competency model data and produces a configurable output file in XML format.
<a href="#">Core Connector: Job Postings</a>	Detects new and changed job postings produces a configurable output file in XML format.
<a href="#">Core Connector: Job Profile and Job Family</a>	Detects new and changed job profile and job family data and produces a configurable output file in XML format.
<a href="#">Core Connector: Job Requisitions</a>	Detects new and changed job requisitions and job requisition data and produces a configurable output file in XML format.
<a href="#">Core Connector: Location</a>	Detects new and changed location data and produces a configurable output file in XML format.
<a href="#">Core Connector: Organization</a>	Detects new and changed organization data and produces a configurable output file in XML format.
<a href="#">Core Connector: Positions</a>	Detects new and changed position data and produces a configurable output file in XML format.
<a href="#">Core Connector: Worker</a>	Detects changes to a worker and produces a configurable output file in XML format or a nonconfigurable file in CSV (Comma-Separated Value) format.

Connector	Description
Core Connector: Worker for LMS Outbound Integration	Detects new and changed worker, job, location, organization, and talent data. Produces a configurable output file in XML format for export to a Learning Management System (LMS).
Directory Service	Connects Workday to LDAP and Active Directory servers.
E-Verify Integration	Connects Workday to the E-Verify service provided by the United States Citizenship and Immigration Services (USCIS). Enables you to verify employment eligibility for your employees and applicants.
Inline Assessment	Connects Workday to third-party assessment vendors for registering candidates that have applied for a job using an external career site.
Kenexa Connector	Exports organization, location, job profile, and job family data from Workday to Kenexa. Requires that you use Job Management staffing model.
Kronos Workforce Timekeeper Outbound	Exports worker data from Workday to Kronos Workforce Timekeeper.
Medicare Integrations	Sends and receives coordination of benefits request and response files from the Centers for Medicare & Medicaid Services (CMS). Files can include data for active and retired employees and their dependents.
Okta Integration	Sends event-based notifications of employee changes directly to your Okta tenant.
Organization Inbound Connector	Imports new, changed, and inactivated organization data from an external application.
Salesforce.com Chatter Integration	Posts events from Workday to Salesforce.com Chatter.
Salesforce.com Worker Sync	Connects Workday to Salesforce.com for account provisioning.
Skillsoft Integration	Imports licensed courseware from Skillsoft into your learning catalog in Workday as external digital courses.
Social Security Number Verification Service Integration	Generates data file for upload to Social Security Number Verification Service. Enables you to verify that your employee names and Social Security numbers (SSN) match Social Security Administration records.
Talent Profile Inbound Connector	Imports updates to certifications, competencies, and completed trainings for one or more workers.
Unistaff Connectors	Exchanges data between Workday and Unistaff, enabling your organization to align with data privacy requirements for the Russian Federation. Supports:

Connector	Description
	<ul style="list-style-type: none"> <li>• Export of Workday foundation data.</li> <li>• Import of new hires and personal information updates for workers.</li> </ul>

## Reference: Student Connectors Catalog

Connector	Description
Education Test Result Inbound Connector See <a href="#">Student Admissions Connectors</a> .	Imports test results in a Workday-defined XML format. Use this connector to import results for education tests not supported by other Student Admissions connectors.
National Student Clearinghouse Connectors	Sends enrollment, degree, and graduation data to the National Student Clearinghouse (NSC).
SPEEDE External Transcript Inbound See <a href="#">Student Admissions Connectors</a> .	Imports student transcripts from the NSC Standardization of Postsecondary Education Electronic Data Exchange (SPEEDE) service.
Student Admissions Connectors	<p>Imports test results for these education tests:</p> <ul style="list-style-type: none"> <li>• ACT (formerly American College Testing)</li> <li>• Advanced Placement (AP).</li> <li>• Graduate Management Admission Test (GMAT).</li> <li>• Graduate Record Examination (GRE).</li> <li>• Postsecondary Education Readiness Test (PERT).</li> <li>• SAT (formerly Scholastic Assessment Test).</li> <li>• Test of English as a Foreign Language (TOEFL).</li> </ul> <p>Note: Workday provides a separate integration template for each test. Each template supports only 1 test.</p>
Student Financial Aid Connectors	Imports and exports transaction data for these formats: <ul style="list-style-type: none"> <li>• Alternative Loan Applications.</li> <li>• Common Origination and Disbursement (COD).</li> <li>• Institutional Student Information Reports (ISIRs).</li> <li>• Transfer Student Monitoring (TSM) and Financial Aid History (FAH).</li> </ul>
Student Financials Connectors	<ul style="list-style-type: none"> <li>• Sends refund data to Transact (formerly Cashnet) merchants.</li> <li>• Generates IRS Form 1098-T data for enrolled students.</li> </ul>

Connector	Description
<a href="#">Student Outbound Connector</a>	Exports data for students with changes in their status and profile information in a Workday-defined XML format.
<a href="#">Student Records Connectors</a>	Exports transcript data in a Workday-defined XML format.
<a href="#">Student Recruiting Connectors</a>	Imports student prospects from the ACT Enroll student search service.
<a href="#">Student Transaction Log Outbound Connector</a>	Monitors your tenant for Student-related transactions that meet specified transaction type, effective date, and entry date criteria. Exports an XML file with transaction records for these transactions from Workday.
<a href="#">The Common Application Inbound Integration</a>	Imports a subset of first-year student applicant data from The Common Application.

## Reference: Third-Party Payroll Connectors Catalog

Connector	Description
<a href="#"><i>Payroll Effective Change Interface</i></a>	Exports payroll-related subset of HR, compensation, and benefits deduction data. The connector exports the data in XML format with effective dates in the sequence that they occurred. You can transform the XML into a format supported by your payroll provider.
<a href="#"><i>Worker Effective Change Interface</i></a>	Captures a full stack of worker data changes within an effective range. The connector exports the data in an XML format text file and includes data changes related to corrections, rescinds, indirect, retroactive, and future-dated transactions.
<a href="#"><i>Payroll Interface</i></a>	Exports payroll-related subset of HR, compensation, and benefits deduction data. The connector exports the data in XML format. You can transform the XML into a format supported by your payroll provider.
<a href="#"><i>External Payroll Results Inbound</i></a>	Imports data generated by an external payroll endpoint to payroll results.
<a href="#"><i>Import External Payslips</i></a>	Imports employee payslips from an external payroll endpoint.
<a href="#"><i>External Payroll Documents</i></a>	Imports external payslips, external tax documents, and other external payroll documents into Workday.

## Reference: Workday Payroll Connectors Catalog

Connector	Description
<a href="#">ADP Check Print</a>	Exports Workday payroll and payslip data to ADP, enabling you to outsource printing of checks and pay advices.
<a href="#">Ceridian Check Print Service</a>	Exports Workday payroll and payslip data to Ceridian, enabling you to outsource printing of checks and pay advices, or to outsource full banking services.
<a href="#">Check Printing Connector</a>	Connects Workday to regional banks that don't use the Ceridian check printing format. The Check Printing Connector enables you to customize output for the requirements of a specific bank.
<a href="#">Electronic Income Withholding Order Integrations</a>	Connects Workday to the Federal Office of Child Support Enforcement (OCSE) web portal for exchange of Electronic Income Withholding Order records and acknowledgments.
<a href="#">Electronic Payments</a>	Connects Workday to your company bank or financial institution for inbound and outbound payment processing.
<a href="#">HM Revenue &amp; Customs Incoming Notifications</a>	Connects Workday to HM Revenue & Customs Data Provisioning Service (DPS) to receive: <ul style="list-style-type: none"> <li>P6/P6B and P9 tax notifications</li> <li>SL1 and SL2 student loan notifications</li> </ul>
<a href="#">HM Revenue &amp; Customs RTI Integration</a>	Connects Workday to HM Revenue & Customs Real Time Information (RTI) to send Full Payment Submission (FPS) files.
<a href="#">HM Revenue &amp; Customs RTI Employer Payment Summary Integration</a>	Connects Workday to HM Revenue & Customs Real Time Information (RTI) to send Employer Payment Summary (EPS) files.
<a href="#">Payment Acknowledgment</a>	Imports payment acknowledgments in ISO 20022 format so that you can view payment status, complete successful payments, and cancel or reprocess rejected payments.
<a href="#">Payment Connector</a>	Connects Workday to your company bank or financial institution for outbound payment processing.
<a href="#">Payroll Journal Outbound Connector</a>	Exports journal entries, include payroll accounting details, from Workday to an external endpoint.
<a href="#">Service Canada ROE</a>	Generates ROE (Record of Employment) files for manual upload to Employment and Social Development Canada (ESDC), and imports ROE status files generated by Service Canada into Workday.

Connector	Description
Tax Filing (Canada T4, T4A, RL-1, RL-2)	Generates T4, T4A, RL-1, or RL-2 files for manual upload to the Canadian Revenue Agency or the Revenue Quebec Agency.
Tax Filing (USA)	Exports periodic, quarterly, and annual tax data from Workday Payroll to ADP or Ceridian.
Time Off Inbound and Payroll Input Connectors	Connects Workday to external time and attendance tracking applications, such as Kronos Workforce Timekeeper.
UK Civil Service Pension Files	Generates data files for manual upload to the Civil Service pension scheme administrator.
Worker Time Block Inbound Connector	Imports time block data generated by an external time and attendance application into Workday.
Worksite Reporting	Generates MWR (Multiple Worksite Record) files for upload to the Bureau of Labor Statistics, United States Department of Labor.

## Benefits Connectors

### Setup Considerations: Cloud Connect for Benefits

You can use this topic to help make decisions when planning your configuration and use of Cloud Connect for Benefits (CCB). It explains:

- Why to set it up.
- How it fits into the rest of Workday.
- Downstream impacts and cross-product interactions.
- Security requirements and business process configurations.
- Questions and limitations to consider before implementation.

Refer to detailed task instructions for full configuration details.

#### What It Is

Cloud Connect for Benefits is a collection of prebuilt integrations to benefit providers across a range of categories, including:

- Medical, Dental, Vision.
- Life and Disability.
- Flexible Spending Accounts and Health Savings Accounts.
- COBRA Administration.
- Retirement Savings (Outbound and Inbound).
- Medical Underwriting Decisions (inbound).

Cloud Connect for Benefits also supports integrations for additional benefit plans. Examples: Employee assistance programs, commuter benefits, or long-term care.

## Business Benefits

Cloud Connect for Benefits enables you to exchange benefits-related data between Workday and benefit providers.

## Use Cases

With Cloud Connect for Benefits, you can:

- Select an integration template specific to your vendor and product.
- Configure integration service attributes to control integration behavior.
- Map data from Workday to the format that the vendor supports.
- Define a schedule for integration runs.
- Exchange data securely with vendors using different network transport protocols.

## Questions to Consider

Question	Considerations
Does Workday provide a Cloud Connect for Benefits integration template that supports your vendor/product combination?	<ul style="list-style-type: none"> <li>• To see if Workday supports your vendor/product combination, search the <a href="#">CCB Providers</a> or <a href="#">CCB Products</a> pages on Workday Community.</li> <li>• If your provider supports the ANSI X12N 834 file format, use the generic ANSI X12 834 V2 template.</li> </ul>
Are your vendors based in the US?	<p>Most CCB integrations are for US-based vendors. Workday supports these Canadian providers:</p> <ul style="list-style-type: none"> <li>• Great West.</li> <li>• ManuLife.</li> <li>• Standard Life Assurance.</li> <li>• Sun Life.</li> </ul>

## Recommendations

- Consider engaging with professional services when implementing Cloud Connect for Benefits integrations.
- Start your implementation well in advance of your open enrollment period. For many CCB providers, Workday might not hear about changes to vendor file formats until you start your implementation. Try to test early so that Workday can make necessary changes to a template in time for your go-live date.
- Before setting up your integration test environment, work with your benefits functional partner to ensure that integrations can support your plan setup.
- Plan out the number and type of test cycles that the benefits provider requires before certifying your integration. Work with your benefits provider to determine how many test cycles they require.
- Consider using the generic Benefits Connector integration if these conditions are true:
  - Workday doesn't provide a template that supports your vendor/product combination.
  - Workday doesn't plan to develop a template that supports your vendor/product combination.

## Requirements

Subscribe to the Cloud Connect for Benefits SKU.

## Limitations

Actual contribution amounts are only available to Cloud Connect for Benefits integrations from Workday Payroll. If you use a third-party payroll provider, benefit integrations send estimated amounts based on the benefit plan setup.

## Tenant Setup

No impact.

## Security

Enable security for these domains to configure Cloud Connect for Benefits integrations.

- *Integration Build*
- *Integration Configure*

Enable security for these domains for Cloud Connect for Benefits integrations to access Workday data:

Security Domain	Required for Products
<i>Change Retirement Savings (Business Process)</i>	Retirement Savings Inbound.
<i>Integration Event</i>	<ul style="list-style-type: none"> <li>• Evidence of Insurability (EOI) Inbound.</li> <li>• Outbound.</li> <li>• Retirement Savings Inbound.</li> </ul>
<i>Person Data: Citizenship Status</i>	Outbound.
<i>Person Data: Date of Birth</i>	Outbound.
<i>Person Data: Date of Death</i>	Outbound.
<i>Person Data: Gender</i>	Outbound.
<i>Person Data: ID Information</i>	<ul style="list-style-type: none"> <li>• Evidence of Insurability (EOI) Inbound.</li> <li>• Outbound.</li> <li>• Retirement Savings Inbound.</li> </ul>
<i>Person Data: Marital Status</i>	Outbound.
<i>Reports: Pay Calculation Results for Worker (Results)</i>	Outbound.
<i>Worker Data: Beneficiaries and Dependents</i>	Outbound only.
<i>Worker Data: Benefit Elections</i>	<ul style="list-style-type: none"> <li>• Evidence of Insurability (EOI) Inbound.</li> <li>• Outbound.</li> <li>• Retirement Savings Inbound.</li> </ul>
<i>Worker Data: Benefits</i>	<ul style="list-style-type: none"> <li>• Evidence of Insurability (EOI) Inbound.</li> <li>• Retirement Savings Inbound.</li> </ul>
<i>Worker Data: Compensation by Organization</i>	Outbound.
<i>Worker Data: Court Order Details</i>	Outbound.
<i>Worker Data: Current Staffing Information</i>	Outbound.
<i>Worker Data: Payroll (Payroll Input)</i>	Retirement Savings Inbound.
<i>Worker Data: Payroll Interface (Payroll Input by Worker)</i>	Retirement Savings Inbound.
<i>Worker Data: Public Worker Reports</i>	<ul style="list-style-type: none"> <li>• Evidence of Insurability (EOI) Inbound.</li> <li>• Outbound.</li> </ul>

Security Domain	Required for Products
	<ul style="list-style-type: none"> <li>• Retirement Savings Inbound.</li> </ul>

## Business Processes

You can use the *Integration Process Event* business process to manage how your integrations run.

## Reporting

Report	Description
All Integration Systems	View all integrations that you've created.
View Integration System	View an integration that you've created. You can then edit a specific integration that you locate with this report.
Integration Events	<p>Displays:</p> <ul style="list-style-type: none"> <li>• A summary of integration events that are in process or completed.</li> <li>• Details about the status for each integration event.</li> </ul>

## Connections and Touchpoints

Features	Considerations
Benefits	Cloud Connect for Benefits integrations send and receive benefits data to and from vendors.
HCM Core	Cloud Connect for Benefits integrations send worker data to vendors.
Payroll	If you use Workday Payroll, outbound Cloud Connect for Benefits integrations send actual contribution amounts.

Workday offers a Touchpoints Kit with resources to help you understand configuration relationships in your tenant. Learn more about the [Workday Touchpoints Kit](#) on Workday Community.

## Getting Started with Cloud Connect for Benefits

### Concept: Cloud Connect for Benefits

Cloud Connect for Benefits (CCB) is a collection of prebuilt integrations to benefit providers across a range of categories. You can configure an integration using attributes, maps, and overrides. Data then flows to your benefit providers based on a predefined schedule that incorporates benefit life events. You can use any CCB provider-specific integration, or the [Benefits Connector](#), an integration template with a configurable set of HCM data across a range of categories.

Workday delivers information to providers in their preferred format by supporting:

- Industry standards such as ANSI ASC X12N 834 (version 5010) and LIMRA Data Exchange (LDE) formats.
- Proprietary file formats.
- Text file with comma-delimited fields.

- Text file with pipe-delimited fields.
- Text file with fixed-width fields.
- XML.

Text files are UTF-8 encoded rather than using ANSI encoding.

Workday maintains data security throughout the transmission process by using data encryption and secure transport protocols. If provider specifications change, Workday updates the integration to meet the new requirements.

View the current Cloud Connect for Benefits catalog: <https://community.workday.com/node/141741>.

Each integration has a template associated with it that contains services, attributes, maps, and overrides. You create an integration system using the specific integration template. You're then able to configure:

- Optional services.
- Field attributes to select specific data elements to be reported on the file for these templates: BC, ANSI, and LDEx.
- Integration attributes for data that are the same for everyone reported on the file
- Maps to translate Workday tenanted values to what the provider needs to see
- Overrides for items that might not be stored in discrete fields in Workday or for accessing calculated fields

The integration takes care of all data fields that are the same for *all* customers and implementations. The integration hides attributes with a default value because it shouldn't override the value.

## Sent and Retrieved Data

The information that Workday passes to or receives from benefit providers depends on:

- The type of benefits available to workers.
- The requirements for each provider.

Examples:

Medical, Dental, Vision	<ul style="list-style-type: none"> <li>• Subscriber data.</li> <li>• Enrollment data.</li> <li>• Dependent information.</li> <li>• Eligibility data.</li> </ul>
Life and Disability	<ul style="list-style-type: none"> <li>• Subscriber data.</li> <li>• Enrollment data.</li> <li>• Compensation data.</li> <li>• Coverage information.</li> <li>• Beneficiary information.</li> </ul>
Flexible Spending Accounts and Health Savings Accounts	<ul style="list-style-type: none"> <li>• Subscriber data.</li> <li>• Enrollment data.</li> <li>• Contribution amounts.</li> <li>• Goal amounts.</li> </ul>
COBRA Administration	<ul style="list-style-type: none"> <li>• Subscriber data.</li> <li>• Termination data.</li> <li>• Data for persons newly enrolled in COBRA-eligible plan.</li> </ul>
Retirement Savings (outbound)	<ul style="list-style-type: none"> <li>• Subscriber data.</li> <li>• Enrollment data.</li> </ul>

Retirement Savings (inbound)	<ul style="list-style-type: none"> <li>Contribution amounts.</li> <li>Changes to contribution elections.</li> <li>Loan data. Workday Payroll uses data from inbound integrations to maintain deductions.</li> </ul>
Medical Underwriting Decisions (inbound)	Statuses (approved or denied) and the decision date.
Additional Benefit Plans	<ul style="list-style-type: none"> <li>Employee assistance programs.</li> <li>Commuter benefits.</li> <li>Long-term care.</li> </ul>

## Contribution Amounts

Workday Payroll can send contribution amounts to providers of defined contribution plans and flexible spending account plans (HSA, spending accounts, commuter, and retirement savings).

## Goal Amounts

Workday sends goal amounts to flexible spending account plan administrators to ensure that claims don't exceed annual plan contributions.

The integration uses values from benefit elections for the workers and the effective date used to launch the integration. The integration relies on what is in the Benefits data and performs no calculations.

### Reference

[The Next Level: Benefits Integrations](#)

## Concept: Planning a Benefit Provider Integration

Each Cloud Connect for Benefits integration requires initial configuration to tailor the way that it maps and delivers data to a benefit provider. You can arrange configuration through Workday Professional Services or any certified Workday Services Partner.

Note: Schedule plenty of time before your next open enrollment for configuring and testing your integrations. If you change benefit providers, your timeline is longer. The timeline varies depending on whether your benefit provider is already in the Cloud Connect for Benefits catalog or a new addition.

These sections describe the prerequisites and implementation process to help you plan a new benefit provider integration. Most of these activities happen in parallel with your Workday HCM implementation.

### Before You Begin

Verify the quality of your data to shorten your implementation cycle. If you start with clean data, you encounter fewer problems.

### Implementation Process

Workday provides a set of templates as the starting point for all Cloud Connect for Benefits integrations. To simplify initial configuration as well as ongoing maintenance, the templates have some delivered values and prompts for data in Workday.

Related Information

### Tasks

[Set Up Test Environment for Benefits Integration on page 544](#)

## Concept: Cloud Connect for Benefits Integration Templates

Workday provides a template for each Cloud Connect for Benefits integration to enable configuration of customer-specific values.

- Attributes are available for data elements that pertain to everyone on the file.
- Maps are used to translate *internal* Workday values to *external* vendor values. Workday provides enumerations in a drop-down list, where possible. Drop-down lists streamline implementation, reduce configuration errors, and simplify ongoing maintenance.
- Overrides provide an even more powerful way to configure what Workday sends to your provider.

Related Information

### Tasks

[Change Benefit Provider Integration Maps](#) on page 546

## Concept: Cloud Connect for Benefits Field Overrides

Field overrides are a flexible tool to customize integration systems that use a Workday integration template. Each Workday template provides a standard framework for integration system creation and configuration. Field overrides give you an additional way to control data sent on the file, including use of custom or calculated fields.

Overrides give you the ability to use report fields or calculated fields to supply the values that your benefit provider requires. Example: To match a class structure or division in your provider environment, you can create calculated fields to concatenate multiple values in Workday. You can use overrides along with attributes and maps.

## Concept: Inbound Cloud Connect for Benefits Integrations

Cloud Connect for Benefits supports 2 types of inbound integrations:

- Retirement Savings
- Evidence of Insurability (EOI) Underwriting Decisions

Depending on the inbound data and product, the integration updates data in Workday in different ways:

- Retirement Savings, Loans: Workday creates new payroll input records.
- Retirement Savings, Deferrals: Workday creates retirement savings benefits change events.
- EOI Underwriting Decisions:
  - Workday updates decision status and date of decision.
  - Workday supports Approved and Denied statuses only.
  - You can configure the integration to leave open or close EOI Underwriting Decisions with a status that Workday doesn't support. Future updates to closed EOI Underwriting Decisions require manual processing.

### Processing for Third-Party Payroll

Workday creates payroll input records for loan changes.

Workday doesn't process deferral changes as direct payroll input. Workday updates elections with benefit events.

You can view payroll inputs for third-party payroll in the External Payroll Input Finder report. You can view inputs for a specific worker in the Maintain External Payroll Input for Worker task. You can also use the related action off a worker under Pay to view inputs.

There's no indicator on the payroll input for ongoing deductions for third-party payroll. Workday displays these deductions without an end date.

## Create Benefit Provider Integration

### Steps: Set Up Benefit Provider Integration

#### Prerequisites

Request a file specification from your benefit provider so that you can familiarize yourself with their data requirements.

#### Context

Set up an integration system using a template in the Cloud Connect for Benefits Template Category that sends employee benefits data to a benefit provider.

#### Steps

1. [Create Integration System](#) on page 1967.

In the New Using Template prompt, select the Cloud Connect for Benefits category, then select the template for your benefit provider. Some benefit providers have multiple integration templates for different products. Make sure that you select the correct template. The template names have this format: *WBN - [Provider Name]: [Product]*.

2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the applicable domains:

Security Domain	Required for Products
<i>Change Retirement Savings (Business Process)</i>	Retirement Savings Inbound.
<i>Integration Event</i>	<ul style="list-style-type: none"> <li>Evidence of Insurability (EOI) Inbound.</li> <li>Outbound.</li> <li>Retirement Savings Inbound.</li> </ul>
<i>Person Data: Citizenship Status</i>	Outbound.
<i>Person Data: Date of Birth</i>	Outbound.
<i>Person Data: Date of Death</i>	Outbound.
<i>Person Data: Gender</i>	Outbound.
<i>Person Data: ID Information</i>	<ul style="list-style-type: none"> <li>Evidence of Insurability (EOI) Inbound.</li> <li>Outbound.</li> <li>Retirement Savings Inbound.</li> </ul>
<i>Person Data: Marital Status</i>	Outbound.
<i>Reports: Pay Calculation Results for Worker (Results)</i>	Outbound.
<i>Worker Data: Beneficiaries and Dependents</i>	Outbound.
<i>Worker Data: Benefit Elections</i>	<ul style="list-style-type: none"> <li>Evidence of Insurability (EOI) Inbound.</li> </ul>

Security Domain	Required for Products
	<ul style="list-style-type: none"> <li>Outbound.</li> <li>Retirement Savings Inbound.</li> </ul>
<i>Worker Data: Benefits</i>	<ul style="list-style-type: none"> <li>Evidence of Insurability (EOI) Inbound.</li> <li>Retirement Savings Inbound.</li> </ul>
<i>Worker Data: Compensation by Organization</i>	Outbound.
<i>Worker Data: Court Order Details</i>	Outbound.
<i>Worker Data: Current Staffing Information</i>	Outbound.
<i>Worker Data: Dependent National IDs</i>	Outbound (Dental, Medical, Vision only).
<i>Worker Data: Payroll (Payroll Input)</i>	Retirement Savings Inbound.
<i>Worker Data: Payroll Interface (Payroll Input by Worker)</i>	Retirement Savings Inbound.
<i>Worker Data: Public Worker Reports</i>	<ul style="list-style-type: none"> <li>Evidence of Insurability (EOI) Inbound.</li> <li>Outbound.</li> <li>Retirement Savings Inbound.</li> </ul>
<i>Worker Data: Workers</i>	<p>Outbound. Use for contextual security only.  See the <i>Get_Workers Contextual Security</i> section  of <a href="#">Concept: Get Workers SOAP Web Service Guidelines and Troubleshooting</a>.</p>

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

3. [Set Up Attributes and Maps in Benefits Integration](#) on page 541.
4. [Set Up Integration Field Overrides for a Connector](#) on page 1973.

#### Related Information

##### Concepts

[Concept: Cloud Connect for Benefits Integration Templates](#) on page 539

[Concept: Planning a Benefit Provider Integration](#) on page 538

## Set Up Attributes and Maps in Benefits Integration

### Prerequisites

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

### Context

After you create a benefit provider integration, configure the integration attributes and maps to specify values for the output file.

- Integration attributes identify what benefit plans to include in the integration. Integration attributes also provide customer-specific values for data elements.
- Integration maps define relationships between values in Workday and codes in the external endpoint.

### Steps

- Access the View Integration System report.
- As a related action on the integration system, select *Integration System > Configure Integration Attributes*.

3. Specify values for the attributes in the Integration Attributes grid:

- For attributes without automatically populated values, add a row and specify a Value.
- For attributes whose automatically populated values you want to change, or attributes that have a comment in the Value field, select the Override Template Values check box. Then specify a new Value.
- Optionally specify that a value applies to a particular environment using the Restricted to Environment field.

Look at each attribute Description for guidance on how to configure the appropriate values. If necessary, request the correct values from your benefit provider.

4. Save your changes, then as a related action on the integration system, select Integration System > Configure Integration Maps.

5. In the Integration Maps grid, specify how to map Workday data to the output file:

- Add a row for each value from your tenant, select an Internal Value at the prompt, then select the corresponding External Value.

You can map more than 1 Internal Value to each External Value, but you can't map the same Internal Value to more than 1 External Value. The External Value prompt displays the valid values for your provider based on their file specification. You can view a description of each value from its related actions menu.

- (Optional) Provide a Default Value for any data element that doesn't have mapped values.

Each map Description identifies the corresponding position in the file. Workday requires every map; don't leave any map blank or Workday sends data from your tenant data to the output file, which results in an error.

6. Click OK to save your changes.

### Example

These tables display sample values for the attributes and maps in the *WBN - HIPAA 834 Health Insurance (v2)* integration service:

Attribute	Value
<i>Carrier Output HIPAA 834 EDI</i>	Yes
<i>Interchange Sender ID</i>	76-0689535
<i>Application Sender Code</i>	472243
<i>Master Policy Number</i>	98675
<i>Plan Sponsor Name</i>	Global Modern Services, Inc.
<i>Sponsor ID</i>	2458538
<i>Provider Entity Relationship Code</i>	25

Map	Automatically Populated Value	Internal Value	External Value
<i>Coverage Level Code</i>	IND	EE+1 Dependent EE+Family EE Employee Only	ECH FAM EMP
<i>Enrollment Relationship</i>	53	Child Domestic Partner Spouse	03 04 01
<i>Gender</i>	U	Female Male	F M
<i>Health Care Classification</i>	PDG	HMO	HLT

Map	Automatically Populated Value	Internal Value	External Value
		Indemnity	HLT
		PPO	HLT
<i>Position Time Type</i>		Full-time	FT
		Part-time	PT

## Next Steps

If the integration system has a field override service, configure the override values.

## Set Up Field Overrides in Benefits Integration

### Prerequisites

Determine if your integration system has field overrides. Access the View Integration System report and look for either of these field override documents for Version 1 of the ANSI X12 834 template:

- *WBN - HIPAA 834: Medical, Dental, Vision, Insurance - Field Override*
- *WBN - HIPAA 834: Medical, Dental, Vision, Insurance - Coverage Level Field Override*

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

### Context

A field override service gives you greater flexibility to map data to 834 elements. Each benefit provider has a unique set of fields that enable override values based on the provider implementation of the 834 format. You can use calculated fields or report fields to provide values for these fields, which often require a class structure or division. Cloud Connect for Benefits uses the Data Initialization Service (DIS) to manage field overrides. See [Steps: Set Up Data Initialization Service \(DIS\) Integration](#) on page 587.

With some integration services you can create parameters at multiple levels, depending on what you need to send to your benefits provider. The integration uses parameters to extract data from Workday, optionally with calculated fields, and store data for later use. Where you create these parameters dictates how you can use them downstream. You can create parameters globally (for the entire integration event) or at the document level (worker, dependent, or benefit election, or benefit plan). You can use parameters downstream in other parameters or in calculated fields.

Consider:

- Dated field overrides only accept values with a *date* data type. The DIS framework validates the values and an error is produced if there is a non-date value or null.
- Loop 2300 in the 834 is for plan-level data. You can now create a calculated field to return different values based on plan rather than based on worker (non-DIS).

### Steps

1. Access the View Integration System report and select your integration system from the Cloud Connect for Benefits prompt.
  2. As a related action on the integration system, select Integration System > Configure Integration Field Overrides.
- The Configure Integration Field Overrides grid displays the integration service and the field overrides. Depending on the service that you select, you might see Parameters, which you can expand to view the field overrides.
3. To understand what values your provider expects, review the list of fields against the file specification for your provider.

4. For each field, click the Override External Field prompt to select a calculated field or report field that provides the appropriate value.  
The selection list only contains fields related to the business object shown in uses Business Object as Class.
5. If any fields have a *Prompt - Text* override, specify the Value Type and Value for the field.
6. When you're finished, click OK to save your changes.

### Concepts

[Concept: Calculated Fields](#)

## Test and Manage Benefit Provider Integration

### Set Up Test Environment for Benefits Integration

#### Prerequisites

Before setting up your integration test environment, make sure that you configured the benefits part of your Workday test environment correctly. Your integration won't cause some errors that you can encounter when testing your integration, especially benefits elections not appearing on the output file. Instead, not configuring electronic signatures correctly, or by not finalizing benefits open enrollment before running the integration causes errors.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

#### Context

You can test our tenant sandbox integrations by associating different attribute values with your sandbox and production environments. Example: You can test an integration to validate data after you modify benefit plans or you modify integration maps. Testing is also useful during open enrollment.

Another option is to switch to test mode, which limits each integration event to 500 records. By working with a subset of data, you can view the integration results faster to validate your mappings and setup.

Workday recreates tenant sandboxes with each update. If you configure integration attributes in your sandbox environment, copy these values to your production environment to ensure that they aren't overwritten in the next update.

#### Steps

1. Access the View Integration System report.
2. Select an integration system at the prompt.
3. As a related action on the integration system, click Integration System > Configure Integration Attributes.
4. For each attribute that you want to configure:
  - a) Add a row in the Attribute Value(s) column.
  - b) In the Value field, specify the value that you want to use for testing.
  - c) In the Restricted To Environment field, select Sandbox.

Note: Leave the Restricted To field blank to specify a value that applies to all environments except the one with a restricted value. Example: To use ABCPROD.TXT as the output filename for your production environment and ABCTEST.TXT for all other environments. Restrict ABCPROD.TXT to your production environment. Leave the Restricted To field blank for ABCTEST.TXT. When the integration runs in the production environment, it creates an output file named ABCPROD.TXT. When it runs in any other environment, it creates a file named ABCTEST.TXT.

5. If you want to test the integration with a subset of data, set the *Enable Test Mode* attribute to true in the WBN outbound integration service.

As a best practice, restrict this value to your sandbox environment to ensure that integrations in your production environment always include a full set of data.

### **Example**

- Send sandbox data to your own FTP site. Then, specify a sandbox value for the *Endpoint* attribute.
- Send your benefit provider a test value by specifying a sandbox value for the *Output Filename* attribute.

### **Next Steps**

When you finish testing or if you want to test with a full set of data, set the *Enable Test Mode* attribute to false. Using this option, the integration events include all applicable records. Always make sure that *Enable Test Mode* is set to false when you go into production.

[Concept: Planning a Benefit Provider Integration](#) on page 538

#### **Tasks**

[Set Up Benefit Electronic Signatures](#)

[Finalize Open Enrollment Elections](#)

## **Include Payroll Balances in Benefits Integration**

### **Prerequisites**

Actual contribution amounts are only available to Cloud Connect for Benefits integrations from Workday Payroll. If you use a third-party payroll provider, benefit integrations send estimated amounts based on the benefit plan setup.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

### **Context**

Send actual contribution amounts from Workday Payroll to benefit providers who manage defined contribution plans and flexible spending accounts. Benefit providers can receive the subscriber data, enrollment data, and actual contribution amounts in a single integration file.

For defined contribution plans, the payroll amounts include both the employee and employer contributions, as well as any loan repayments by an employee.

### **Steps**

1. Access the View Integration System report.
2. Select an integration system at the prompt.
3. As a related action on the integration system, click Integration System > Configure Integration Services.
4. In the Integration Services grid, select the Enabled check box for the *WBN - Include Payroll Balances* service.
5. As a related action on the integration system, click Integration System > Configure Integration Attributes.

6. In the Integration Attributes grid, edit the attributes for the *WBN - Include Payroll Balances* service:
  - a) Find the *Employee Deduction Codes* and *Employer Deduction Codes* attributes in the grid.
  - b) Add a row for each attribute.
  - c) In the Value column, enter the deduction code values in a comma-delimited list. These values are the deduction codes that you defined in Workday for the associated benefit plan.

## Next Steps

Integrations that include payroll results have 2 additional launch parameters, Payroll Start Date and Payroll End Date. Edit the integration schedule so that it corresponds to your pay periods by using the Launch / Schedule Integration task.

Related Information

### Concepts

[Concept: Cloud Connect for Benefits](#) on page 536

### Tasks

[Steps: Schedule, Launch, and Troubleshoot Benefit Provider Integration](#) on page 547

## Change Benefit Provider Integration Maps

### Prerequisites

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

### Context

Integration maps specify how values in Workday map to values in an external endpoint. Benefit provider integrations have 2 map types:

- *Simple maps* have a one-to-one correlation between Workday values and external values.
- *Configurable maps* concatenate multiple values in Workday to match a class structure or division in a benefit provider endpoint.

You configure maps during initial configuration, but if your benefit programs change, you can modify the maps to accommodate these changes. Typically, you update integration maps when you add or change benefit plans, benefit options, coverage codes, or deduction codes. You can also modify integration maps due to:

- Organizational changes, such as adding a division.
- Data discrepancies between Workday and your benefit providers.

### Steps

1. Access the View Integration System report.
2. At the Integration System prompt, select the integration system that you want to edit.
3. As a related action on the integration system, select Integration System > Configure Integration Maps.
4. Edit maps by adding, removing, or changing entries in the Map Values columns:
  - To add an entry, insert a row in the grid and specify the Internal Value and External Value.
  - To delete an entry, remove the current row from the grid.
  - To change an entry, edit the values in the Internal Value and External Value columns.

Note: Use caution when you edit integration maps. If you enter values in an incorrect format, errors can occur when the integration runs. Values are both case sensitive and space sensitive.

## Launch and Troubleshoot Benefit Provider Integration

### Steps: Schedule, Launch, and Troubleshoot Benefit Provider Integration

#### Context

Schedule a benefit provider integration that runs either one-time in the future or on a recurring basis. Select the integration frequency, define the schedule, and specify dates for the launch criteria. In scheduled integrations, Workday typically determines the appropriate values for date parameters when the integration runs.

In manual integrations, specify values for date parameters instead of having Workday calculate the values when the integration runs.

Security: *Integration Build* and *Integration Configure* in Integration functional area.

#### Steps

1. [Launch an Integration](#) on page 24.
2. (Optional) View status reports for the integration.  
See: [Reference: Integration Status Reports](#) on page 554
3. (Optional) [Audit Integration Events](#) on page 29.
4. (Optional) [FAQ: Benefit Provider Integration Common Issues](#) on page 554.

[Manage Scheduled Future Processes](#)

## Concept: Benefits Integration Launch Parameters

### Scheduled Integration Launch Parameter Examples

#### Example 1: Full File, Run Weekly

To schedule a weekly full file integration, specify these values for the Effective Date and Last Update launch parameters:

Field	Value Type	Value
Effective Date	<i>Determine Value at Runtime</i>	Current Effective Date
Last Update	<i>Determine Value at Runtime</i>	Current Moment (DateTime)

Each time the integration runs, it sends a full file with all benefit enrollment data that is:

- Current as of the Last Update
- Effective as of the Effective Date

Based on the date and time at launch.

**Example 2: Full File, Include Ended Coverage Once, Run Now**

To schedule a weekly full file that includes ended coverages, specify these parameter values:

Field	Value Type	Value
Effective Date	<i>Determine Value at Runtime</i>	Current Effective Date
Last Update	<i>Determine Value at Runtime</i>	Current Moment ( <i>DateTime</i> )
From Effective Date	<i>Determine Value at Runtime</i>	As Of Effective Date of Last Completed Integration Event
From Last Update	<i>Determine Value at Runtime</i>	As Of Entry <i>DateTime</i> of Last Completed Integration Event

(*WBN - Full File - Include Ended Coverage Once* integration service enabled).

Each time the integration runs, it sends a file that contains:

- All current enrollment data as of the Last Update and effective as of the Effective Date.
- Terminations entered between the From Last Update and the Last Update with an effective date no later than the Effective Date.
- Terminations that have an effective date between the From Effective Date and the Effective Date.

**Example 3: Change File, Run Weekly**

To schedule a weekly change file integration, specify these parameter values:

Field	Value Type	Value
Effective Date	<i>Determine Value at Runtime</i>	Current Effective Date
Last Update	<i>Determine Value at Runtime</i>	Current Moment ( <i>DateTime</i> )
From Effective Date	<i>Determine Value at Runtime</i>	As Of Effective Date of Last Completed

Field	Value Type	Value
		Integration Event
From Last Update	Determine Value at Runtime	As Of Entry DateTime of Last Completed Integration Event

(WBN - Launch Change File - Event Based integration service enabled.)

Each time the integration runs, it sends a file that contains:

- Enrollment changes that occurred between the last integration run (From Last Update) and the current date and time (Last Update).
- Changes that are effective between the From Effective Date and the Effective Date.

#### Example 4: Payroll Contributions, Run Semi-Monthly

Schedule a semimonthly integration that includes payroll contribution data for a flexible spending account or a retirement savings plan:

Field	Value Type	Value
Effective Date	Determine Value at Runtime	Current Effective Date
Last Update	Determine Value at Runtime	Current Moment (DateTime)
From Effective Date	Determine Value at Runtime	As Of Effective Date of Last Completed Integration Event
From Last Update	Determine Value at Runtime	As Of Entry DateTime of Last Completed Integration Event
Payroll Start Date	Determine Value at Runtime	As Of Entry DateTime of Last Completed Integration Event

Field	Value Type	Value
Payroll End Date	Determine Value at Runtime	Current Moment (DateTime)

(WBN - *Include Payroll Balances* integration service enabled. WBN - *Launch Change File - Event Based* integration service required for change file in this example. WBN - *Full File - Include Ended Coverage Once* integration service required for full file in this example.)

Each time the integration runs, it sends a file that contains:

- Enrollment changes that occurred between the last integration run (From Last Update) and the current date and time (Last Update).
- Changes that are effective between the From Effective Date and the Effective Date.
- Payroll contributions made between the last integration run (Payroll Start Date) and the current date and time (Payroll End Date).

## Manual Integration Launch Parameter Examples

### Example 1: Open Enrollment, Run Now

Send open enrollment data for the upcoming plan year. Specify the Effective Date of the benefit plan and enable the Last Update to populate the current date automatically. In this example, the Effective Date is 1/1/2012 and the Last Update automatically populates with 11/30/2011:

Field	Value Type	Value
Effective Date	Specify Value	01/01/2012
Last Update	Specify Value	11/30/2011 05:57:37 PM

This integration runs once on 11/30/2011. The integration creates an output file that contains all open enrollment data for the 2012 plan year.

### Example 2: Full File, Run Now

To send a full enrollment file, use the default parameters. The Effective Date automatically populates with the current date. The Last Update automatically populates with the current date and the time at launch:

Field	Value Type	Value
Effective Date	Specify Value	07/08/2011

Field	Value Type	Value
Last Update	Specify Value	07/08/2011 03:55:45.515 PM

In this example, the integration runs once on 7/8/2011. The integration creates an output file that contains all current enrollment data as of the Last Update (7/8/2011 at 3:55:45.515). The file is effective as of the Effective Date (7/8/2011).

#### Example 3: Full File, Include Ended Coverage Once, Run Now

To send a full file that includes ended coverages, keep the default Effective Date and Last Update values. Change the From Effective Date and From Last Update to specify the date range for ended coverages:

Field	Value Type	Value
Effective Date	Specify Value	07/08/2011
Last Update	Specify Value	07/08/2011 03:57:06.956 PM
From Effective Date	Specify Value	07/01/2011
From Last Update	Specify Value	07/01/2011 02:57:06 PM

(WBN - Full File - Include Ended Coverage Once integration service enabled).

If you enabled the *WBN - Include Payroll Balances* service, specify the Payroll Start Date and Payroll End Date. These values enable you to report payroll contributions.

In this example, the integration runs once on 7/8/2011 and creates an output file that contains:

- All current enrollment data as of the Last Update (7/8/2011 at 3:57:06.956) and effective as of the Effective Date (7/8/2011).
- Terminations with these constraints:
  - Entered between the From Last Update (7/1/2011 at 2:57:06) and the Last Update (7/8/2011 at 3:57:06:956)
  - With an effective date no later than the Effective Date (7/8/2011)
- Any terminations that have an effective date between the From Effective Date (7/1/2011) and the Effective Date (7/8/2011).

This integration would include a termination entered on 7/5 with an effective date of 6/15. The integration

#### Example 4: Change File, Run Now

wouldn't include a termination entered on 7/5 with an effective date of 7/15.

To send a change file, keep the default Effective Date and Last Update. Change the From Effective Date and From Last Update to specify the date range for changes:

Field	Value Type	Value
Effective Date	Specify Value	07/08/2011
Last Update	Specify Value	07/08/2011 04:52:00.55 PM
From Effective Date	Specify Value	07/01/2011
From Last Update	Specify Value	07/01/2011 03:52:00 PM

(WBN - *Launch Change File - Event Based* integration service enabled.)

If the integration has the *WBN - Include Payroll Balances* integration service, specify the Payroll Start Date and Payroll End Date. These values enable you to report payroll contributions.

In this example, the integration runs once on 7/8/2011 and creates an output file that contains:

- Changes that were:
  - Entered between the From Last Update (7/1/2011 at 3:52:00) and the Last Update (7/8/2011 at 4:52:00.55)
  - With an effective date no later than the Effective Date (7/8/2011)
- Any changes that have an effective date between the From Effective Date (7/1/2011) and the Effective Date (7/8/2011).

This integration would include a change entered on 7/5 with an effective date of 6/30. The integration wouldn't include a change entered on 7/5 with an effective date of 7/15.

COBRA integrations are an exception: they always include future dates for ending of coverage that are past the Effective Date at the time of launch.

#### Example 5: FSA, Run Now

To send an FSA file, use the Payroll Start Date and Payroll End Date parameters. The Payroll Start Date and Payroll End Date parameters select data from any pay period that *ends* during the date range.

Field	Value Type	Value
Payroll Start Date	Specify Value	07/05/2011
Payroll End Date	Specify Value	07/15/2011 11:59:00 PM

In this example, the integration runs once. The integration creates an output file that contains all FSA data for any pay period that *ends* during the range. The integration would include a pay period that runs from 07/01/2011 and ends on 07/14/2011. The integration includes this pay period even though the pay period starts before the Payroll Start Date value.

## Concept: Benefit Integration Error Reporting

### How Workday Reports Errors

Error messages identify the context of a problem, along with any missing map values and missing or invalid fields, such as the name of a worker or dependent. Example: the name of the worker or dependent.

When an integration file contains errors, Workday doesn't transmit data but fully processes the file to produce a comprehensive error report. If field truncation occurs, Workday reports the issue as a warning, processing continues, and Workday transmits data if the integration encounters no other errors. Integration events can generate up to 500 error messages before processing stops and up to 500 warnings before Workday issues a final warning.

Enhanced error messages are available in all integrations that support the ANSI ASC X12N 834 (834) format, as well as these integrations with proprietary output formats:

A - D	E - L	M - Z
ADP COBRA	<i>EideBailly</i> FSA	MetLife Voluntary Products
ADP FSA	Fidelity Investments 401K	<i>SunLife</i> Life and AD&D
AST Equity Solutions ESPP	Hartford Life and Disability	<i>SunLife</i> Health
CBIZ FSA	Innovative Care Systems STD LTD	United HealthCare FSA
Ceridian COBRA	ING <i>Compsych</i>	UNUM Life and AD&D
CIGNA <i>Starbridge</i> Medical	Lincoln Financial Life and AD&D	UNUM Telephonic Output
<i>Conexis</i> COBRA		<i>WageWorks</i> FSA

### Message Examples

Common integration errors include missing fields or attributes, empty map values, and field truncation.

Message	Resolution
<i>John Doe has missing or invalid data. "Employee SSN" is required and is missing a value.</i>	To add the missing data, access the Edit IDs task. In the National IDs grid, select the National ID Type and enter the Identification #.

Message	Resolution
<p><i>Ann Smith has missing or invalid data. The value 123-456-78910 is too long for "Phone Number" and will be truncated in the output. Phone Number should have length equal to or shorter than 12.</i></p>	<p>To avoid field truncation warnings in the future, access the Contact Information report. As a related action on the worker, select Personal Data &gt; Maintain Contact Information. Correct the phone number to fit the required length.</p>
<p><i>"Client Id" is required and is missing a value. Please check the value in the integration attribute "Originator ID."</i></p>	<p>To specify the attribute value, access the View Integration System report. As a related action on the integration system, select Integration System &gt; Configure Integration Attributes. Find <i>Originator ID</i> in the grid, add a row, and specify the appropriate value.</p>
<p><i>The value 6 isn't valid for "Plan Identifier." "Plan Identifier" is mapped from the group number on the benefit plan in Workday. Please check the integration map "Plan Identifier" to verify the value has been mapped.</i></p>	<p>To map the correct data, access the View Integration System report. As a related action on the integration system, select Integration System &gt; Configure Integration Maps. Find <i>Plan Identifier</i> in the grid and specify the correct internal value.</p>

## Reference: Integration Status Reports

You can monitor the status of an integration with these Workday reports:

Process Monitor

View integrations that are currently running or have already run.

Scheduled Future Processes

View integrations that you scheduled but haven't yet launched. You can also edit, delete, suspend, or activate a scheduled request, or transfer integration ownership.

Integration Events

View a summary of all integration activities that are in process or completed.

[Manage Scheduled Future Processes](#)

## FAQ: Benefit Provider Integration Common Issues

### Transmission Errors

What if my integration event has a status of *Completed with errors*?

If the response message indicates that Workday couldn't find the destination address, try to relaunch the integration. The destination site might be temporarily down.

If the response message indicates that a mapping error occurred, check with your provider for more specific information. If you can identify the point of failure, you can modify the integration map.

How do I resolve a transaction failure for an integration event?

A transaction failure status indicates that a service wasn't available. Try to launch the integration again.

## Data Errors

Benefit providers use different methods to communicate data errors, including reports and online tools. No matter how you receive error reports, note that if you fix data directly with your provider, you must also update Workday. Otherwise the next integration event will overwrite the corrected data with your provider.

What if my provider reports a discrepancy in enrollment data?

First check eligibility and enrollment data for the employee in Workday. If the data is incorrect or missing, update the employee information in Workday. Workday retransmits the corrected data with the next scheduled integration.

If the employee data is correct in Workday, contact your provider to verify the issue or contact Workday support.

What if my provider reports that data is missing?

If auditing is enabled in your integration, access the Integration Events report to look for missing data in the output file. You might need to relaunch the integration using different parameters.

Also, make sure that your integration mapping supplies values for all fields required by your provider. Some providers have mandatory data requirements that don't match fields required by Workday.

Why are new hires missing from the integration file?

Check your benefit plan configuration in Workday. Your enrollment event rules and benefit eligibility rules might specify a waiting period or certain eligibility criteria.

Ensure that you launched the integration with the correct date parameters. In most cases, the Effective Date and Last Update fields should be the integration run date. Using this date ensures that the integration file captures all current enrollment data.

How do I resolve data mismatches?

Name, address, or Social Security number mismatches are often due to poor data quality. Review employee data in Workday to find and resolve these issues.

Data mismatches can occur when policy effective dates differ from event occurrence dates. Plan or dependent mismatches can result when the plan accepted enrollment information under a different plan.

Other data discrepancies might be due to coding differences. Verify that your integration map specifies the correct values for provider codes.

What if an employee reports an issue?

First check the eligibility and enrollment data for the employee in Workday. If the data is incorrect or missing, update the employee information in Workday. Workday retransmits the corrected data with the next scheduled integration.

What happens if an employee moves to a foreign country?

If the employee data is correct in Workday, compare the change dates for the employee data with the integration launch date. If you made changes after the last launch, then Workday includes the information the next time the integration runs.

If an error occurs during creation of the HTML audit file, does it affect the integration?

Workday has added support for foreign addresses to all integrations that use the 834 format. Integration templates have factory settings to match foreign address requirements for each provider. Integrations that report ended coverage or COBRA qualifying events complete successfully for employees who relocate outside of the U.S. or Canada.

What happens if the date range for the integration spans 2 plan years?

No, this error doesn't affect the integration. Workday logs a warning, but the integration processing continues.

The integration always sends data applicable to the Plan Year in which the Effective Date falls. Workday uses the integration launch parameters to determine the Plan Year. Example: assume that you schedule your integration to run on the 10th day of each month. Also assume that you specify the Effective Date as the first day of the next month. If your Plan Year is the same as the calendar year, the integration sends data for the current Plan Year. The integration sends data for the 10 January through 10 November integration events. However, the 10 December integration event sends data applicable for the next Plan Year. In this case, the Effective Date would be 01 January, thus in the next Plan Year.

To avoid this issue, Workday recommends that you create and configure a separate integration schedule for December. This schedule should use the last day of the current month as the Effective Date.

## Open Enrollment Integration Tasks

### Concept: Open Enrollment Integration Checklist

Careful planning is essential during open enrollment to ensure proper configuration and testing of benefit provider integrations. Use these guidelines when planning your open enrollment activities so that integrations are ready for production when benefits become effective for the new plan year.

Not all benefit plan years are identical to a calendar year. Common other plan years span calendar years. Examples: April 1st through March 31, July 1st through June 30th, November 1st through October 31.

Additional open enrollment planning tools are available in the [Open Enrollment Checklist](#) on the Workday Community.

#### Plan Integrations with New Providers

If you're introducing a new benefit provider, first check the Cloud Connect for Benefits catalog. The new provider might be in the network.

Next, ensure that you understand the time line and responsibilities. The time line and responsibilities vary based on whether:

- The provider is already in the network.
- The provider is new to the Cloud Connect for Benefits catalog.

#### Establish Benefit Plans for the New Plan Year

Create new benefit plans or update existing plans for the new plan year. Be sure to request benefit rates from your providers early so that you can complete your benefit plan definitions.

Don't change the name of an existing benefit plan or provider as a shortcut to creating new plans or providers. These changes impact current integrations and benefit enrollment history.

Ask your providers if benefit plan codes change for the new plan year so that you can update your integration maps. Coordinate the timing of map changes with your providers based on how you manage current year enrollment data during and after open enrollment. Also, take this opportunity to review the overall configuration of your benefit plans to see if consolidation is possible. The ideal configuration is a one-to-one relationship between a Workday benefit plan and a third-party provider benefit plan.

#### Link Benefit Plans to Integration Systems

When you offer a new benefit plan with the same provider, link the plan to your existing integration. Likewise, if you discontinue a plan, remove the integration link.

If you're establishing relationships with new benefit providers, you'll configure links from the benefit plans to the new integrations during implementation.

## Manage Integrations During Open Enrollment

During open enrollment, you gather benefit elections for the new plan year. You still manage enrollment data for new hires, terminations, and life events in the current plan year. Check with your benefit providers and find out how to manage integration schedules while open enrollment is in progress. Some providers prefer to receive existing enrollment data as scheduled, while others can suspend or stop the current integration schedule.

## Submit Final Enrollment Data to Benefit Providers

When open enrollment concludes, send final enrollment data to your providers. Schedule a one-time integration with an effective date that matches the start of the new plan year. Example: specify an Effective Date of 1/1/2012 if the benefit plan year is the same as the calendar year. The integration sends benefit elections for the new plan year only.

Be sure to arrange the timing of this integration with your provider. It's also important to finalize the open enrollment event in Workday. The integration file then contain all enrollments for your employees. Otherwise, if an employee record is missing from the file, some benefit providers could end coverage.

## Reset Integration Schedules

You can schedule integrations on a plan-year basis. Before the new plan year starts, reset the integration schedules with your existing benefit providers.

## Send Final Elections for the Current Year

When the current plan year ends, send your provider the final file as of the last day of the year. Example: if the benefit plan year is the same as the calendar year, specify an Effective Date of 12/31/2011. This integration event is likely an ad hoc launch rather than a scheduled event. The final file notifies the provider of ended coverage for employees who change benefit providers during open enrollment. The final file also includes elections, terminations, and other changes for the current plan year only.

## Link Benefit Plans to Integration Systems

### Prerequisites

You've already set up Benefit plans in Workday for the upcoming plan year.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

### Context

Update the links between benefit plans and provider integrations so that they reflect changes for the new plan year. Link new benefit plans to a current integration if the plans are with the same provider, or remove links for any discontinued plans.

Integration attributes establish links between benefit plans and integrations.

### Steps

1. Access the View Integration System report.
2. Select the Integration System and click OK.
3. As a related action on the integration system, click Integration System > Configure Integration Attributes.
4. In the Integration Attributes grid, configure the *Benefit Plans* attribute in the WBN outbound integration service:
  - To add benefit plans to the integration system, click the Value prompt to select the new plans that are associated with this benefit provider.
  - To remove benefit plans from the integration system, select the discontinued plans.

### Next Steps

After you add a benefit plan to an existing integration system, modify the integration map to include any new parameters that the plan requires.

Related Information

### Concepts

[Concept: Planning a Benefit Provider Integration on page 538](#)

## COBRA Integration

### Set Up Event-Based Change Files

### Prerequisites

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

### Context

Configure a *COBRA* integration so that it subscribes to life events, so that the integration sends event-based change files rather than full file extracts.

You usually configure change files during initial implementation. If you didn't configure change files, or if you need to edit the integration subscriptions, follow this procedure.

### Steps

1. Access the View Integration System report.

2. Select the integration system at the prompt and click OK.
3. In the Integration Services grid, check to see if these services are configured correctly:
  - *WBN - Launch Change File - Event Based*: Enable
  - *Transaction Log Service* Enable

If not, follow these steps to enable the services:

- a) As a related action on the integration system, select Integration System > Configure Integration Services.
  - b) Select the Enabled check box for each service.
  - c) Click OK to save your changes.
4. As a related action on the integration system, click Integration System > Configure Integration Transaction Log.
  5. Click Subscribe to specific Transaction Types and then select these transaction types at the prompt:
    - For a COBRA new hire integration, select *Benefit Election - Event Lite Type*.
    - For a COBRA qualifying event integration, select *COBRA Record - Event Lite Type*
    - If your provider receives new hire and qualifying event information in a single integration, select both *Benefit Election - Event Lite Type* and *COBRA Record - Event Lite Type*.

## Result

When launched, the *COBRA* integration makes web service calls to obtain the event history for the transactions that you've configured and sends a change file to the provider.

## Concept: COBRA Integration

Workday tracks employee COBRA eligibility; Workday is not a COBRA administrator. To enable COBRA administration, you create an integration with a third-party COBRA service provider. When qualifying events occur, Workday sends employee COBRA eligibility data to the service provider. Your service provider can then manage the COBRA administration and notifications.

## Planning

Some COBRA administrators require 2 integration files, each with its own integration system:

- An initial enrollment file that identifies new members of COBRA-eligible benefit plans.
- A qualifying events file that identifies COBRA qualified beneficiaries

Other COBRA administrators only need the qualified beneficiary data as they receive initial enrollments outside of Workday. Work with your COBRA administrator and Workday Professional Services to determine the appropriate configuration for your organization.

## Prerequisites

Before you configure a COBRA integration, define how Workday designates [COBRA](#) eligibility.

## Configuration

Map the COBRA eligibility reasons in Workday to the corresponding event codes for the COBRA administrator. COBRA administrators have different requirements so configuration can vary by integration. Contact Professional Services for assistance.

Configure your COBRA Qualifying Events integration to support plan activity that bridges the current plan year. Enable the integration service [Get Prior Plan Year Benefit Plans Data Initialization Service](#).

## Launch Options

Use the Launch / Schedule Integration task to launch a COBRA integration. You can schedule the integration to run now, in the future, or on a recurring basis.

COBRA integrations require date parameters to search for qualifying events. You can specify values for these parameters at launch time or, in scheduled integrations, you can have Workday determine the values.

## Maintenance

Notify your COBRA administrator when you change existing benefit plans or rates, or when you add new plans eligible for COBRA. These changes often occur during open enrollment.

After manually coordinating these changes with your COBRA administrator, review and modify your integration attributes and map to reflect the changes.

## COBRA Dates

COBRA integrations capture 3 dates from the Grant COBRA Eligibility task:

Date	Definition
COBRA Eligible Date	The date that a worker or dependent is eligible for COBRA coverage. Typically, this date is the day after the loss of coverage, which isn't necessarily the same as the event date.
Qualifying Event Date	The date of the event that caused a worker or dependent to lose regular benefit coverage.
COBRA Coverage End Date	The last date of benefit coverage for a worker or dependent. Example: Coverage might end on the last day of the month in which the qualifying event happened.  Note: This date is the end of COBRA coverage (the continuation), not the end of regular coverage. The length of coverage is typically 18 months, but it can be longer in certain circumstances.

Example: You terminate an employee on September 9 and regular benefit coverage is in effect through September 30. The Grant COBRA Eligibility task would have these dates:

- COBRA Eligible Date = October 1
- Qualifying Event Date = September 9
- COBRA Coverage End Date = April 1 (18 months after COBRA Eligible Date)

Example: A dependent loses coverage at age 25. If the birthday of the dependent is July 31, the COBRA dates would be:

- COBRA Eligible Date = August 1
- Qualifying Event Date = July 31
- COBRA Coverage End Date = February 1 (18 months after COBRA Eligible Date)

## Ended Coverage Reporting

### Steps: Report Ended Coverage Once

#### Prerequisites

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

#### Context

Configure a benefit provider integration to report ended coverages one-time and then drop subscribers from subsequent integration output files. This setting only applies to full files. The setting works with the *End Coverage Configuration* attribute to determine when ended coverages are reported.

#### Steps

1. Access the View Integration System report and select the integration at the prompt.
2. In the Integration Services grid, check to see if the *Full File - Include Ended Coverage Once* service is enabled. If not, follow these steps to enable the service:
  - a) As a related action on the integration system, select Integration System > Configure Integration Services.
  - b) Select the Enabled check box.
3. Configure the ended coverage attributes in the *WBN - Enrollment Transform* integration service:
  - a) As a related action on the integration system, select Integration System > Configure Integration Attributes.
  - b) For *End Coverage Configuration*, specify ALWAYS, COVERAGE, or CARRIER based on your benefit provider requirements. Don't specify NEVER. Don't leave this attribute blank.
 

Note: The *End Coverage Configuration* attribute has a preset setting in newer integration templates. If Workday doesn't display this attribute in your integration system, then the integration template includes the appropriate setting automatically.
  - c) For *End Coverage History*, leave the value blank. This option isn't applicable for integrations that report ended coverage once.
4. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Human\_Resources* web service.  
See: [Steps: Grant Integration or External Endpoint Access to Workday](#).
5. Set up integration subscriptions:
  - a) As a related action on the integration system at the top of the page, select Integration System > Configure Integration Transaction Log.
  - b) Click Subscribe to specific Transaction Types and at the prompt, select *Benefit Election - Event Lite Type*.

#### Result

When you launch or schedule the integration, specify values for 2 additional integration parameters: From Effective Date and From Last Update. Output files then report ended coverages for workers based on enrollment events that occurred between the specified dates. To have Workday determine these values when a scheduled integration runs, use these settings:

Field	Value Type	Value
Effective Date	<i>Determine Value at Runtime</i>	<i>Current Date</i>
Last Update	<i>Determine Value at Runtime</i>	<i>Current Moment (DateTime)</i>

Field	Value Type	Value
From Effective Date	<i>Determine Value at Runtime</i>	<i>As Of Effective Date of Last Completed Integration Event</i>
From Last Update	<i>Determine Value at Runtime</i>	<i>As Of Entry DateTime Date of Last Completed Integration Event</i>

The integration reports future-dated ended coverages when the ended coverage becomes effective, not when you entered the change. Example: Workday records a benefit change for a worker on November 25 that results in ended coverage effective December 15. When the integration runs on November 30, it doesn't report the ended coverage for the worker. However, when the integration runs on December 15, the integration reports ended coverage and then drops the record.

COBRA integrations are an exception. They always include future-dated ended coverages. The *WBN - Enrollment (v2)* integration service includes an *Include Future Coverage End Dates* attribute set to *Yes* in all COBRA integrations. Since it's preconfigured, Workday doesn't display this attribute.

#### Related Information

##### **Concepts**

[Concept: Cloud Connect for Benefits Integration templates](#) on page 539

##### **Tasks**

[Steps: Grant Integration or External Endpoint Access to Workday](#)

## Concept: Ended Coverage Options

Each benefit provider has specific requirements regarding when and how you report ended coverage in integration files. Workday accommodates these requirements through a combination of integration configuration options.

Note: Workday doesn't report future dated ended coverage, except in COBRA integrations. All other benefit provider integrations report ended coverage when the change takes effect.

### When Ended Coverage Is Reported

Workday provides 4 options for reporting ended coverages. If your integration uses a vendor-specific integration template, ended coverage has a factory default setting based on your provider requirements. Otherwise, this setting is configured in the *End Coverage Configuration* attribute in the *WBN - Enrollment Transform* integration service. The ended coverage setting applies to both full extracts and change files.

Workday provides these ended coverage options:

ALWAYS

Ended coverages are always in output files. This option is the default.

NEVER

Ended coverages are never in output files. If all coverage ends for a subscriber, the integration drops the subscriber information from the output file.

COVERAGE

Ended coverages are in output files only when all coverage in a plan type ends. The integration includes only the latest ended coverage.

CARRIER

Ended coverages are in output files only when all coverage with a carrier ends.

Example: An organization has 2 health care providers:

- Provider A offers PPO and EPO medical plans and a dental plan
- Provider B offers an HMO medical plan

This table displays how the integration reports ended coverages when the same option applies to both providers:

Event	Always	Never	Coverage		Carrier
Subscriber Enrolls in PPO and Dental Plans with Provider A	Provider A PPO Dental	Provider A PPO Dental	Provider A PPO Dental	Provider A PPO Dental	Provider A PPO Dental
Subscriber Changes to EPO Plan with Provider A	Provider A End EPO Dental	Provider A EPO Dental	Provider A EPO Dental	Provider A EPO Dental	Provider A EPO Dental
Subscriber Changes to HMO Plan with Provider B	Provider A PPO End EPO End Dental	Provider A Dental Provider B HMO Dental	Provider A EPO End Provider B HMO	Provider A Dental Provider B HMO	Provider A Dental
Subscriber Ends Dental Coverage with Provider A	Provider A PPO End EPO End Dental End	Provider A No Subscriber Data Provider B HMO	Provider A Dental End Provider B HMO	Provider A EPO End Provider B HMO	Provider A EPO End Dental End Provider B HMO
Subscriber Ends Medical Coverage with Provider B	Provider A PPO End EPO End Dental End	Provider A No Subscriber Data Provider B No Subscriber Data	Provider A No Subscriber Data Provider B HMO End	Provider A No Subscriber Data Provider B HMO End	Provider A No Subscriber Data Provider B HMO End
	Provider B HMO End				

### How Long Ended Coverage Is Reported

You can report ended coverage once or for a given period. These options are mutually exclusive and apply only to full files, not change files.

Include Ended Coverage Once

The *WBN - Full File - Include Ended Coverage Once* integration service specifies that ended coverages are reported only once. The integration drops ended

## Ended Coverage History

coverages from subsequent integration output files. This option requires integration subscriptions to particular benefit enrollment events.

Integrations that report ended coverages once have 2 additional launch parameters: *From Effective Date* and *From Last Update*. Output files include ended coverages for workers who completed benefit enrollment events between the given dates.

The *Ended Coverage History* attribute in the *WBN - Enrollment Transform* service specifies how long to include ended coverages in output files.

The attribute value indicates the number of days to include ended coverages in full extracts. The number of days is based on the Effective Date that you use to launch the integration. Example: you specify a value of 30 for the *Ended Coverage History* attribute. In this case, the integration includes ended coverages within the last 30 days of the Effective Date. If you launch an integration with an Effective Date of 1/31/10, the output file includes subscribers and dependents with ended coverages on or after 1/1/10.

If you set this attribute to zero or leave it blank, the integration includes all ended coverages in output files.

## Ended Coverage for Dependents

You can report ended coverage for dependents differently than for participants by using the *Dependent End Coverage Configuration* attribute in the *WBN - Enrollment Transform* integration service. Specify a value of ALWAYS, NEVER, COVERAGE, or CARRIER. ALWAYS is the default option.

Leave this attribute blank to have dependents inherit the employee configuration that the *End Coverage Configuration* attribute specifies.

### Related Information

#### Concepts

[Concept: Cloud Connect for Benefits Integration Templates](#) on page 539

[Concept: Planning a Benefit Provider Integration](#) on page 538

## Workday Benefits Connector

### Concept: Workday Benefits Connector

With Workday Benefits Connector, you can manage benefits-related HR data and send it to a third-party benefits provider of your choice. Benefits Connector can capture changes to employee data and configure a benefits extract. You can then transform the file to meet the requirements of your external benefits provider.

Benefits processing needs can vary based on:

- Organization size.
- Data complexity.
- External vendor requirements.

To support different processing needs, Workday Benefits Connector offers a choice of implementation options.

All Benefits Connector integrations extract data using Workday Web Services or Data Initialization Service (DIS). Benefits Connector integrations then create benefits extract files in a Workday-defined XML format.

There are 2 versions of the Workday Benefits Connector:

- V1 is the original connector that uses web services to extract data but doesn't support all benefit plan types.
- V2 (Recommended) is the latest connector that provides DIS extraction and supports all benefit plan types.

Your benefits provider might require you to transform the file into the format that they support using one of these options:

- Transformation step on the business process. You configure the business process definition to transform the Benefits Connector output file into the format required by your benefits provider.
- Workday Studio integration. You configure the business process definition to launch a Workday Studio integration. The Studio integration transforms the Benefits Connector output file into the format required by your benefits provider.

Note: If your benefits provider is able to transform Benefits Connector output files, you don't need to use either option.

Benefits Connector is an integration template with a configurable set of HCM data across a range of categories. Benefits providers only need a subset of the employee data in Workday. Benefits Connector enables you to specify which data elements to include in benefits output files. You can also specify how to detect changes based on Workday transactions. When launched, the integration captures changes to employee data and creates an output file in XML format based on your specifications.

You can also create full extracts of employee data with integrations that use the Benefits Connector template. This option is helpful during initial implementation, supports vendors who require full files, and also enables you to synchronize data when necessary. Full extracts include all data for active employees, plus data for terminated employees.

## Supported Plan Types

Benefits Connector enables you to export data relevant to these types of benefits plans:

Supported Plan Type	v1	v2
Additional Benefits		Yes
Flexible Spending Account (FSA)	Yes	Yes
Health Plans (Medical, Dental, Vision, Drug)	Yes	Yes
Health Savings Plans (HSA)		Yes
Life and Disability	Yes	Yes
Retirement Savings Account	Yes	Yes

## Benefits Connector Launch Parameters

Benefits Connector provides these launch parameters:

Parameter	Value Type	Description
Effective Date	Specify Value or Determine Value at Runtime	The date when enrollments are valid. Workday populates the current date automatically. In most cases, specify the launch date unless you're sending enrollment data for the next plan year.

Parameter	Value Type	Description
Last Update	<i>Specify Value or Determine Value at Runtime</i>	The launch date. Workday populates the current date and time automatically. To ensure that the integration uses the current snapshot of Workday, don't change this value.
From Effective Date	<i>Specify Value or Determine Value at Runtime</i>	The effective date for enrollment changes to include in the file. Workday populates the current date automatically. Only applies to change files.
From Last Update	<i>Specify Value or Determine Value at Runtime</i>	The date and time of the last successful change file integration. Workday populates the current date and 1 hour before the current time automatically. Only applies to change files.
Change Detection	<i>Specify Value</i>	(v1 only) Specify how to search for changes to benefits data: <ul style="list-style-type: none"> <li>• <i>All Effective</i>. Selects changes to employee data with an effective date between these launch parameters: <i>Effective Date</i> and <i>From Effective Date</i>. This option selects changes regardless of when you entered them.</li> <li>• <i>Incremental</i>. Selects changes to employee data that you entered between the <i>Last Update</i> and <i>From Last Update</i> launch parameters. This option selects changes with an effective date on or before the <i>Effective Date</i> parameter.</li> </ul>
Payroll Start Date	<i>Specify Value or Determine Value at Runtime</i>	The start date and time for payroll contributions reported by the integration. Only applies to flexible spending accounts and retirement savings plans. The <i>Use Payment Date</i> integration attribute determines whether amounts are based on period dates or payment dates.
Payroll End Date	<i>Specify Value or Determine Value at Runtime</i>	The end date and time for payroll contributions reported by the integration. Only applies to flexible spending accounts and retirement savings plans. The <i>Use Payment Date</i> integration attribute determines whether amounts are based on period dates or payment dates.

[Concept: Benefits Connector V2 Change Detection on page 572](#)

[Reference: Benefits Connector V2 Audit Files on page 575](#)

## Steps: Set Up the Workday Benefits Connector V2 Integration

### Prerequisites

- Request the file specification from your benefit provider so that you can familiarize yourself with their data requirements.
- Compare the data requirements for your benefit provider with the output options provided by Benefits Connector.
- Determine an approach for transforming integration output into the benefit provider format. Example: a Document Transformation integration or Workday Studio integration.
- Plan out the number and type of test cycles that the benefits provider requires before certifying your integration. Work with your benefits provider to determine how many test cycles they require.

## Context

You can create an integration that sends employee benefits data to a benefits provider. Workday simplifies the configuration process with the Benefits Connector integration template. The template provides predefined categories of data that you can select and customize for output.

## Steps

1. [Create Integration System](#) on page 1967.  
Enter *Benefits Connector* at the New Using Template prompt.
2. [Set Up Benefits Connector V2 Integration Services](#) on page 568.
3. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:
  - *Integration Build*
  - *Integration Event*
  - *Integration Process*

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

4. [Select and Set Up Connector Output Fields](#) on page 1977.
5. [Set Up Benefits Connector V2 Attributes and Maps](#) on page 570.
6. (Optional) [Set Up Integration Sequence Generators](#) on page 1969.  
Set up the Workday sequence generator to create unique filenames for integration output files. To perform this step, enable the *BC Filename* integration service.
7. (Optional) [Add Custom Fields to Connector Output](#) on page 1978.  
If the output file requires additional data elements beyond elements offered in the predefined data sections, create a field override service and configure custom fields.
8. (Optional) For the Changes Only file, you can override the translation logs as a related action on the integration system [Integration System > Configure Integration Transaction Log](#).
9. (Optional) [Steps: Set Up Document Transformation Connector](#) on page 594.
10. [Launch an Integration](#) on page 24.
11. Test the integration by running the number of test cycles requested by the benefits provider.
12. Perform a full load and validate the results.

## Set Up Benefits Connector V2 Integration Services

### Prerequisites

Security: *Integration Configure* domain in the Integration functional area.

## Context

Specify the categories of data or configuration options for the output file.

## Steps

1. As a related action on the integration, select Integration > Configure Integration Services.
2. In the Integration Services grid, select the Enabled check box for each integration service that you want to activate.

Note: Workday requires the *Benefits Connector* integration service and enables it automatically. Workday also automatically enables the *Transaction Log Service* for change detection processing when you enable the *Changes Only* integration services.

Option	Description
CCB - Benefit Connector v2	Enabled by default. A service that indicates processing.
CCB Benefits Connector v2 Full File	Reports the most recent data in Workday as of these <i>Effective Date</i> and <i>Last Update</i> launch parameters: <ul style="list-style-type: none"> <li>• <i>Effective Date</i></li> <li>• <i>Last Update</i></li> <li>• <i>From Effective Date</i></li> <li>• <i>From Last Update</i></li> </ul>
CCB - Benefit Connector v2 Changes Only	Report changes with an effective date or entry date within a date range: <ul style="list-style-type: none"> <li>• <i>Effective Date</i></li> <li>• <i>Last Update</i></li> <li>• <i>From Effective Date</i></li> <li>• <i>From Last Update</i></li> </ul>
Transaction Log Service	Conditionally enabled when you enable the <i>CCB Benefits Connector V2 Changes Only</i> service. Workday configures a subset of transaction types by default. Modify as needed for your integration.
CCB Benefit Connector v2 Payroll Results	Provides these additional launch parameters to the Launch/Schedule Integration task for reporting payroll contribution start and end dates: <ul style="list-style-type: none"> <li>• <i>Payroll Start Date</i></li> <li>• <i>Payroll End Update</i></li> <li>• <i>Payroll Date Selection Based on:</i> <ul style="list-style-type: none"> <li>• <i>Based on Payment Date</i></li> <li>• <i>Based on Period End Date</i></li> </ul> </li> </ul>
CCB - Sequence Generator	Specifies unique output filenames.
CCB - Delivery Service	Specifies file transport and encryption options for the output file.
Integration Document Retention	Specifies the duration (in days) that the integration output is available for viewing.

Option	Description
CCB - Additional Filters	Specifies the organizations that you want to include in the integration.
CCB - Debug Service	Provides the ability to filter output by workers as well as scrub files using these parameters: <ul style="list-style-type: none"> <li>• <i>Exclude Members or Only Include Members</i></li> <li>• <i>Employees</i></li> <li>• <i>Mask Workday Support Files</i></li> </ul>

## Next Steps

Select the individual fields to include in each data section, then configure the output file and map Workday values to the external endpoint. See [Reference: Benefits Connector Data Sections](#) on page 574.

[Steps: Set Up the Workday Benefits Connector V2 Integration](#) on page 567

[Concept: Benefits Connector Workflow](#) on page 571

[Concept: Workday Benefits Connector](#) on page 565

## Set Up Benefits Connector V2 Attributes and Maps

### Prerequisites

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

### Context

After you create a Benefits Connector integration system and select output fields, configure the integration attributes and maps for the output file.

You can configure required and optional attributes for your integration system, enabling you to customize how the integration reports the data changes. The integration map enables you to map an internal value to a different external value in the output file. Workday maps data according to these rules:

- In the *Integration Maps* grid, add a row for each tenant value. Select the Internal Value and enter the External Value for the output file.
- (Optional) Provide a Default Value for data elements for values that you haven't mapped.

### Steps

1. Access the View Integration System report.
2. As a related action on the integration system, select Integration System > Configure Integration Attributes.

3. Specify values for the attributes in the Integration Attributes grid:

- For attributes without automatically populated values, add a row and specify a Value.
- For attributes whose automatically populated values you want to change, select the Override Default Values check box and specify a new Value.
- Optionally specify that a value applies to a particular environment using the Restricted to Environment field.

Attribute	Description
Benefits Plans	Add a row for each benefit plan that the integration system supports. The benefit plan must exist in Workday; if necessary, use the Create Benefit Plan task to add a benefit plan.
Document Retention Policy	Specify the duration, in days, that the integration output is available for viewing.
Enable Test Mode	Select to limit the number of subscribers in the output file to 100 and to prevent delivering the file to the vendor
Include Benefit Eligible Employees	Include employees in the population selection who are eligible but not enrolled.
Include Prior Values	Select to include the <i>PriorValue</i> attribute that contains the previous value for a field.
Organization Type for Organization One, Two, Three, Four, and Five	Specify which type of organization to include in the output file (Example: Cost Center or Region). When you configure the integration maps, you map a Workday value for this organization type.
Perform Character Translation	Enable translation of UTF-8 accented characters to nonaccented equivalents.

4. Save your changes, then as a related action on the integration system, select Integration System > Configure Integration Maps.

5. In the Integration Maps grid, specify output file values for Workday data:

- Add a row for each Workday value, select the Internal Value, and enter the External Value for the output file.
- (Optional) Provide a Default Value for any data elements whose values you haven't mapped.

The contingent worker organization has *Regular* and *Contingent* types. In the *Worker Type* map, define external values for the *Regular* and *Contingent* types. Then create a Default Value of *Other* for any unmapped worker types.

You only define mappings for the data elements that you include in the output file. Example: if the Personal Data Section only includes Gender and Marital Status, specify values in those 2 maps and leave the other maps in the section empty.

#### Related Information

##### **Steps: Set Up the Workday Benefits Connector V1 Integration**

[Set Up Benefits Connector V1 Attributes and Maps on page 580](#)

##### **Steps: Set Up the Workday Benefits Connector V2 Integration**

[Steps: Set Up the Workday Benefits Connector V2 Integration on page 567](#)

[Concept: Benefits Connector Workflow on page 571](#)

[Concept: Workday Benefits Connector on page 565](#)

## Concept: Benefits Connector Workflow

Workday manages the benefits data extract process by requesting 2 pieces of information: *what* changes to look for, and *when* to look for those changes. When you launch an integration built with Benefits Connector, you specify:

- The *Effective Date* when enrollments are valid.
- The *Last Update* date and time; always use the current moment for this value.

If you enabled the CCB Benefits Connector V2 Changes Only integration service, you must specify:

- The *From Effective Date*, the effective date for enrollment changes to include in the file.
- The *From Last Update* date and time, the date of the last successful change file integration.

Workday looks for field-level changes to employee data and generates a benefits extract that reflects the changes you're interested in. The transaction log drives the change detection process by tracking event-based changes to employee data. Through a subscription to transaction log events, the integration identifies employees whose changes it reports to your payroll provider.

Note: Workday automatically enables the transaction log service for the Changes Only output files. If you configure this service in your integration, Workday filters employees based on their transaction log entries within the specified time period. Otherwise, the integration skips this step and all employees pass to the next stage of processing.

Workday uses this logic to create a benefits output file:

- Find employees eligible for the plan that you specified in the *Benefit Plan* attribute.
- Filter employees based on subscriptions to transaction log events (if you configured the transaction log service):
  - Select employees who have transaction log events that are effective before or during the defined date range.
  - Exclude events with effective dates forward (future to) the defined date range.
- Compare data for the selected employees at the beginning and end of the date range for which you launched the integration.
- Identify field-level data changes.
- Determine if the integration includes the changed data in the integration output.
- Include employees who have changes to data in the integration.
- Exclude employees who have no data changes or whose changes don't affect data in the integration.

[Concept: Benefits Connector V2 Change Detection](#) on page 572

[Reference: Benefits Connector V2 Audit Files](#) on page 575

## Concept: Benefits Connector V2 Change Detection

Benefits Connector integrations support 2 change detection methods. Using the Change Only or Full File integration services, you can select the appropriate method depending on the requirements of your benefits provider. The methods are:

### Full File

To send a full file to the benefits provider, select this integration service. The benefits extract includes employee data that is effective in the defined date range. When Workday has future-dated transactions, it excludes them from the extract file.

### Changes Only

(Optional) You can also include previous values for data fields when you enable the *Include Prior Values* integration attribute.

To send a changes-only file to your benefits provider, select this method. The benefits extract includes only changes that:

- You entered in Workday after the date of the last successful run.
- Are effective before or during the defined date range.

### How Dates Affect Benefits Extracts

Dates are important to understanding the changes that Benefits Connector integrations pick up. If you discover that events are missing from an extract, look at the relationship between:

- The last successful run date.
- The period start date.
- The event entry date.
- The event effective date.

Example: Events might be missing from an extract if these conditions are true:

- The event entry date is after the last successful run.
- The event effective date isn't in the current or prior period.

### Concept: Benefits Connector V2 Data Validation and Error Handling

Benefits Connector applies a number of validation rules to employee data based on how you configure your benefits integration.

View integration messages by accessing one of these reports:

Report	Description
Process Monitor	View integrations that are currently running or have already run. To view message details, drill-down on the numbers in the Errors & Warnings column.
Integration Events	Lists integration events and displays the launch date and time, the name of the person who launched the integration, its status, and the event response message.
Integration Messages	Provides a status summary and message details for integration events.

## Reference: Benefits Connector Data Sections

Before you build an integration with the Benefits Connector template, familiarize yourself with each section of the benefits extract. Understand which fields are available for output and how the configuration options affect integration behavior.

During integration configuration, you enable integration field attributes for each data section that you want to include in benefits extracts. The integration system has an integration attribute that specifies whether to create a full extract file, or a file that includes only changes:

- Full extract: the integration includes all data for all employees, regardless of changes.
- Changes only: the integration includes data for employees who had at least 1 change. If an employee had 1 change, the integration includes all data for all sections for that employee.

Section	Description
Header	<ul style="list-style-type: none"> <li>• Every output file has a header section.</li> <li>• Always includes: <ul style="list-style-type: none"> <li>• <i>Effective Date</i>.</li> <li>• <i>Last Update</i>.</li> <li>• <i>From Effective Date</i>.</li> <li>• <i>From Last Update</i>.</li> </ul> </li> <li>• Workday includes these fields only if you enable the Payroll Results integration service: <ul style="list-style-type: none"> <li>• <i>Payroll Start Date</i>.</li> <li>• <i>Payroll End Date</i>.</li> </ul> </li> <li>• Transmission Type: <i>Changes File</i> or <i>Full File</i>.</li> <li>• Includes <i>Employee Count</i>.</li> </ul>
Personal Data	<ul style="list-style-type: none"> <li>• This section has a single record.</li> <li>• Name fields are based on the legal name.</li> <li>• Map: <i>Gender</i> and <i>Marital Status</i> values using the integration maps provided for these values.</li> </ul>
Status Data	<ul style="list-style-type: none"> <li>• This section has a single record.</li> <li>• Map <i>Worker Type</i>, <i>Termination Reason</i>, and <i>Leave Type</i> using the integration maps provided for these values.</li> <li>• <i>Employee Status</i> codes are: Active, On Leave, On Leave with Benefits, On Leave with Pay, and Terminated.</li> </ul>
Position Data	<ul style="list-style-type: none"> <li>• This section has a single record.</li> <li>• Reports employee's primary position.</li> <li>• An employee can belong to several different organizations. You can include up to 3 organization references in the output file. Configure the integration attributes to specify which organization type is valid for each field.</li> <li>• Map <i>Organization</i> type using the integration map provided for this value.</li> </ul>
Coverage: Health Plan	<ul style="list-style-type: none"> <li>• This section can have multiple records.</li> <li>• Operation codes are ADD, REMOVE, MODIFY, and NONE when you enable the Changes Only service.</li> <li>• Map <i>Plan Type</i> using the integration map provided for this value.</li> </ul>
Coverage: FSA Plan Data	<ul style="list-style-type: none"> <li>• This section can have multiple records.</li> <li>• Operation codes are ADD, REMOVE, MODIFY, and NONE.</li> <li>• Map <i>Plan Type</i> using the integration map provided for this value.</li> </ul>

Section	Description
Coverage: Retirement Savings Plan Data	<ul style="list-style-type: none"> <li>This section can have multiple records.</li> <li>Operation codes are ADD, REMOVE, MODIFY, and NONE when you enable the <i>Changes Only</i> service.</li> <li>Map <i>Plan Type</i> using the integration maps provided for these values.</li> </ul>
Coverage: Life and Disability Data	<ul style="list-style-type: none"> <li>This section can have multiple records.</li> <li>The Coverage Target field applies to employees or dependents.</li> <li>Operation codes are ADD, REMOVE, MODIFY, and NONE when you enable the <i>Changes Only</i> service.</li> <li>Map <i>Plan Type</i> using the integration maps provided for these values.</li> </ul>
Coverage: HSA Plan	<ul style="list-style-type: none"> <li>This section can have multiple records.</li> <li>Operation codes are ADD, REMOVE, MODIFY, and NONE when you enable the <i>Changes Only</i> service.</li> <li>Map <i>Plan Type</i> using the integration maps provided for these values.</li> </ul>
Coverage: Additional Benefits Plan	<ul style="list-style-type: none"> <li>This section can have multiple records.</li> <li>Operation codes are ADD, REMOVE, MODIFY, and NONE when you enable the <i>Changes Only</i> service.</li> <li>Map <i>Plan Type</i> using the integration maps provided for these values.</li> </ul>
Dependent Data	<ul style="list-style-type: none"> <li>This section can have multiple records.</li> <li>Name fields are based on legal name.</li> <li>Map <i>Relationship</i> using the integration maps provided for these values.</li> </ul>
Beneficiary Data	<ul style="list-style-type: none"> <li>This section can have multiple records.</li> <li>Name fields are based on legal name.</li> <li>Map <i>Relationship</i> using the integration maps provided for these values.</li> </ul>
Plan Eligibility Data	This section can have multiple records.
Payroll Results Data	<ul style="list-style-type: none"> <li>This section can have multiple records.</li> <li>Map <i>Deduction Codes</i> and <i>Accumulation Codes</i> using the integration maps provided for these values.</li> </ul> <p>Note: This map is required to output payroll data.</p>
Additional Information	Create extensible field overrides to add data not included in the previous sections to the output file.

[Concept: Workday Benefits Connector](#) on page 565

## Reference: Benefits Connector V2 Audit Files

Workday attaches 4 audit reports to each Benefits Connector integration event. After an integration runs, access the Integration Events report to view the audit files. Select the event that you're interested in to

open the View Background Process page and then click the Output Files tab. Audit files expire 90 days after Workday creates them. Workday automatically deletes the files after they expire.

### Data Changes Audit

The Data Changes Audit is a readable version of the integration output file. This report has 2 components:

#### Extract Summary

Displays the change detection method and date range specifications.

#### Worker Details

Provides summarized and detailed views of employee data changes, and displays the worker count. The summarized view displays employee names, IDs, and the categories of changed data. The detailed view displays current field values. If the data has changed, the detailed view also displays prior values. Workday highlights new records in green, modified records in gray, and highlights deleted records in red.

To toggle between views for all employees, or select an employee in the summary list to view details, select Show or Hide.

### Partition Audit Report

The Partition Audit report includes details on all employees that the integration processed when creating the benefits output file. The employee records identify in what audit file that you can find the employee record for troubleshooting.

### Exception Log Report

The Exception Log report helps you troubleshoot integration errors. The report includes employee details that generate a warning or error when the integration creates the benefits output file. You can view these details for each employee to determine why the benefits extract included or excluded the employees:

- Processing details
- Validation messages
- Current properties
- Transaction log details

In some cases, employees had transactions that didn't affect the set of data configured in the benefits extract. In other cases, the integration encountered an error while processing these employees.

### XML Output File

The output file contains the actual data that the Benefits Connector integration created. This file is in XML format.

### Messages Audit

The Messages Audit is a zip file that contains a summary of web service requests and responses in XML format. Workday generates this audit report for troubleshooting purposes.

## FAQ: Benefits Connector

Does Benefits Connector support changing output field values to uppercase?

The Benefits Connector template itself doesn't include the ability to change the case of field values.

Example: from *Logan Mcneil* to *LOGAN MCNEIL*.

The Benefits Connector output file can require a transformation into the file format that your benefits provider uses. To the file format, use a Document Transformation integration or a Studio-based integration. You could change the case of field values using that subsequent transformation.

## Workday Benefits Connector (V1)

### Steps: Set Up the Workday Benefits Connector V1 Integration

#### Prerequisites

- Request the file specification from your benefit provider so that you can familiarize yourself with their data requirements.
- Compare the data requirements for your benefit provider with the output options provided by Benefits Connector.
- Determine an approach for transforming integration output into the benefit provider format. Example: a Document Transformation integration or Workday Studio integration.
- Plan out the number and type of test cycles that the benefits provider requires before certifying your integration. Work with your benefits provider to determine how many test cycles they require.

#### Context

You can create an integration that sends employee benefits data to a benefits provider. Workday simplifies the configuration process with the Benefits Connector integration template. The template provides predefined categories of data that you can select and customize for output.

#### Steps

1. [Create Integration System on page 1967](#).  
Enter *Benefits Connector* at the New Using Template prompt.
2. [Set Up Benefits Connector V1 Integration Services on page 579](#).

3. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

- *Integration Event*
- *Person Data: Birth Place*
- *Person Data: Citizenship Status*
- *Person Data: Date of Birth*
- *Person Data: Date of Death*
- *Person Data: Disabilities*
- *Person Data: Gender*
- *Person Data: Home Contact Information*
- *Person Data: ID Information*
- *Person Data: Marital Status*
- *Person Data: Military Status*
- *Person Data: Nationalities*
- *Person Data: Personal Data*
- *Reports: Pay Calculation Results for Worker (Results)*
- *Worker Data: Beneficiaries and Dependents*
- *Worker Data: Benefit Elections*
- *Worker Data: Compensation By Organization*
- *Worker Data: Public Worker Reports*
- *Worker Data: Work Contact Information*

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

4. [Select and Set Up Connector Output Fields](#) on page 1977.
5. [Set Up Benefits Connector V1 Attributes and Maps](#) on page 580.
6. (Optional) [Set Up Integration Sequence Generators](#) on page 1969.  
Set up the Workday sequence generator to create unique filenames for integration output files. To perform this step, enable the *BC Filename* integration service.
7. (Optional) [Add Custom Fields to Connector Output](#) on page 1978.  
If the output file requires additional data elements beyond elements offered in the predefined data sections, create a field override service and configure custom fields.
8. As a related action on the integration system, select **Integration System > Configure Integration Transaction Log**.  
Select **Subscribe to all Transaction Types** except and select the transactions to exclude from benefits processing.
9. (Optional) [Steps: Set Up Document Transformation Connector](#) on page 594.
10. [Launch an Integration](#) on page 24.
11. Test the integration by running the number of test cycles requested by the benefits provider.
12. Perform a full load and validate the results.

#### Related Information

## Set Up Benefits Connector V1 Integration Services

### Prerequisites

Security: *Integration Configure* domain in the Integration functional area.

### Context

Specify which categories of data to include in the output file and select output file options.

### Steps

1. As a related action on the integration, select Integration > Configure Integration Services.
2. In the Integration Services grid, select the Enabled check box for each integration service that you want to activate. These integration services provide categories of data or configuration options for the output file.

Note: The *Benefits Connector* integration service is required and enabled automatically. The *Transaction Log Service* isn't enabled automatically, but is required for change detection processing.

Option	Description
BC Change File Launch Parameters	Provides an additional <i>Change Detection</i> launch parameter to the Launch/Schedule Integration task when generating change files. The launch parameter includes these options: <ul style="list-style-type: none"> <li>• All_Effective</li> <li>• Incremental</li> </ul>
BC Workday Payroll Service	Provides these additional launch parameters to the Launch/Schedule Integration task for reporting payroll contribution start and end dates: <ul style="list-style-type: none"> <li>• Payroll Start Date</li> <li>• Payroll End Update</li> </ul>
BC Personal Data Section Fields	Provides employee personal data and contact information.
BC Status Data Section Fields	Provides employment status and service dates.
BC Position Data Section Fields	Provides: <ul style="list-style-type: none"> <li>• Job profile data.</li> <li>• Salary and base compensation elements.</li> <li>• Organization membership data.</li> </ul>
BC FSA Plan Data Section Fields	Provides FSA (Flexible Spending Account) plan data, including: <ul style="list-style-type: none"> <li>• Enrollment and coverage dates.</li> <li>• Employee and employer goal amounts.</li> <li>• Period and Year-To-Date (YTD) contribution amounts.</li> </ul>
BC Retirement Savings Data Section Fields	Provides data for retirement savings plans, including: <ul style="list-style-type: none"> <li>• Plan identification data.</li> </ul>

Option	Description
	<ul style="list-style-type: none"> <li>• Coverage dates.</li> <li>• Payroll dates.</li> <li>• Payment dates.</li> <li>• Loan data.</li> <li>• To-date amounts.</li> </ul>
BC Life and Disability Data Section Fields	Provides life and disability plan data, including: <ul style="list-style-type: none"> <li>• Plan identification data.</li> <li>• Enrollment period and coverage dates.</li> <li>• Approved coverage level details.</li> <li>• Beneficiary IDs.</li> </ul>
BC Dependent Data Section Fields	Provides personal data and contact information for dependents of employees.
BC Eligibility Data Section Fields	Provides Benefit Plans and plan eligibility dates for the employee. Use for Retirement Savings Plans only.
Transaction Log Service	Provides a record of event-based changes to employee data that are relevant to benefits integrations. Don't enable this service in integrations that generate full extracts.
BC Delivery Service	Provides file transport and encryption options for the output file.
BC Filename	Provides unique output filenames by using the Workday sequence generator.
CCB - Debug Service	Generates a Messages Audit file each time the integration runs.  For best performance, Workday recommends that you disable this integration service for any integration that runs in Production.

## Next Steps

Select the individual fields to include in each data section, then configure the output file and map Workday values to the external endpoint.

[Steps: Set Up the Workday Benefits Connector V1 Integration](#) on page 577

## Set Up Benefits Connector V1 Attributes and Maps

### Prerequisites

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

## Context

After you create a Benefits Connector integration system and select output fields, configure the integration attributes and maps for the output file.

Integration attributes define various processing options for the output file, such as:

- The retention period for audit files.
- Data validation rules.
- Whether Workday always includes data or only when changes occur.

Integration maps control how Workday maps values to the external benefits provider. Only a subset of data elements requires an integration map. Workday maps data according to these rules:

- If an integration map has rows of data, Workday uses the map to convert Workday values to external values. If you don't define a Workday value in the map, Workday uses the automatically populated value for the map. If the automatically populated value is blank, Workday issues an error or a warning message and the external value is empty.
- If an integration map is empty, Workday uses reference IDs in the output file. In the View Integration System report, click the Integration Maps tab to see which reference ID corresponds to each map. The only exception is the Region map, which uses the Workday region name instead of a reference ID. If a Workday value has no reference ID, Workday issues an error or warning and the external value is empty.

## Steps

1. Access the View Integration System report.
2. As a related action on the integration system, select Integration System > Configure Integration Attributes.
3. Specify values for the attributes in the Integration Attributes grid:
  - For attributes without automatically populated values, add a row and specify a Value.
  - For attributes whose automatically populated values you want to change, select the Override Default Values check box and specify a new Value.
  - Optionally specify that a value applies to a particular environment using the Restricted to Environment field.

Attribute	Description
Benefits Plans	Add a row for each benefit plan that the integration system supports. The benefit plan must exist in Workday; if necessary, use the Create Benefit Plan task to add a benefit plan.
Client Name	Enter your organization name. The integration includes this value in the benefits extract header.
Client Number	Unique number that identifies you to your benefits provider.
Country Code	Specifies the country code used in addresses in the benefits extract. If you don't override this attribute, the integration uses ISO 3166-1 Alpha 2 codes. If you want to provide 3-digit codes instead, add a row and select <i>ISO_3166-1_Alpha-3_Code</i> .
Document Retention Policy	If you don't override this attribute, sets to 30 days. You can change the retention period to 60, 90, 120, or 180 days.
Employee Deduction Codes	Select payroll deductions to include in the output file.

Attribute	Description
Full Extract	Generates a full file of employee data, including all data sections and fields that you configure in the integration, rather than a changes-only file. If you select this option, don't enable the <i>Transaction Log Service</i> .
Identifier Type for Alternative Identifier	Select the type of identifier for employees and dependents.
Include Prior Values	Includes the prior values of data elements that have changed.
Organization Type for Organization One, Two, Three, Four, and Five	Specify which type of organization to include in the output file (Example: Cost Center or Region). When you configure the integration maps, you map a Workday value for this organization type.
Remove Accented Characters	Replaces accented characters in employee data with the unaccented equivalent characters in the output file.
Use Payment Date	Specifies that Workday use the payment date for employee payroll when generating the output file.
Use Preferred Name when present	If you don't override this attribute, the output file uses Legal Name. To use Preferred Name instead of Legal Name, select the check box.
Version	Select the version number of the output file. The initial version number matches the current Workday version number. In future releases, you upgrade to a later version only if you need new functionality.
Worker Data Validation	Select how Workday resolves processing errors for employee data, such as when a mapped field contains a value that you didn't define in the corresponding map: <ul style="list-style-type: none"> <li>• <i>abort</i>: Workday doesn't create an integration output file.</li> <li>• <i>include</i>: Workday includes the affected employee data and returns a warning on the associated integration process event.</li> <li>• <i>omit</i>: Workday doesn't include the affected employee data on the integration output file.</li> </ul>
Output Document Tags	Applies selected tags to the integration output file.

4. Save your changes, then as a related action on the integration system, select Integration System > Configure Integration Maps.
5. In the Integration Maps grid, specify output file values for Workday data:
  - a) Add a row for each Workday value, select the Internal Value, and enter the External Value for the output file.
  - b) (Optional) Provide a Default Value for any data elements whose values you haven't mapped.

Example: your organization has *Hourly* and *Salary* pay rate types. In the *Pay Rate Type* map, define external values for the *Hourly* and *Salary* rate types. Then create a Default Value of *Other* for any unmapped pay rate types.

You only define mappings for the data elements that you include in the output file. Example: if the Personal Data Section only includes Gender and Marital Status, specify values in those 2 maps and leave the other maps in the section empty.

#### Related Information

##### **Steps: Set Up the Workday Benefits Connector V2 Integration**

[Set Up Benefits Connector V2 Attributes and Maps](#) on page 570

[Reference: Benefits Connector Data Sections](#) on page 574

##### **Steps: Set Up the Workday Benefits Connector V1 Integration**

[Steps: Set Up the Workday Benefits Connector V1 Integration](#) on page 577

#### **Concept: Benefits Connector V1 Change Detection**

Benefits Connector integrations support 2 change detection methods. Using the Change Detection launch parameter, you select the appropriate method depending on the requirements of your benefits provider. The methods are:

Include all changes effective in the defined time period

To send a full file to the benefits provider, select this method. The benefits extract includes all changes to employee data that are effective in the defined date range. The extract includes these changes regardless of when you entered the changes into Workday. When Workday has future-dated transactions, Workday excludes them from the extract file. Workday includes these transactions when their effective date is in the defined date range processed by the integration.

Include only changes entered since the last successful run

To send a changes-only file to your benefits provider, select this method. The benefits extract includes only changes that:

- You entered in Workday after the date of the last successful run.
- Are effective before or during the defined date range.

#### **How Dates Affect Benefits Extracts**

Dates are important to understanding the changes that Benefits Connector integrations pick up. If you discover that events are missing from an extract, look at the relationship between:

- The last successful run date.
- The period start date.
- The event entry date.
- The event effective date.

Example: Events might be missing from an extract if:

- The event entry date is after the last successful run, but the event effective date isn't in the current or prior period.
- The event entry date isn't after the last successful run and change detection isn't set to *All Effective*.
- The event entry date isn't after the last successful run and change detection is set to *All Effective*, but the event effective date isn't in a specified date range.

[Steps: Set Up the Workday Benefits Connector V1 Integration](#) on page 577

## Concept: Benefits Connector V1 Data Validation and Error Handling

Benefits Connector applies a number of validation rules to employee data based on how you configure your benefits integration. An integration attribute called *Worker Data Validation* gives you control over integration processing when employees fail these validation checks. Workday provides 3 options that can accommodate the needs of your benefits provider:

Include	Includes an employee in a benefits output file even if validation errors occur. Integration processing continues and Workday reports the errors as warnings on the integration event.
Omit	Select this option if your benefits provider can accept benefits output files that contain some invalid data. The benefits provider can fix the imported data and you can apply the same changes to the data in Workday later.
Abort	Excludes data for an employee from a benefits output file when validation errors occur. Integration processing continues, Workday reports the errors, and the benefits output file contains data for the rest of the employees.

Abort	Select this option if your benefits provider rejects benefits files that contain invalid data. In this case, the invalid or missing data for 1 employee doesn't hold up benefits processing for other employees. You can update the employee data in Workday later and generate a supplemental benefits output file.
-------	--

View integration messages by accessing one of these reports:

Report	Description
Process Monitor	View integrations that are currently running or have already run. To view message details, drill-down on the numbers in the Errors & Warnings column.
Integration Events	Lists integration events and displays the launch date and time, the name of the person who launched the integration, its status, and the event response message.
Integration Messages	Provides a status summary and message details for integration events.

### Related Information

#### [Steps: Set Up the Workday Benefits Connector V2 Integration](#)

[Reference: Benefits Connector V2 Audit Files on page 575](#)

## Steps: Set Up the Workday Benefits Connector V1 Integration

[Steps: Set Up the Workday Benefits Connector V1 Integration on page 577](#)

## Reference: Benefits Connector V1 Audit Files

Workday attaches 4 audit reports to each Benefits Connector integration event. After an integration runs, access the Integration Events report to view the audit files. Select the event that you're interested in to open the View Background Process page and then click the Output Files tab. Audit files expire 90 days after Workday creates them. Workday automatically deletes the files after they expire.

### Data Changes Audit

The Data Changes Audit is a readable version of the integration output file. This report has 2 components:

#### Extract Summary

Displays the change detection method and date range specifications.

#### Worker Details

Provides summarized and detailed views of employee data changes, and displays the worker count. The summarized view displays employee names, IDs, and the categories of changed data. The detailed view displays current field values. If the data has changed, the detailed view also displays prior values. Workday highlights new records in green, modified records in gray, and deleted records in red.

To toggle between views for all employees, or select an employee in the summary list to view details, select Show or Hide.

### Diagnostic Audit

The Diagnostic Audit is designed to help you troubleshoot integration errors. The report includes details on all employees that the integration processed when creating the benefits output file. You can view these details for each employee to determine why the benefits extract included or excluded the employees:

- Processing details
- Validation messages
- Current properties
- Transaction log details

In some cases, employees have transactions that don't affect the set of data configured in the benefits extract. In other cases, the integration encounters an error while processing these employees.

You can also use the Diagnostic Audit to tune the performance of a Benefits Connector integration. The audit lists the transaction log entries that the integration processed for each employee. If many employees in the diagnostic audit file don't have relevant data changes, reconfigure the transaction log service to exclude certain transaction types.

### Benefits Extract

The benefits extract contains the actual data that the Benefits Connector integration created. This file is in XML format.

## Messages Audit

The Messages Audit is a zip file that contains a summary of web service requests and responses in XML format. Workday generates this audit report for troubleshooting purposes. Workday generates this file only if you enable the CCB - Debug Service integration service.

Note: For best performance, Workday recommends that you disable this integration service for any integration that runs in Production.

# Data Initialization Service (DIS) Integration

## Concept: Data Initialization Service (DIS)

Custom integrations can use a Data Initialization Service (DIS) to gather data using report fields in Workday. The Data Initialization Service is an integration service that you create, configure, and associate with an integration based on the *Cloud Integration Template*. This service provides these benefits:

- DIS provides flexible configuration options for navigating to as many related business objects as your integration requires, using *Document Builders*. Example: you can navigate from Worker, to Dependents, to Benefit Elections, to Beneficiaries.
- You can configure these custom integrations to extract only the data fields that you need. DIS improves performance by eliminating processing time spent retrieving, filtering, and joining data.
- DIS provides data extract parallelization, improving performance and reducing complexity.
- DIS doesn't make API calls. Your integration is more resilient to network fluctuations and more performant. Using DIS eliminates time spent waiting for data over the network.
- Time spent gathering data in DIS doesn't count toward the Studio processing time limit. Using DIS reduces the failure rate of your integrations and improving the number of integrations you can run overall.
- You can assign a DIS to more than 1 custom integration. You can associate more than 1 DIS with a *Cloud Integration Template*-based integration.
- You can nest multiple sublevels of data. Using *Document Builders*, you can group related data together, then add that data to integration output. DIS currently doesn't support file data types. Grouping related data together improves performance.

### Overview

DIS is an integration service that you add (as a custom integration service) to an integration based on the *Cloud Integration Template*. This service enables you to define:

- How to extract data from Workday.
- How to format the data in XML.

Because DIS works with template-based integrations, you can schedule the integration, and specify delivery options.

### Related Information

#### **Reference**

[Workday 33 What's New Post: Data Initialization Service for Custom Integrations](#)

## Steps: Set Up Data Initialization Service (DIS) Integration

### Prerequisites

- Evaluate your integration processing needs before setting up this integration.
- (Optional) Write a Studio integration to retrieve and process DIS documents.
- Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

### Context

You can build a custom integration that exports only the data that your integration needs, in a format that you define. You can select report fields and calculated fields

### Steps

1. [Create Integration System](#) on page 1967.  
Enter *Cloud Integration Template* at the New using Template prompt.
2. From the related actions menu of the integration, select Integration System > Configure Integration Services.
3. In the Integration Service prompt, select *Create Integration Data Initialization Service*.
4. [Set Up Integration Data Initialization Service](#) on page 588.
5. (Optional) [Set Up Sub-Document for Data Initialization Service \(DIS\)](#) on page 593.
6. (Optional) To write a Studio integration to retrieve and process DIS documents, select Integration System > Add Cloud Collection as a related action on the integration.  
Use the parallel Studio component to process files in parallel, which doesn't increase load on tenants and remote servers.
7. (Optional) [Create Integration Business Process](#) on page 1950.
8. (Optional) [Set Up Integration Delivery](#) on page 1952.
9. Grant the account under which the integration runs access to these domains:
  - *Integration Event*
  - *View* access to any domain that secures the report fields and calculated fields that your Data Initialization Service uses.

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

10. [Launch an Integration](#) on page 24.

- 11.(Optional) Use the Integration Event > Retrieve Technical Files related action to view DIS Partial Documents, DIS Performance Log, Exception Log, and schemas for these logs.

Use the Exception Log to view diagnostic information about all exceptions thrown when Workday uses these configured items to build the DIS output files:

- 12.(Optional) Use the Integration Event > Generate DIS Performance Summary related action after the integration completes to generate 1 HTML summary report per DIS output file.

The report provides a summary of the longest running fields and instances. Workday doesn't track fields that take less than 5 milliseconds. Workday doesn't collect performance data once the raw performance log exceeds 4 megabytes.

# Set Up Integration Data Initialization Service

## Prerequisites

Security: *Integration Build Custom Services* domain in the Integration functional area.

## Context

You can create a Data Initialization Service and define how the service extracts data from Workday. You can define file formatting and field attributes. You can then add the service to a *Cloud Integration Template*-based integration system.

## Steps

1. Access the Create Integration Data Initialization Service task.
2. As you complete the Output Document section, consider:

Option	Description
Document Filename	Workday applies this name to the partial and final integration output files. Workday appends partial files with a - character and number of the partition. Example: <i>HelloWorldDIS-23.xml</i> .
Wrapper Element Name	Workday applies this value as the root XML element in the integration output file.

3. As you complete the Population section, consider:

Option	Description
Population using	Select a custom advanced report that defines the data set to populate the integration. The integration uses this report and the report filters to define the population only. The integration doesn't use any of the report fields in the custom report or the namespaces of the report. The custom report must be an advanced report.
Returned Business Object	Workday displays the primary business object for the data source of the custom report.
Order using	(Optional). To specify the sort order for data fields, select a <i>Text</i> report field or calculated field. If you don't select a report field or calculated field: <ul style="list-style-type: none"> <li>• The integration uses the order of the custom report from the Population using field.</li> <li>• The integration doesn't use the sort order of the custom report.</li> </ul>
Partition Size	(Optional). You can select the maximum number of instances of the population per partial integration output file. To reduce out of memory or time risks with downstream processing optimization, Workday recommends that you specify 25, or the

Option	Description
	minimum possible size. The maximum size is 2000. Each partition has a 2-hour process limit.

4. As you complete the Schema and Build section, consider:

Option	Description
Web Service Alias	Specify the name of the XML node element for 1 object of the population.
Do Not Merge Documents	<p>Workday recommends that you select this check box. If selected, the integration doesn't merge partial documents. Example: If the integration returns 45 workers, and you set the Partition Size to 25, Workday generates 2 output files.</p> <p>If you select this check box, create a downstream integration (such as a Studio integration) to process and merge the partial documents in parallel. Using this approach doesn't increase the load on tenants and remote servers.</p>
Field Details	<ul style="list-style-type: none"> <li>To create a single field, select Data Type. Then, specify the data type that matches the report field or calculated field that you want to use. You can override the datatype returned by the report or calculated field.</li> </ul> <p>Instances (plural) datatype serializes using Reference IDs. For Instances (plural) cast to text, Workday uses the display ID in the integration output.</p> <p>Reference ID Type: Applies only to fields that return Instances (plural). Select a reference ID to include in the integration output. If you don't select a reference ID type, the integration includes all reference IDs in the integration output.</p> <ul style="list-style-type: none"> <li>To create a subdocument with related data fields (Example: Address fields for a worker home address), select Sub-Document.</li> </ul>
Build content using	<ul style="list-style-type: none"> <li>For a single field, select the report field from the Value prompt. Or, select a Document Parameter created and saved in Step 7. Workday displays report fields associated with the Returned Business Object.</li> <li>For a subdocument, select or create a Document Builder that defines the subdocument.</li> </ul>
Loop on instances	Select a report field to loop on the instances for the document builder. The return type of the

Option	Description
	field must match the context business object of the document builder. Workday doesn't display report fields with required prompts.
Value	Select a report field or calculated field based on the business object of the document. This prompt displays only: <ul style="list-style-type: none"> <li>Report fields and calculated fields with a data type that matches the Data Type value.</li> <li>All fields if the Data Type field is empty.</li> </ul>
Value Type (External Parameter Assignment(s))	Select how you want to provide values for prompts that the report field or calculated field uses.
Value (External Parameter Assignment(s))	Enter a value depending on the Value Type: <ul style="list-style-type: none"> <li><i>Determine Value at Runtime</i>: select a report field or calculated field.</li> <li><i>Document Parameter</i>: select a parameter that you defined in the previous step. Workday requires that you save the document parameter before you can use it here.</li> <li><i>Specify a Value</i>: select or enter a value based on the prompt.</li> </ul>

5. (Optional) In the Field Attribute Service Options section, consider:

Option	Description
Field Attribute Service?	Enables you to configure formatting options for fields that you select in the Schema and Build grid.
Show "Required" Option	Adds a Required flag to the DIS schema. This option doesn't affect whether the integration includes data in the output file.
Show "Maximum Length" Option	Enables you to define maximum lengths for fields in the output file.

6. As you complete the Parameters section, consider:

Option	Description
Value Type	Select how you want to provide values in the Value field.
Value	Enter a value depending on the Value Type: <ul style="list-style-type: none"> <li><i>Determine Value at Runtime</i>: select a report field or calculated field based on</li> </ul>

Option	Description
	<p>the business object of the document. This prompt displays only:</p> <ul style="list-style-type: none"> <li>Report fields and calculated fields with a data type that matches the Value Type value.</li> <li>All fields if the Value Type field is empty.</li> <li><i>Specify a Value</i>: select or enter a value based on the prompt.</li> <li><i>Integration Attribute</i>: Select an integration attribute of the integration system. Available for Global Parameters only.</li> <li><i>Launch Parameter</i>: Select a launch parameter of the integration system. Available for Global Parameters only.</li> </ul>
Value Type (External Parameter Assignments(s))	Select how you want to provide values for prompts that the report field or calculated field uses.
Value (External Parameter Assignments(s))	<p>Enter a value depending on the Value Type:</p> <ul style="list-style-type: none"> <li><i>Determine Value at Runtime</i>: select a report field or calculated field.</li> <li><i>Specify a Value</i>: select or enter a value based on the prompt.</li> </ul>

7. As you complete the Report Criteria section, consider:

Option	Description
Value Type	Select how you want to provide values for the prompts.
Value	<p>Value: Enter a value depending on the Value Type:</p> <ul style="list-style-type: none"> <li><i>Determine Value at Runtime</i>: select a report field or calculated field.</li> <li><i>Document Parameter</i>: select a parameter that you defined in the previous step. Save the document parameter before you can use it here.</li> <li><i>Specify a Value</i>: select or enter a value based on the prompt.</li> </ul>

8. (Optional) As you complete the Integration Attributes section, consider:

Option	Description
Attribute Type	<p>Select the type of attribute:</p> <ul style="list-style-type: none"> <li><i>Enumeration</i>: Select an integration enumeration from the prompt. To create a new integration enumeration, access the Create Integration Enumeration Definition task.</li> <li><i>Data Type</i>: Select a datatype to apply.</li> </ul>

Option	Description
Multi-Select	Enables you to enter multiple values for the attribute.
Option(s)	Select additional attribute configuration options: <ul style="list-style-type: none"> <li><i>Display As Password</i>: Displays the entered text as asterisks.</li> <li><i>Required for Launch</i>: Prevents the integration from launching if the attribute has no value.</li> </ul>

You can set separate values for each integration that uses the Data Initialization Service. You can also use attributes as report filters or output them as fields using doc parameters.

9. (Optional) As you complete the Integration Maps section, consider:

Option	Description
Internal Value Type	<ul style="list-style-type: none"> <li><i>Enumeration</i>: Select an integration enumeration from the prompt. To create a new integration enumeration, access the Create Integration Enumeration Definition task.</li> <li><i>Data Type</i>: Select a datatype to apply.</li> <li><i>Option(s)</i>: To display the entered text as asterisks, select <i>Display As Password</i>.</li> </ul>
External Value Type	<ul style="list-style-type: none"> <li><i>Enumeration</i>: Select an integration enumeration from the prompt. To create a new integration enumeration, access the Create Integration Enumeration Definition task.</li> <li><i>Data Type</i>: Select a datatype to apply.</li> <li><i>Option(s)</i>: To display the entered text as asterisks, select <i>Display As Password</i>.</li> </ul>
Exception Rule(s)	Select exception rules to apply to the map. Workday prevents the integration from running if the integration triggers the exception rules.

- Use the Integration Document Field > Configure Integration Map related action to add the map to a field you selected in the Schema and Build grid. The Internal Value Type of the map must match the Build content Using field value.
- The External Value Type of the map must match the data type of the report field or calculated field.
- Configure a default value for the map that the integration uses when there's no default value for the integration.

10. As you complete the Launch Parameters section, consider:

Option	Description
Launch Parameter Type	<ul style="list-style-type: none"> <li><i>Enumeration</i>: Select an integration enumeration from the prompt. To create a new integration enumeration, access the Create Integration Enumeration Definition task.</li> </ul>

Option	Description
	<ul style="list-style-type: none"> <li><i>Data Type:</i> Select a datatype to apply.</li> </ul>
Option(s)	Select additional options for the launch parameter.
Default Processing	Default values when the integration launches.

Each integration that uses DIS displays the DIS launch parameters, as well as the launch parameters of its other services. You can use launch parameters to configure variable fields used to populate DIS output dynamically.

## Set Up Sub-Document for Data Initialization Service (DIS)

### Prerequisites

Security: *Integration Build Custom Services* domain in the Integration functional area.

### Context

You can use the Create Document Builder task to define a discrete set of related data fields. You can then use the Document Builder in:

- A Data Initialization Service.
- Another Document Builder.

The Document Builder specifies a group of fields for an integration output document.

### Steps

1. Access the Create Document Builder task.
2. Specify a Document Builder Name and Context Business Object.

The Context Business Object field enables you to access fields related to a different Primary Business Object than the object that the parent subdocument uses.

3. As you complete the Schema and Build section, consider:

Option	Description
Field Details	<ul style="list-style-type: none"> <li>To create a single field, select Data Type. Then, specify the data type that matches the report field or calculated field that you want to use. You can override the data type returned by the report or calculated field.</li> </ul> <p>Instances (plural) data type serializes using Reference IDs. For Instances (plural) cast to text, Workday uses the display ID in the integration output.</p> <p>Reference ID Type: Applies only to fields that return Instances (plural). Select a reference ID to include in the integration output. You must select a Reference ID Type. If you don't select a Reference ID Type, Workday won't include any reference IDs in the integration output.</p>

Option	Description
	<ul style="list-style-type: none"> <li>To create a subdocument with related data fields (Example: Address fields for a worker home address), select Sub-Document.</li> </ul>
Build content using	<ul style="list-style-type: none"> <li>For a single field, select the report field from the Value prompt. Or, select an existing Document Parameter. Workday displays report fields associated with the Returned Business Object.</li> <li>For a subdocument, select or create a Document Builder that defines the subdocument.</li> </ul>
Loop on instances	Select a report field to loop on the instances for the document builder. The return type of the field must match the Context Business Object of the document builder.
Value Type (External Parameter Assignment(s))	Select how you want to provide values for prompts that the report field or calculated field uses.
Value (External Parameter Assignment(s))	Enter a value depending on the Value Type: <ul style="list-style-type: none"> <li><i>Determine Value at Runtime</i>: select a report field or calculated field.</li> <li><i>Document Parameter</i>: select a parameter that you defined in the previous step. Workday requires that you save the document parameter before you can use it here.</li> <li><i>Specify a Value</i>: select or enter a value based on the prompt.</li> </ul>

## Result

You can select this Document Builder from the Document Builder prompt in:

- The Create Integration Data Initialization task.
- The Create Document Builder task, if you want to add this Document Builder as a subdocument under another Document Builder.

# Document Transformation Connector

## Steps: Set Up Document Transformation Connector

### Prerequisites

Before setting up this integration, you must:

- Create an integration system that generates the file in the original format.
- Determine what format the recipient of the output file requires.

- Review the available options for Element Transformation and Validation (ETV) and XML To Text (XTT) formatting.
- Create an Extensible Stylesheet Language Transformation (XSLT) file that defines the transformation from Workday XML format to the recipient format.

## Context

Create a Document Transformation integration to take the output file generated by a Connector and transform the file based on instructions in an XSLT file. Document transformation supports only Connector integrations such as Benefits Connector, Payroll Interface, or Core Connector: Worker. Since these integrations don't support a specific endpoint, their XML output documents require transformation before the integration sends them to the endpoint.

## Steps

1. Access the Create Integration System task and at the Integration Template prompt, enter *Document Transformation*.  
Security: *Integration Build* in the Integration functional area.
2. As a related action on your Document Transformation, select Workday Integration System > Configure Integration Attributes, then add a row for each attribute and specify a value:

Option	Description
Transformation	Select tags to use to find tagged documents and to apply to output documents: <ul style="list-style-type: none"> <li>• Input Document Tags. Select the tags that the Document Transformation integration should search for. The integration system will process the first document that it finds with a tag matching what you specify. If empty, the integration searches for documents tagged <i>Deliverable</i>.</li> <li>• Output Document Tags. Select the tags that the Document Transformation integration should apply to a document after transforming it. A subsequent <i>Document Delivery Service</i> step can use the tag to identify a document for delivery to a specific endpoint. If empty, the integration applies a <i>Deliverable</i> tag.</li> </ul>
Output Encoding	Select the encoding of the output file. Examples: US-ASCII, ISO-8859-1, UTF-8, UTF-16. This value overrides any encoding that you specify in the XSLT transformation file.
Audit Validation Messages	Attaches complete validation messages for each event in the Messages Audit. If not selected, the integration generates a single message for all events and doesn't include full details for all events.
Multiple Input Documents	Processes all input documents with tags that match all of the tags specified on the Input Document Tags attribute.  The tags enable the integration to process multiple input documents on a single XSLT

Option	Description
	file. Attaches complete validation messages for each event in the Messages Audit. If not selected, the integration generates a single message for all events and doesn't include full details.
Carry Forward Input Tags	Adds tags to the output document from the corresponding input document and the Output Document Tags attribute. The tags enable you to identify transformed output documents uniquely.
Integration Document Retention	Enter the number of days that Workday should preserve output files.

Security: *Integration Configure* in the Integration functional area.

3. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Integration Event* security domain.  
See: [Steps: Grant Integration or External Endpoint Access to Workday](#).
4. [Set Up Integration Sequence Generators](#) on page 1969.
5. As a related action on your integration system, select **Integration System > Configure Integration Attachment Service** and add the XSLT file that defines how the integration system transforms output documents.  
Security: *Integration Configure* in the Integration functional area.
6. [Create Integration \(Step\)](#).  
Add the integration system as a subprocess on the business process for the outbound integration system that generates the Workday XML output file.

## Reference: Arithmetic Attributes for Document Transformation

### Overview

These attributes enable you to:

- Count the number of times an element occurs in a document.
- Calculate the sum of the values in a number of elements.

You can place the resulting number into another element. This action is a common requirement for text formats that require a footer to contain such totals. Each of these attributes contains the name of a variable or a comma-separated list of variable names.

Note: Element Transformation and Validation (ETV) and XML To Text (XTT) variables share scope as internal variables used by the Document Transformation Connector. The Document Transformation Connector prefixes its variables with *dt*. To avoid conflicts, don't name your variables with a prefix of *dt*.

- *addNumber* – Adds the value of the element to the existing value of the variable.
- *incrementNumber* – Increments the value of the variable by one.
- *number* – Replaces the value of the element with the value of the variable.
- *setBoolean* – Sets the variable to a Boolean value.

- `setNumber` – Sets the variable to the value of the element.
- `setProperty` – Sets the variable to a string value.

### **addNumber**

Summary	Adds the numeric value of the current element to a variable.
Valid Values	A comma-separated list of variable names.
Scope	Element only.

The `addNumber` attribute adds the numeric value of the current element to the variable named in the attribute. Typically, this action updates a single variable. You can update multiple variables by providing a comma-separated list of variable names.

Calculate the total of 2 record elements:

```
<Sample>
  <record etv:addNumber="aNumber">3.56</record>
  <record etv:addNumber="aNumber">1.01</record>
  <result etv:number="aNumber" />
</Sample>
```

This example produces:

```
<Sample>
  <record>3.56</record>
  <record>1.01</record>
  <result>4.57</result>
</Sample>
```

### **incrementNumber**

Summary	Counts the number of occurrences of an element.
Valid Values	A comma-separated list of variable names.
Scope	Element only.

Increment the value of a variable or variables named in the attribute. To increment multiple variables, included a comma-separated list of variable names. The attribute usually is attached to each occurrence of the element that you want to count. The `number` attribute can then be used to place the value of the variable into the results produced. Workday assumes that all number variables have a value of zero when first used or retrieved.

Count the occurrence of elements:

```
<Sample>
  <record etv:incrementNumber="aNumber">3.56</record>
  <record etv:incrementNumber="aNumber">1.01</record>
  <result etv:number="aNumber" />
</Sample>
```

This example produces:

```
<Sample>
  <record>3.56</record>
  <record>1.01</record>
  <result>2</result>
```

```
</Sample>
```

## number

The count element is populated with the number of *incrementNumber* attributes that have been found in the document up to this point. Because the execution of the *incrementNumber* attribute updates the value of a mediation context property, it's possible to access or modify this property across ETV invocations.

Example: when processing a large XML input set the assembly can split and apply ETV attributes to the XML in chunks. Using the same property with *incrementNumber* across all ETV invocations enables the developer to share a running count across the entire input.

Summary	Workday replaces the value of the element with the value of the variable.
Valid Values	A variable name.
Scope	Element only.

Place the value of a variable into an element. Use this attribute with *setNumber*, *incrementNumber*, and *addNumber* to provide counts and totals in the footers of documents. All *number* variables are assumed to have a value of zero when first used or retrieved. They're not scoped and can be reassigned with the *setNumber* attribute.

Populate the value of the result element:

```
<Sample>
  <record etv:addNumber="aNumber">3.56</record>
  <record etv:addNumber="aNumber">1.01</record>
  <result etv:number="aNumber" />
</Sample>
```

This example produces:

```
<Sample>
  <record>3.56</record>
  <record>1.01</record>
  <result>4.57</result>
</Sample>
```

## setBoolean

Summary	Sets the value for a variable to a Boolean value.
Valid Values	A property name.
Scope	Element only.

Define the property of a variable. Use assembly, XSLT, or other programming constructs like any other property in the mediation context. Workday generates the Boolean value using Java rules for determining true/false values.

Set the value of a property in the mediation context:

```
<record etv:setBoolean="error.indicator">true</record>
```

This XML populates the mediation context property *error.indicator* with the Boolean TRUE:

## setNumber

Summary	Sets the value for a variable to the value in the element.
Valid Values	A variable name.
Scope	Element only.

Place the value of an element into a variable. Use this attribute with *incrementNumber*, *addNumber*, and *number* to provide counts and totals in the footers of documents.

Initialize a variable that you'll increment later and use to populate the count element:

```
<Sample>
  <initial etv:setNumber="aNumber">5</initial>
  <records>
    <record etv:incrementNumber="aNumber">3.56</record>
    <record etv:incrementNumber="aNumber">1.01</record>
  </records>
  <result etv:number="aNumber" />
</Sample>
```

This example produces:

```
<Sample>
  <initial>5</initial>
  <records>
    <record>3.56</record>
    <record>1.01</record>
  </records>
  <count>7</count>
</Sample>
```

## setProperty

Summary	Sets the value for a variable to a string value.
Valid Values	A string name.
Scope	Element only.

Place a string value into a variable. Access the value using assembly, XSLT, or other programming constructs like any other property in the mediation context.

Set the value of a property in the mediation context:

```
<Sample>
  <ssnetv:setProperty="employee.ssn">123-45-6789</record>
</Sample>
```

The mediation context property *employee.ssn* is populated with the value 123-45-6789.

## Reference: Comma-Separated Value (CSV) Attributes for Document Transformation

### Overview

These attributes provide support for formatting documents in CSV format. Workday can use the separator and quotes attributes together to indicate whether to add separators. You can create both comma and pipe-delimited formats using a combination of the separator and quotes attributes. If other delimiters are required, the *quotesWhenMatches* attribute can be used to specify a regular expression that is used to determine if a value is quoted.

- quotes – Specify the rules governing when an element value is placed in quotes – possible values are *csv*, *pipe-delimited*, *always* and *never*.
- quoteStyle – Specify the type of quotation mark to use.
- quoteWhenMatches – Specify a regular expression to determine if the element values are included in quotes.
- separator – Display a character in the results between each of the child elements that this attribute is attached to.

### quotes

Summary	Indicates whether Workday includes the values from elements in quotes when displayed in the results.
Valid Values	Either <i>always</i> , <i>never</i> , <i>csv</i> , or <i>pipe-delimited</i> . If you don't specify a value, Workday never includes the values from elements in quotes.
Scope	Element and all child elements.

The *quotes* attribute indicates whether the values from elements are included in quotes. If the value is *always*, then Workday always uses quotes. If the value is *csv*, then the rules commonly associated with the use of quotes in CSV files are applied. In this case, Workday applies quotes to a value if it contains a comma, newline, or quote character. If the value it starts or ends with white space, Workday applies quotes to the value. Workday replaces a quote character in the value with 2 quote characters.

Apply the CSV rules for *quotes*:

```
<Sample xtt:separator="," xtt:quotes="csv">
  <item>Simple</item>
  <item>Includes a ,</item>
  <item> Starts with space</item>
  <item>Ends with space </item>
  <item>Contains a " character</item>
  <item>Contains a newline character</item>
</Sample>
```

This example produces:

```
<Simple,"Includes a ,"," Starts with space","Ends with space ","Contains a
  " character","Contains a newline character"
```

**quoteStyle**

Summary	Indicates whether to use single or double quotes when the results are quoted using the <i>quotes</i> attribute.
Valid Values	Either <i>single</i> or <i>double</i> . If you don't specify a value, Workday uses double quotes.
Scope	Element and all child elements.

When you use the *quotes* attribute, use the *quoteStyle* attribute to define whether to use single ('') or double ("") quotation marks.

Using the *quoteStyle* attribute to apply CSV rules:

```
<Sample xtt:separator="," xtt:quotes="csv" xtt:quoteStyle="single">
  <item>Simple</item>
  <item>Includes a ,</item>
  <item> Starts with space</item>
  <item>Ends with space </item>
</Sample>
```

This example produces:

```
Simple,'Includes a ',',Startswith space','Ends with space '
```

**quoteWhenMatches**

Summary	Quotes values when Workday uses unusual separator characters in CSV style files.
Valid Values	A regular expression.
Scope	Element and all child elements.

Specify a regular expression that, when matched, places the value within quotes.

Using the *quoteWhenMatches* attribute to apply CSV rules:

```
<Sample xtt:separator="X" xtt:quoteWhenMatches=". *X.*">
  <item>Simple</item>
  <item>Includes an X character</item>
  <item>Simple</item>
</Sample>
```

This example produces:

```
SimpleX"Includes an X character"XSimple
```

**separator**

Summary	Workday places an attribute value between the text contained in each of the child elements of the element that the attribute is attached to.
Valid Values	Any text.
Scope	Element only.

Place the value of the separator attribute separator.

```
<Sample xtt:separator=" , ">
  <item>One</item>
  <item>Two</item>
  <item>Three</item>
</Sample>
```

This example produces:

```
One , Two , Three
```

## Reference: Date/Time Attributes for Document Transformation

### Overview

These attributes enable you to specify a date or *dateTime* format. Format the element values provided as input to the steps as defined by the XML Schema specification. Workday converts these values to the format specified in the attributes.

- **dateFormat** – The date format pattern, such as *yyyyMMdd*.
- **dateTimeFormat** – The date/time format pattern, such as *yyMMdd:HH:mm:ss*.
- **timezone** – The time zone to be used when creating the value for the returned document, such as *PST*. If you've opted in to the Workday 32 - Time Zones feature and don't use an ISU, then Workday uses the user's local time zone.

### dateFormat

Summary	Specifies the date format pattern that Workday converts dates to.
Valid Values	A date format pattern as used in Java.
Scope	Element only.

Convert the value of an element to the format specified in the attribute.

Use the *dateFormat* attribute to specify a date format.

```
<Birth_Date etv:dateFormat="dd/MM/yyyy">1960-03-24</Birth_Date>
```

This example produces:

```
<Birth_Date>24/03/1960</Birth_Date>
```

### dateTimeFormat

Summary	Specifies the <i>dateTime</i> format pattern that Workday converts <i>dateTime</i> values to.
Valid Values	A date format pattern as used in Java.
Scope	Element only.

Specify a date and time format. Workday processes the value of the element as a *dateTime* and converts the original value to the format specified in this attribute.

Specify a date and time format:

```
<Last_Update etv:dateFormat="dd/MM/yyyy:hh/mm/ss" >2010-10-13T07:30:45</Last_Update>
```

This example produces:

```
<Last_Update>13/10/2010:07/30/45</Last_Update>
```

## timezone

Summary	Specifies the time zone that Workday uses for <i>dateTime</i> values in the results.
Valid Values	The name of a time zone as used by the Java class <code>java.util.TimeZone</code> .
Scope	Element and all child elements.

Specify the time zone for values formatted using the *dateTimeFormat* attribute. Values formatted using the *dateFormat* attribute are unaffected by the *timezone* attribute.

Convert a *dateTime* value using a *timezone* offset of -08:00:

```
<Last_Update etv:timezone="EST" etv:dateTimeFormat="dd/MM/yyyy:hh|mm|ss">2010-11-18T02:57:22.019-08:00</Last_Update>
```

Workday changes the hour value from 02 to 05:

```
<Last_Update>18/11/2010:05|57|22</Last_Update>
```

Workday doesn't convert a *dateTime* value because the *dateTime* value has no *timezone* offset.

```
<Last_Update etv:timezone="EST" etv:dateTimeFormat="dd/MM/yyyy:hh|mm|ss">2010-11-18T02:57:22.019</Last_Update>
```

This example produces:

```
<Last_Update>18/11/2010:02|57|22</Last_Update>
```

## Reference: Fixed-Length Formatting Attributes for Document Transformation

### Overview

These attributes enable the integration to create fixed width format documents. The fixed length of each element is specified using the *fixedLength* attribute. Workday pads values shorter than the length specified by the attribute using the *paddingCharacter*. Workday truncates values that are longer than the attribute value.

- align – Indicates whether values are aligned to the left or to the right when padding is added.
- *fixedLength* – The number of characters in this fixed-length field.
- *paddingCharacter* – The padding character to use for a value shorter than the fixed length.

## align

Summary	Indicates whether Workday aligns fixed-length values that require padding to the left or the right.
Valid Values	Either <i>left</i> or <i>right</i> . If you don't specify a value, Workday applies left padding.
Scope	Element and all child elements.

Control whether Workday aligns fixed-length values that require padding to the left or the right.

Right-align content of a fixed length:

```
<Sample xtt:align="right">
  <item xtt:fixedLength="10">Short</item>
  <item xtt:fixedLength="10">Much Too Long</item>
  <item xtt:fixedLength="10">Just Right</item>
</Sample>
```

This example produces:

```
ShortMuch Too LJust Right
```

## fixedLength

Summary	Indicates the length of a fixed-width field.
Valid Values	A positive integer.
Scope	Element only.

Control display of the element values in a fixed-width field. Values shorter than this length are padded with the space character to the length specified. To specify an alternative character, use the *paddingCharacter* attribute.

Workday truncates values longer than the length without any error or warning messages. To display an error or warning message, use the *maxLength* attribute.

Truncate values to a fixed length:

```
<Sample>
  <item xtt:fixedLength="10">Short</item>
  <item xtt:fixedLength="10">Much Too Long</item>
  <item xtt:fixedLength="10">Just Right</item>
</Sample>
```

This example produces:

```
Short      Much Too LJust Right
```

## paddingCharacter

Summary	Indicates the character that Workday uses for padding fixed-length values.
Valid Values	Any character. If you don't specify a value, Workday uses the space character.
Scope	Element and all child elements.

Specify the padding character that Workday applies when fixed-length values require padding.

Pad fixed-length characters if less than a specified length:

```
<Sample xtt:paddingCharacter="-">
  <item xtt:fixedLength="10">Short</item>
  <item xtt:fixedLength="10">Much Too Long</item>
  <item xtt:fixedLength="10">Just Right</item>
</Sample>
```

This example produces:

```
Short-----Much Too LJust Right
```

## Reference: Grouped Attributes for Document Transformation

### Overview

Workday provides a single class attribute to apply 1 or more Element Transformation and Validation (ETV) attributes to an element.

#### class

Summary	Applies a number of ETV attributes to an element.
Valid Values	String – the name of a class defined using the <i>class</i> element.
Scope	Element only.

The *class* element enables you to define 1 or more *attributes* as part of a class. You can then use the *class* attribute as a convenient way to apply all of those attributes. Workday applies the attributes included in the *class* element only to the element that the *class* attribute is attached to. Workday ignores the scoping rules for the original attribute. You can use the *class* attribute with other attributes. An attribute placed directly on an element takes precedence over the same within the class.

This example displays 2 ways to group attributes:

```
<!-- 1. Creating simple class. Using XTT here-->
<xtt:class xtt:name="detailClass" xtt:fixedLength="30" xtt:align="left"
  xtt:paddingCharacter="*"/>
<!-- 2. Create and build classes off one another. Using ETV here to show
  either works but you
    should use one or the other in your xsl depending on your output needs
  (XML or text).-->

  <etv:class etv:name="detailClass1" etv:fixedLength="30" /> <!-- Initial
class -->
  <etv:class etv:name="detailClass2" etv:class="detailClass1"
etv:align="left"/> <!-- Class extending another class -->
    <etv:class etv:name="detailClass3" etv:class="detailClass2"
etv:paddingCharacter="*"/>
      <!-- Class extending again. -->

  <!-- Using your classes -->
<Employee xtt:separator=",">
  <!-- 2. Using the class and adding more attributes -->
<FirstName etv:class="detailClass3" etv:startTag="DETAIL:" etv:endTag=":END">
  <xsl:value-of select="wd:First_Name"/> </FirstName>
<!-- 1. Using the simple class only -->
```

```
<Last_Name xtt:class="detailClass">
<xsl:value-of select="wd:Last_Name" /> </Last_Name>
</Employee>
```

This XSLT produces:

First Name	Last Name
DETAIL: Abby*****	:END, Brennan*****
DETAIL: Adam*****	:END, Carlton*****

## Reference: Integration Value Attributes for Document Transformation

### Overview

These attributes replace the value of an element with a value from the integration system. You can define Integration attributes, launch parameters, or integration maps using report fields that can contain references to objects as opposed to simple types. If Workday finds a reference, the Element Transformation and Validation (ETV) step places a Reference ID in the output file.

- attribute – The name of an integration attribute. Workday replaces the element value with the value from the integration attribute.
- direction – The direction that the integration map is applied in. This attribute controls whether the *map* attribute converts an internal Workday value to an external value or the other way around.
- launchParameter – The name of a launch parameter. Workday replaces the element value with the value from the launch parameter.
- map – The name of an integration map. Workday replaces the element value with the equivalent value as specified in the integration map.
- mapAlternateValue – Applies this value to the map attribute value. Use if the integration map named by the map attribute is empty.
- mapAppliedOnEmptyInput – If this attribute is set to true, then the integration map is applied even when there's no input value.
- mapReferenceID – If the integration map named by the map attribute is empty, Workday uses the value of this Reference ID.
- sequencedValue - The name of a sequenced value. Workday replaces the element value with the value from the sequenced value.

### attribute

Summary	Specifies the name of an integration attribute whose value Workday places into the element.
Valid Values	The name of an integration attribute.
Scope	Element only.

You can use this attribute to replace the value of an element with the value of an integration attribute. If the attribute contains multiple values, then the Element Transformation and Validation (ETV) step returns the element multiple times, once for each value. The XML To Text (XTT) step returns the values as text, concatenated together.

Replace the value of an element with the value of an integration attribute.

```
<Cost_Center etv:attribute="Cost Center" />
```

This example produces:

```
<Cost_Center>CC46</Cost_Center>
```

Define the integration attribute as a Reference ID and create a *wd:ID* element:

```
<Organization_Reference etv:attribute="Cost Center" />
```

This example produces:

```
<wd:Organization_Reference wd:Descriptor="Cost Center 46">
    <wd:ID wd:type="WID">cda8ef556ddf425ebcd3bc40f4016ccb</wd:ID>
</wd:Organization_Reference>
```

If the attribute contains multiple values, the ETV step outputs the element multiple times, once for each value. The XTT step outputs the values as text, concatenated together.

If the attribute value is part of XSLT logic, use the *xsl:param* element to retrieve an integration attribute value. To define the *xsl:param* name, prefix the integration attribute name with *attr\_* and replace any spaces with an underscore. Example:

```
<xsl:param name="attr_Root_Organization" />
```

The element contains the text value of any integration attribute value. Multivalued attributes are output as a comma-separated list.

### direction

Summary	Specifies the direction that Workday uses when applying an integration map
Valid Values	Either <i>out</i> or <i>in</i> . If you don't specify a value, Workday maps internal values to external values. When the value is <i>in</i> , Workday maps external values to internal values.
Scope	Element and all child elements.

Integration maps contain 2 sets of values: the internal values and the external values. If you don't specify a value for *map*, the *map* attribute converts an internal value to an external value. The *direction* attribute enables an integration map to be used to convert external values to internal ones.

If the direction is *in* and the map contains multiple internal values and multiple values for the mapped value, the ETV step returns the element multiple times. The ETV step performs this action once for each value. The XTT step returns the values as text, concatenated together.

Add the direction attribute to the element containing the map attribute or to a parent element.

```
<Bank_Account_Type etv:direction="in" etv:map="AccountType">Checking</
Bank_Account_Type>
```

Workday replaces the value of the element with the internal value from the integration map. This example produces:

```
<Bank_Account_Type>C</Bank_Account_Type>
```

You can also use Reference IDs as the internal values in an integration map. If the map contains Reference IDs, then Workday creates a *wd:ID* element.

```
<wd:Worker_Type_Reference etv:direction="in" etv:Map="Employee
Type">SEASONAL</wd:Worker_Type_Reference>
```

This example produces:

```
<wd:Worker_Type_Reference wd:Descriptor="Seasonal">
  <wd:ID wd:type="WID">cda8ef556ddf425ebcd3bc40f4016ccb</wd:ID>
</wd:Worker_Type_Reference>
```

If the value of *direction* is *in* and the map contains multiple internal values for the mapped value, ETV processing returns the element multiple times. ETV returns the element once for each value. XTT processing returns the values as text, concatenated together.

### launchParameter

Summary	Specifies the name of a sequenced value that Workday places into the element.
Valid Values	The name of a launch parameter for the integration system.
Scope	Element only.

Use the *launchParameter* attribute to replace the value of an element with the value of a launch parameter.

If the launch parameter contains multiple values, then the ETV processing returns the element multiple times, once for each value. XTT processing returns the values as text, concatenated together.

Replace the value of an element with the value of a launch parameter:

```
<Cost_Center etv:launchParameter="Cost Center" />
```

The ETV processing replaces the value of this element with the value of the launch parameter:

```
<Cost_Center>CC46</Cost_Center>
```

You can also use Reference IDs as the launch parameter value in an integration system. If the launch parameter contains Reference IDs, then Workday creates a *wd:ID* element.

```
<Organization_Reference etv:launchParameter="Cost Center" />
```

The ETV processing replaces the value of this element with the value of the launch parameter:

```
<wd:Organization_Reference wd:Descriptor="Cost Center 46">
  <wd:ID wd:type="WID">cda8ef556ddf425ebcd3bc40f4016ccb</wd:ID>
</wd:Organization_Reference>
```

If the *launchParameter* contains multiple internal values, then ETV processing returns the element multiple times, once for each value. XTT processing returns the values as text, concatenated together.

### map

Summary	Applies an integration map to the contents of the element.
Valid Values	The name of an integration map on the integration system for the integration.
Scope	Element only.

Use the *map* attribute to apply integration maps to values. The values can be simple types or Reference IDs as required by the integration map. Workday reports unmapped values as messages. The *severity* attribute dictates the severity of these messages.

Replace the value of an element with the value of a launch parameter:

```
<Bank_Account_Type etv:map="Account Type">C</Bank_Account_Type>
```

The value of the *map* attribute is replaced with the value from the integration map.

```
<Bank_Account_Type etv:map="Account Type">Checking</Bank_Account_Type>
```

You can also use Reference IDs as the *map* attribute value in an integration map. If the *map* parameter contains Reference IDs, then Workday creates a *wd:ID* element is created.

```
<Employee_Type etv:map="Employee Type">
  <wd:Worker_Type_Reference wd:Descriptor="Seasonal">
    <wd:ID wd:type="WID">cda8ef556ddf425ebcd3bc40f4016ccb</wd:ID>
    <wd:ID wd:type="Employee_Type_ID">EMPLOYEE_TYPE-10</wd:ID>
  </wd:Worker_Type_Reference>
</Employee_Type>
```

This example produces:

```
<Employee_Type>SEASONAL</Employee_Type>
```

The name of the first child element (*Worker\_Type\_Reference* in the preceding example) isn't important. The Workday Web Service return Reference IDs using a variety of names. This approach enables Workday to copy these elements directly from the Web service responses.

Apply an integration map named *Marital Status* to a marital status Reference ID:

```
<Marital_Status etv:map="Marital Status">
  <xsl:copy-of select="wd:Payee_Personal_Data/wd:Marital_Status_Reference" />
</Marital_Status>
```

If you don't provide a value for the name of an integration map and you didn't specify a default value, Workday displays a message.

### mapAlternateValue

Summary	Identifies an alternate value to use in the case where the integration map is empty.
Valid Values	The alternate value.
Scope	Element only.

If the integration map named by the *map* attribute is empty, use the *mapAlternateValue* attribute to populate the results with an alternate value. This option enables you to provide integration maps in the integration that you don't have to populate. If the integration map is configured with at least 1 value, then the *mapAlternateValue* attribute is ignored.

Map an empty attribute to an alternate value:

```
<Employee_Type etv:map="Employee Type" etv:mapAlternateValue="Full Time">Regular</Employee_Type>
```

This example produces:

```
<Employee_Type>Full Time</Employee_Type>
```

Map an empty attribute of *Employee\_Type\_ID* to a nonexistent reference ID:

```
<Employee_Type etv:map="Employee Type" etv:mapAlternateValue="alternate"
etv:mapReferenceID="Employee_Type_ID">
<wd:Worker_Type_Reference wd:Descriptor="Seasonal">
<wd:ID wd:type="WID">cda8ef556ddf425ebcd3bc40f4016ccb</wd:ID>
</wd:Worker_Type_Reference>
</Employee_Type>
```

The mapping fails because the reference ID doesn't exist. This example produces:

```
<Employee_Type>alternate</Employee_Type>
```

### mapAppliedOnEmptyInput

Summary	Maps an empty input value to a default value.
Valid Values	Boolean, either <i>true</i> or <i>false</i> . When set to <i>true</i> , an empty input value is mapped to a default value.
Scope	Element only.

If a field doesn't have an input value, you can set the value of *mapAppliedOnEmptyInput* to true, which sets the empty field value to a default value.

Attempting to apply a map without a default value to an empty input value generates an ETV message. The ETV message returns *No value output from applying integration map* (unless the integration map is empty and *etv:mapAlternateValue* is set). This message is the typical response when applying a map that doesn't produce an output value.

### mapReferenceID

Summary	Identifies a Reference ID or Reference descriptor value used in the case where the integration map is empty.
Valid Values	The name of a Reference ID.
Scope	Element only.

If the integration map named in the *map* attribute is empty, use the *mapReferenceID* attribute to populate the value returned with a Reference ID or reference descriptor. This option enables you to provide integration maps on the integration that an implementer can decide not to populate. If the integration map is configured with at least 1 value, then the *mapReferenceID* attribute is ignored.

Map reference IDs to populate values when you don't configure the integration map with values:

```
<Employee_Type etv:map="Employee Type"
etv:mapReferenceID="Employee_Type_ID">
<wd:Worker_Type_Reference wd:Descriptor="Seasonal">
<wd:ID wd:type="WID">cda8ef556ddf425ebcd3bc40f4016ccb</wd:ID>
<wd:ID wd:type="Employee_Type_ID">EMPLOYEE_TYPE-10</wd:ID>
</wd:Worker_Type_Reference>
</Employee_Type>
```

This example produces:

```
<Employee_Type>EMPLOYEE_TYPE-10</Employee_Type>
```

If the integration map isn't configured with any values, map *Descriptor* to the value of the *mapReferenceID* attribute.

```
<Employee_Type etv:map="Employee Type" etv:mapReferenceID="Descriptor">
  <wd:Worker_Type_Reference wd:Descriptor="Seasonal">
    <wd:ID wd:type="WID">cda8ef556ddf425ebcd3bc40f4016ccb</wd:ID>
    <wd:ID wd:type="Employee_Type_ID">EMPLOYEE_TYPE-10</wd:ID>
  </wd:Worker_Type_Reference>
</Employee_Type>
```

This example produces:

```
<Employee_Type>Seasonal</Employee_Type>
```

### sequencedValue

Summary	Specifies the name of a sequenced value that Workday places into the element
Valid Values	String, the name of a sequenced value.
Scope	Element only.

Sequence Generators defined on an integration system generate unique values for use within integrations. These values can be placed into an element using the *sequencedValue* attribute.

Replace the contents of an element with a value:

```
<Document_Number etv:sequencedValue="Document Number" />
```

This example produces:

```
<Document_Number>57</Document_Number>
```

## Reference: Number Formatting Attributes for Document Transformation

### Overview

These attributes enable you to specify a number format. Format the element values provided as input to the steps as defined by the XML Schema specification. Workday converts the values to the format specified in the attributes.

- *decimalSeparator* – The decimal separator character.
- *groupingSeparator* – The grouping separator character.
- *numberFormat* – The number format pattern. Example: #,###.00.
- *scale* – The position of an implied decimal place in the formatted value.

### decimalSeparator

Summary	Specifies the decimal separator that Workday uses when reformatting numbers.
---------	--

Valid Values	Any character.
Scope	Element and all child elements.

Specify the symbol used as the decimal separator when Workday reformats numbers. If you don't specify a value, Workday uses the current locale.

Specify a decimal separator:

```
<Salary etv:numberFormat="#,###.00" etv:decimalSeparator=","
etv:groupingSeparator=".">10000</Salary>
```

This example produces:

```
<Salary>10.000,00</Salary>
```

### groupingSeparator

Summary	Specifies the grouping separator that Workday uses when reformatting numbers.
Valid Values	Any character.
Scope	Element and all child elements.

Specify the symbol to use as a separator when Workday reformats numbers. If you don't specify a value, Workday uses the current locale if not specified.

Specify a grouping separator:

```
<Salary etv:numberFormat="#,###.00" etv:decimalSeparator=","
etv:groupingSeparator=".">10000</Salary>
```

This example produces:

```
<Salary>10.000,00</Salary>
```

### numberFormat

Summary	Specifies the number format pattern that Workday converts numbers to.
Valid Values	String, a number format pattern as used in Java.
Scope	Element only.

Specify a number format. Workday processes the value of the element as a number and converts the number to the format specified in this attribute.

Specify a number format:

```
<Salary etv:numberFormat="#,###.00">10000</Salary>
```

This example produces:

```
<Salary>10,000.00</Salary>
```

**scale**

Summary	Specifies the position of an implied decimal place that Workday uses when reformatting numbers.
Valid Values	A positive integer.
Scope	Element and all child elements.

Specify the position of an implied decimal place used when Workday reformats numbers.

Specify the position of an implied decimal place:

```
<Salary etv:numberFormat="0000000000" etv:scale="2">12345.67</Salary>
```

This example produces:

```
<Salary>0001234567</Salary>
```

## Reference: Text Insertion and Removal Attributes for Document Transformation

**Overview**

These attributes enable you to add additional text before or after an element when it's converted to a text document. These attributes also enable you to remove the content of an element. These attributes can be useful when creating documents that use more complex text file formats such as Electronic Data Interchange (EDI).

- **endTag** – Place the contents of the attribute after the value of the element in the output document.
- **omit** – Don't copy the contents of the element to the output message.
- **startTag** – Place the contents of the attribute before the value of the element in the output document.

**endTag**

Summary	Place that attribute value after the value of the element in the output message.
Valid Values	Any text.
Scope	Element only.

Place the *endTag* attribute value in the output message after the value of the attached element.

Place a value before the element it's attached to:

```
<Sample xtt:endTag=":END">Hello World</Sample>
```

This example produces:

```
Hello World:END
```

**omit**

Summary	Don't copy the contents of the element to the output message.
---------	---

Valid Values	<i>true</i> or <i>false</i> .
Scope	Element and all child elements.

Specify that Workday doesn't copy the contents of an element to the output document. Use *omit* with XML To Text (XTT) processing in an XML document created by an Extensible Stylesheet Language Transformation (XSLT) to produce different results during conversion. Example: Apply an alternative stylesheet to your XML to generate an audit file that contains additional information that you later omit from the final document.

You can use the *omit* attribute with *setNumber*. Example: Introduce an additional element into the XML document containing a *setNumber* attribute to reset a variable to zero.

When the *omit* attribute contains the value *true* on an element, the values are processed but results aren't sent to the output. You can use this option when summing or incrementing number values that Workday doesn't use directly, but from which Workday derives information. The attribute inherits its value. In some instances, you can set the *omit* attribute to *false* to include a required child element in the output.

Exclude contents of an element from the output:

```
<Sample>
  <item>One</item>
  <item etv:omit="true">Two</item>
  <item>Three</item>
</Sample>
```

This example produces:

```
<Sample>
  <item>One</item>
  <item>Three</item>
</Sample>
```

## startTag

Summary	Workday places an attribute value in the output file before the value of the element.
Valid Values	Any text.
Scope	Element only.

Place the value of the attribute value in the output message before the value of the attached element.

Place a value before the element it's attached to:

```
<Sample xtt:startTag="START:>Hello World</Sample>
```

This example produces:

```
START:Hello World
```

## Reference: Truncation Attributes for Document Transformation

### Overview

The *maxLength* attribute specifies the maximum number of characters that an element can have. Unless otherwise stated, Workday returns an error message for any element that exceeds this length. These attributes enable you to state that Workday truncates these values.

- *fieldLengthCalculation* – Specifies whether the integration measures the length in characters or bytes.
- *reportTruncation* – Controls whether the integration reports truncation of a value:
  - In a validation message.
  - By adding an attribute to the XML document itself indicating that Workday truncates the value.
- *truncate* – A boolean value indicating if the integration truncates elements longer than their maximum length.

### **fieldLengthCalculation**

Summary	Controls how the integration calculates the length of a value for use with the <i>maxLength</i> attribute.
Valid Values	Either <i>characters</i> or <i>bytes</i> , followed by the character encoding. If you don't specify a value, Workday calculates the length in characters.
Scope	Element only.

Indicate whether Workday calculates the length of a field in characters or in bytes. If Workday calculates the length in bytes, then Workday provides the character encoding in the attribute.

Count the length of a field set by the *maxLength* attribute:

```
<Sample etv:truncate="true" etv:fieldLengthCalculation="bytes:utf-8"
etv:maxLength="6">Straße</Sample>
```

This example produces:

```
<Sample>Straß</Sample>
```

### **reportTruncation**

Summary	Specifies how Workday reports the truncation of a value.
Valid Values	A comma-separated list containing one or more of these values: <i>none</i> , <i>attribute</i> , <i>critical</i> , <i>error</i> , <i>warning</i> , or <i>info</i> . If you don't specify a value, Workday doesn't report truncated values.
Scope	Element and all child elements.

If you set the *truncate* attribute to *true*, the integration truncates any value that exceeds the maximum length specified by *maxLength*. The *reportTruncation* attribute controls how the integration reports truncation of a value, if at all. Workday can report the truncation as a validation message, or Workday can add an attribute to the message itself.

When *reportTruncation* is *none*, Workday truncates the values without reporting them. When the value is *attribute*, Workday adds a *truncated="true"* attribute to any elements whose values Workday truncated. You can use this option in later processing steps to identify truncated values.

Truncate an element and apply the attribute value to later elements:

```
<City etv:truncate="true" etv:reportTruncation="attribute"
      etv:maxLength="30">Llanfairpwllgwyngyllgogerychwyrndrobwyllyllantysiliogogoch</
    City>
```

This example produces:

```
<City etv:truncated="true">Llanfairpwllgwyngyllgogerychwyt</City>
```

Truncate an element to a maximum length of 30 and display a warning:

```
<City etv:truncate="true" etv:maxLength="30"
      etv:reportTruncation="warning">Llanfairpwllgwyngyllgogerychwyrndrobwyllyllantysiliogogoch</
    City>
```

This example produces:

```
<City>Llanfairpwllgwyngyllgogerychwyt</City>
```

Workday also produces a warning message:

```
<wdext:Integration_Message>
  <wdext:Severity>WARNING</wdext:Severity>
  <wdext:Summary> The value of City exceeds the maximum length of 30. The
  value has been truncated.</wdext:Summary>
</wdext:Integration_Message>
```

## truncate

Summary	If a value exceeds the length specified in the <i>maxLength</i> attribute, controls whether the integration truncates the value.
Valid Values	Boolean; when <i>true</i> , the integration truncates values.
Scope	Element and all child elements.

Truncate a value when you add the *maxLength* attribute to the parent element. The integration truncates a value only if *truncate* (set to *true*) is attached to that element or a parent element.

Truncate an element to a maximum length of 30:

```
<City etv:truncate="true"
      etv:maxLength="30">Llanfairpwllgwyngyllgogerychwyrndrobwyllyllantysiliogogoch</
    City>
```

This example produces:

```
<City>Llanfairpwllgwyngyllgogerychwyt</City>
```

## Reference: Validation Attributes for Document Transformation

### Overview

Workday provides attributes to apply validation rules to the contents of the element they're attached to for Element Transformation and Validation (ETV) or XML To Text (XTT) processing. These attributes provide control over the message that Workday reports when an element fails a validation rule, and create custom messages.

The messages use the name of the element, with underscores replaced with space, to refer to the value that failed the validation check. This convention is useful where you can give the elements meaningful names.

- enumeration – A comma-separated list of values. The element must contain one of the values listed.
- maxLength – The maximum length of the value in the element.
- message – Text of a message to be output in the same way as a message resulting from a validation. You can require other validation rules not supported by these existing sets of attributes. You can implement such validation rules in an Extensible Stylesheet Language Transformation (XSLT). You can use the message attribute to add your message to the list of messages generated by ETV or XTT processing.
- minLength – The minimum length of the value in the element.
- name – Use this attribute to provide a name to be used in validation messages instead of the element name.
- nameAttribute – This attribute contains the qualified name of another attribute that contains the name to be used in validation messages.
- required – The element must contain at least 1 character.
- severity – The severity of the message. One of these severity levels: info, warning, error, or critical.
- target – The target of the validation message. Example: when processing employee data, this target can be the employee name.
- targetWID – The Workday ID of the target. Workday uses the target to provide a hyperlink in the message.

### enumeration

Summary	Validates that an element contains one of a specific list of values.
Valid Values	A comma-separated list of values.
Scope	Element only.

Set a list of values to validate the contents of the element. The enumeration attribute doesn't alter the contents of the element.

Validate the contents of an element using specific values:

```
<Sample>
  <A etv:enumeration="this,that">this</A>
  <B etv:enumeration="this,that">other</B>
</Sample>
```

This example produces:

```
<Sample>
  <A>this</A>
  <B>other</B>
```

```
</Sample>
```

Workday also produces a warning message:

```
<wdext:Integration_Message>
  <wdext:Summary>The value of B is invalid</wdext:Summary>
</wdext:Integration_Message>
```

### maxLength

Summary	Specifies the maximum length for the value of an element.
Valid Values	A numeric value indicating the maximum length.
Scope	Element only.

Workday acts on this attribute based on the *truncate* attribute. If *truncate* is true, then any value that exceeds *maxLength* is truncated. If *truncate* is false, a message reports that the value exceeds *maxLength*.

### message

Summary	Provides the text of a message.
Valid Values	Any text value.
Scope	Element only.

Display a *message* for a custom validation rule applied during the XSL Transformation. The presence of this attribute always causes a validation message to display.

Display a message for a custom validation rule:

```
<Social_Security_Number etv:message="The Social Security Number is invalid"
  etv:severity="error">1234123412345</Social_Security_Number>
```

This example produces:

```
<wdext:Integration_Message>
  <wdext:Severity>ERROR</wdext:Severity>
  <wdext:Summary>The Social Security Number is invalid.</wdext:Summary>
</wdext:Integration_Message>
```

### minLength

Summary	Specifies the minimum length for the value of an element.
Valid Values	A numeric value indicating the minimum length.
Scope	Element only.

If the value of the element is less than the length specified in this attribute, Workday returns a message stating that the value is too short.

**name**

Summary	Provides the name that Workday uses in validation messages.
Valid Values	Any text.
Scope	Element only.

Supply a field name that validation messages use. If you don't specify a value, Workday uses the element name in the validation message.

Display an error message using the original element name:

```
<SSN etv:required="true"></SSN>
```

This example produces:

```
<wdext:Integration_Message>
  <wdext:Summary>No SSN was found. This is a required field for the output
  document.</wdext:Summary>
</wdext:Integration_Message>
```

Display an error message containing a custom element name:

```
<SSN etv:name="Social Security Number" etv:required="true"></SSN>
```

This example produces:

```
<wdext:Integration_Message>
  <wdext:Summary>No Social Security Number was found. This is a required
  field for the output document.</wdext:Summary>
</wdext:Integration_Message>
```

**nameAttribute**

Summary	Provides a reference to an attribute containing the name of the field used in validation messages.
Valid Values	A name identifying another attribute.
Scope	Element and all child elements.

Refer to another attribute that contains the name of the field required for a validation message.

Use the *nameAttribute* attribute to identify the attribute and the associated field to be displayed in a validation message.

```
<Sample xtt:nameAttribute="ID">
  <item ID="Z453" etv:required="true">One</item>
  <item ID="Z454" etv:required="true"> </item>
  <item ID="Z455" etv:required="true">Three</item>
</Sample>
```

This example produces:

```
<wdext:Integration_Message>
  <wdext:Summary>No Z454 was found. This is a required field for the output
  document.</wdext:Summary>
</wdext:Integration_Message>
```

## required

Summary	Indicates that the element must contain a value.
Valid Values	<i>true</i> or <i>false</i> .
Scope	Element only.

Require the Social Security Number element to contain a value and display a message if it's empty:

```
<Social_Security_Number etv:required="true">1234123412345</Social_Security_Number>
```

This example produces:

```
<Social_Security_Number etv:required="true"></Social_Security_Number>
```

Workday also produces a warning message:

```
<wdext:Integration_Message>
  <wdext:Summary>No Social Security Number was found for John Smith. This is
  a required field for the output document.</wdext:Summary>
</wdext:Integration_Message>
```

## severity

Summary	Sets the severity of messages.
Valid Values	Either <i>info</i> , <i>warning</i> , <i>error</i> , or <i>critical</i> . Workday uses the default value used if you don't set this attribute to <i>error</i> .
Scope	Element and all child elements.

The *severity* attribute is used to control the severity of messages. This attribute applies to messages created by the validation attributes as well as the *message* attribute.

Set a severity level on a required attribute and produce the related validation message:

```
<Social_Security_Number etv:required="true" etv:severity="ERROR"></Social_Security_Number>
```

This example produces:

```
<wdext:Integration_Message>
  <wdext:Severity>ERROR</wdext:Severity>
  <wdext:Summary> No value was found for Social Security Number. This is a
  required field for the output document.</wdext:Summary>
</wdext:Integration_Message>
```

## target

Summary	Provides the name of the target, which is typically a worker.
Valid Values	Any text value.
Scope	Element and all child elements.

When *required* is true, create messages that add information to the error message describing a failed validation.

Add text to a validation message.

```
<Social_Security_Number etv:required="true" etv:target="John Smith"></Social_Security_Number>
```

This example produces:

```
<wdext:Integration_Message>
  <wdext:Summary>No Social Security Number was found for John Smith. This is
  a required field for the output document.</wdext:Summary>
</wdext:Integration_Message>
```

### targetWID

Summary	Provides the Workday ID of the target.
Valid Values	A Workday ID. You can provide multiple Workday IDs as a comma-separated list.
Scope	Element and all child elements

When *required* is true, create messages that add the Workday ID (WID) of the target object. If the message is attached to an Integration Event, the message includes a hyperlink to the target object.

Add the Workday ID to a message:

```
<Social_Security_Number etv:required="true" etv:target="John Smith"
  etv:targetWID="2af9579a2bde48d49bfc16ce5bcd138"></Social_Security_Number>
```

This example produces:

```
<wdext:Integration_Message>
  <wdext:Target>2af9579a2bde48d49bfc16ce5bcd138</wdext:Target>
  <wdext:Summary>No Social Security Number was found for John Smith. This is
  a required field for the output document.</wdext:Summary>
</wdext:Integration_Message>
```

## Reference: Document Transformation Sample Use Case

This example displays how you can use the XML To Text (XTT) step with an XSLT transformation to generate a CSV file containing employee data. The XTT step produces a file that contains these values for an employee:

- Name.
- Social Security Number.
- Postal address.
- Date of birth.
- Gender.

Use an XSLT stylesheet to loop through employee data and copy only the data needed for the CSV file.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet
  xmlns:wd="urn:com.workday/bsvc" version="2.0"
  xmlns:xsd="http://www.w3.org/2001/XMLSchema"
```

```

xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
xmlns:xtt="urn:com.workday/xtt">
<xsl:output indent="yes" method="xml" />
<xsl:template match="/*">
    <Employees xtt:truncate="true" xtt:severity="error">
        <xtt:class xtt:name="date" xtt:dateFormat="dd/MM/yyyy" />
        <xsl:for-each select="wd:Worker">
            <!-- Variable declarations have been omitted. -->
            <Employee xtt:target="{$EmployeeName}">
                xtt:targetWID="{$EmployeeWID}"
                xtt:quotes="csv"
                xtt:endTag="
#xA;">
                <Personal_Data xtt:separator=",">
                    <First_Name xtt:required="true">
                        <xsl:value-of select="$NameData/wd:First_Name" />
                    </First_Name>
                    <Last_Name xtt:required="true">
                        <xsl:value-of select="$NameData/wd:Last_Name" />
                    </Last_Name>
                    <Social_Security_Number xtt:required="true">
                        <xsl:value-of select="$SSN" />
                    </Social_Security_Number>
                    <Address_Line_1 xtt:required="true" xtt:maxLength="10">
                        <xsl:value-of select="$Address/wd:Address_Line_Data[1]" />
                    </Address_Line_1>
                    <Address_Line_2 xtt:maxLength="50">
                        <xsl:value-of select="$Address/wd:Address_Line_Data[2]" />
                    </Address_Line_2>
                    <City xtt:required="true" xtt:maxLength="20">
                        <xsl:value-of select="$Address/wd:Municipality" />
                    </City>
                    <State>
                        <xsl:value-of select="$State" />
                    </State>
                    <Zip>
                        <xsl:value-of select="$Address/wd:Postal_Code" />
                    </Zip>
                    <BirthDate xtt:class="date">
                        <xsl:value-of select="$PersonalData/wd:Birth_Date" />
                    </BirthDate>
                    <Gender xtt:map="Gender">
                        <xsl:copy-of select="$PersonalData/wd:Gender_Reference" />
                    </Gender>
                    </Personal_Data>
                </Employee>
            </xsl:for-each>
        </Employees>
    </xsl:template>
</xsl:stylesheet>

```

In the preceding example, the *target* and *targetWID* attributes are set at the employee level. Any error messages produced by the XSLT include the current employee name. The XSLT parses through all of the fields, whether or not an employee record contains the field. The *xtt:class* element defines a *dateformat* pattern. The *BirthDate* element refers to this class attribute.

The XSLT produces:

```

<Employees
    xmlns:xtt="urn:com.workday/xtt"
    xmlns:wd="urn:com.workday/bsvc"
    xtt:truncate="true"
    xtt:severity="error">
    <xtt:class xtt:name="date" xtt:dateFormat="yyyy/MM/dd" />

```

```

<Employee
    xtt:target="Logan McNeil"
    xtt:targetWID="66a65677834f0a9b586dd5645e9004"
    xtt:quotes="csv"
    xtt:endTag="&#xD;&#xA;">
    <Personal_Data xtt:separator=",">
        <First_Name xtt:required="true">Logan</First_Name>
        <Last_Name xtt:required="true">McNeil</Last_Name>
        <Social_Security_Number xtt:required="true"></
Social_Security_Number>
        <Address_Line_1 xtt:required="true" xtt:maxLength="10">3870
Pacific Avenue</Address_Line_1>
        <Address_Line_2 xtt:maxLength="50" />
        <City xtt:required="true" xtt:maxLength="20">San Francisco</
City>
        <State>CA</State>
        <Zip>94111</Zip>
        <BirthDate xtt:class="date">1972-05-25-08:00</BirthDate>
        <Gender xtt:map="Gender">
            <wd:Gender_Reference wd:Descriptor="Female">
                <wd:ID wd:type="WID">77da47525a434e98894dd95c641a68d4</
wd:ID>
                <wd:ID wd:type="Gender_Code">245.1</wd:ID>
            </wd:Gender_Reference>
        </Gender>
    </Personal_Data>
</Employee>
</Employees>

```

Next, when you apply the XTT step, Workday produces these results:

```
Logan,McNeil,,3870 Pacif.,,San Francisco,CA,94111,1972/05/25,F
```

The Social Security Number for the employee is missing from the example. The XTT step also produces this error message:

```
No Social Security Number available for Logan McNeil. Social Security Number
is a required
field.
```

## Concept: Document Transformation Connector

Element Transformation and Validation (ETV) and XML To Text (XTT) provide a number of different ways to transform and validate elements in an XML document.

Workday provides several categories of attributes that enable you to process elements:

- Arithmetic elements: count and sum element values; optionally write calculation results to another element.
- Comma-separated Value (CSV) formatting: format output documents in CSV.
- Date/Time formatting: Apply date, date-time, and time zone formatting.
- Element Text Addition and Removal: apply additional fixed text to the start or end of an element, or leave element content out of the output document.
- Fixed-length formatting: define formatting rules to make all output values the same length, using truncation and padding characters.
- Grouped attributes: define groups of attributes and apply them to an element as a single action.
- Integration System: insert integration attribute, launch parameter, and map values into elements.
- Number Formatting: specify number formatting, including decimals, grouping, and scale.

- Truncation: truncate element length (in characters or bytes) and specify error reporting.
- Validation: apply validation rules to elements and define messages that Workday returns when elements fail these rules.

## XML Validity

The ETV and XTT processing instructions require that the XML output by the XSLT transformation is valid XML.

## Scope Rules

You can attach many attributes (such as *dateFormat* or *maxLength*) to elements of simple types and only apply these attributes to the elements to which they're attached. Others (such as *target* or *truncate*) can be attached to any element and child elements inherit their value.

## Reusing Attributes

ETV and XTT enable you to define groups of attributes as reusable classes. You can define these groups using an element called *class*. You can refer to the group later using the attribute *class*.

Example: Define a reusable number or date format:

```
<etv:class etv:name="decimal" etv:numberFormat="##,##.00"
  etv:decimalSeparator="," etv:groupingSeparator="." />
<Salary etv:class="decimal">10000</Salary>
```

This XML produces:

```
<Salary>10.000,00</Salary>
```

## Precedence of Multiple Attributes

You can use different attributes together on the same elements. Example: you can extract the value of a launch parameter, map it using an integration map, and place it in the output file. If you use multiple attributes together, Workday applies these attributes in this order:

1. Data extraction: Example: *attribute*, *launchParameter*, *sequencedValue*, or *number*.
2. Apply Integration Map.
3. Formatting. Example: *numberFormat* or *dateFormat*.
4. Number addition. Example, *addNumber*.
5. Truncation.
6. Validation.

Note: If you use one or more of the attributes *launchParameter*, *sequencedValue*, or *number* on a single element, the behavior is undefined.

# Concept: Document Transformation and Validation

## Add Workday-Specific Instructions and Validate XML Documents

Element Transformation and Validation (ETV) and XML To Text (XTT) enable you to add processing instructions to an XSLT transformation using attributes. The Document Transformation Connector enables you to specify an XSLT transformation that generates XML with embedded ETV and XTT attributes. These attributes transform and validate the output documents for the integration.

The XTT step supports instructions that convert XML documents to text. It converts documents from XML to text formats such as comma-separated values (CSV), fixed width, or other text formats. XTT

also supports many of the transformation and validation instructions supported by ETV. You can use the XTT step standalone or with the ETV step. You control the process by using the *namespace* attribute. The ETV step processes attributes in the *urn:com.workday/etv* namespace. Workday passes attributes in the *urn:com.workday/xtt* namespace through the ETV step. The XTT step then processes these attributes.

### Transform and Validate XML Documents

Element Transformation and Validation (ETV) transforms and validates the elements within an XML document. ETV uses the instructions provided by attributes attached to the elements.

Specify that the maximum length for *City* is 30 and that longer values are truncated.

```
<?xml version="1.0" encoding="utf-8"?>
<Sample xmlns:etv="urn:com.workday/etv">
  <City etv:truncate="true"
    etv:maxLength="30">Llanfairpwllgwyngyllgogerychwyrndrobwyllynantysiliogogogoch</
  City>
</Sample>
```

This example produces:

```
?xml version="1.0" encoding="utf-8"?>
<Sample>
  <City>Llanfairpwllgwyngyllgogerychwy</City>
</Sample>
```

Workday truncates the value to 30 characters and removes the ETV attributes.

Require that the *Social\_Security\_Number* element contain a value:

```
<?xml version="1.0" encoding="utf-8"?>
<Sample xmlns:etv="urn:com.workday/etv">
  <Social_Security_Number etv:required="true"></Social_Security_Number>
</Sample>
```

This example produces:

```
<?xml version="1.0" encoding="utf-8"?>
<Sample>
  <Social_Security_Number></Social_Security_Number>
</Sample>
```

Workday also produces a warning message:

No value is available for Social Security Number. Social Security Number is a required field.

### Convert XML Documents to Text

XML To Text (XTT) converts documents from XML to text formats like comma-separated values (CSV), fixed width, or other text formats.

Separate each row with a newline, each item by a comma, and quote each value based on the rules for CSV files:

```
<?xml version="1.0" encoding="utf-8"?>
<Document xmlns:xtt="urn:com.workday/xtt" xtt:separator="\r\n" xtt:quotes="csv">
  <Row xtt:separator=",">
    <Item>A1</Item>
    <Item>B1</Item>
```

```

<Item>C1</Item>
</Row>
<Row xtt:separator=" , ">
  <Item>A2</Item>
  <Item>B2</Item>
  <Item>C2</Item>
</Row>
<Row xtt:separator=" , ">
  <Item>A3</Item>
  <Item>B3</Item>
  <Item>C3</Item>
</Row>
</Document>

```

This example produces:

```

A1 , B1 , C1
A2 , B2 , C2
A3 , B3 , C3

```

## Use ETV and XTT with XSLT

You can use the ETV and XTT steps with XSLT. Use the XSLT stylesheet to create the XML document that Workday processes by these 2 steps.

Apply an XSLT stylesheet to generate an error message for a missing Social Security Number. Add the *etv:required* attribute to the Social Security Number element:

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:etv="urn:com.workday/etv">
  <xsl:template match="/">
    <Sample>
      <Social_Security_Number etv:required="true">
        <xsl:value-of select="Worker/PersonalData/SSN" />
      </Social_Security_Number>
    </Sample>
  </xsl:template>
</xsl:stylesheet>

```

Use this approach to add simple *xsl:value-of* statements to the XSLT that copy values from the input document to the output document. The attributes control the processing applied to the elements.

# Financials Connectors

## Accounting Journal Connector

### Steps: Set Up Accounting Journal Connector

#### Prerequisites

- Access to an SFTP server that contains the accounting journal files.

- Accounting journal data files must be in the Workday-defined XML or Comma-Separated Value (CSV) format.
- Create ledger accounts and worktags for all Workday accounts.

## Context

You can create an integration that imports accounting journal data files into Workday from an external SFTP endpoint.

## Steps

1. Access the Create Source System task and create 1 source for each external endpoint.  
Security: *Set Up: Map Worktags* domain in the Worktags functional area.
2. Access the Create Integration Worktag Mapping task and map each external code to corresponding Ledger Account and worktags, Ledger Accounts, and worktags.  
Security: *Set Up: Map Worktags* domain in the Worktags functional area.
3. Access the Create Integration System task and enter *Core Connector: Accounting Journal Inbound* at the New Using Template prompt.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
4. (Optional) Enable integration services. As you complete this section, consider:

Option	Description
Maintain Journal Sources Configuration – DIS	Enable this service if you configured Suspense Accounting with Journal Sources. If you enable this service, the integration displays a Warning message instead of an Error Message for each journal with missing code mappings. The integration continues to process the journal.
Financials Document Delivery Service	Select the Configure Files for External Delivery integration attribute to enable this service to deliver these output files to external endpoints: <ul style="list-style-type: none"> <li>• CSV Audit Diagnostic File</li> <li>• Errors Only File</li> </ul> To deliver these files, you must select the associated integration attributes: <ul style="list-style-type: none"> <li>• Create Audit File in CSV Format</li> <li>• Create Errors Only File</li> </ul> To deliver files to external endpoints, configure a document delivery step on a business process in the integration system.           We don't support backslashes on these fields when you generate an audit file on a CSV import file: <ul style="list-style-type: none"> <li>• Journal Entry Memo</li> <li>• Journal External Reference ID</li> <li>• Journal Line External Reference ID</li> <li>• Journal Line Memo</li> </ul>

5. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

- *Accounting Journal Event* (business process)
- *Integration Event*

See: [.../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).

6. Select Integration System > Configure Integration Attributes as a related action on the integration system and enter integration service attributes.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

7. Select Integration System > Configure Integration Maps as a related action on the integration system. Map values between Workday and the accounting journal data files.

Use the *Worktag Mapping Definition for External Code* integration map to associate the integration worktag mappings that you created in Step 3 with the integration system. Workday uses the External Value configured for this Integration Map in the input file to reference the map. Example: `<ExternalCode jc:name="RegionMap">West</ExternalCode>`.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

8. Set Up Integration Retrieval on page 1957.

9. Launch an Integration on page 24.

To return journals with any status update or within a specific date range:

- Select *Payroll Journal Outbound Request* as your provider.
- Use the *Journal Date Query Option* field.

## Concept: Accounting Journal Connector

Import accounting journal data into Workday from an external endpoint with the Accounting Journal Connector. This integration (and related Workday tasks) translates data between:

- External chart of account structures
- Your Workday worktag and account structures

The integration imports data in a Workday-defined XML or Comma-Separated Value (CSV) format.

### Accounting Journal Connector Integration and Supporting Tasks

The Accounting Journal Connector consists of these components and supporting tasks:

Component	Description
Create Source System	This task enables you to define external source endpoints.
Create Integration Worktag Mapping	This task enables you to map between: <ul style="list-style-type: none"> <li>• External codes for source accounts</li> <li>• Ledger accounts or worktags in Workday.</li> </ul>
<i>Core Connector: Accounting Journal Inbound</i>	This integration template enables you to create an integration system that: <ul style="list-style-type: none"> <li>• Retrieves an XML or CSV file from an external SFTP endpoint that contains accounting journal data.</li> </ul>

Component	Description
	<ul style="list-style-type: none"> <li>Translates data by applying the mapping rules that you define with the Create Integration Worktag Mapping task.</li> <li>Maps rules that you define directly in the integration as part of integration maps.</li> <li>Loads the data into Workday.</li> <li>Supports reporting and error handling at the Journal and Journal Line levels.</li> </ul>

## Launch/Schedule Options

Workday provides these launch schedule options for the Accounting Journal Connector:

- Launch on schedule. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration retrieves any files from the endpoint.
- Launch immediately. You can launch the integration manually.

## Processing Notes

If the *LedgerAccountingReferenceID* element exists in the Accounting Journal Connector input file, Workday ignores the external code values that map to ledger accounts. You can override integration attribute values by populating them in the input file.

## Error Handling

The Accounting Journal Connector enables you to generate an errors-only file for faster error resolution:

- To enable this optional feature, enable the *Create Errors Only File* integration attribute.
- When the integration loads an accounting journal file, it creates an errors-only file if there are errors in the original file. The integration attaches the errors-only file to the output files section of the integration event.
- The errors-only file is in the same format (XML or CSV) as the original accounting journal file. It contains only the journals that are in error. Example: you load 25 journals into Workday, and 2 journals fail to load. Workday generates an errors-only file that contains the 2 failed journals.
- After you resolve any errors in the errors-only file, you load the file into Workday using the Accounting Journal Connector.

## Reference: Accounting Journal Connector CSV File Format

The CSV import file format has 2 types of rows:

- Header row. The first row in the CSV file is a fixed header row. The header row describes the columns that the journal data rows populate. There can be only 1 header row in a file, and it must be the first row of the file. You can skip the optional columns in the input file by removing the column or leaving it empty.
- Journal Data rows. These rows consist of journal header and journal lines details. The integration loads all journal lines with the same *JournalKey* value as a single journal entry in Workday.

Boolean values are *1* (true) and *0* (false). Date value format is *YYYY-MM-DD*.

When you enter a value for a ReferenceID field, you must also provide a reference ID type.

Example: The header field is titled *AccountingJournalReferenceID*. Enter an acceptable value for the *AccountingJournalReferenceIDType* header field.

Workday considers a field required unless otherwise stated.

Download the [Accounting Journal Connector CSV import file template](#) to view a full list of available fields.

You can include these columns for the journal header:

Journal Header Fields	Type	Description
JournalKey	Text	Aggregates journal lines belonging to the same journal. Workday loads all journal lines with the same <i>JournalKey</i> as a single journal entry.
AccountingJournalID	Text	For this field, you can: <ul style="list-style-type: none"> <li>Create an accounting journal with the value provided in this field. If you leave the field empty, Workday generates a unique accounting journal ID.</li> <li>Update an accounting journal by providing a reference to an existing accounting journal ID.</li> <li>Change the accounting journal ID for an existing journal by entering a new value in this field. Enter the reference for the old accounting journal ID in the <i>AccountingJournalReferenceID</i> field.</li> </ul>
AccountingJournalReferenceIDType	Text	Required if you provide a value on <i>AccountingJournalReferenceID</i> . Enter either: <ul style="list-style-type: none"> <li><i>Account_Set_ID</i></li> <li><i>WID</i></li> </ul>
AccountingJournalReferenceID	Text	Optional field. Identifies an existing accounting journal. Enter a reference to an existing journal in Workday or leave the field empty. If this field is empty, Workday generates a unique ID.
Submit	Boolean	Optional field. Determines if you save the journal in draft mode or submit it. Enter: <ul style="list-style-type: none"> <li><i>0</i> to save the journal in draft mode with a status of <i>Created</i>.</li> <li><i>1</i> to submit the journal with a status of <i>Posted</i>.</li> </ul>

Journal Header Fields	Type	Description
		If the field is empty, Workday automatically enters <i>0</i> .
DisableOptionalWorktagBalancing	Boolean	<p>Optional field. Disables worktag balancing for the given journal. Enter:</p> <ul style="list-style-type: none"> <li><i>0</i> to enable worktag balancing.</li> <li><i>1</i> to disable worktag balancing.</li> </ul> <p>If the field is empty, Workday automatically enters <i>1</i>.</p>
LockedinWorkday	Boolean	<p>Optional field. Determines if you can edit the journal in Workday. Enter a value of <i>1</i> to lock the journal. You can't edit, cancel, or change a locked journal. If the field is empty, Workday automatically enters <i>0</i>.</p>
AddOnlyJournal	Boolean	<p>Optional field. Determines if Workday updates an existing journal or creates a new journal. Enter:</p> <ul style="list-style-type: none"> <li><i>0</i> to update an existing journal.</li> <li><i>1</i> to create a new journal.</li> </ul> <p>If you update an existing journal, you must enter the reference on the AccountingJournalReferenceID field.</p>
CreateJournalwithErrors	Boolean	<p>Optional field. Determines if Workday creates a journal in <i>Created</i> status for a ledger company with alternate account sets, even if the alternate ledger account isn't mapped.</p>
RoundLedgerAmounts	Boolean	<p>Optional field. Determines how Workday balances the rounding differences for the ledger amounts on a multicurrency journal entry. Enter a value of <i>1</i> to enable rounding of ledger amounts. Don't set this value if your journal is intercompany.</p>
JournalNumber	Text	<p>Optional field. Workday automatically generates a value using the sequencing number configuration when you create a new journal. If you reference an</p>

Journal Header Fields	Type	Description
		existing journal entry, leave this field empty.
CompanyReferenceIDType	Text	Provide a value for this field based on the CompanyReferenceID field. Enter: <ul style="list-style-type: none"><li>• <i>Company_Reference_ID</i></li><li>• <i>Organization_Reference_ID</i></li><li>• <i>WID</i></li></ul>
CompanyReferenceID	Text	Provide a reference ID to an existing company in Workday for the accounting journal.
Currency	Text	Provide references to the company currency. The currencies you reference must match company currencies.
JournalforAllLedgers	Boolean	Determines if Workday creates a single ledger journal or both primary and alternate ledger journals.
LedgerType	Text	Provide the value for an existing ledger type in Workday. If you configured the ledger type map in your integration system, you can enter an external value from the map. Workday then links the value to a Workday ledger type.
BookCode	Text	Optional field. Provide the value for an existing book code ID in Workday. If you configured the book code map in your integration system, you can enter an external value from the map. Workday then links the value to a Workday book code.
AccountingDate	Date	Provide the accounting date of the journal.
JournalSource	Text	Provide the value for an existing accounting journal source in Workday.
BalancingWorktagReferenceIDTypeText		Required field if you provide a value on BalancingWorktagReferenceID. The fields you can enter include: <ul style="list-style-type: none"><li>• <i>Business_Unit_ID</i></li></ul>

Journal Header Fields	Type	Description
		<ul style="list-style-type: none"> <li>• <i>Cost_Center_Reference_ID</i></li> <li>• <i>Custom_Organization_Reference_ID</i></li> <li>• <i>Fund_ID</i></li> <li>• <i>Organization_Reference_ID</i></li> <li>• <i>Region_Reference_ID</i></li> <li>• <i>WID</i></li> </ul>
BalancingWorktagReferenceID	Text	Optional field. Provide the reference ID for the anchor balancing worktag for the journal. If you enter a reference ID, you must enable worktag balancing. You can't enter a reference ID if you specify a value for RoundLedgerAmounts.
BalancingWorktag_ExternalCodeMapName	Text	Optional field. Provide the name of the balancing worktag external code map. After configuring an external code map using the Create Integration Worktag Mapping task, enter the external value for the map.
BalancingWorktag_ExternalCodeMapValue	Text	Optional field. Provide the value that Workday needs to look up from the balancing worktag external code map.
OptionalBalancingWorktags_WorktagType1	Text	<p>Optional field. You can add 1 or more optional balancing worktags to the journal header. You must prefix the worktag type with <i>OptionalBalancingWorktags_</i>.</p> <p>Example: A cost center worktag should display as <i>OptionalBalancingWorktags_Cost_Center</i>.</p> <p>If you enter a value for this field, you must enable optional balancing worktag for the company.</p>
OptionalBalancingWorktagsExternalCode_ExternalCodeMapName1	Text	Optional field. You can provide 1 or more optional balancing worktag external codes to the journal header. When you configure an optional balancing worktag external code map using the Create Integration Worktag Mapping task, prefix the <i>External Value of Map Name</i> with <i>OptionalBalancingWorktagsExternalCode_</i> .

Journal Header Fields	Type	Description
		Example: An external code map called <i>RegionMap</i> should display as <i>OptionalBalancingWorktagsExternalCode_RegionM</i>
RecordQuantity	Boolean	Optional field. Enter <i>1</i> if you enter values for both Quantity and Unit of Measure on a journal line. If you don't provide a value, Workday automatically enters <i>0</i> .
JournalEntryMemo	Text	Optional field. Free text comment regarding the journal entry.
JournalExternalReferenceID	Text	Optional field. Enables you to maintain references to your external endpoints at the journal header level. You can use this free text field in reports.
DocumentLink	Text	Optional field. Enables you to provide a link to additional information regarding your journal.
AdjustmentJournal	Boolean	Optional field. Determines if the journal entry is an adjustment. Enter a value of <i>1</i> to treat this journal entry as an adjustment. If you don't provide a value, Workday automatically enters <i>0</i> .
IncludeTaxLines	Boolean	Optional field. Determines if the journal includes tax detail data. Enter a value of <i>1</i> to indicate if you enter tax detail data in the journal lines. If you don't provide a value, Workday automatically enters <i>0</i> .
CreateReversal	Boolean	Optional field. Determines if Workday should create a reversal journal for the original journal. Enter a value of <i>1</i> if you wish to create a reversal. If you don't provide a value, Workday automatically enters <i>0</i> .
ReversalDate	Date	Optional field. If you create a reversal journal, you can enter an accounting date for that reversal. If you leave this field empty, Workday uses the first day of the next open period to post the reversal journal. If there's no open period, then

Journal Header Fields	Type	Description
		Workday generates the journal in <i>Created</i> status.
ControlTotalAmount	Decimal	Optional field. Provide a value that equals the sum of all journal lines. Workday validates the total value of all journal lines is equal to the amount you specify for the control amount. You can enter up to 26 total digits, including up to 6 fractional digits.
CurrencyRateType	Text	Optional field. Provide the value for an existing currency rate type in Workday.  If you configured a currency rate type map in your integration system, you can enter the external value from the map. Workday then links the value to a Workday currency rate type.
AlternateLedgerCurrencyRateType	Text	Optional field. Provide the value for an alternate currency rate type.
DisplayAccountSetID	Text	Optional field. Provide the value for an existing account set in Workday. If you leave this field empty, Workday derives this field from the ledger account for the journal.  If you configured a display account set map in your integration system, you can enter the external value from the map. Workday then links the value to a Workday account set.

You can include these columns for the journal lines:

Journal Line Fields	Type	Description
JournalLineOrder	Text	Optional field. Provide an ordered set of values that Workday can use to sort and display journal lines in the application. Workday also uses these values to sort your journal lines when you print invoices.  Example: <i>1a, 1b, 1c</i> .
LineCompanyReferenceIDType	Text	Required if you provide a value on LineCompanyReferenceID.  You can enter:

Journal Line Fields	Type	Description
		<ul style="list-style-type: none"> <li>• <i>Company_Reference_ID</i></li> <li>• <i>Organization_Reference_ID</i></li> <li>• <i>WID</i></li> </ul>
LineCompanyReferenceID	Text	Optional field. Uniquely identifies the company on the line for intercompany journals. If this field is empty in your input file, Workday uses the CompanyReferenceID value you provided. For journals that aren't intercompany, leave this field blank or use your CompanyReferenceID value.
LedgerAccountReferenceID_ParentIDType	Text	Required if you provide a value on LedgerAccountReferenceID_ParentID. You can enter: <ul style="list-style-type: none"> <li>• <i>Account_Set_ID</i></li> <li>• <i>WID</i></li> </ul>
LedgerAccountReferenceID_ParentIDText	Text	Optional field. Uniquely identifies an existing parent ledger account. You can provide the ID to the parent ledger account of the ledger account you enter for LedgerAccountReferenceID.
LedgerAccountReferenceIDType	Text	Required if you provide a value on LedgerAccountReferenceID. You can enter: <ul style="list-style-type: none"> <li>• <i>Ledger_Account_ID</i></li> <li>• <i>WID</i></li> </ul>
LedgerAccountReferenceID	Text	Optional field. Uniquely identifies an existing ledger account. You can provide a reference to an existing ledger account in Workday. You can leave this field empty and enter a reference to the ledger account on the ExternalCode_ExternalCodeMapName field. Workday then matches the external code you enter to the ledger account you mapped in the Create Integration Worktag Mapping task.
AlternateLedgerAccountReferenceIDParentIDType	Text	Required if you provide a value for AlternateLedgerAccountReferenceID_ParentID. You can enter:

Journal Line Fields	Type	Description
		<ul style="list-style-type: none"> <li>• <i>Account_Set_ID</i></li> <li>• <i>WID</i></li> </ul> <p>Workday only uses this field if you've selected an alternate account set on the Edit Company Accounting Details task.</p>
AlternateLedgerAccountReferenceID	Text	<p>Optional field. Uniquely identifies an existing alternate parent ledger account. You can provide the ID to the alternate parent ledger account of the ledger account you enter in the AlternateLedgerAccountReferenceID field.</p>
AlternateLedgerAccountReferenceIDType	Text	<p>Required if you provide a value for AlternateLedgerAccountReferenceID. You can enter:</p> <ul style="list-style-type: none"> <li>• <i>Ledger_Account_ID</i></li> <li>• <i>WID</i></li> </ul>
AlternateLedgerAccountReferenceIDText	Text	<p>Optional field. Uniquely identifies an existing alternate ledger account (ALA). You can provide a reference to an existing ALA in Workday. You can create ALA mapping using the Create Alternate Account Set Mapping task.</p> <p>Workday only uses this field if you configured an alternate account set for the company you specified on CompanyReferenceID. You can configure an alternate account set for a company using the Edit Company Accounting Details task.</p>
DebitAmount	Decimal	Enter either a debit amount or a credit amount, but not both. You can enter up to 26 digits before the decimal point and 2 digits after.
CreditAmount	Decimal	Enter either a debit amount or a credit amount, but not both. You can enter up to 26 digits before the decimal point and 2 digits after.

Journal Line Fields	Type	Description
LineCurrency	Text	Optional field. Provide the 3-digit ISO code for the currency you use on the journal line.
LineCurrencyRate	Decimal	Optional field. Provide the currency exchange rate for the line currency you specify.
LedgerDebitAmount	Decimal	Enter either a ledger debit amount or a ledger credit amount, but not both. You can enter up to 26 digits before the decimal point and 2 digits after.
LedgerCreditAmount	Decimal	Enter either a ledger debit amount or a ledger credit amount, but not both. You can enter up to 26 digits before the decimal point and 2 digits after.
AlternateLedgerCurrency	Text	References an existing alternate ledger currency for the company.
AlternateLedgerCurrencyRate	Decimal	Optional. Provide the positive numeric currency rate value that overrides the current alternate ledger currency rate value.
AlternateLedgerDebitAmount	Decimal	Enter the currency value that overrides the debit amount for the alternate ledger currency journal line.
AlternateLedgerCreditAmount	Decimal	Enter the currency value that overrides the credit amount for the alternate ledger currency journal line.
Quantity	Decimal	Optional field. Use with Unit of Measure.
UnitOfMeasure	Text	Optional field. Use with Quantity.
Quantity2	Decimal	Optional field. Use with Unit of Measure 2. Only use if you entered Quantity and Unit of Measure.
UnitOfMeasure2	Text	Optional field. Use with Quantity 2. Only use if you entered Quantity and Unit of Measure.
LineMemo	Text	Optional field. Use this as a freeform text field on the journal line.
JournalLineExternalReferenceID	Text	Optional field. Enables you to maintain references to your

Journal Line Fields	Type	Description
		external endpoints at the journal line level. You can use this free text field in reports.
BudgetDate	Date	Optional field. Provide the budget date for the journal line. Required if you selected the View Budget Date check box when you created the ledger.
BalancingWorktagAffiliateIDType	Text	Required if you provide a value on BalancingWorktagAffiliateID. You can enter: <ul style="list-style-type: none"> <li>• <i>Business_Unit_ID</i></li> <li>• <i>Cost_Center_Reference_ID</i></li> <li>• <i>Custom_Organization_Reference_ID</i></li> <li>• <i>Fund_ID</i></li> <li>• <i>Organization_Reference_ID</i></li> <li>• <i>Region_Reference_ID</i></li> <li>• <i>WID</i></li> </ul>
BalancingWorktagAffiliateID	Text	Optional field. Provide a reference to a balancing worktag affiliate. Enable worktag balancing to define a balancing worktag affiliate.
ExcludefromSpendReport	Boolean	Optional field. For expense reports and supplier invoice transactions tied to a capital project worktag, Workday creates special accounting to debit the Work in Progress account. Workday also records the amount as a debit into the spend account. This action is necessary to reflect correct amounts for the purposes of budget checking and reporting, and any other custom spend reports.
Worktag_WorktagType1	Text	Optional field. Enter 1 or more worktags at the end of each row. Each worktag column has a Worktag_ prefix. The field name identifies the worktag type.  Example: If your worktag type is <i>Cost_Center</i> , then the name of the field is <i>Worktag_Cost_Center_Reference_ID</i> .
ExternalCode_ExternalCodeMapName	Text	Optional field. If you map your external chart of accounts information with the Create

Journal Line Fields	Type	Description
		<p>Integration Worktag Map task, provide the external codes to the journal connector for lookup. Enter 1 or more external codes at the end of each row. Each external code column has an ExternalCode_ prefix followed by the map name created by Workday.</p> <p>Example: If your integration worktag map is <i>Region</i>, then the name of the field is ExternalCode_Region.</p>

You can include these columns for the tax lines:

Tax Line Fields	Type	Description
TaxTransactionDate	Date	Required if you add any values to Tax Details on a journal line.
TaxTypeReferenceIDType	Text	Required if you provide a value on TaxTypeReferenceID. You can enter: <ul style="list-style-type: none"> <li>• <i>Tax_Type_ID</i></li> <li>• <i>WID</i></li> </ul>
TaxTypeReferenceID	Text	Required if you add any values to Tax Details on a journal line. Provide a reference ID to an existing tax type in Workday.
TaxableAmount	Decimal	Optional field. Provide the taxable amount of the transaction line, based on the journal line debit and credit amounts.
TaxCodeReferenceIDType	Text	Required if you provide a value on TaxCodeReferenceID. You can enter: <ul style="list-style-type: none"> <li>• <i>Tax_Code_ID</i></li> <li>• <i>WID</i></li> <li>• <i>Withholding_Tax_Code_ID</i></li> </ul>
TaxCodeReferenceID	Text	Required if you add any values to Tax Details on a journal line. Provide a reference ID to an existing tax code in Workday.
TaxRateReferenceIDType	Text	Required if you provide a value on TaxRateReferenceID. You can enter: <ul style="list-style-type: none"> <li>• <i>Tax_Rate_ID</i></li> <li>• <i>WID</i></li> </ul>

Tax Line Fields	Type	Description
		<ul style="list-style-type: none"> <li>• <i>Withholding_Tax_Rate_ID</i></li> </ul>
TaxRateReferenceID	Text	Required if you add any values to Tax Details on a journal line. Provide the reference ID to an existing tax rate in Workday.
TaxApplicabilityReferenceIDType	Text	Required if you provide a value on TaxApplicabilityReferenceID. You can enter: <ul style="list-style-type: none"> <li>• <i>Tax_Applicability_ID</i></li> <li>• <i>WID</i></li> </ul>
TaxApplicabilityReferenceID	Text	Required if you provide a value for TaxCodeReferenceIDType. Provide a reference ID of your tax applicability or leave the field empty.
TaxRecoverabilityReferenceIDType	Text	Required if you provide a value on TaxRecoverabilityReferenceID. You can enter: <ul style="list-style-type: none"> <li>• <i>Tax_Recoverability_Object_ID</i></li> <li>• <i>WID</i></li> </ul>
TaxRecoverabilityReferenceID	Text	Optional field. If you have a transaction tax rate on a journal line, provide a reference ID to your tax recoverability.  To find the reference IDs to your tax recoverability, access the Integration IDs report and select <i>Tax Recoverability</i> on the Business Object prompt.
TaxRecoverabilityTypeReferenceIDType	Text	Required if you provide a value on TaxRecoverabilityTypeReferenceID. You can enter: <ul style="list-style-type: none"> <li>• <i>Tax_Recoverability_Type_ID</i></li> <li>• <i>WID</i></li> </ul>
TaxRecoverabilityTypeReferenceID	Text	Required if you add any values to Tax Details on a journal line. Provide a reference ID to a tax recoverability type in Workday for your manual journals. You can enter references to these tax recoverability types: <ul style="list-style-type: none"> <li>• <i>Fully Recoverable</i></li> <li>• <i>Non Recoverable</i></li> </ul>
TaxPointDateReferenceID	Text	Required if you add any values to Tax Details on a journal line.

Tax Line Fields	Type	Description
		<p>Provide a reference ID to a tax point date type on your manual journals. You can enter:</p> <ul style="list-style-type: none"> <li>• <i>Accounting Date</i></li> <li>• <i>Expense Report Date</i></li> <li>• <i>Goods/Service Delivery Date</i></li> <li>• <i>Invoice/Adjustment Date</i></li> <li>• <i>Invoice/Adjustment Received Date</i></li> <li>• <i>Payment Date</i></li> <li>• <i>Transaction Date</i></li> </ul>
TaxSupplierReferenceIDType	Text	<p>Required if you provide a value on TaxSupplierReferenceID. You can enter:</p> <ul style="list-style-type: none"> <li>• <i>Supplier_ID</i></li> <li>• <i>Supplier_Reference_ID</i></li> <li>• <i>WID</i></li> </ul>
TaxSupplierReferenceID	Text	<p>Optional field. Uniquely identifies an existing supplier. You can provide the reference ID of the supplier.</p>
TaxCustomerReferenceIDType	Text	<p>Required if you provide a value on TaxCustomerReferenceID. You can enter:</p> <ul style="list-style-type: none"> <li>• <i>Customer_ID</i></li> <li>• <i>Customer_Reference_ID</i></li> <li>• <i>WID</i></li> </ul>
TaxCustomerReferenceID	Text	<p>Optional field. Uniquely identifies an existing customer. You can provide the reference ID of the customer.</p>
TaxExternalBusinessEntityName	Text	<p>Optional field. The name of the customer or supplier if you don't define them within Workday.</p>
TaxExternalBusinessEntityAddress	Text	<p>Optional field. The address for the customer or supplier if you don't define them within Workday.</p>
TaxExternalBusinessEntityTaxID	Text	<p>Optional field. The tax ID for the customer or supplier if you don't define them within Workday.</p>
TaxableEventLineReferenceLineOrder	Text	<p>Optional field. Enter the line order of the journal line to which the tax line relates. Workday uses the line order to relate the</p>

Tax Line Fields	Type	Description
		<p>tax line to the taxable event journal line.</p> <p>Separate each taxable event journal line reference on the <code>TaxableEventLineReferenceLineOrder</code> field with a semicolon</p>

You can include these columns for the business processes:

Business Process Fields	Type	Description
BP_AutoComplete	Boolean	<p>Optional field. Determines how Workday handles business process steps. When you enter a value of <i>1</i>, Workday automatically completes business processes. Completion includes:</p> <ul style="list-style-type: none"> <li>Automatically completing approvals.</li> <li>Bypassing reviews and To Dos.</li> <li>Suppressing notifications.</li> </ul> <p>Enter a value of <i>0</i> to disable automatic completion of business processes. If you leave this field empty, Workday automatically enters <i>0</i>.</p>
BP_Comment	Text	Optional field. Free text comment regarding the business process.
BP_WorkerReferenceIDType	Text	Required if you provide a value on BP_WorkerReferenceID. You can enter:
BP_WorkerReferenceID	Text	Optional field. Provide the reference ID of the person adding the comment.

You can include these columns for the intercompany business processes:

Inter-Company Business Subprocess Fields	Type	Description
InterCompanyBP_AutoComplete	Boolean	Optional field. Determines how Workday handles the intercompany business process steps. When you enter a value of <i>1</i> , Workday automatically

Inter-Company Business Subprocess Fields	Type	Description
		<p>completes business processes. Completion includes:</p> <ul style="list-style-type: none"> <li>• Automatically completing approvals.</li> <li>• Bypassing reviews and to dos.</li> <li>• Suppressing notifications.</li> </ul> <p>Enter a value of <i>0</i> to disable automatic completion of intercompany business processes. If you leave this field empty, Workday automatically enters <i>0</i>. You can't enable InterCompanyBP_AutoComplete if you enable InterCompanyBP_Skip.</p>
InterCompanyBP_Skip	Boolean	<p>Optional field. Determines if Workday skips the intercompany business process. Workday can only skip the business process if the definition allows skips. When you enter a value of <i>1</i>, Workday automatically skips the business process.</p> <p>Enter a value of <i>0</i> to disable automatic skipping of intercompany business processes. If you leave this field empty, Workday automatically enters <i>0</i>. You can't enable InterCompanyBP_Skip if you enable InterCompanyBP_AutoComplete.</p>
InterCompanyBP_Comment	Text	Optional field. Free text comment regarding the intercompany business process.
InterCompanyBP_WorkerReferenceID	Text	<p>Required if you provide a value for InterCompanyBP_WorkerReferenceID. You can enter:</p> <ul style="list-style-type: none"> <li>• <i>Contingent_Worker_ID</i></li> <li>• <i>Employee_ID</i></li> <li>• <i>WID</i></li> </ul>
InterCompanyBP_WorkerReferenceID	Text	Optional field. Uniquely identifies an intercompany business process worker. You can provide the reference ID of an existing intercompany

Inter-Company Business Subprocess Fields	Type	Description
		business process worker or leave this field blank.
IntercompanyBP_Attachment_FileName	Text	Required if you provide a value on any fields that begin with <i>InterCompanyBP_Attachment_</i> . Enter the filename for the intercompany business process attachment.
IntercompanyBP_Attachment_EventDescription	Text	Optional field. Free text comment regarding the intercompany business process attachment.
IntercompanyBP_Attachment_EventCategoryReferenceIDType	Text	Required if you provide a value on the IntercompanyBP_Attachment_EventCategoryReferenceID field. You can enter: <ul style="list-style-type: none"> <li>• <i>Document_Category_ID</i></li> <li>• <i>Document_Category__Workday_Owned_ID</i></li> <li>• <i>WID</i></li> </ul>
IntercompanyBP_Attachment_EventCategoryReferenceID	Text	Optional field. Provide the category of the attachment.
IntercompanyBP_Attachment_FileBase64	Base64	Optional field. Convert your intercompany business process file attachment to Base64Binary format. After conversion, provide the attachment file contents.
IntercompanyBP_Attachment_ContentType	Text	Optional field. Provide the file format of the intercompany business process attachment.

You can include these columns for the attachments:

Attachment Information Fields	Type	Description
Attachment_FileName	Text	Optional field. Provide the name of the attachment file. Maximum length is 255 characters.
Attachment_FileType	Text	Optional field. Provide the file format of the attachment.
Attachment_FileEncoding	Text	Optional field. Provide the name of the encoding used for the attachment.
Attachment_Compressed	Boolean	Optional field. Specifies if the attachment is compressed at the external endpoint. Enter a value of <i>1</i> to indicate that the attachment is compressed.

Attachment Information Fields	Type	Description
Attachment_CompaniesWithoutAccessReferenceID	Text	Required if you provide a value on the Attachment_CompaniesWithoutAccessReferenceID field. You can enter: <ul style="list-style-type: none"> <li>• <i>Company_Reference_ID</i></li> <li>• <i>Organization_Reference_ID</i></li> <li>• <i>WID</i></li> </ul>
Attachment_CompaniesWithoutAccessReferenceID	Text	Optional field. Specifies companies that can't view files attached to the intercompany child journal. You can provide reference IDs of existing companies or leave the field blank.  Provide the associated reference IDs for Attachment_CompaniesWithoutAccessReferenceID and Attachment_CompaniesWithoutAccessReferenceID on a separate column for each company you wish to restrict.
Attachment_FileComment	Text	Optional field. Free text comment regarding the attachment file.

## Ad Hoc Bank Transaction Connector

### Steps: Set Up Ad Hoc Bank Transaction Connector

#### Prerequisites

- Access to an SFTP server that contains the ad hoc bank transaction files.
- The ad hoc bank transaction files must be in the Workday-defined XML or Comma-Separated Value (CSV) format.
- Create ledger accounts and worktags for all Workday accounts.

#### Context

You can create an integration to load ad hoc bank transactions from an external endpoint into Workday.

#### Steps

1. Access the Create Source System task and create 1 source for each external endpoint.  
Security: *Set Up: Map Worktags* domain in Worktags functional area.
2. Access the Create Integration Worktag Mapping task and map each external code to a corresponding ledger account and worktag in Workday.  
Security: *Set Up: Map Worktags* domain in Worktags functional area.
3. Access the Create Integration System task and enter *Core Connector: Ad Hoc Bank Transactions Inbound (Enhanced Performance)* at the New Using Template prompt.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
4. Select Integration System > Configure Integration Attributes as a related action on the integration system and enter integration service attributes.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
5. Select Integration System > Configure Integration Maps as a related action on the integration system and map external values to internal Workday values.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
6. [Set Up Integration Retrieval](#) on page 1957.  
Specify how the integration system retrieves ad hoc bank transaction files from your external endpoint.

7. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

- *Integration Event*
- *Process: Ad hoc Bank Transaction - Core*

See: <..../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita>.

8. Launch an Integration on page 24.

Schedule how often the integration system runs.

9. Create Integration Notifications on page 31.

Configure your integration to send notification messages to specified groups for integration events.

## Concept: Ad Hoc Bank Transaction Connector

The *Core Connector: Ad Hoc Bank Transactions Inbound (Enhanced Performance)* integration template enables you to import ad hoc bank transactions into Workday from an external endpoint. The integration template supports import of ad hoc bank transactions in Workday-defined XML and Comma-Separated Value (CSV) formats.

### Ad Hoc Bank Transaction Connector Integration and Supporting Tasks

The Connector consists of these components and supporting tasks:

Component	Description
Create Source System	This task enables you to define external source endpoints.
Create Integration Worktag Mapping	Define mapping between: <ul style="list-style-type: none"> <li>• External codes for source accounts.</li> <li>• Corresponding ledger accounts or worktags in Workday.</li> </ul>
<i>Core Connector: Ad Hoc Bank Transactions Inbound (Enhanced Performance)</i>	This integration template enables you to create an integration system that: <ul style="list-style-type: none"> <li>• Retrieves an XML or CSV file from an external SFTP endpoint that contains ad hoc bank transaction data.</li> <li>• Translates data by applying the mapping rules that you define with the Create Integration Worktag Mapping task. Applies mapping rules that you define directly in the integration as part of integration maps.</li> <li>• Loads the data into Workday.</li> <li>• Supports reporting and error handling at the ad hoc bank transaction and line levels for ad hoc bank transactions.</li> </ul>

### Launch/Schedule Options

Workday provides these launch schedule options for the integration:

- Launch by an Integration step on a business process.
- Launch on schedule. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration retrieves any files from the endpoint.
- Launch immediately. You can launch the integration manually.

## Processing Notes

If the *LedgerAccountingReferenceID* element exists in the Connector input file, Workday ignores the external code values that map to ledger accounts. You can override integration attribute values by populating them in the input file.

## Reference: Ad Hoc Bank Transaction Connector CSV File Format

The CSV import file format has 2 record types:

- Transaction Header. The first record in the CSV file is a fixed header record. The header record describes the fields that the transaction type populates. There can be multiple transaction headers in a single file. Each transaction header describes a different transaction. If a transaction has multiple transaction lines, then the header-level information only needs to be on the first transaction record. You don't need to repeat header-level information for subsequent transaction lines.
- Transaction Line. This record type consists of transaction line details. If a transaction has multiple transaction lines, the records for the transaction lines should display consecutively in the file.  
Example: You can't include lines of transaction A, followed by lines of transaction B, followed by additional lines of transaction A.

Boolean values are *1* (true) and *0* (false). Date value format is *YYYY-MM-DD*.

### Transaction Header Fields

Field Name	Type	Required?	Description/Notes
<i>AdHocBankTransactionKey</i>	Text	Yes	The integration loads all transaction lines with the same <i>AdHocBankTransactionKey</i> into Workday as a single ad hoc bank transaction. Transaction lines that belong to the same transaction should display consecutively within the file.
<i>AdHocBankTransactionID</i>	Text	No	This field uniquely identifies the transaction. If this field is empty, Workday generates a unique ID.

Field Name	Type	Required?	Description/Notes
<i>AdHocBankTransactionReferenceIDType</i>	Text	Varies	Required if <i>AdHocBankTransactionReferenceID</i> is present. Valid values: <ul style="list-style-type: none"><li>• Workday ID</li><li>• Ad_hoc_Bank_Transaction_ID</li></ul>
<i>AdHocBankTransactionReferenceID</i>	Text	No	Reference to an existing ad hoc bank transaction for update-only purposes.
<i>Submit</i>	Boolean	No	Indicates if you're submitting the transaction or saving it in draft mode. If you set this flag to True, you're indicating that you're submitting the transaction.
<i>LockedInWorkday</i>	Boolean	No	Controls if you can edit the transaction in Workday. If you set the flag to True, you can't edit, cancel, or change the transaction in Workday. However, you can submit a draft transaction. You can update the transaction only from the web service.
<i>AddOnly</i>	Boolean	No	Indicates that the processing is in add-only mode and not an update.
<i>TransactionDate</i>	Date	Yes	Ad hoc bank transaction date.
<i>TransactionMemo</i>	Text	Yes	Free form text field for ad hoc bank transaction memo.
<i>CompanyReferenceIDType</i>	Text	Yes	Valid values: <ul style="list-style-type: none"><li>• Workday_ID</li><li>• Company_Reference_ID</li><li>• Organization_Reference_ID</li></ul>
<i>CompanyReferenceID</i>	Text	Yes	Reference to an existing Company that holds the asset.
<i>Currency</i>	Text	Yes	Reference to the currency of the company. If you specify the currency, it must match the default currency for the company.
<i>BankAccountReferenceIDType</i>	Text	Yes	Valid values: <ul style="list-style-type: none"><li>• Workday_ID</li><li>• Bank_Account_ID</li><li>• Petty_Cash_Account_ID</li></ul>
<i>BankAccountReferenceID</i>	Text	Yes	Reference to an existing Bank Account.
<i>CurrencyRateType</i>	Text	No	Reference ID to an existing instance of Currency Rate Type.
<i>CurrencyRateOverride</i>	Decimal(18, 6)	No	Transaction to Bank Account Currency Conversion Rate.
<i>TransactionAmount</i>	Decimal(18, 3)	Yes	Transaction amount.
<i>DepositOrWithdrawal</i>	Text	Yes	Deposit or Withdrawal.

Field Name	Type	Required?	Description/Notes
<i>AdhocBankTransactionPurposeReferenceID</i>	Text	Varies	Required if <i>AdhocBankTransactionPurposeReferenceID</i> is present. Valid values: <ul style="list-style-type: none"> <li>• WID</li> <li>• Ad_hoc_Bank_Transaction_Purpose_ID</li> </ul>
<i>AdhocBankTransactionPurposeReferenceText</i>	Text	No	Reference to an existing ad hoc bank transaction purpose.
<i>TransactionID</i>	Text	No	Free-form text for any reference notes.
<i>ExternalReference</i>	Text	No	Free-form text for external reference field.
<i>JournalSource</i>	Text	No	Enter the Journal Source to record the ad hoc bank transaction.
<i>RemoveBankAccountWorktagOnOffset</i>	Boolean	No	If set to True, the integration excludes the Bank Account worktag on Offset journal entries.
<i>EliminateFXGainLoss</i>	Boolean	No	If set to True, Workday eliminates the foreign exchange gains and losses from the transaction.

## Transaction Line Fields

Description/Notes
<b>Line Fields</b>
<b>Optional</b> . Line order. If specified, the value sorts the lines in Workday and displays when you print the invoice.
<b>Required if <i>AffiliateReferenceID</i> is present.</b> Valid values: <ul style="list-style-type: none"> <li>• WID</li> <li>• Company_Reference_ID</li> <li>• Organization_Reference_ID</li> </ul>
<b>Reference ID value of the company.</b> If this value is empty, Workday automatically populates the company from the invoice header. Workday validates that an appropriate intercompany relationship exists when you provide a different value from the invoice header.
<b>Required if <i>AnySpendCategoryID</i> ReferenceID is present.</b> Valid values: <ul style="list-style-type: none"> <li>• WID</li> <li>• Spend_Category_ID</li> </ul>
<b>Reference ID value of the spend category.</b> A spend category is a classification of items and services that drive the accounting. All expense items are associated with a <i>Spend Category</i> and sales items are associated with a Revenue Category. If you provide a value for a sales item, the revenue category automatically populates. Workday recommends that you provide a value for either sales item or revenue category but not both. Workday requires this field if the sales item is blank.
<b>Required if <i>AnyRevenueCategoryID</i> ReferenceID is present.</b> Valid values: <ul style="list-style-type: none"> <li>• WID</li> <li>• Revenue_Category_ID</li> </ul>
<b>Reference ID to an existing <i>Spend Category</i>.</b> A <i>Spend Category</i> is a classification of items and services that drive the accounting. All sales items are associated with a Revenue Category and expense items are associated with a <i>Spend Category</i> .

<b>Description/Notes</b>	
<b>Line Fields</b>	
<b>Main values</b>	<i>ReferenceID_ParentIDType</i>
	<ul style="list-style-type: none"> <li>• WID</li> <li>• Account_Set_ID</li> </ul>
<b>Contains a unique identifier for an instance of a parent object</b>	
<b>Required if <i>LedgerAccountReferenceID</i> is present.</b>	Valid values:
	<ul style="list-style-type: none"> <li>• WID</li> <li>• Ledger_Account_ID</li> </ul>
<b>Reference to an existing Ledger Account.</b>	The Ledger Account reference is a 2-part Reference ID, composed of:
	<ul style="list-style-type: none"> <li>• The Ledger Account ID.</li> <li>• The Reference ID for the Ledger Account Set that it's a part of.</li> </ul>
<b>Main values</b>	<i>LedgerAccountReferenceID_ParentIDType</i>
	<ul style="list-style-type: none"> <li>• Workday ID</li> <li>• Ledger_Account_ID</li> </ul>
<b>Contains a unique identifier for an instance of a parent object</b>	
<b>Required if <i>AlternateLedgerAccountReferenceID</i> is present.</b>	Valid values:
	<ul style="list-style-type: none"> <li>• Workday ID</li> <li>• Ledger_Account_ID</li> </ul>
<b>Alternate Ledger Account (ALA)</b>	Provides the ability to override the account to which you mapped the Ledger Account by the Alternate Account Set Mapping rules. Use this field only when you enable Alternate Account Set for the header company. Example: if the Ledger Account is 1000 Cash, and the mapping rules map the journal to the 1100 Alternate Cash account, setting the ALA to 1200: Other Cash Account causes the journal to use Other Cash rather than Alternate Cash.
<b>Map Account</b>	
(26, 6)	
<b>Required if <i>TaxApplicabilityReferenceID</i> is present.</b>	Valid values:
	<ul style="list-style-type: none"> <li>• WID</li> <li>• Tax_Applicability_ID</li> </ul>
<b>The preference ID value of</b>	the tax applicability. If the transaction line has a tax code, then Workday requires the tax applicability.
<b>Required if <i>TaxCodeReferenceID</i> is present.</b>	Valid values:
	<ul style="list-style-type: none"> <li>• WID</li> <li>• Tax_Code_ID</li> <li>• Withholding_Tax_Code_ID</li> </ul>
<b>The preference ID value of</b>	the tax code. If the transaction line has a tax applicability value, Workday will validate that the transaction line also has a tax code.
<b>Required if <i>TaxRateReferenceID</i> is present.</b>	Valid values:
	<ul style="list-style-type: none"> <li>• WID</li> <li>• Tax_Rate_ID</li> <li>• Withholding_Tax_Rate_ID</li> </ul>
<b>Reference to Tax Rate for Tax Code.</b>	
<b>Required if <i>TaxRecoverabilityReferenceID</i> is present.</b>	Valid values:
	<ul style="list-style-type: none"> <li>• WID</li> <li>• Tax_Recoverability_Object_ID</li> </ul>
<b>Reference to Tax Recoverability for Tax Rate.</b>	

Description/Notes
Line Fields
<b>Required if TaxRateReferenceID is present.</b> Valid values:
<ul style="list-style-type: none"> <li>• WID</li> <li>• Tax_Rate_ID</li> <li>• Withholding_Tax_Rate_ID</li> </ul>
<b>Reference to Tax Rate for Tax Code.</b>
<b>Required if TaxRecoverabilityReferenceID is present.</b> Valid values:
<ul style="list-style-type: none"> <li>• WID</li> <li>• Tax_Recoverability_Object_ID</li> </ul>
<b>Reference to Tax Recoverability for Tax Rate.</b>
<b>Required if TaxRateReferenceID is present.</b> Valid values:
<ul style="list-style-type: none"> <li>• WID</li> <li>• Tax_Rate_ID</li> <li>• Withholding_Tax_Rate_ID</li> </ul>
<b>Reference to Tax Rate for Tax Code.</b>
<b>Required if TaxRecoverabilityReferenceID is present.</b> Valid values:
<ul style="list-style-type: none"> <li>• WID</li> <li>• Tax_Recoverability_Object_ID</li> </ul>
<b>Reference to Tax Recoverability for Tax Rate.</b>
<b>Required if TaxRateReferenceID is present.</b> Valid values:
<ul style="list-style-type: none"> <li>• WID</li> <li>• Tax_Rate_ID</li> <li>• Withholding_Tax_Rate_ID</li> </ul>
<b>Reference to Tax Rate for Tax Code.</b>
<b>Required if TaxRecoverabilityReferenceID is present.</b> Valid values:
<ul style="list-style-type: none"> <li>• WID</li> <li>• Tax_Recoverability_Object_ID</li> </ul>
<b>Reference to Tax Recoverability for Tax Rate.</b>
<b>Required if TaxRateReferenceID is present.</b> Valid values:
<ul style="list-style-type: none"> <li>• WID</li> <li>• Tax_Rate_ID</li> <li>• Withholding_Tax_Rate_ID</li> </ul>
<b>Reference to Tax Rate for Tax Code.</b>
<b>Required if TaxRecoverabilityReferenceID is present.</b> Valid values:
<ul style="list-style-type: none"> <li>• WID</li> <li>• Tax_Recoverability_Object_ID</li> </ul>
<b>Reference to Tax Recoverability for Tax Rate.</b>
<b>Notes for the line</b>

<b>Description/Notes</b>
Line
Fields
<b>Required</b> <i>If Worktag Affinity Reference ID is present. Valid values:</i>
<ul style="list-style-type: none"> <li>• Business_Unit_ID</li> <li>• Cost_Center_Reference_ID</li> <li>• Custom_Organization_Reference_ID</li> <li>• Fund_ID</li> <li>• Organization_Reference_ID</li> <li>• Region_Reference_ID</li> <li>• Workday ID</li> </ul>
<b>Defines</b> <i>Worktag Affinity Reference ID</i> when you enable balancing worktag.
<b>Worktag</b> <i>You can add one or more worktags at the end of each row as additional columns. The field name identifies the worktag type. Example: Worktag_</i>
<i>Cost_Center_Reference_ID, Worktag_Project_ID).</i>
<b>Worktag_Type_2</b>
<b>Worktag_Type_n</b>
<b>Next can Add One or More</b> External Codes to the end of each row as additional columns. Each code must have a prefix of <i>ExternalCode</i> . The field name identifies the name of the internal reference to the Integration worktag Mapping created in Workday. Example: <i>ExternalCode_Region</i> . Configure the <i>Worktag Mapping Definition for External Code</i> integration map to map this internal reference (Example: <i>Region</i> ) to the actual integration worktag mapping defined in the application.
<b>Note</b> <i>ExternalCode_Name_2</i>
<b>Note</b> <i>ExternalCode_Name_n</i>

## Business Process Parameters (for Each Transaction)

<b>Description/Notes</b>
Process
Parameter
Field
<b>Allows to True:</b>
<ul style="list-style-type: none"> <li>• Workday processes the business process automatically.</li> <li>• Workday approves all approvals.</li> <li>• Workday bypasses all reviews and To Dos automatically.</li> <li>• Workday suppresses all notifications automatically.</li> </ul>
<b>Text</b> <i>Comment regarding the business process.</i>
<b>Required</b> <i>If Person ID Reference ID is present. Valid values:</i>
<ul style="list-style-type: none"> <li>• Workday ID</li> <li>• Contingent_Worker_ID</li> <li>• Employee_ID</li> </ul>
<b>Reference ID of the Person adding the comment.</b>

## Inter-Company Business Subprocess Parameters (for Each Transaction)

Description/Notes
Subprocess Parameter
<b>autoComplete</b> Workday automatically processes the business process.
<ul style="list-style-type: none"> <li>• Workday processes the business process automatically.</li> <li>• Workday approves all approvals.</li> <li>• Workday bypasses all reviews and To Dos automatically.</li> <li>• Workday suppresses all notifications automatically.</li> </ul>
<b>skipStep</b> Workday skips the business process automatically if you enable step skipping for the step.
<b>textComment</b> Text comment regarding the business process.
<b>referenceID</b> Reference ID of the Workday worker or employee ID ( <code>WorkerReferenceID</code> ) value. Valid values:
<ul style="list-style-type: none"> <li>• Workday ID</li> <li>• Contingent_Worker_ID</li> <li>• Employee_ID</li> </ul>
<b>referenceIDOfPersonAdding</b> Reference ID of the person adding the comment.

## Attachment Information (for Each Transaction)

Description/Notes
Information
Field
<b>name</b> Name of the attachment file. Maximum length is 255 characters.
<b>fileFormat</b> File format.
<b>contentType</b> Content type of the attachment.
<b>encoding</b> Encoding of the attachment.
<b>anyContent</b> Any content for the attachment information.
<b>isCompressed</b> Boolean attribute identifying whether you compressed the attachment.

# Bank Fee Analysis Connectors

## Steps: Set Up Bank Fee Statement Connectors

### Prerequisites

Know the file format that the bank uses for bank fee statements.

### Context

You can create an integration to import bank fee statements in 1 of these formats:

- *ASC X12 EDI 822*
- *ISO 20022 camt.86 V1*
- *ISO 20022 camt.86 V2*
- Workday-defined XML format.

## Steps

- Access the Create Integration System task and enter the template name for the format that you want to import: at the New Using Template prompt:

Option	Description
ASC X12 EDI 822	<i>Import EDI 822 Bank Fee Statements</i>
ISO 20022 camt.86 V1	<i>Import ISO 20022 V1 Bank Fee Statements</i>
ISO 20022 camt.86 V2	<i>Import ISO 20022 V2 Bank Fee Statements</i>
Workday-defined XML format.	<i>Core Connector: Bank Fee Statements Inbound</i>

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

- [Set Up Integration Retrieval](#) on page 1957.

Specify how the integration system retrieves bank fee statements from an external endpoint.

- Select Integration System > Configure Integration Attributes as a related action on the integration system and enter integration service attributes.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

- Select Integration System > Configure Integration Maps as a related action on the integration system. Map values between Workday and the external file format.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

- [Launch an Integration](#) on page 24.

Schedule how often the integration system runs.

- Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

- Integration Event*
- Process: Bank Fee Statements*

See: [.../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).

- [Create Integration Notifications](#) on page 31.

Configure your integration to send notification messages to specified groups for integration events.

## Concept: Bank Fee Statement Connectors

Bank Fee Statement Connectors enable you to import bank fee statements from your financial institutions for analysis and reporting purposes:

Workday provides these integration templates to support different file formats for bank fee statements:

- Import EDI 822 Bank Fee Statements*. This template supports import of bank fee statements in the ASC X12 EDI 822 format.
- Import ISO 20022 V1 Bank Fee Statements*. This format supports import of bank fee statements in the ISO 20022 camt.86 V1 format.
- Import ISO 20022 V2 Bank Fee Statements*. This format supports import of bank fee statements in the ISO 20022 camt.86 V2 format.
- Core Connector: Bank Fee Statements Inbound*. This template supports import of bank fee statements in a Workday-defined format. Use this template if your bank uses a file format other than EDI 822 or ISO 20022 camt.86 V1 or camt.86 V2.

Note: This template requires that you create a custom transformation to convert bank fee statements into the Workday-defined format.

## Launch/Schedule Options

Workday provides these launch schedule options for the Bank Fee Statement Connectors:

- Launch with an Integration step on a business process.
- Launch by schedule. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration sends or retrieves any files to or from the endpoint.
- Launch immediately. You can launch the integration manually.

## Bank Statement Import Integrations

### Steps: Set Up Bank Statement Load Integration

#### Prerequisites

Security: *Integration Build* domain in the Integration functional area.

#### Context

Implement an integration to import prior-day and intraday bank statement files into Workday from an external endpoint.

#### Steps

1. Access the Create Integration System task and enter the applicable template name at the New Using Template prompt.

Option	Description
Core Connector Inbound - Bank Statements	Integration accepts any format. If file isn't in Workday Bank Statement Connector format, the integration requires a Document Transformation integration to convert the file into the Workday format.
Import ISO 20022 V2 Bank Statements	Integration accepts files in ISO 20022 V2 format. The integration supports these subformats: <ul style="list-style-type: none"> <li>• <i>camt.053.001.02</i> for prior day statements.</li> <li>• <i>camt.052.001.02</i> for intraday statements.</li> </ul>

Option	Description
Import BAI2 Bank Statement	Integration accepts files in BAI2 format.
Import BTRS Bank Statement	Integration accepts files in BTRS format.
Import MT940/942 Bank Statements	Integration accepts files in either MT940 or MT942 formats.

Security: *Integration Build* domain in Integration functional area.

2. Enable one or more of the optional integration services:

Option	Description
Bank Statements Connector Common Configurations	Workday recommends that you enable this service.
Document Attachment Service	Available for Core Connector Inbound - Bank Statements only. Attaches an XSLT file for performing custom document transformation for the inbound file.
Enable Message Auditing	Workday recommends that you enable this service only when: <ul style="list-style-type: none"> <li>• You first implement the integration.</li> <li>• You diagnose an issue with the integration.</li> </ul>

The Configure Integration Services task displays all integration services, including required services. Required integration services aren't editable.

3. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

- *Integration Event*
- *Process: Banking*
- *Process: Bank Reconciliation*

See: [../../../../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#)

4. Select Integration System > Configure Integration Attributes as a related action on the integration system and enter integration service attributes.

Security: *Integration Configure* domain in Integration functional area.

5. Select Integration System > Configure Integration Maps as a related action on the integration system. Map values between Workday and the external file format.

Security: *Integration Configure* domain in Integration functional area.

6. Set Up Integration Retrieval on page 1957.

7. Launch an Integration on page 24.

8. Create a transformation that converts bank statement files into the format required by the Bank Statement Connector.

This isn't required for BAI2, BTRS, ISO20022, MT940, or MT942.

See: Steps: Set Up Document Transformation Connector on page 594.

## Concept: Bank Statement Load Integrations

Bank statement integrations import bank statement files into Workday from an external endpoint. Workday provides these integration templates to support different file formats for bank statements:

- *Import ISO 20022 V2 Bank Statements.* This template supports the *camt.053.001.02* file format for prior day statements and *camt.052.001.02* file format for intraday statements.
- *Import BAI2 Bank Statement.* This template supports the BAI2 file format.
- *Import BTRS Bank Statement.* This template supports the BTRS file format.
- *Import MT940/942 Bank Statement Load Integration.* This template supports MT940 or MT942 file formats.
- *Core Connector Inbound - Bank Statements.* This template can import files in a Workday-defined bank statement format. You define a conversion (Document Transformation) to convert bank statement files from native format into the Workday-defined format. This template enables you to import bank statement data from banks that don't support the standard bank statement formats.

## Integration Services

The Bank Statement Load integration templates include these configurable integration services:

Integration Service	Available for Template	Description
Bank Statements Connector Common Configurations	All	<p>Provides these services:</p> <ul style="list-style-type: none"> <li>• Enable/disable file uniqueness validations.</li> <li>• Integration maps for domestic bank codes and bank account numbers.</li> <li>• (Core Connector Inbound - Bank Statements only) File-level schema validations on the bank statement file. Enables you to reject an entire bank statement file or reject only invalid statements.</li> </ul>
Document Attachment Service	Core Connector Inbound - Bank Statements only.	Enables you to attach an XSLT file to the integration system. The integration system uses the XSLT to convert inbound files into the format supported by the integration.
Enable Message Auditing	All	Records and stores additional audit messages.

## Launch/Schedule Options

Workday provides these launch schedule options for the Bank Statement Load integrations:

- Launch with an Integration step on a business process.
- Launch by schedule. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration retrieves any files from the endpoint.
- Launch immediately. You can launch the integration manually.

## Reference: Bank Statements Connector XML Schema

The Bank Statements Connector requires all bank statement files to be in this XML format:

Element	Level	Details and Validations
<i>BankStatementFileData</i>	1	Top-level element of document.
<i>SenderIdentification</i>	2	Must be in <i>string</i> format.
<i>ReceiverIdentification</i>	2	Must be in <i>string</i> format.
<i>FileCreationDate</i>	2	Must be in <i>date</i> format.
<i>FileCreationTime</i>	2	Must be in <i>string</i> format.
<i>FileIdentificationNumber</i>	2	Must be in <i>string</i> format. Required field.

Element	Level	Details and Validations
<i>BankStatementData</i>	2	Container for following level 3 elements. Minimum 1 element required; you can add more than 1 element.
<i>BankStatementId</i>	3	Must be in <i>string</i> format.
<i>SameDayBankStatementIndicator</i>	3	Must be in <i>boolean</i> format.
<i>StatementBeginDate</i>	3	Must be in <i>date</i> format.
<i>StatementEndDate</i>	3	Must be in <i>date</i> format.
<i>DomesticBankCode</i>	3	Must be in <i>string</i> format. If empty, <i>BankIdentificationCode</i> must have a valid value.
<i>BankIdentificationCode</i>	3	Must be in <i>string</i> format. If empty, <i>DomesticBankCode</i> must have a valid value.
<i>BankAccountNumber</i>	3	Must be in <i>string</i> format. If empty, IBAN must have a valid value.
<i>IBAN</i>	3	Must be in <i>string</i> format. If empty, <i>BankAccountNumber</i> must have a value.
<i>BankAccountCurrency</i>	3	Must be in <i>string</i> format.
<i>BankStatementBalanceData</i>	3	Container for following level 4 elements. Schema permits zero, 1, or more instances of this element.
<i>BalanceTypeCode</i>	4	Required field. Must be in <i>string</i> format.
<i>AlternateBalanceTypeCode</i>	4	Must be in <i>string</i> format.
<i>BalanceTypeSubCode1</i>	4	Must be in <i>string</i> format.
<i>BalanceTypeSubCode2</i>	4	Must be in <i>string</i> format.
<i>BalanceAmount</i>	4	Must be in <i>decimal</i> format. Maximum 18 digits total. Maximum 17 digits to right of decimal.
<i>BalanceDebitIndicator</i>	4	Must be in <i>boolean</i> format. Boolean <i>true</i> indicates a Debit. Boolean <i>false</i> indicates a Credit.
<i>BalanceItemCount</i>	4	Must be in <i>string</i> format. Maximum 18 characters, limited to positive numbers 0-9. This field doesn't permit decimals.
<i>BalanceFundsAvailabilityData</i>	4	Container for following level 4 elements. Schema permits zero, 1, or more instances of this element.
<i>FundsAvailabilityAmount</i>	5	Required field. Must be in <i>decimal</i> format. Maximum 18 digits total. Maximum 17 digits to right of decimal.
<i>FundsAvailabilityDate</i>	5	Must be in <i>date</i> format. If empty, <i>NumberOfDaysUntilAvailable</i> field must have a valid value.
<i>NumberOfDaysUntilAvailable</i>	5	Must be in <i>decimal</i> format, positive value. Maximum 18 digits total. No digits to right of decimal. If empty, <i>FundsAvailabilityDate</i> field must have a valid value.
<i>UnknownNumberOfDaysIndicator</i>	5	Must be in <i>boolean</i> format.
<i>BankStatementTransactionData</i>	3	Container for following level 4 elements. Schema permits zero, 1, or more instances of this element.
<i>TransactionTypeCode</i>	4	Required field. Must be in <i>string</i> format.
<i>AlternateTransactionTypeCode</i>	4	Must be in <i>string</i> format.
<i>TransactionTypeSubCode1</i>	4	Must be in <i>string</i> format.
<i>TransactionTypeSubCode2</i>	4	Must be in <i>string</i> format.
<i>TransactionAmountInAccountCurrency</i>	4	Must be in <i>decimal</i> format. Maximum 18 digits total. Maximum 17 digits to right of decimal.
<i>TransactionAmountInOriginatingCurrency</i>	4	Must be in <i>decimal</i> format. Maximum 18 digits total. Maximum 17 digits to right of decimal.
<i>OriginatingCurrency</i>	4	Must be in <i>string</i> format.
<i>CurrencyExchangeRate</i>	4	Must be in <i>decimal</i> format.
<i>TransactionDebitIndicator</i>	4	Must be in <i>boolean</i> format. Boolean <i>true</i> indicates a Debit. Boolean <i>false</i> indicates a Credit.
<i>TransactionDate</i>	4	Required field. Must be in <i>date</i> format.

Element	Level	Details and Validations
<i>TransactionValueDate</i>	4	Must be in <i>date</i> format.
<i>Addenda</i>	4	Must be in <i>string</i> format.
<i>ReversalIndicator</i>	4	Must be in <i>boolean</i> format.
<i>BankReferenceNumber</i>	4	Must be in <i>string</i> format.
<i>CustomerReferenceNumber</i>	4	Must be in <i>string</i> format.
<i>AdditionalReference1</i>	4	Must be in <i>string</i> format.
<i>AdditionalReference2</i>	4	Must be in <i>string</i> format.
<i>AdditionalReference3</i>	4	Must be in <i>string</i> format.
<i>AdditionalReference4</i>	4	Must be in <i>string</i> format.
<i>AdditionalReference5</i>	4	Must be in <i>string</i> format.
<i>TransactionFundsAvailabilityData</i>	4	Container for following level 5 elements. Schema permits zero, 1, or more instances of this element.
<i>FundsAvailabilityAmount</i>	5	Required field. Must be in <i>decimal</i> format. Maximum 18 digits total. Maximum 17 digits to right of decimal.
<i>FundsAvailabilityDate</i>	5	Must be in <i>date</i> format. If empty, <i>NumberOfDaysUntilAvailable</i> field must have a valid value.
<i>NumberOfDaysUntilAvailable</i>	5	Must be in <i>decimal</i> format. Maximum 18 digits total. No digits to right of decimal. If empty, <i>FundsAvailabilityDate</i> field must have a valid value.
<i>UnknownNumberOfDaysIndicator</i>	5	Must be in <i>boolean</i> format.

# Credit Card Integrations

## Steps: Set Up Integration for Credit Cards and Transactions

### Prerequisites

To ensure accurate matches from integration files, establish merchant codes, names, and alternate names in:

- Maintain Airlines
- Maintain Car Rental Agencies
- Maintain Class of Service
- Maintain Credit Card Expense Code Mapping
- Maintain Hotels
- Maintain Travel Cities

### Context

You can create an integration system to import credit cards and card transaction data into Workday. You can then process the transactions in Workday Expenses.

### Steps

1. Access the Create Integration System task and enter the template name:

Option	Description
Import MasterCard CDF3File Masked	Imports masked MasterCard Common Data Format 3 (CDF3) credit card transaction data. Workday supports Level 1, Level 2, and Level 3 information for expense credit card transactions. Workday only supports Air fare and Hotel Folio data for Level 3 enhanced data.
Import Visa VCF4 Scrubbed	Imports scrubbed Visa Commercial Format (VCF) 4.4 credit card and credit card transaction data. Workday supports Level 1, Level 2, and Level 3 information for expense credit card transaction data. Workday only supports Air fare data for Level 3 enhanced data.
Import Credit Cardholder File (AMEX GL1205 - MASKED)	Imports masked files directly into your tenant. For files imported in this format, the integration checks the Plastic Indicator field. If the value is N and there's no worker associated with the card, Workday filters it out.
Import Credit Card Transaction File (AMEX GL1025 - MASKED)	Imports masked GL1025 transaction files.
Import AMEX Central Travel Data File (Masked)	Imports masked central travel card transactions from AMEX.
Global Remittance for AMEX	Generate remittance files with alternate account identifiers for AMEX in a Global Remit Layout file format.

2. (Optional for integrations for credit card transaction only) To enable mapping of data from the transaction file to Workday, enable one or more of these integration services:

Option	Description
Dynamic Map Service - Cities	Enables Workday to link a city on the inbound card transaction file to the corresponding city in Workday.
Dynamic Map Service - Airlines	Enables Workday to link an airline on the inbound card transaction file to the corresponding airline in Workday.
Dynamic Map Service - Hotels	Enables Workday to link a hotel on the inbound card transaction file to the corresponding hotel in Workday.
Dynamic Map Service - Car Rental	Enables Workday to link a car rental agency on the inbound card transaction file to the corresponding car rental agency in Workday.

3. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Process: Credit Card* and *Integration Event* security domains.

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

4. Select Integration System > Configure Integration Attributes as a related action on your integration system.

Security: *Integration Configure* domain in the Integration functional area.

When implementing this integration, accept the default settings for all Dynamic Map Service integration attributes. You can modify the Dynamic Map Service settings only if instructed to do so by Workday Support.

5. (Optional) To withhold specific transaction types from self-service users or track service classes for airlines, select Integration System > Configure Integration Maps and configure integration maps:

Option	Description
<i>Class of Service</i>	Specify which category codes for airline classes correspond to your internal service classes. Use the Maintain Class of Service task to define the service classes that are of interest to your organization for reporting purposes.  Example: You want to classify all airline transactions with the code R or Y as <i>Economy</i> .
<i>Transaction Types</i>	Select which financial institution-specific transaction codes correspond to internal transaction codes in Workday.  Work with your financial institution during implementation to list and map all transaction types initiated by the financial institution. Example: Credit card annual fee, late payment fee, finance charge. Visa has a standard list of codes for financial institution initiated transaction type codes.
<i>Transaction Status Codes</i>	Select the status codes of transactions that you don't want to display to employees for expense reports.

Option	Description
	Credit card administrators see all transactions. This map only limits the transactions that are available to self-service users.

## 6. Set Up Integration Sequence Generators on page 1969.

Set up the sequence generator for the credit card and credit card transaction filenames.

## 7. Set Up Integration Retrieval on page 1957.

Configure retrieval of transaction files.

### Next Steps

If you import a file with an invalid employee ID, the integration loads the transactions but doesn't assign them to a credit card. If you then load another file with the correct employee ID, Workday links any unassigned transactions to the card automatically. If you create the card manually, assign the unassociated transactions to the employee. Click Credit Card Transaction File Load in the Target Instance column on the Integration Details tab. Then click Fix Errors to assign transactions to the correct worker credit card.

Related Information

#### Reference

[The Next Level: Expense Credit Card Integrations](#)

## Concept: Credit Card and Card Transaction Integrations

Workday provides integrations that enable you to:

- Import credit cards and credit card transactions.
- Export AMEX remittance files.

### AMEX Cardholder Listings Integration

You can implement an integration to accept cardholder listing files with masked or tokenized credit card numbers.

- Masked. American Express provides cardholder listing files with all but the last 4 digits replaced by X. Using masked files, you can only load transaction files for a single card for each worker per corporate account.
- Tokenized. American Express provides cardholder listing files with all digits tokenized. Workday recommends you bring in tokenized credit card numbers if you plan on using Global Remittance.

This integration enables you to use AMEX data as the source-of-truth for credit card records in Workday, eliminating the need for manual updates.

### AMEX Global Remittance (GL1205)

Workday provides an integration that can generate and export remittance file data in a global file format to AMEX.

### AMEX Global Expense Credit Card Transactions (GL1025)

You can create an integration system to import American Express (AMEX) global credit card expenses into Workday so that you can process the transactions in Workday Expenses. Workday supports electronic load for AMEX file format GL1025 Global Daily Unbilled Transactions.

You can implement your integration to accept transaction files with masked or tokenized credit card numbers.

Along with transaction summaries, Workday imports travel expense details for airline, hotel, and car rental transactions. Workday maps the data automatically to expense items. Workday bases the mapping on the expense code mappings for your credit cards.

Workday supports both masked and tokenized credit card numbers.

## Concept: MasterCard CDF3 15.01 Credit Card Transaction Integration

You can create an integration system to import masked MasterCard Common Data Format 3 (CDF3) credit card transaction data into Workday. MasterCard provides credit card and card transaction files with all but the last 4 digits replaced by X or with all but the first 6 digits replaced by X. You can then process the transactions in Workday Expenses. Workday:

- Supports Level 1, Level 2, and Level 3 information for expense credit card transactions.  
Note: Workday only supports Air fare and Hotel Folio data for Level 3 enhanced data.
- Supports electronic load for the MasterCard CDF3 15.01 format.
- Identifies transactions using the Employee ID field on the integration input file.

Along with transactions summaries, Workday:

- Imports travel expense details for airline, hotel, and car rental transactions.
- Maps the data automatically to expense items. Configure Merchant Category Code mapping to expense items to support this.

Note: If your organization uses more than one network, you can map both Visa and MasterCard product codes to the same expense item.

You can access the View Credit Card Transaction task to view MasterCard CDF3 credit card transaction data.

### Level 3 Enhanced Data

You can view and report on level 3 hotel data from MasterCard credit card transactions. To determine if your card program is eligible for Level 3 Enhanced Data, customers using MasterCard Commercial cards issued by Smart Data participating banks, can reach out to their issuer to confirm if they are enrolled in Enhanced Data for Passenger Transport (Airline) and Lodging (Hotel). If you're not enrolled, you can request enrollment.

For customers already receiving MasterCard Commercial data through another system or Smart Data, you can verify if a Match Date is associated with the hotel transaction in your CDF3 file.

Workday supports the United States region.

Workday supports these hotel chains and their brands:

Hotel Chain	Brand
Carlson/Radisson Hotels	Park Plaza, Park Inn, Radisson, Regent International, Country Inn
Hyatt Hotels	Park Hyatt, Andaz, Grand Hyatt, Hyatt Regency, Hyatt Place, Hyatt Summerfield Suites, Hyatt Resorts, Hyatt Vacation Club
Intercontinental Hotel Group	Intercontinental, Crowne Plaza, Hotel Indigo, Holiday Inn, Holiday Inn Express, Staybridge Suites, Candlewood Suites
Marriot/Starwood	Marriot, JW Marriot, Renaissance, Courtyard by Marriot, Residence Inn, Fairfield Inn, TownePlace Suites, Spring Hill Suites, Ritz Carlton, Westin,

Sheraton, Four Points by Sheraton, W Hotels, Le Meridien, St.Regis, Aloft Hotels

## Hotel Information

You can view enhanced level 3 data associated with a hotel stay in the Hotel Information section in the View Credit Card Transaction task. This section includes:

- Audio Visual Charges
- Banquet Charges
- Business Center Charges
- Cash Disbursements Amounts
- Conference Room Charges
- Customer VAT Number
- Folio Number
- Gift Shop Charges
- Gratuity Charges
- Guest Name
- Health Club Charges
- Internet Access Charges Amount
- Laundry Dry Clean Amount
- Lounge Bar Charges
- Mini Bar Charges
- Movie Charges
- No Show
- Other Service Amount
- Other Service Code
- Other Service Type
- Prepaid Expenses Amount
- Room Service Charges Amount
- Tax Exempt
- Total Amount Charged on Credit Card
- Total Charges Amount
- Total Non Room Charges Amount
- Total Room Tax
- Total Tax Amount
- Transportation Charges
- Valet Charges

You can also create custom reports based on these fields to analyze your organization's spend.

## Tax Information

You can view tax information associated with credit card transactions in the Tax Information section in the View Credit Card Transaction task. This section includes:

- Additional Tax Charged
- Tax Amount
- Tax Type Code

You can also create custom reports based on these fields.

### Concepts

Concept: Expense Credit Card Transaction Data Mapping

## Tasks

Steps: Review and Correct Credit Card Transactions

### Concept: Visa Commercial Format 4.4 (VCF 4) Credit Card Transaction Integration

You can create an integration system to import scrubbed Visa Commercial Format (VCF) 4.4 credit card transaction data into Workday. Visa replaces each actual credit card number with a new, unique, scrubbed 16-digit number on the VCF4.4 file. Workday identifies the credit card account using this number. Since the unique number isn't the actual credit card number, the actual credit card number is secure. You can then process the transactions in Workday Expenses. Workday:

- Supports Level 1, Level 2, and Level 3 information for expense credit card transactions.
- Note: Workday only supports Airfare and Hotel Folio data for Level 3 enhanced data.
- Supports electronic load for the Visa Commercial Format (VCF) 4.4.
  - Identifies transactions using a combination of:
    - Account Number
    - Posting Date
    - Sequence Number
    - Transaction Reference

Along with transaction summaries, Workday:

- Imports travel expense details for airline, hotel, and car rental transactions.
- Mapping is based on the expense code mappings for your credit cards.
- Maps the data automatically to expense items.

Note: Note: If your organization uses more than one network, you can map both Visa and MasterCard product codes to the same expense item.

### Level 3 Enhanced Data

You can view and report on level 3 hotel data from Visa credit card transactions. Visa Commercial Data Solutions provides enhanced data procured through several sources such as acquirers, GDS, TMCs and Hotels. If you're not already enrolled, ensure the financial institution you work with subscribes your corporate card program for enhanced data through Visa Commercial Solutions Experience portal.

### Hotel Information

You can view enhanced level 3 data associated with a hotel stay in the Hotel Information section in the View Credit Card Transaction task. This includes:

- Charge Date
- Check In Date
- Checkout Date
- Commodity Code
- Daily Room Rate
- Health Club Charges
- If Purchase ID
- Line Item Subtotal
- Merchant Service Description
- No Show Indicator
- Prepaid Expenses Amount
- Sequence Number
- Source Amount
- Total Business Center Charges
- Total Charges Amount

- Total Folio Cash Advances
- Total Food/Beverages Charges
- Total Gift Shop Purchases
- Total Laundry Charges
- Total Mini-Bar Charges
- Total Movie Charges
- Total Non-Room Charges
- Total Room Tax Amount
- Total Telephone Charges
- Total Valet Parking Charges

You can also create custom reports based on these fields to analyze your organization's spend.

[2025R1 Feature Release Note: Visa Level 3 Hotel Data for Expense Credit Cards](#)

## **Reference: Credit Card Formats Supported for Expense Integrations**

Workday supports these various credit card formats for inbound integrations:

File Type	Primary Account Number (PAN)
AMEX GL1205 Cardholder Listing Files	Workday supports masked.
AMEX GL1025 Global Daily Unbilled Transactions	Workday supports masked.
AMEX Central Travel Data File	Workday supports masked.
AMEX Global Remittance	Workday supports masked.
MasterCard CDF3 15.01	Mask all but the last 4 digits.
Visa VCF4 (VCF4.4)	Replaces the actual credit card number.
Bank of America SBF (Visa and Mastercard) (Do Not Use)	Mask all but the last 4 digits. Workday recommends you use MasterCard CDF3 or Visa VCF4.4 instead.
Citibank VISA (Do Not Use)	Mask all but the last 4 digits. Workday recommends you use MasterCard CDF3 or Visa VCF4.4 instead.

## **Currency Exchange Rate Connector**

### **Steps: Set Up Integration to Import Currency Exchange Rates into Workday**

#### **Prerequisites**

Set up an external endpoint that stores the currency exchange rates.

## Context

You can create an integration to load currency exchange rates from an external endpoint into Workday.

## Steps

1. Access the Create Integration System task and enter *Core Connector: Currency Rates* at the New Using Template prompt.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
2. (Optional) Enable the Enable Message Auditing integration service.  
The Configure Integration Services task displays all integration services, including required services. Required integration services aren't editable.
3. Select Integration System > Configure Integration Attributes as a related action on the integration system and enter integration service attributes.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
4. [Set Up Integration Retrieval](#) on page 1957.  
Specify how the integration system retrieves files with currency exchange rates from your external endpoint.
5. [Launch an Integration](#) on page 24.  
Schedule how often the integration system runs.
6. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:
  - *Integration Event*
  - *Set Up: Currency Rates*
 See: [..../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).
7. [Create Integration Notifications](#) on page 31.  
Configure your integration to send notification messages to specified groups for integration events.

## Concept: Currency Exchange Rate Connector

The Currency Exchange Rate Connector enables you to import currency exchange rates into Workday from an external endpoint. Workday provides the *Core Connector: Currency Rates* integration template. The integration template supports import of currency exchange rates in Workday-defined XML and Comma-Separated Value (CSV) formats.

Optionally, the integration can calculate and load the inverse rate for each currency pair. Example: if you load a USD/EUR exchange rate of 1 *USD* = 0.94 *EUR*, the integration can calculate and load the inverse rate 1 *EUR* = 1.07 *USD*.

## Integration Services

The *Core Connector: Currency Rates* integration template includes these integration services:

Integration Service	Required/ Optional	Description
Core Connector: Currency Rates - Deployed Service	Required	Launches the integration.
Core Connector: Currency Rates Service	Required.	Processes incoming currency rates file. Optionally, calculates inverse exchange rates.
Financials Document Retrieval Service	Required.	Retrieves currency rates file from external endpoint.
Integration Document Retention	Required.	Retains copy of each integration file.
Enable Message Auditing	Optional	Records and stores additional audit messages.
Core Connector: Currency Rates Post-Processing Service	Required	Performs additional processing after the integration loads the input file into Workday.

## Launch/Schedule Options

Workday provides these launch schedule options for the Currency Exchange Rate Connector integration:

- Launch with an Integration step on a business process.
- Launch by schedule. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration retrieves any files from the endpoint.
- Launch immediately. You can launch the integration manually.

## Reference: Currency Exchange Rate Connector File Schema

The Currency Exchange Rate Connector supports 2 Workday-defined file formats, Comma-Separated Value (CSV), and XML.

### CSV File Format

Column Name	Column Type	Description
<i>CalculateInverseRate</i>	<i>Boolean</i>	Select to calculate the inverse rates for the currency pairs included in the input file. This calculation enables you to reduce the cost of retrieving additional exchange rate data. You can also configure this value in the integration attributes.
<i>CalculateCrossRates</i>	<i>Boolean</i>	Select to calculate the cross rates between 2 currencies when you know the exchange rates of a common third currency. This calculation enables you to reduce the cost of retrieving exchange rate data. This value applies to the currency pairs you've included in the input file. You can also configure this value in the integration attributes.
<i>CrossRatesAnchorCurrency</i>	<i>String</i>	Select the currency you want to use as a reference when you calculate cross rates. You can also configure this value in the integration attribute.
<i>EffectiveTimestamp</i>	<i>DateTime or Date</i>	Effective time stamp of the currency rate. Examples: <ul style="list-style-type: none"> <li>• 2011-01-01T00:00:00 (<i>DateTime</i>)</li> <li>• 2011-01-01 (<i>Date</i>)</li> </ul>
<i>FromCurrency</i>	<i>String</i>	Source currency name in ISO 4217 code format.
<i>TargetCurrency</i>	<i>String</i>	Target currency name in ISO 4217 code format.

Column Name	Column Type	Description
<i>CurrencyRateType</i>	<i>String</i>	Currency rate type for the currency rate. Valid values: <ul style="list-style-type: none"> <li>• Average</li> <li>• Budget</li> <li>• Current</li> <li>• Financial Budget</li> <li>• Historic Equity</li> <li>• Quarterly Average</li> </ul>
<i>CurrencyRate</i>	<i>Decimal</i>	Currency rate value. Field supports up to 12 decimal precision.

</xsd:schema>

## Customer Lockbox Integration

### Steps: Set Up Customer Payment Lockbox Integration

#### Prerequisites

Your bank must be able to generate lockbox files for customer payments. The payments must be in the format that Workday defines for this integration.

#### Context

Implement an integration to import lockbox files for customer payments into Workday from an external endpoint.

#### Steps

1. Access the Create Integration System task and enter *Import Customer Payments Lockbox* at the New Using Template prompt.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
2. Enable one or more of the optional integration services:

Option	Description
Enable Message Auditing	Workday recommends that you enable this service only when you first implement the integration, or when you diagnose an issue.
Integration Document Retention	Specify the number of days that the integration should retain integration files.

The Configure Integration Services task displays all integration services, including required services. Required integration services aren't editable.

3. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:
  - *Customer Deposit Event* (business process)
  - *Integration Event*
  - *Process: Customer Deposit*
  - *Process: Customer Invoice*
  - *Process: Customer Invoice Payment*

See: [.../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).

4. Select Integration System > Configure Integration Attributes as a related action on the integration system and enter integration service attributes.  
Workday displays attributes for each enabled integration service. If you enable additional integration services, more attributes display in the Configure Integration Attributes task.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
5. Select Integration System > Configure Integration Maps as a related action on the integration system and map values between Workday and the external file format.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
6. [Set Up Integration Retrieval](#) on page 1957.  
Specify how the integration system retrieves bank statement files from your external endpoint.

7. [Launch an Integration](#) on page 24.

Schedule how often the integration system runs.

#### Related Information

#### Reference

[The Next Level: Customer Lockbox Overview](#)

## Concept: Customer Payment Lockbox Integration

A lockbox is a post office box (PO box) that is accessible by a bank. A company's customers send their payments to the PO box or the Lockbox. The bank collects and processes the payments, and deposits to the company's bank account.

The Customer Payment Lockbox is an inbound integration that imports Bank Administration Institute (BAI2) lockbox data into Workday from an external endpoint.

- Workday provides a single *Import Customer Payments Lockbox* integration template. This template enables you to import lockbox data from any bank that can generate lockbox files in the Workday defined file format.
- You can schedule the Lockbox integration to pick up the Lockbox file on a desired frequency, and create deposits and payments in Workday.
- The deposits and payments have the lockbox details automatically populated in the memo section to help you track payment origin.
- You can run the lockbox process in combination with the Auto-Application Payment process to further automate the cash receipt process. The lockbox integration uses the customer invoice number from the inbound lockbox file to match against the invoice number in Workday. When the numbers match, the Remit-From/Bill-To Customer is populated on the customer invoice payment and the auto-apply flag is set to true.
- To enable importing payments for multiple bank accounts for a given bank, ensure to select the Lockbox Bank Account checkbox in your integration system. This results in multiple lockboxes in 1 file.
- When you have multiple lockboxes, within each lockbox group, remittances are sub-grouped into 1 or more batches with item and dollar totals at the batch level.
- To enable a bank for a lockbox, edit the desired bank account for a company and add 1 or more lockboxes on the Lockbox Setup tab. The Lockbox consists of a name, effective date, country, address, and usage. Once configured, you can view the lockbox on the Settlement tab of the bank account.
- You can then configure the Lockbox for the company in the Remit-To Lockbox section on the Banking Information tab of a customer.

Lockbox processing behavior:

- Each Lockbox file is booked to 1 currency and 1 bank account. There can be many deposits in each Lockbox file and each deposit can contain many payments.
- Each payment can refer to none, 1 or many invoices.
- The Lockbox connector doesn't generate any customer payments or deposits when there is a null file.
- When there is no match, the customer invoice payment has an *Unapplied* status.
- When the payment only covers a portion of the invoice being paid, the customer invoice has a payment status of *Partially Paid*. Ensure to enable the Unpaid Customer Invoices and Adjustments DIS to retrieve a list of unpaid or partially paid customer invoices.
- Lockbox integration supports check payment format. To use for wires and ACH payment types, ensure that the bank can put the data in the required lockbox format for the fields that support the *Put Customer Payment* and *Submit Customer Deposit* APIs.

## Web Services

- *Put Customer Payment*to load payments.
- *Submit Customer Deposit*to load deposits.
- *Get Customer Deposits*to match duplicate deposit.

## Integration Attributes

The *Import Customer Payments Lockbox* integration template includes these configurable integration attributes:

Integration Attribute	Description
Currency	The currency associated with each payment. It's required.
Enable Deposit Control Total	Check this box to include the control total (Batch Total Amount) on the Deposit. When the Deposit Control Total is included the Payment totals within the Deposit will be validated against this amount.
Enable Duplicate Deposit Checking	Check this box to prevent duplicate deposits from being loaded in Workday. A duplicate deposit is one that has the same Reference ID as another deposit.
Enable Invoice Currency on Payment	Enabling this attribute sends the invoice currency information to Workday given all the selected invoices in the payment are in Workday and have the same currency.
Lockbox Bank Account	Select this check box to use Processing Destination to support multiple Lockbox Bank Accounts. Otherwise this integration uses Destination.
Payment Date	Check this box to use Processing Date. Otherwise, this integration uses the Check Date.
Payment Locked in Workday	To disable editing and canceling the customer payment inside the Workday Application, set to <i>True</i> . When set to true, you can update the customer payment only from the web service.
Payment Type	The payment type associated with each payment. It's required.
Submit Deposit for Approval	Select this check box to submit the transaction. If this attribute is not checked the transaction is always saved in draft status.
Use Remit-From Customer on Customer Profile	With this option, if the Bill-To customers of all the invoices in a payment are different, then Workday uses the Remit-From Customer field data on the customer profile to populate this field on the payment. If Workday is unable to identify a unique Remit-From Customer on the customer profile, then this field on the payment is blank.

## Integration Maps

The *Import Customer Payments Lockbox* integration template includes these configurable integration maps:

Integration Map	Description
Account to Company	Map Lockbox Bank Account Number to a Workday Company.
Account to Bank Account	Map Lockbox Bank Account Number to a Workday Bank Account.

You can map the lockbox to a company and a bank account and can have multiple values for each map.

## Integration Services

The *Import Customer Payments Lockbox* integration template includes these configurable integration services:

Integration Service	Description
Enable Message Auditing	Records and stores additional audit messages. Workday recommends that you enable this service only when you first implement the integration, or when you diagnose an issue.
Integration Document Retention	Retains integration files for audit and troubleshooting purposes.

## Customer Payment Lockbox File Format

### Records Nesting in the Lockbox File

The Customer Payment Lockbox integration imports lockbox files in a Workday-defined format.

- The file is ASCII text.
- Each line consists of 1 data record. See character length limits in the table.
- Each record has multiple fields. Each field occupies a specific positions on the line. The field must occupy all positions defined for it. Example: a field has 10 positions and your data for that field is fewer than 10 characters. You must pad the remaining positions as defined in the file format.
- The file includes multiple types of records. Some records include subrecords. For successful processing, all these records including payment information are required. When there is an empty or missing record, then the file has errors and you will need to contact your bank.

Record	Description
Type 1 Record	Immediate address header record.  Marks the beginning of a file and identifies both the source bank and the destination (your company) of the data. Maximum 1 record per file. Each data record must be exactly 300 characters wide.
Type 2	Service record.  Identifies the purpose, content, and physical characteristics of the data. Immediately follows type 1 record. Maximum 1 record per file.  Each data record must be exactly 300 characters wide.
Type 5	Lockbox header record.  Provides information that is common to all items for the lockbox. Maximum 1 record per lockbox. Each data record must be exactly 300 characters wide.
Type 6	Check detail record.  Contains the data associated with a check. There's 1 detail record per remittance.  Each data record must be exactly 300 characters wide.
Type 4	Overflow record.  Contains invoice information related to the check.  Each data record must be exactly 300 characters wide.
Type 7	Batch total record.  Marks the end of a batch. Used for balance and control purposes.  Each data record must be exactly 300 characters wide.

Record	Description
Type 8	<p>Service total record.</p> <p>Marks the end of all batches for a lockbox. Used for balance and control purposes.</p> <p>Maximum 1 record per lockbox.</p> <p>Each data record must be exactly 80 characters wide.</p>
Type 9	<p>Destination trailer record.</p> <p>Marks the end of a file and includes the total number of records transmitted. Maximum 1 record per file.</p> <p>Each data record must be exactly 80 characters wide.</p>

Each file has this format:

- A: Begins with a type 1 and type 2 record and ends with a type 9 record.
- B: Each lockbox reported in the file begins with a type 5 record and ends with a type 8 record. When you have multiple lockboxes, section 5 through 8 will repeat for each lockbox. Each section must have records to avoid errors.
- C: Each lockbox section contains one or more batches of payments. A type 7 record marks the end of each batch.
- D: Information for each check and remittance is contained in a type 6 record and one or more type 4 records.

a	Type 1			
a	Type 2			
a	b	Type 5		
a	b	c	d	Type 6
a	b	c	d	Type 4
a	b	c	Type 7	
a	b	Type 8		
a	Type 9			

## Launch/Schedule Options

Workday provides these launch schedule options for the Customer Payment Lockbox integration:

- Launch with an Integration step on a business process.
- Launch by schedule. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration retrieves any files from the endpoint.
- Launch immediately. You can launch the integration manually.

## Accounting

The accounting will debit the cash account posting rule and credit the undeposited receipts posting rule. Manual or auto application of the payments will then debit undeposited receipts and credit receivables or unapplied payments.

Action	Debit	Credit
Run Lockbox Process	Cash	Unapplied Payments
Apply Payments	Unapplied Payments	Receivables
Place Payment On Account	Unapplied Payments	Unapplied On Account Payments

## Related Information

### Reference

[The Next Level: Customer Lockbox Overview](#)

## Reference: Customer Payment Lockbox Integration File Format

### Type 1 Record – Immediate Address Header

This record is always the first record in the file.

Field Name	Position	Size	Description
Record type	1	1	(Numeric) Always 1.
Priority code	2-3	2	(Numeric) Always 00 (2 zeros).
Destination	4-13	10	(Alpha-numeric) Number identifying you as the receiver of the file. Typically that value is your lockbox DDA account number. Left justified, space-filled.
Origin	14-23	10	(Alpha-numeric). Bank routing/transit number. Left justified, space-filled.
Date	24-29	6	(Numeric) Processing date (date that you entered the data into the external application). Format YYMMDD.
Time	30-33	4	(Numeric) Processing time (time that you entered the data into the external application). Military time (24-hour format) in format HHMM.
Reserved	34-300	267	(Alpha-numeric) Space-filled.

### Type 2 Record – Service

This record always follows the type 1 record.

Field Name	Position	Size	Description
Record type	1	1	(Numeric) Always 2.
Ultimate network address	2-11	10	(Alpha-numeric) Same value as Destination field in the type 1 record. Left justified, space-filled.
Ultimate network origin	12-21	10	(Alpha-numeric) Same value as Origin field in the type 1 record. Left justified, space-filled.
Reference code	22-31	10	(Numeric) Zero-filled.
Service type	32-34	3	(Numeric) Always 400.
Record size	35-37	3	(Numeric) Always 300.
Blocking factor	38-41	4	(Numeric) Indicates the number of characters in a block of data. Always 0300.
Format code	42	1	(Numeric) Always 1.
Reserved	43-300	258	(Alpha-numeric) Space-filled.

### Type 5 Record – Lockbox Header

The file includes 1 type 5 record per lockbox. For the first lockbox in the file, the type 5 record follows the type 2 (service) record. For all other lockboxes, the type 5 record follows a type 8 (service total) record.

Field Name	Position	Size	Description
Record type	1	1	(Numeric) Always 5.
Reserved	2-7	6	(Numeric) Zero-filled.
Lockbox number	8-14	7	(Numeric) Right-justified, zero-filled.
Date	15-20	6	(Numeric) Processing date. Format YYMMDD.
Processing destination	21-30	10	(Alpha-numeric) Same value as Destination field in the type 1 record. Left justified, space-filled.
Processing origin	31-40	10	(Alpha-numeric) Same value as Origin field in the type 1 record. Left justified, space-filled.
Reserved	41-300	260	(Alpha-numeric) Space-filled.

## Type 6 Record – Detail

The file includes 1 type 6 record per transaction.

Field Name	Position	Size	Description
Record type	1	1	(Numeric) Always 6.
Batch number	2-4	3	(Numeric) Unique batch number. Right-justified, zero-filled.
Item number	5-7	3	(Numeric) Sequential number that identifies each remittance within the batch. Right-justified, zero-filled.
Remittance amount	8-17	10	(Numeric) Format \$\$\$\$\$\$\$\$\$\$¢¢. Right-justified, zero-filled, implied decimal. Required field.
Remittance RTN	18-26	9	(Alpha-numeric) Routing/transit number from the MICR line of the check. If none, space-filled.
Remittance account number	27-36	10	(Alpha-numeric) Account number from the MICR line of the check, excluding any embedded spaces or dashes. Left justified, space-filled. If none, space-filled
Check number	37-46	10	(Alpha-numeric) Left justified, space-filled. Truncate this value if the original check number exceeds 10 characters.
Check level user-defined field 1.	47-76	30	(Alpha-numeric) Left justified, space-filled. If none, space-filled.
Filler	77-80	4	(Alpha-numeric) Space-filled.
Vicor TID	81-87	7	(Numeric) Assigned for scanning/image research purposes. Right-justified. If none, zero-filled.
Check date	88-93	6	(Alpha-numeric) Format YYMMDD. Required field.
Check level remitter name.	94-123	30	(Alpha-numeric) Left justified, space-filled. If none, space-filled.
Check level remitter account number.	124-153	30	(Alpha-numeric) Customer number or other identifier you use to identify the party submitting the check. Left justified, space-filled. If none, space-filled.
Postmark date	154-159	6	(Alpha-numeric) Format YYMMDD. Required field.
Remitter zip code	160-168	9	(Alpha-numeric) Left justified. If none, space-filled.
Envelope sequence number	169-171	3	(Numeric) Right-justified. If none, zero-filled.
Check level user-defined field 2.	172-201	30	(Alpha-numeric) Left justified, space-filled. If none, space-filled.
Check level user-defined field 3.	202-231	30	(Alpha-numeric) Left justified, space-filled. If none, space-filled.
Check level user-defined dollar field 1.	232-242	11	(Numeric) Format \$\$\$\$\$\$\$\$\$\$¢¢. Right-justified, zero-filled, implied decimal.
Reserved	243-300	58	(Alpha-numeric) Space-filled.

## Type 4 Record – Overflow

The integration supports 1 or more type 4 records per transaction for invoice information related to the check. Type 4 records follow their associated type 6 (detail) records.

Field Name	Position	Size	Description
Record type	1	1	(Numeric) Always 4.
Batch number	2-4	3	(Numeric) Same value as the batch number for the associated type 6 record. Right-justified, zero-filled.
Item number	5-7	3	(Numeric) Same value as the item number for the associated type 6 record. Sequential number that identifies a given remittance within the batch. Right-justified, zero-filled.

Field Name	Position	Size	Description
Overflow type	8	1	(Numeric) Always 6.
Overflow sequence number	9-10	2	(Numeric) Sequence number of this record within all type 4 records for a transaction. Right-justified, zero-filled.
Last indicator	11	1	(Numeric) Valid values: <ul style="list-style-type: none"> <li>0: There are one or more additional type 4 records following this record.</li> <li>9: There are no more type 4 records for the transaction.</li> </ul>
Invoice number	12-26	15	(Alpha-numeric) Left justified, space-filled. If none, send N/A.
Invoice amount	27-36	10	(Numeric) Format \$\$\$\$\$\$\$\$\$\$¢. Right-justified, zero-filled, implied decimal.
Invoice level user-defined field 1	37-66	30	(Alpha-numeric) Left justified, space-filled. If none, space-filled. You can use this field to submit Purchase Order Number values.
Filler	67-80	14	(Alpha-numeric) Space-filled.
Invoice date	81-86	6	(Alpha-numeric) Format YYMMDD. If none, send 111111.
Gross invoice amount	87-97	11	(Numeric) Format \$\$\$\$\$\$\$\$\$\$¢. Right-justified, zero-filled, implied decimal.
Discount invoice amount	98-108	11	(Numeric) Format \$\$\$\$\$\$\$\$\$\$¢. Right-justified, zero-filled, implied decimal.
Invoice remitter account number with lockbox customer	109-138	30	(Alpha-numeric) Customer number or other identifier you use to identify a customer in addition to the check remitter identified in the associated 6 record. Used when you use a single check for payments to multiple customer accounts. Left justified, space-filled. If none, space-filled.
Envelope sequence number	139-141	3	(Numeric) Same value as the envelope sequence number in the associated type 6 record. Right-justified. If none, zero-filled.
Invoice amount due	142-152	11	(Numeric) Format \$\$\$\$\$\$\$\$\$\$¢. Right-justified, zero-filled, implied decimal.
Invoice level user-defined field 2	153-182	30	(Alpha-numeric) Left justified, space-filled. If none, space-filled. You can use this field to submit Purchase Order Number values.
Invoice level user-defined field 3	183-212	30	(Alpha-numeric) Left justified, space-filled. If none, space-filled. You can use this field to submit Purchase Order Number values.
Invoice level user-defined field 4	213-242	30	(Alpha-numeric) Left justified, space-filled. If none, space-filled. You can use this field to submit Purchase Order Number values.
Invoice level user-defined dollar field	243-253	11	(Numeric) Format \$\$\$\$\$\$\$\$\$\$¢. Right-justified, zero-filled, implied decimal.
Invoice level user-defined dollar field 2	254-264	11	(Numeric) Format \$\$\$\$\$\$\$\$\$\$¢. Right-justified, zero-filled, implied decimal.
Invoice level user-defined dollar field 3	265-275	11	(Numeric) Format \$\$\$\$\$\$\$\$\$\$¢. Right-justified, zero-filled, implied decimal.
Invoice level user-defined dollar field 4	276-286	11	(Numeric) Format \$\$\$\$\$\$\$\$\$\$¢. Right-justified, zero-filled, implied decimal.
Invoice level user-defined date field	287-292	6	(Alpha-numeric) Format YYMMDD. If none, send 111111.
Reserved	293-300	8	(Alpha-numeric) Space-filled.

## Type 7 Record – Batch Total

A type 7 record marks the end of a batch. You use this record for balance and control purposes. A type 7 record follows the last type 6 (detail) or type 4 (overflow) record in the batch.

Field Name	Position	Size	Description
Record type	1	1	(Numeric) Always 7.
Batch number	2-4	3	(Numeric) Same as the batch number used in the type 6 records and type 4 records within the batch. Right-justified, zero-filled.
Last item number	5-7	3	(Numeric) Right-justified, zero-filled.
Lockbox number	8-14	7	(Alpha-numeric) Same as the lockbox number in the associated type 5 record. Right-justified, zero-filled.
Processing date	15-20	6	(Numeric) Format YYMMDD. Required field.
Item count	21-23	3	(Numeric) Number of remittances in the batch, which equals the number of type 6 records in the batch. Right-justified, zero-filled.
Batch total amount	24-33	10	(Numeric) Remittance USD total of the batch. Format \$\$\$\$.###. Right-justified, zero-filled, implied decimal.
Batch summary data	34-300	267	(Alpha-numeric) Space-filled.

## Type 8 Record – Service Total

A type 8 record follows the last type 7 (batch total) record for a lockbox.

Field Name	Position	Size	Description
Record type	1	1	(Numeric) Always 8.
Last batch number	2-4	3	(Numeric) Right-justified, zero-filled.
Last item number	5-7	3	(Numeric) Right-justified, zero-filled.
Lockbox number	8-14	7	(Alpha-numeric) Same value as the lockbox number in the associated type 5 record. Right-justified, zero-filled.
Processing date	15-20	6	(Numeric) Format YYMMDD.
Item count	21-23	3	(Numeric) Number of remittances for this lockbox. Equals the number of type 6 records in the lockbox. Right-justified, zero-filled.
Lockbox total amount	24-33	10	(Numeric) Remittance dollar total for the lockbox. Format #####.##. Right-justified, zero-filled, implied decimal.
Filler	34	1	(Alpha-numeric) Space-filled.
Batch count	35-37	3	(Numeric) Number of batches for the lockbox. Right-justified, zero-filled.
Reserved	38-80	43	(Alpha-numeric) Space-filled.

## Type 9 Record – Destination Trailer

The type 9 record is the last record in the file.

Field Name	Position	Size	Description
Record type	1	1	(Numeric) Always 9.
Record count	2-7	6	(Numeric) Total number of records in the file, including this type 9 record. Right-justified, zero-filled.
Reserved	8-80	73	(Alpha-numeric) Space-filled.

## Sample File

1001234567890121000248 0611101648  
21234567890121000248 00000000040008000801

## DAS2 Integration

## Steps: Set Up DAS2 Integration

## Prerequisites

- Set up these details on your company:
    - A company address with a street number extension of *Bis*, *Ter*, *Quater*, or *Quinquies* and a numeric postcode that doesn't begin with *00*.
    - The SIREN number, SIRET number, and APE code tax IDs.
  - Set up these details on payees you want to report on:
    - An address.
    - A payee category.
    - The *DAS2* tax authority form type.
  - For payees that are based in France, also set up these details:
    - The SIRET number tax ID.
    - A street number extension of *Bis*, *Ter*, *Quater*, or *Quinquies* and a numeric postcode that doesn't begin with *00*.

## Context

You can create an integration to generate electronic TD/Bilatéral files from transaction entries to present to French tax authorities. DAS2 is a declaration of payments made to third parties that exceed a specified threshold.

## Steps

1. Access the Maintain Third-Party Payments Configuration task.

Select Aggregate Category Mapping, then map the DAS2 payment categories to Workday spend categories or spend category hierarchies.

After you map the payment categories, add all payment categories to 1 row and enter the threshold specified by the tax authority.

Security: *Set Up: Tax* domain in the Common Financial Management functional area.

See also:

- [Concept: Third-Party Payments Integration](#)
- [Steps: Set Up Third-Party Payments Integration](#)

2. (Optional) Access the Maintain Supplier Classifications task.

You can add a supplier classification to differentiate between companies and individuals as suppliers.

As you complete the task, consider:

Classification Name	Enter a name for your supplier classification. Example: <i>Individual</i> .
Field Title	Create field titles for your suppliers' first and last names, and professions. Example: <ul style="list-style-type: none"> <li>• <i>First Name</i></li> <li>• <i>Last Name</i></li> <li>• <i>Profession</i></li> </ul>
Simple Classification Type	Select <i>Text</i> or <i>Multiple Choice - Single Select</i> for your fields.

3. (Optional) Access the Change Supplier Classification task.

Select a supplier and add your supplier classification to the Supplier Classification field, then populate the names and profession.

4. Create Integration System.

Select *DAS2* in the New Using Template prompt.

5. Create an Integration System User (ISU) and grant the ISU Get and Put access to the *Integration Event* domain.

See [../../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).

6. Select Integration System > Configure Integration Attributes from the related actions menu of the integration system.

Enter integration service attributes. When you're using individual supplier classifications, ensure you select your supplier classification for the Individual Supplier Classification attribute.

Security: These domains in the Integration functional area:

- *Integration Build*
- *Integration Configure*

7. (Optional) Select Integration System > Configure Integration Field Overrides from the related actions menu of the integration system.

Select the IndividualAsSupplier subdocument.

As you complete the task, consider:

Field Details	Select <i>Supplier Classification Field</i> .
---------------	---

Value	Map each row in the Field(s) column to your supplier classification fields.
-------	---

8. [Launch an Integration on page 24.](#)

## Next Steps

Submit your DAS2 file to the tax authority.

## Concept: DAS2 Integration

You can use the *DAS2* integration template to generate DAS2 audit files in the electronic TD/Bilatéral format specified by the French tax authority. The integration exports the totals of these payments for a company when the total amount paid to a payee exceeds the threshold set by the tax authority:

- Supplier invoice payments, including supplier invoice adjustments.
- Ad hoc payments.
- Miscellaneous payments.

The integration also includes corrections made through accounting adjustments.

You can include payees by assigning the *DAS2* tax authority form type to:

- Ad hoc payees on the *Edit Ad Hoc Payee* task.
- Contingent workers on the *Assign Tax Authority Form Type to Contingent Worker* task.
- Miscellaneous payees on the *Edit Miscellaneous Payee* task.
- Suppliers on the *Create Supplier Change* task.

## Source Data

Since DAS2 requires that all fields have values, the integration populates a zero or space in the output when a field in Workday has no value. To avoid problems, enter values for all fields required for DAS2 in your company and payee details.

Additionally, ensure that you set up these details for any French companies or payees:

- A full address with a street number extension of *Bis*, *Ter*, *Quater*, or *Quinques*. Workday converts the extension to the appropriate format in the output.
- A numeric postcode that doesn't begin with *00*.
- The APE code.
- The SIREN number.
- The SIRET number.

You can't enter a SIRET number for ad hoc payees and contingent workers. Workday recommends that you use these payee types only for payees outside of France.

## Mapping Payment Categories

Before setting up the integration, you can access the *Maintain Third-Party Payments Configuration* task to map the payment categories on the DAS2 form to Workday spend categories.

You can use the Aggregate Category Mapping option to set up the payment threshold specified by the tax authority. When you select this option, you can group the payment categories and set a threshold for the total value of all payments. The integration output then includes payees only when you've paid them more than the threshold amount.

## Output Files

When the integration runs, Workday generates a ZIP file containing the DAS2 text file. You can find the file on the Output Files tab of the integration event.

### Concepts

[Concept: Third-Party Payments Integration on page 1009](#)

## EBICS Integrations

### Steps: Set Up EBICS

#### Context

You can set up the Electronic Banking Internet Communication Standard (EBICS) transmission protocol to transact securely with financial institutions. To use EBICS, add the EBICS contract to the business process of either:

- Payment integration to transfer payment files.
- Bank statement integration to import bank statements.
- Payment acknowledgment integration to import payment acknowledgments.

Note: When you set up EBICS in your Implementation tenant, your setup doesn't transfer to your Production tenant. You must set up EBICS again in your Production tenant. Before Workday can re-initialize you in the Production tenant, you must first contact your bank to reset your EBICS credentials.

#### Steps

1. [Create EBICS Contract on page 765](#).

Security: *Set Up: Bank Entity* domain in the Banking and Settlement functional area.

2. Select State > Initialize from the related actions menu of the user on the contract.

Once the status of the user is *Pending Activation*, Workday generates an initialization letter for you to send to your financial institution.

3. Select State > Activate or Deactivate from the related actions menu of the user on the contract.

Activate the user in Workday.

4. Select State > Cancel or Initialize from the related actions menu of the contract.

Initialize the contract when your financial institution provides you with the keys.

5. Create an integration system user (ISU) and integration system security group for EBICS.

Configure the ISU with integration system security groups and domain security policies.

Grant the ISU *Get* and *Put* access to these domains:

- *Configuration Set: Integrations* domain in the System functional area.
- *Set Up: Bank Entity* domain in the Banking and Settlement functional area.

See [..../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).

## 6. Edit Business Processes.

On the business process for the integration system that you want to use the contract for, add the EBICS step:

- For payment integrations, replace the document delivery step with the EBICS step.  
When you set up EBICS for a payment integration, Workday recommends that you add the EBICS users as approvers on the *Settlement Run Event* business process.
- For bank statement and payment acknowledgment integrations, replace the document retrieval step with the EBICS step.

Select:

- *Service* in the Type prompt.
- *EBICS* in the Specify prompt.

## 7. Access the business process definition for the integration system that you configured for EBICS.

To configure EBICS, select an order type that you configured for the user on the contract. The order type must also be compatible with the integration you configured for EBICS.

When you run the integration, Workday recommends that you select the ISU that you configured for EBICS.

## Next Steps

If you set up EBICS for a payment integration, create a settlement run to send payment files to your financial institution using the EBICS transmission. Workday recommends that you test your EBICS configuration by transferring a test payment file.

To check if your payment file delivery is successful, view your settlement run:

1. In the Payment Groups grid in the Payment Groups tab, click the payment message for the payment group that you want to verify.
2. In the Business Process grid in the Business Process tab, click *Integration Process: EBICS Configuration and Transmission - For EBICS Configuration*.
3. Click the integration event in the Initial Integration Event section. The status says *Completed* when your payment file delivery is successful.

Related Information

### Tasks

[Steps: Set Up Bank Integrations for Settlement Processing](#) on page 849

### Reference

[2022R1 What's New Post: EBICS Version 2.5](#)

## Create EBICS Contract

### Prerequisites

- Obtain Electronic Banking Internet Communication Standard (EBICS) information from your financial institution.
- Security: *Set Up: Bank Entity* domain in the Banking and Settlement functional area.

### Context

You can create an EBICS contract to record information in Workday that you obtained from your financial institution. You can add the contract to your integrations to transact securely with your financial institution using the EBICS transmission protocol.

## Steps

1. Access the Create EBICS Contract task.
2. As you complete the EBICS Connectivity Information section, consider:

Option	Description
EBICS Id	Enter a unique ID for the EBICS contract in Workday.
Partner Id	Enter the EBICS customer ID that your financial institution provides.
Country	This prompt is only for reporting purposes and doesn't affect how the EBICS contract interacts with your financial institution.
Financial Institution	This prompt is only for reporting purposes and doesn't affect how the EBICS contract interacts with your financial institution.

3. As you complete the EBICS Users grid, consider:

Option	Description
User Id	Enter the user ID that your financial institution provides. The EBICS user authorizes sending the payment file.
User Name	Enter the name of the EBICS user in Workday.
Signature	<p>Select the electronic signature types for the EBICS users.</p> <p>EBICS contracts require either:</p> <ul style="list-style-type: none"> <li>• A user with an E signature.</li> <li>• A user with an A signature and a second user with either an A or B signature.</li> </ul> <p>EBICS T contracts require a user with a T signature.</p> <p>When there are users with different signature types in the EBICS contract, Workday prioritizes the signatures based on the order that you list the users in the contract.</p> <p>Example: The contract has 3 users with different signature types. Ordered from first to last, the users have signature types A, B, and E. Workday uses signature types A and B for the contract.</p>
Order Types	Select the EBICS order type that specifies the file format and other requirements your financial institution uses for processing the payment file.

## Next Steps

- Activate the EBICS users and the contract.
- Add the contract to the business process of the integration that you want to use for EBICS.
- Use the Find EBICS Contracts report to view the contracts that you've created.

[Steps: Set Up Settlement](#)

## EDI Supplier Integrations

### Steps: Set Up Integration to Import EDI 810 Supplier Invoices

#### Prerequisites

- Know the IP address for the external vendor endpoint.
- Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

#### Context

You can create an integration to import supplier invoices in the American Standards Committee (ASC) X12 810 EDI format from a supplier.

When you expect suppliers to send credit memos as invoice adjustments through an EDI 810 integration:

- Ask suppliers not to populate the BIG04 segment with a purchase order (PO) number, or else build a preprocessor to remove the PO number.
- Consider whether your *Return to Supplier Event* business process configuration creates an invoice adjustment when you create a return.

When the *Return to Supplier Event* business process creates invoice adjustments, the EDI 810 integration might result in duplicate credit memos: one created through the business process, and another when you receive an invoice adjustment through EDI.

#### Steps

1. Access the Maintain Units of Measure task.

Enter the units of measure that you want to use for EDI 810 transactions in the EDI Code field.

Note: To avoid processing errors, enter all units of measure in the EDI Code column, even when they're the same as the UN CEFACT Common Code.

Security: *Set Up: Unit of Measure* domain in the Common Financial Management functional area.

2. [Create Integration System](#) on page 1967.

From the New Using Template prompt, select *Supplier Invoice EDI 810 Inbound*.

You can enable the optional *EDI 810 Additional opt-in Configurations Service* integration service to create supplier invoices that might cause errors in *Draft* status instead of causing the integration to fail.

3. [Create Integration Business Process](#) on page 1950.

4. [Set Up Integration Retrieval](#) on page 1957.

Configure document retrieval to import EDI 810 files.

5. Select Integration System > Configure Integration Attributes from the related actions menu on the integration system.

Enter integration service attributes. As you complete the task, consider:

Integration Attribute	Description
Interchange Sender ID	Enter the ID provided by the supplier.

Integration Attribute	Description
Default Company/Supplier From PO	<p>Enable this attribute to populate the company and supplier on the supplier invoice from the PO referenced in the EDI 810 file.</p> <p>When the values in the EDI 810 file differ from the values on the PO in Workday, the values in Workday take precedence.</p>
Skip Control Total Amount Verification	<p>Enable this attribute to deactivate errors that occur when the control total amount in the TDS01 segment doesn't match the total of the lines for the invoice.</p>
Enable Pre-Processing	<p>Enable this attribute to deactivate certain validations and create supplier invoices that would otherwise cause errors in <i>Draft</i> status.</p> <p>When you enable this attribute, Workday creates supplier invoices in <i>Draft</i> status when the:</p> <ul style="list-style-type: none"> <li>• Supplier invoice contains both valid and invalid line numbers for the referenced PO.</li> <li>• ITM01 segment on the inbound file is missing a line number value.</li> <li>• Referenced PO number doesn't exist for the company.</li> <li>• EDI 810 file references a PO with a change order in progress where the invoice also contains an invalid PO line reference.</li> </ul> <p>Before you enable this attribute, consider:</p> <ul style="list-style-type: none"> <li>• This feature works with the Supplier Invoice Work Area.</li> <li>• You must configure a supplier reference ID for any suppliers that send EDI 810 invoices.</li> <li>• The integration uses the Submit Supplier Invoice Request web service.</li> </ul>
Spend Category for Freight and Other Charges	<p>Enable this attribute for when your EDI 810 file includes amounts for freight and other charges. Workday creates a zero-cost line on your Workday supplier invoice with the spend category that you configure, and your freight amounts and other charges remain on the header of the invoice.</p>
Include Landed Costs in Tax	<p>Enable this attribute to include the Freight Amount and Other Charges in the total tax calculation for your supplier invoice.</p>
EDI 810 Work Area Enhancement	<p>Displays when you enable the optional <i>EDI 810 Additional opt-in Configurations Service</i> integration service on your integration.</p>

Integration Attribute	Description
	<p>Enable this attribute to:</p> <ul style="list-style-type: none"> <li>Process more of the EDI 810 data that you import into Workday.</li> <li>Correct EDI 810 transaction errors in the Supplier Invoice Work Area.</li> </ul>

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

- Select Integration System > Configure Integration Maps from the related actions menu on the integration system.

You can map values between Workday and the EDI 810 file. This mapping is useful in cases when values from your suppliers are ZZ (Mutually Defined), or a supplier sends an invoice without a PO.

As you complete the task, consider:

Map	Description
Company Mapping EDI File	<p>Map this value to avoid processing errors.</p> <p>The External Value that you specify for the selected company must match the GS03 and ISA08 segments in the EDI 810 file.</p>
Supplier Mapping EDI File	<p>Map this value when the selected supplier in Workday doesn't have a DUNS number that matches the GS02 segment on the EDI 810 file.</p> <p>When you haven't configured a DUNS number on the supplier profile, update the supplier to add it or enter the DUNS number in the External Value.</p>

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

- (Optional) Access the Maintain Supplier Invoice System Validation task.

Select which validation errors to ignore when you create supplier invoices using the EDI 810 integration. When applicable, Workday creates a supplier invoice in *Draft* status and directs it to the Supplier Invoice Work Area report, where you can change and correct the invoice to complete processing.

Security: *Set Up: Supplier Accounts* domain in the Supplier Accounts functional area.

- Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Integration Event* domain.

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

- (Optional) [Create Integration Notifications](#) on page 31.

- [Launch an Integration](#) on page 24.

## Related Information

### Tasks

[Steps: Set Up Supplier Invoices](#)

[Steps: Set Up Supplier Invoice Work Area](#)

### Reference

[Reference: Valid Element Codes for Inbound EDI 810 Files](#) on page 782

[Reference: Supplier Invoice Work Area](#)

## Steps: Set Up Integration to Export EDI 850 Purchase Orders

### Prerequisites

Know the IP address for the external vendor endpoint.

### Context

You can create an integration to export purchase orders (POs) in the American Standards Committee (ASC) X12 850 EDI format to a supplier.

Workday trims these ASC X12-supported delimiters from the 850 outbound file: ~ ^ : \* |

Example: Workday processes *123~ABC* as *123ABC*.

### Steps

1. Change Supplier Information.

For suppliers that you plan to use EDI with:

- Configure DUNS numbers in the supplier details.
- Select *EDI* or *EDI Auto* as the issue option for purchase orders.

When a supplier uses a different ID, configure an alternate value to populate in the GS03 segment. Specify an Alternate Name Usage of *EDI Integration Name*.

2. (Optional) Access the Edit Company Industry Codes task.

We recommend that you use this task to configure DUNS numbers for companies that send EDI 850 purchase orders. Workday populates the DUNS number in the GS03 segment in EDI 850 files.

From the Industry Code Type prompt, select *DUNS NUMBER*, and enter the company DUNS number in the Industry Code field.

Security: *Set Up: Company General* in the Common Financial Management functional area.

3. (Optional) Access the Maintain Companies as Customers or Suppliers task.

When your companies are also set up as customers, ensure that the DUNS number on the customer profile matches the DUNS number on the company.

Access the related actions menu of the company in the Operates as Customer column and check the DUNS number.

When you don't configure a DUNS number on the Edit Company Industry Codes task, Workday uses the DUNS number from the customer profile in EDI 850 files.

Security: *Set Up: Company Accounting* domain in the Common Financial Management functional area.

4. Maintain Customer Account Number Rules.

To process EDI 850 files correctly, configure customer account numbers. Customer account numbers can populate on EDI 850 files through the deliver-to or ship-to customer account number on purchase orders at the header or line level.

Security: *Set Up: Procurement* domain in the Procurement functional area.

5. Access the Maintain Units of Measure task.

Enter the units of measure (UOM) that you want to use for EDI 850 transactions in the EDI Code field. To issue service lines on POs, configure a UOM row with this information:

Column	
EDI Code	HR
Unit of Measure Dimension	Time

Column	
Unit of Measure Name	Hours

Note: To avoid processing errors, enter all UOMs in the EDI Code column, even when they're the same as the UN CEFACT Common Code.

Security: *Set Up: Unit of Measure* domain in the Common Financial Management functional area.

#### 6. (Optional) Maintain Purchase Order Types.

In the EDI Code column, specify the qualifier code to send in the BEG02 segment of EDI 850 files that use a particular purchase order type.

By default, Workday sends:

- *CN* when the purchase order type is Bill Only, Consignment, or both.
- *SA* for other purchase order types.

Example: If you want to configure rush orders as a purchase order type, you would set the required BEG02 identifier to *RO* to meet EDI standards.

#### 7. (Optional) Set Up Shipping Information.

In the EDI Code field, enter the shipping method that you want to send to suppliers for EDI 850 transactions.

Commonly accepted shipping methods that you can configure include:

- *ON* for STANDARD NEXT DAY
- *NM* for NEXT DAY 8:00 AM
- *PA* for NEXT DAY 10:30 AM
- *SE* for SECOND DAY
- *3D* for THIRD DAY
- *SP* for SATURDAY

#### 8. Create Integration System on page 1967.

From the New Using Template prompt, select *Purchase Order EDI 850 Outbound*.

Enable the optional *EDI 850 Filename Sequence Generator* integration service.

You can create multiple EDI 850 integration systems when different companies or suppliers require different configurations.

#### 9. Select Integration System > Configure Integration Attributes from the related actions menu on the integration system.

Enter integration service attributes. As you complete the task, consider:

Integration Attribute	Description
MSG segment for PO header	Enable this attribute to send multiple MSG segments when the Memo on the header of a purchase order is longer than the character limit for a single MSG segment. Workday splits the memo across multiple MSG segments.  When you don't enable this attribute, Workday truncates the memo.
Change Ship to Contact Code from AR to RQ	Enable this attribute when a supplier requests that you populate the PER^01 segment with <i>RQ</i> instead of the default value <i>AR</i> .
Receiver ID	Enter the supplier ID to populate in the ISA08 segment in the EDI 850 file.

Integration Attribute	Description
N9 Before N1 Segment	Enable this attribute when an interchange partner requests that you send the N9 segment before the N1 segment.  When you don't enable this attribute, Workday generates the file with the N1 segment first.
Disable Unit Cost Rounding	Enable this attribute to allow item unit costs to have up to 6 decimal places. This setting helps reduce pricing errors caused by rounding when you submit purchase orders.
Sender ID	Enter a value when you have multiple companies that use the same code when sending orders to suppliers.
ISA07 Qualifier	Enter a 2-character value to override the default ZZ when the interchange provider requires ISA07 to have a different value.
Interchange Usage Indicator	Select an option to indicate in the ISA15 segment whether you sent the message from a test environment or production environment.  By default, the integration populates the ISA15 segment with P (production).

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

10.(Optional) Select Integration System > Configure Integration Field Attributes from the related actions menu of the integration system.

Include the supplier part auxiliary ID when:

- A PO originates from a supplier punchout requisition.
- The supplier requires this field.

When the supplier provided the ID on their response to the requisition, the field populates on the PO1 segment with a VO qualifier.

Select the Purchase\_Order\_Goods\_Line folder.

In the Field Configuration grid, select the **Include in Output** check box for the **Supplier\_Part\_Auxiliary\_ID** field.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

11. [Set Up Integration Sequence Generators](#) on page 1969.

Configure 2 sequence generators to enable the integration services and ensure that each EDI 850 file is unique:

- *EDI 850 Batch ID Sequence Generator*
- *EDI 850 Filename Sequence Generator*

Workday uses these values in the ISA13 (Interchange Control Number) assigned on your EDI 850 outbound files.

Note: To avoid errors, ensure that the sequences are 9 digits in length.

12. [Create Integration Business Process](#) on page 1950.

[13. Set Up Integration Delivery](#) on page 1952.

Specify how the integration system delivers EDI 850 files to the external vendor endpoint.

In the Document(s) section, select From this Integration Process.

In the Transport Type section, select the *SFTP* transport type and enter the SFTP details.

[14. Create an Integration System User \(ISU\)](#) and grant it Get and Put access to the *Integration Event* domain.

See [Steps: Grant Integration or External Endpoint Access to Workday](#).

[15. \(Optional\) Create Integration Notifications](#) on page 31.

Workday recommends that you configure notifications to inform users or security groups when integrations complete with warnings or errors.

[16. Edit Business Processes](#).

Configure your *Purchase Order Issue Event* business process to launch the integration when you issue POs.

We recommend that you trigger the integration using the *Launch EDI 850 Outbound Integration* service step. When you have more than 1 EDI 850 integration, access the *Maintain Supplier Links* task to specify which integration system to use for which purchase orders.

Alternatively, you can add an integration step and configure your EDI 850 integration. From the Value Type prompt, select *Determine Value at Runtime*. From the Value prompt, select *Purchase Order*. When you have more than 1 EDI 850 integration, add multiple integration steps and configure entry conditions to specify which integration system to use for which purchase orders.

[17. \(Optional\) Access the Maintain Supplier Links task](#).

Specify which integration systems to use when you

- Trigger integrations with the *Launch EDI 850 Outbound Integration* service step.
- Have different EDI 850 configurations for certain companies or suppliers.

On the *Supplier Links* for EDI PO Issue tab, add rows to the grid to specify which integration systems to use for certain companies or suppliers.

Security: *Set Up: Procurement* domain in the Procurement functional area.

[18. \(Optional\) Launch an Integration](#) on page 24.

You can launch the integration manually when you need to reprocess errors.

## Result

When you issue multiple POs by EDI at the same time, we consolidate the files by supplier and acknowledgment status for the issued purchase orders. Example:

Purchase Order	Supplier	Acknowledgment Expected	EDI File
PO-1000	Independent Technology Solutions	Yes	File001.edi
PO-1001	Independent Technology Solutions	No	File002.edi
PO-1002	Independent Technology Solutions	Yes	File001.edi
PO-1003	Global Catering Services	Yes	File003.edi

#### [Issue Purchase Orders](#)

## Create Suppliers

The Next Level: Spend Management EDI Integrations: A Comprehensive Mini Series

### Reference

Reference: Valid Element Codes for Outbound EDI 850 Files on page 787

## Steps: Set Up Integration to Import EDI 855 Purchase Order Acknowledgments

### Prerequisites

- Know the IP address for the external vendor endpoint.
- Retrieve the ISA06 Interchange Sender ID code from the external vendor.
- Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

### Context

You can create an integration to import purchase order acknowledgments (POAs) in the American Standards Committee (ASC) X12 855 EDI format.

When you import a POA, Workday:

- Appends the EDI status code in the Memo field for each purchase order line.
- Matches the purchase order line number sent by the supplier for the POA.
- Maps *MF* qualifiers for manufacturers to the free-text *Manufacturer Name* alternate item identifier.

You can't process suppliers sending multiple acknowledgment lines for the same purchase order line in Workday within the same file.

### Steps

1. Access the Edit Tenant Setup - Financials task.

In the Business Document Sequence IDs section, create or select an ID generator from the ID Generator for Purchase Order Acknowledgement prompt.

In the Procurement Options section, select the Enable Purchase Order Acknowledgements check box.

Security: *Set Up: Tenant Setup - Financials* domain in the System functional area.

2. Steps: Automate Changes from Purchase Order Acknowledgments

Workday recommends automating changes from Purchase Order Acknowledgments to ensure data accuracy after you import.

3. Access the Maintain Units of Measure task.

Set up units of measure for EDI using the X12 standards. Enter the units of measure that you want to use for EDI 855 transactions in the EDI Code column.

Note: To avoid processing errors, enter all units of measure in the EDI Code column, even when they're the same as the UN CEFACT Common Code.

Security: *Set Up: Unit of Measure* domain in the Common Financial Management functional area.

4. Change Supplier Information.

For suppliers that you expect to receive EDI 855 files from, select the Acknowledgement Expected check box in the Procurement Options.

With this configuration, Workday sets the ISA14 segment to 1 when you issue EDI 850 files. This informs suppliers that you expect an acknowledgment.

5. Create Integration System on page 1967.

From the New Using Template prompt, select *Purchase Order Acknowledgment EDI 855 Inbound*.

- Select Integration System > Configure Integration Attributes as a related action on the integration system and enter integration service attributes.

As you configure the attributes, consider:

Integration Attribute	Description
Interchange Sender ID	You don't need to specify a value when suppliers pass the customer DUNS information in the ISA06.  When you do need to map this value, ensure that your supplier sets the ISA05 qualifier to ZZ in the EDI 855 file.
Validate Receiver ID	Select to validate that the DUNS number for the customer in the EDI file matches the DUNS number on a company in Workday.  When you enable this attribute, Workday compares the ISA06 value on the EDI 855 file with DUNS numbers maintained on: <ul style="list-style-type: none"> <li>• The Edit Company Industry Codes task.</li> <li>• Customer profiles, when you've configured companies as customers.</li> </ul>
Validate Sender ID	Select to validate that the DUNS number for the supplier in the EDI file matches the DUNS number on a supplier in Workday.  When you enable this attribute, Workday compares the GS02 value on the EDI 855 file with the DUNS number of suppliers.  Note: When you enable both Validate Sender ID and Validate Receiver ID and 1 of the validations fails, Workday displays an error even when the purchase order matches a valid number in your tenant.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

- (Optional) Select Integration System > Configure Integration Maps as a related action on the integration system.

Map values that you expect in the EDI 855 file to the equivalent data in Workday.

In the External Value column, enter the values you expect to receive in the ACK segment for each purchase order line.

In the Internal Value column, enter the display name of the Universal Item Identifier without the spaces.

Access the Maintain Item Identifier Types task to configure more item identifiers if the supplier expects it. For each alternate item identifier you configure, the Internal Value on the integration map must match the name of the Universal Identifier Item Type on the Maintain Item Identifier Types task. When you map these values, they display on the POA.

To enable automated item substitution, ensure your maps translate the VC (Vendor Catalog), VP (Vendor Part), or VN (Vendor Number) external values to the Supplier Catalog Number internal value. Configure the Supplier Catalog Number on the *Maintain Item Identifier Types* task.

- Create Integration Business Process on page 1950.

9. [Set Up Integration Retrieval](#) on page 1957.  
Configure document retrieval to import EDI 855 files.
10. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Integration Event* domain.  
Access the related actions menu of the system user created and select Security Profile > Assign Integration System Groups  
See [Steps: Grant Integration or External Endpoint Access to Workday](#).
- 11.(Optional) [Create Integration Notifications](#) on page 31.  
Workday recommends that you set up notifications to inform appropriate security groups or users when your integration completes with these statuses:
  - *Completed With Warnings*
  - *Completed With Errors*
12. [Launch an Integration](#) on page 24.

#### Reference

Reference: [Valid Element Codes for EDI 855 Purchase Order Acknowledgment Files](#) on page 795

## Steps: Set Up Integration to Import EDI 856 Advance Ship Notices

### Prerequisites

- Know the IP address for the external vendor endpoint.
- Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

### Context

You can create an integration to import advance ship notices (ASNs) in the American Standards Committee (ASC) X12 856 EDI format.

### Steps

1. Access the Edit Tenant Setup - Financials task.  
In the Business Document Sequence IDs section, create or select an ID generator from the ID Generator for Advanced Ship Notice prompt.  
In the Procurement Options section, select the Enable Advanced Ship Notices check box.  
Security: *Set Up: Tenant Setup - Financials* domain in the System functional area.
2. Access the Maintain Units of Measure task.  
Set up units of measure for EDI using the X12 standards. Enter the units of measure that you want to use for EDI 856 transactions in the EDI Code column.  
Note: To avoid processing errors, enter all units of measure in the EDI Code column, even when they're the same as the UN CEFACT Common Code.  
Security: *Set Up: Unit of Measure* domain in the Common Financial Management functional area.
3. [Change Supplier Information](#).  
For suppliers you expect to receive ASNs from, select the Enable ASN check box in the Procurement Options. You can also enter when you expect to receive ASNs in the ASN Due in Days field.
4. [Create Integration System](#) on page 1967.  
From the New Using Template prompt, select *Advance Ship Notice EDI 856 Inbound*.

- Select Integration System > Configure Integration Attributes as a related action on the integration system and enter integration service attributes.

Enter the Interchange Sender ID provided by the supplier to import ASNs successfully. Workday passes this value in the ISA06 segment of EDI 856 files. To ensure Workday maps this value successfully, ensure that your suppliers set the ISA05 qualifier to ZZ in your EDI 856 file.

**Security:** *Integration Build* and *Integration Configure* domains in the Integration functional area.

- Select Integration System > Configure Integration Maps as a related action on the integration system.

Map values that you expect in the EDI 856 file to the equivalent data in Workday. As you configure the mappings, consider:

Map	Description
Company Mapping EDI File	Map this value to avoid processing errors. The External Value that you specify for the selected company must match the GS03 and ISA08 segments in the EDI 856 file.
Supplier Mapping EDI File	Map this value when the selected supplier in Workday doesn't have a DUNS number that matches the GS02 segment on the EDI 856 file.  When you haven't added a DUNS number on the supplier profile, update the supplier to add it or enter the DUNS number in the External Value.

- Create Integration Business Process on page 1950.

- Set Up Integration Retrieval on page 1957.

Configure document retrieval to import EDI 856 files.

- Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Integration Event* domain.

From the related actions menu of the ISU, select Security Profile > Assign Integration System Groups.

See: [Steps: Grant Integration or External Endpoint Access to Workday](#)

- (Optional) Edit Business Processes.

Configure the *Advanced Ship Notice Event* business process. To create receipts automatically when you receive ASNs, add the *Initiate Receipt Events from Advanced Ship Notice* service step.

- (Optional) Create Integration Notifications on page 31.

Workday recommends that you set up notifications to inform appropriate security groups or users when your integration completes with these statuses:

- Completed With Warnings
- Completed With Errors

- Launch an Integration on page 24.

## Result

When suppliers send ASNs, Workday imports the file and records the data. When you've configured the *Advanced Ship Notice Event* business process, Workday can create receipts automatically to reduce workload on the dock.

When suppliers send ASNs with a zero quantity for the purchase order line, Workday doesn't create receipts associated with the purchase order. For just-in-time requisition types, you can access the

Schedule Purchase Order Close Lines for Receiving task and select the Restrict to PO Lines with zero shipped quantities check box. When you select this option, Workday only includes purchase order lines that have zero quantity ASNs in the close for receiving updates.

#### Related Information

##### Reference

[Reference: Valid Element Codes for Inbound EDI 856 Files](#) on page 800

## Steps: Configure the Procure-to-Pay Integrations Work Area

### Prerequisites

Set up inbound integrations in Workday for:

- EDI 810 (Supplier Invoices)
- EDI 855 (Purchase Order Acknowledgements)
- EDI 856 (Advance Shipment Notices)

### Context

You can configure an integrations work area for workers to view all integration errors in 1 place. This provides visibility on inbound EDI integration errors for purchase order acknowledgements (POAs), advance shipment notices (ASNs), and supplier invoices.

### Steps

1. Access the Process: Procurement Integration Work Area - View domain and configure the security policy.  
Add user groups to give workers access to the Procurement Integrations Work Area task.
2. Access the Procure to Pay Integrations Work Area task.
3. Access the Overview tab to view the status and error log of failed EDI 810, 855, and 856 integration events.

As you review the tab, consider:

Column	Description
Request	Displays the integration request Workday object.
Files with Error	Displays the number of files that contain errors and aren't processed.
Log File	Displays a link to the HTML integration error log file.

4. Access the Work Area tab to view each integration error with the document details of the integration runs:

The Work Area tab information is currently only available for EDI 855 and 856 integration events.

Column	Descriptions
Request	The integration event. Displays integration run details such as process history and run time.
Interchange Control Number	The control number assigned by the interchange sender from the ISA13 segment in the EDI file.

Column	Descriptions
Supplier Acknowledgement Number (POA only)	The acknowledgement number that the supplier sends from the BAK08 segment in the EDI file.
EDI Purchase Order	The purchase order number in the EDI file.
Purchase Order	The matched Workday purchase order.
Buyer	The buyer on the matched Workday purchase order.
EDI Supplier	The supplier reference from the supplier in the EDI file.
Supplier	The supplier on the matched Workday purchase order.
Reference ID (POA Only)	The order number reference from the REF02 segment in the 855 EDI file.
Shipment ID (ASN Only)	The shipment identification from the BSN02 segment in the 856 EDI file.
Shipment Date (ASN Only)	The shipment date value from the BSN03 segment in the 856 EDI file.
Error Message	The Workday application error triggered during file processing.
Lines	The number of purchase order lines associated with the failed integration event. Displays the matched purchase order line details and errors associated with the line.
File Names	The names of the EDI files processed by the integration event.

## Concept: EDI Supplier Integrations

EDI supplier integrations send and receive EDI 810, 850, 855, and 856 files to and from Workday. Workday provides these integration templates to support different EDI file formats:

Integration Template	Description
<i>Purchase Order EDI 850 Outbound</i>	Exports purchase orders in the American Standards Committee (ASC) X12 850 EDI format.
<i>Supplier Invoice EDI 810 Inbound</i>	Imports supplier invoices in the American Standards Committee (ASC) X12 810 EDI format.
<i>Advance Ship Notice EDI 856 Inbound</i>	Imports advance ship notices in the American Standards Committee (ASC) X12 856 EDI format.
<i>Purchase Order Acknowledgment EDI 855 Inbound</i>	Imports purchase order acknowledgements in the American Standards Committee (ASC) X12 855 EDI format.

## Launch/Schedule Options

Workday provides these launch schedule options for the Bank Statement Load integrations:

- Launch with an Integration step on a business process.
- Launch by schedule. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration sends or retrieves any files to or from the endpoint.
- Launch immediately. You can launch the integration manually.

#### Related Information

##### Tasks

[The Next Level: Spend Management EDI Integrations: A Comprehensive Mini Series](#)

## Concept: EDI Connector Pre and Postprocessor Common Use Cases

Workday delivers standards-based EDI connectors for these transaction sets:

- Purchase Order - 850
- Purchase Order Acknowledgment - 855
- Advance Ship Notice - 856
- Supplier Invoice - 810

While they're based on published standards, Workday EDI connectors can't anticipate all possible data variations transmitted in EDI documents:

- Customers sometimes have unique EDI requirements that don't strictly adhere to EDI standards.
- Suppliers sometimes transmit segment data that Workday EDI connectors are unable to process.
- Workday might need to enhance or remove data as a result of the customers tenant configuration.

When inbound or outbound document data deviates from Workday EDI connector standards, customers should ask these questions:

- Is this deviation specific to a single supplier?
- Does the requirement adhere to EDI standards?
- Is there an alternative way to consume or produce the inbound or outbound data?

Working directly with the supplier on potential changes is often the fastest, most effective solution to proper EDI processing. If the supplier is unable to assist, you should work with their EDI partner. Research potential solutions you need to provide to alter the raw data before transmitting it to its final destination. When working with the supplier and the EDI partner can't provide a solution, a custom pre and postprocessor integration must be build in Workday Studio.

## Reference: EDI Connector Pre and Postprocessor Common Use Cases

Common use cases found in deployments that result in the need for a custom pre or postprocessor integration:

### Purchase Order - 850

Pre	Post
	Update the N102 segment where N101 is BT to provide a single company name on orders.
	Update the GS values to support additional values such as with GHX Metatrade.
	Suppress ^LT^ in the PO1 line on Consignment POs if the next segment is blank.
	Suppress the spaces in the PER^SR^ ~ and PER^1F^ ~ on Consignment POs when the Procedure Information is blank.

Pre	Post
	Update additional fields to support shipment methods.

### Purchase Order Acknowledgment - 855

Pre	Post
All BAK01 codes received from a supplier, except:	
<ul style="list-style-type: none"> <li>• 01</li> <li>• 04</li> <li>• 06</li> <li>• 44</li> </ul>	
Supplier sends in multiple ACK segments for a single line on a Purchase Order in the same file.	
Validate the Supplier GS ID on the 855 with the Supplier GS ID on the Purchase Order.	

### Advance Ship Notice - 856

Pre	Post
	Close lines for receiving that are short-shipped from the supplier and won't be fulfilled.

### Supplier Invoice - 810

Pre	Post
Purchase Order Line number validation.	Process 810 files that the preprocessor has updated.
Credit Memo Support - Removal of Purchase Order reference (BIG04) and replacing negative amounts (TDS01) with absolute value.	Ensure that the correct tax option is in use and, if applicable, correct taxable amount.
Remove the ITD Line to enable payment terms to populate from purchase order.	
Validation of the Supplier Catalog Number from the IT1 matching the associated purchase order line value.	
Validate the Supplier on the invoice matches the Supplier on the purchase order.	
Remove ^91^Customer Acct Number when included after N1^ST.	
Populate Spend Category and, if applicable, Item on:	
<ul style="list-style-type: none"> <li>• Non-Purchase Order Invoices.</li> <li>• Purchase Order Invoices that include a line that isn't on the Purchase Order.</li> </ul>	

Pre	Post
Map these to a valid instance in Workday from the 810 Integration Mapping setup.	

## Reference: Valid Element Codes for Inbound EDI 810 Files

Integrations based on the *Supplier Invoice EDI 810 Inbound* integration template can import files in the EDI 810 file format. The *EDI 810* integration supports these codes for the corresponding segment/element pairs:

Segment Names	Segment Codes/Element Names	Code/Qualifiers (Definitions)	Workday Fields or Comments
ISA Interchange Control Header	ISA05 Interchange ID Qualifier	ZZ (Mutually Defined)	Not applicable.
ISA Interchange Control Header	ISA06 Interchange Sender	Sender ID	Not applicable.
ISA Interchange Control Header	ISA07 Interchange ID Qualifier	01 (Company DUNS Number) ZZ (Mutually Defined)	Not applicable.
ISA Interchange Control Header	ISA08 Interchange Receiver ID	Provider DUNS	Company
ISA Interchange Control Header	ISA13 Interchange Control Number	Batch Counter	Not applicable.
GS Functional Group Header	GS01 Functional Identifier Code	IN (Supplier Invoice 810)	Not applicable.
GS Functional Group Header	GS02 Application Senders Code	Supplier Alternate Name with Usage EDI Integration Name, or Supplier Alternate Name with Usage Connection Integration Name, or Supplier DUNS Number.	Supplier
GS Functional Group Header	GS03 Application Receivers Code	Provider DUNS Number	Company
ST Transaction Set Header	ST01 Transaction Set Header	810 (Invoice)	Not applicable.
NTE Note/ Special Instruction	NTE01 Note Reference Code	INV (Invoice Instruction)	Not applicable.
NTE Note/ Special Instruction	NTE02 Description	Free form text.	Use this field for the Memo. If your memo is greater than 80 characters, you can have multiple NTE segments which Workday will combine into the memo field.

Segment Names	Segment Codes/ Element Names	Code/Qualifiers (Definitions)	Workday Fields or Comments
BIG Beginning Segment for Invoice	BIG01 Invoice Date	Derived from file or automatically populates the current Date.	Invoice Date
BIG Beginning Segment for Invoice	BIG02 Invoice Number	Not applicable.	External Supplier Reference  If you use the Invoice number in Workday as a unique sequence, the number will get stored in External Supplier Reference.
BIG Beginning Segment for Invoice	BIG04 Purchase Order Number	Not applicable.	Purchase Order Number
BIG Beginning Segment for Invoice	BIG07 Transaction Type Code	Use DI, PR, or CI for standard invoices.  DM (Debit Memo)  CR (Credit Memo)	Not applicable.
REF Reference Numbers	REF01 Reference Number Qualifier	OI (Original Invoice Number)	Not applicable.
REF Reference Numbers	REF02 Reference Number	Not applicable.	Reference Invoice
REF Reference Numbers	REF01 Description	CT (Buyer Contract Number)	Not applicable.
REF Reference Numbers	REF02 Reference Number	Not applicable.	Supplier Contract
REF Reference Numbers	REF01 Reference Number Qualifier	ZZ (Mutually Defined. Used for Adjustment Reason)	Not applicable.
REF Reference Numbers	REF02 Reference Number	Not applicable.	Adjustment Reason
REF Reference Numbers	REF01 Reference Number Qualifier	CA (Cost Allocation Reference)	Not applicable.
REF Reference Numbers	REF03 Description	Not applicable.	Worktags
REF Reference Numbers	REF01 Reference Number Qualifier	CAT (Category Identifier)  ZZ (Mutually Defined)	Not applicable.
REF Reference Numbers	REF02 Description	Not applicable.	Spend Category
N1 Selling Party	N101 Early Identifier Code	SE (Selling Party)  VN (Selling Party - Vendor)	Not applicable.

Segment Names	Segment Codes/ Element Names	Code/Qualifiers (Definitions)	Workday Fields or Comments
		SU (Selling Party - Supplier) II (Selling Party - Issuer of Invoice)	
N1 Selling Party	N103 Identification Code Qualifier	1 (Duns Number) 91 (Customer Account Number) ZZ (Mutually Defined)	Not applicable.
N1 Selling Party	N104 Identification Code	Not applicable.	Supplier
N1 Buying Party	N101 Early Identifier Code	BY (Buying Party) SO (Sold to)	Not applicable.
N1 Buying Party	N103 Identification Code Qualifier	01 (DUNS Number) ZZ (Mutually Defined)	Not applicable.
N1 Buying Party	N104 Identification Code	Not applicable.	Company
N1 Ship To	N101 Early Identifier Code	ST (Ship to) BT (Bill to)	Not applicable.
N1 Ship To	N103 Identification Code Qualifier	91 (Assigned by Seller) UN (GLN) ZZ (Mutually Defined)	Not applicable.
N1 Ship To	N104 Identification Code	Not applicable.	Ship To
N1 Remit to Connection	N101 Early Identifier Code	RI (Remit To) RE (Party Receiving Remittance)	Not applicable.
N1 Remit to Connection	N103 Identification Code Qualifier	ZZ (Mutually Defined)	Not applicable.
N1 Remit to Connection	N104 Identification Code	Not applicable.	Remit-To-Connection
ITD Terms of Sale / Deferred Terms of Sale	ITD03 Terms Discount Percentage	Early payment discount percentage.	Not applicable.
ITD Terms of Sale / Deferred Terms of Sale	ITD05 Terms Discount Days	Number of days in Terms Discount Period until payment is due. Use the number of days if the party earns the discount (up to 30 days).	Not applicable.
ITD Terms of Sale / Deferred Terms of Sale	ITD07 Terms Net Days	Number of days until total invoice amount	Not applicable.

Segment Names	Segment Codes/ Element Names	Code/Qualifiers (Definitions)	Workday Fields or Comments
		is due (discount not applicable) from Invoice Received date.	
CUR Currency	CUR01 Early Identifier Code	SE (Selling Party)	Not applicable.
CUR Currency	CUR02 Name	Not applicable.	Currency
N9 Extended Reference Information	N901 Qualifier URL	URL (Qualifier)	N9 loop contains N9 and MSG segment.
MSG Message Text	MSG01 Free-Form Message Text	URL	MSG segment with URL contained in N9 loop.
N9 Extended Reference Information	N902 Reference Identification	Value for image.	Document Link
IT1 Invoice Baseline Item Data	IT101 Assigned Identification	PO Line Number	PO Line Number
IT1 Invoice Baseline Item Data	IT102 Quantity Invoiced	Any positive number.	Quantity
IT1 Invoice Baseline Item Data	IT103 Unit of Measurement Code	Not applicable.	Unit of Measure
IT1 Invoice Baseline Item Data	IT104 Unit Price	Any positive number.	Unit Price
PID Product Item/ Description	PID01 Item Description Type	F (Free Form)	Not applicable.
PID Product Item/ Description	PID05 Description	Not applicable.	Item Description
TDS Total Monetary Value Summary	TDS01 Total Amount of Invoice	Value of Invoice	Total Invoice Amount
TXI Tax Information	TXI01 Tax Information	TX (All Taxes)	Not applicable.
TXI Tax Information	TX102 Monetary	Not applicable.	Tax amount
SAC Service, Promotion, Allowance, or Change Information	SAC01 Allowance Change Indicator	C (Charge)	Not applicable.
SAC Service, Promotion, Allowance, or Change Information	SAC02 Service Promotion Allowance or Charge Information	Freight: <ul style="list-style-type: none"> <li>• C030</li> <li>• D240</li> <li>• D540</li> <li>• F050</li> <li>• G740</li> <li>• G830</li> <li>• I250</li> </ul> Other Charges: <ul style="list-style-type: none"> <li>• A010</li> </ul>	Not applicable.

Segment Names	Segment Codes/ Element Names	Code/Qualifiers (Definitions)	Workday Fields or Comments
		<ul style="list-style-type: none"> <li>• B090</li> <li>• C040</li> <li>• C310</li> <li>• C510</li> <li>• D270</li> <li>• D500</li> <li>• F155</li> <li>• F800</li> <li>• G821</li> <li>• G970</li> <li>• H090</li> <li>• H550</li> <li>• H850</li> <li>• I590</li> <li>• AFEE</li> </ul> <p>ZZZZ (Mutually Defined)</p>	
SAC Service, Promotion, Allowance, or Change Information	SAC05 Total Amount of Allowance or Change	<p>Freight:</p> <ul style="list-style-type: none"> <li>• C030</li> <li>• D240</li> <li>• D540</li> <li>• F050</li> <li>• G740</li> <li>• G830</li> <li>• I250</li> </ul> <p>Other Charges:</p> <ul style="list-style-type: none"> <li>• A010</li> <li>• B090</li> <li>• C040</li> <li>• C310</li> <li>• C510</li> <li>• D270</li> <li>• D500</li> <li>• F155</li> <li>• F800</li> <li>• G821</li> <li>• G970</li> <li>• H090</li> <li>• H550</li> <li>• H850</li> <li>• I590</li> <li>• AFEE</li> </ul> <p>ZZZZ (Mutually Defined)</p>	<p>Freight Amount Other Charges</p>

## Reference: Valid Element Codes for Outbound EDI 850 Files

The outbound *EDI 850* file supports these codes for the corresponding segment/element pairs:

Segment Name	Segment Code and Element Name	Value Comments or Codes	Workday Field
ISA Interchange Control Header	ISA01 Authorization Information Qualifier	Not applicable.	Not applicable.
ISA Interchange Control Header	ISA02 Authorization Information	If ISA01 is 00, Workday leaves this code blank (10 Spaces).	Not applicable.
ISA Interchange Control Header	ISA03 Security Information Qualifier	Not applicable.	Not applicable.
ISA Interchange Control Header	ISA04 Security Information	If ISA01 is 00, leave this code blank (10 Spaces).	Not applicable.
ISA Interchange Control Header	ISA05 Interchange ID Qualifier	ZZ (Mutually Defined)	Not applicable.
ISA Interchange Control Header	ISA06 Interchange Sender ID	Company DUNS number	Company Identifier
ISA Interchange Control Header	ISA07 Interchange ID Qualifier	01 (Company DUNS Number) ZZ (Mutually Defined)	Not applicable.
ISA Interchange Control Header	ISA08 Interchange Receiver ID	Configured as an integration attribute on integration system. Company DUNS Number.	Not applicable.
ISA Interchange Control Header	ISA09 Interchange Date	Definition	Transmission Date
ISA Interchange Control Header	ISA10 Interchange Time	24 Hours	Transmission Time
ISA Interchange Control Header	ISA11 Repetition Separator	U	Not applicable.
ISA Interchange Control Header	ISA12 Interchange Control Reference Number	401	Not applicable.
ISA Interchange Control Header	ISA13 Interchange Control Number	Counter.	Not applicable.
ISA Interchange Control Header	ISA14 Acknowledgment Requested	0 (False) 1 (True)	Not applicable.
ISA Interchange Control Header	ISA15 Interchange Use Indicator	P (Prod) T (Test) I (Info)	Environment

Segment Name	Segment Code and Element Name	Value Comments or Codes	Workday Field
ISA Interchange Control Header	ISA16 Component Element Separator	Not applicable.	
GS Functional Group Header	GS01 Functional Identifier Code	PO (Purchase Order)	Not applicable.
GS Functional Group Header	GS02 Application Senders Code	Configured as an integration attribute on INTSYS	Sender Trading Partner ID can come from these configurations: Company DUNS Number when you set up Company as a customer account. Sender_ID from INTSYS.
GS Functional Group Header	GS03 Application Receivers Code	Configured as an integration attribute on INTSYS	Receiver Trading Partner ID can come from these configurations: Order from Connection Alternate Name with Connection Integration Name usage. Supplier Alternate Name with EDI Integration Name usage. Supplier DUNS number. Receiver_ID from INTSYS.
GS Functional Group Header	GS04 Date	CCYYMMDD	Transmission Date
GS Functional Group Header	GS05 Time	Not applicable.	Transmission Time
GS Functional Group Header	GS06 Group Control Header	Not applicable.	Counter
GS Functional Group Header	GS07 Responsible Agency Code	Not applicable.	X
GS Functional Group Header	GS08 Version/ Release/ Industry Identifier Code	Not applicable.	401
ST Transaction Set Header	ST01 Transaction Set Identifier Code	Not applicable.	850
ST Transaction Set Header	ST02 Transaction Set Control Number	Counter Increment of the ST-SE groups.	Counter

Segment Name	Segment Code and Element Name	Value Comments or Codes	Workday Field
BEG Beginning Segment for Purchase Order	BEG01 Transaction Set Purpose Code	00 (New Order)	Not applicable.
BEG Beginning Segment for Purchase Order	BEG02 Purchase Order Type Code	SA (Stand-alone Order)	Not applicable.
BEG Beginning Segment for Purchase Order	BEG03 Purchase Order Number	Not applicable.	Purchase Order
BEG Beginning Segment for Purchase Order	BEG04 Release Number	Zero (We don't change order in this document.)	PO Version
BEG Beginning Segment for Purchase Order	BEG05 Date	Date format is CCYYMMDD.	PO Date
BEG Beginning Segment for Purchase Order	BEG06 Contact Number	Not applicable.	Contract Number
CUR Currency	CUR01 Early Identifier Code	Not applicable.	VN
CUR Currency	CUR02 Currency Code	VN (Vendor)	Currency
CUR Currency	CUR03 Exchange Rate	The exchange rate is a 1:1 ratio, and there's no current rate field in the purchase order.	0001
REF Reference Numbers	REF01 Reference Identification Qualifier	If this code isn't available, don't print the segment.	The field depends on the code sent to the supplier; contract CT or RFQ is greater than RFQ KT.
REF Reference Numbers	REF02 Reference Identification	Not applicable.	Workday Contract/ Request
PER Administrative Communication Contact	PER01	BD RQ	None
PER Administrative Communication Contact	PER02	Buyer Name Requestor	BD is Bill-To Contact RQ Ship-To Contact
DTM Date/Time Reference	DTM01 Date/Time Qualifier	Not applicable.	004
DTM Date/Time Reference	DTM02 Date	Not applicable.	Document Date
N1 Selling Party	N101 Entity Identifier Code	ST (Ship To)	ST

Segment Name	Segment Code and Element Name	Value Comments or Codes	Workday Field
N1 Selling Party	N102 Name	Not applicable.	Company Location Name
N1 Selling Party	N103 Identification Code Qualifier	Use PO header ship-to location information	Use qualifier 91 if Location Customer Account exists. Otherwise, don't use it.
N1 Selling Party	N104 Identification Code	Populate only if data is available.	If N103 is 91, then N104 is the Location Customer Account Number or Customer Account Number from the supplier profile. Otherwise, don't use it.
N9 Reference Identification	N901 Reference Identification Qualifier	L1 (Letters or Notes)	L1
N9 Reference Identification	N902 Reference Identification	Not applicable.	Not applicable.
N9 Reference Identification	N903 Free-Form Description	This segment is a mandatory part of the generic EDI file compiler.	Add a header comment. If empty, use the ID of the Purchase Order.
N9 Reference Identification	N904 Date	Not applicable.	Not applicable.
N9 Reference Identification	N905 Time	Not applicable.	Not applicable.
PO1 Baseline Item Data	PO101 Assigned Identification	Not applicable.	Line Number
PO1 Baseline Item Data	PO102 Quantity Ordered	Not applicable.	Quantity Ordered
PO1 Baseline Item Data	PO103 Unit or Basis for Measurement Code	Unit Of Measurement	Unit of Measure
PO1 Baseline Item Data	PO104 Unit Price	Not applicable.	Unit Cost
PO1 Baseline Item Data	PO105 Product/Service ID Qualifier	AB (Pay)	Not applicable.
PO1 Baseline Item Data	PO106 Product/Service ID	VC (Vendor Catalog Number) Item Number	Not applicable.
PO1 Baseline Item Data	PO107 Product/Service ID Qualifier	PID	Workday uses Spend Category if the Goods and Services field isn't available.  Purchase Order Line Supplier Item Identifier

Segment Name	Segment Code and Element Name	Value Comments or Codes	Workday Field
			Purchase Item Identifier Purchase Item Name
PO1 Baseline Item Data	PO108 Product/Service ID	GTS	Item Attribute Configured
PO1 Loop Baseline Item Data	PO1: <ul style="list-style-type: none"> <li>• 10</li> <li>• 12</li> <li>• 14</li> <li>• 16</li> <li>• 18</li> </ul> PO1: <ul style="list-style-type: none"> <li>• 20</li> <li>• 22</li> <li>• 24</li> </ul> Product/Service ID Qualifier	CO (CAS Number) UK (GTIN) HC (HCPS) MF (Manufacturer) MG (Manufacturer #) MN (Model Number) UX (UPN) LT (Lot Number) SN (Serial Number) IN (Item Identifier)	Workday won't send this segment if it doesn't find data. The Item Identifier Type name must match the Universal Item Identifier. Item Attribute Configured
PO1 Loop Baseline Item Data	PO113 Product/Service ID	Not applicable.	Purchase Item Identifier
PO1 Loop Baseline Item Data	PO109 PO1: <ul style="list-style-type: none"> <li>• 15</li> <li>• 17</li> <li>• 19</li> </ul> PO1: <ul style="list-style-type: none"> <li>• 21</li> <li>• 23</li> <li>• 25</li> </ul> Produce/Service ID	Not applicable.	Item Attribute Value
PID Product Item/Description	PID01 Item Description Type	F (Free Form)	Not applicable.
PID Product Item/Description	PID05 Description	Use Spend Category for items without a description.	Not applicable.
SDQ Destination Quantity	SDQ01	WD	Not applicable.
SDQ Destination Quantity	SDQ02 Identification Code Qualifier	GL Workday uses qualifier UL if location GLN exists. If not, Workday uses qualifier 92 for	Not applicable.

Segment Name	Segment Code and Element Name	Value Comments or Codes	Workday Field
		Customer Account number.	
SDQ Destination Quantity	SDQ03 Identification Code	GLN If SDQ02 is UL, then SDQ03 is GLN.	If SDQ02 is 92, then SDQ03 is the Location Customer Account Number if found; otherwise use Customer Account Number from the supplier profile.
SDQ Destination Quantity	SDQ <ul style="list-style-type: none"> <li>• 04</li> <li>• 06</li> <li>• 08</li> <li>• 10</li> <li>• 12</li> <li>• 14</li> <li>• 16</li> <li>• 18</li> <li>• 20</li> <li>• 22</li> </ul> Quantity	Not applicable.	For SDQ04, use Quantity.
SDQ Destination Quantity	SDQ <ul style="list-style-type: none"> <li>• 05</li> <li>• 07</li> <li>• 09</li> <li>• 11</li> <li>• 13</li> <li>• 15</li> <li>• 17</li> <li>• 19</li> <li>• 21</li> </ul> Identification Code	Not applicable.	Workday won't send this segment if it doesn't find data.
TD5 Carrier Details	TD502 Identification Code Qualifier	Not applicable.	Not applicable.
TD5 Carrier Details	TD503 Identification Code	Not applicable.	Not applicable.
TD5 Carrier Details	TD505 Routing	Not applicable.	Not applicable.
MSG Message Text	MSG01 Free Form Text Message	Not applicable.	Only use Line Memo.
N1 Selling Party	N101 Entity Identifier Code	You can loop these segments as ST (Ship To) or BT (Bill To).	ST

Segment Name	Segment Code and Element Name	Value Comments or Codes	Workday Field
N1 Selling Party	N102 Name	Not applicable.	Company Location Name
N1 Selling Party	N103 Identification Code Qualifier	Use PO line location information	Use qualifier 91 if Location Customer Account exists. Otherwise, don't use it.
N1 Selling Party	N104 Identification Code	Populate only if data is available.	If N103 is 91, then N104 is the Location Customer Account Number or Customer Account Number from the supplier profile. Otherwise don't use it.
N2 Additional Name Information	N201 Name	Use this field as a continuation of name 1.	35+ Name Continuation of Ship to Contact Detail.
N2 Additional Name Information	N202 Name	Use this field as a continuation of name 1.	Continuation of N1.
N3 Address Information	N301 Address Information	Ship To Address - Copy the information from the Purchase Order.	Ship To Street Address
N3 Address Information	N302 Address Information	Ship To Address - Copy the information from the Purchase Order.	Continuation Street Address
N4 Geographic Location	N401 City Name	Ship To Address - Copy the information from the Purchase Order.	Ship
N4 Geographic Location	N402 State or Province Code	Ship To Address - Copy the information from the Purchase Order.	Ship To Province/State
N4 Geographic Location	N403 Postal Code	Ship To Address - Copy the information from the Purchase Order.	Ship to Postal Code
N4 Geographic Location	N404 Country Code	3 character country code	Ship to Country Code
PER Administrative Communications Contact	PER01 Contact Function Code	Not applicable.	AR
PER Administrative Communications Contact	PER02 Name	Not applicable.	Ship to Contact Detail

Segment Name	Segment Code and Element Name	Value Comments or Codes	Workday Field
PER Administrative Communications Contact	PER03 Communication Number Qualifier	We use the email first, it can also be fax or telephone.	EM
PER Administrative Communications Contact	PER04 Communication Number	Workday contact information.  If the contact information for Workday isn't available, use the work phone number of the buyer. If that isn't available, use the phone number of the company.	Work email of ship to contact.
PER Administrative Communications Contact	PER05 Communication Number Qualifier	Not applicable.	TE
PER Administrative Communications Contact	PER06 Communication Number	Workday contact information.  If the contact information for Workday isn't available, use the work phone number of the buyer. If that's not available, use the phone number of the company.	Work phone of ship to contact on Worker Profile.
CTT Transaction Totals	CTT01 Number of Line Items	Not applicable.	Number of Items
CTT Transaction Totals	CTT02 Hash Total	PO Line Number	Number of Quantities
AMT Monetary Amount	AMT01 Amount Qualifier Code	Any positive number.	1
AMT Monetary Amount	AMT02 Monetary Amount	Code 1 (Line Total Amount).	Line Total Amount
SE Transaction Set Trailer	SE01 Number of Included Segments	Not applicable.	The count of Segments from ST to SE.
SE Transaction Set Trailer	SE02 Transaction Set Control Number	Segment Counter	Use the Transaction Control Number, the number must be the same as ST02.
GE Functional Group Trailer	GE01 Number of Transaction Sets Included	Not applicable.	The count of ST segments in GE.
GE Functional Group Trailer	GE02 Group Control Number	Not applicable.	Control Numbers of GE.

Segment Name	Segment Code and Element Name	Value Comments or Codes	Workday Field
IEA Interchange Controller Trailer	IEA01 Number of Included Functional Groups	Not applicable.	The count of GS segments in ISA.
IEA Interchange Controller Trailer	IEA02 Interchange Control Number	Not applicable.	Control Number of IST.

### Bill-Only Purchase Orders

Segment Name	Segment Code and Element Name	Value Comments or Codes	Workday Field
BEG Beginning Segment for Purchase Order	BEG02 Purchase Order Type Code	CN (Consignment)	Purchase Order Type
PO1 Loop Baseline Item Data	PO1X Product/Service ID Qualifier	Not applicable.	Item Attribute Configured
N9 Reference Identification	N901	CX (Consignment Classification ID)	Not applicable.
N9 Reference Identification	N902	BO (Bill Only)	Not applicable.
PO1 Loop Baseline Item Data	PO1 Product/Service ID Qualifier	LT (Lot)	Lot Number
PO1 Loop Baseline Item Data	PO1 Product/Service ID Qualifier	SN (Serial Number)	Serial Number
PO1 Loop Baseline Item Data	DTM Date/Time Qualifier	456	Procedure Date
PO1 Loop Baseline Item Data	PER01 Qualifier	1F	Physician
PO1 Loop Baseline Item Data	REF01 Qualifier	EA	Medical Record Number
PO1 Loop Baseline Item Data	PER01 Qualifier	SR	Supplier Representative
PO1 Loop Baseline Item Data	REF01 Qualifier	3H	Procedure Date

### Reference: Valid Element Codes for EDI 855 Purchase Order Acknowledgment Files

Integrations based on the *Purchase Order Acknowledgment EDI 855 Inbound* integration template can import files in the EDI 855 file format. The *EDI 855* integration supports these codes for the corresponding segment / element pairs:

Segment Name	Segment Code and Element Name	Code (Definition)	Workday Field
ST Transaction Set Header	ST01 Transaction Set Identifier Code	855	Not applicable.
BAK Beginning of POA	BAK01 Transaction Set Purpose Code	01 (Cancellation) 06 (Confirmation)	Not applicable.
BAK Beginning of POA	BAK02 Acknowledgment Type Code	The normalized element status follows these code definitions:  AC (Acknowledge - With Detail and Change) - Partially Acknowledged AD (Acknowledge - With Detail, No Change) - Accepted AE (Acknowledge - Hold Status) - Partially Acknowledged AH (Acknowledge - With Exception Detail Only) - Partially Acknowledged AK (Acknowledge - No Detail or Change) - Accepted AP (Acknowledge - Product Replenishment) - Accepted AT (Accepted) - Accepted NA (No Acknowledgment Needed) RD (Rejected with Detail) - Rejected RF (Reject with exception only) - Rejected RJ (Rejected - No Detail) - Rejected RN (Rejected - Not as Agreed) - Rejected RO (Rejected with Offer) - Rejected	Acknowledgment Type

Segment Name	Segment Code and Element Name	Code (Definition)	Workday Field
		RV (Rejected - Violates Industry Practices) - Rejected ZZ (Mutually Defined)	
BAK Beginning of POA	BAK03 Purchase Order Number	Not applicable.	PO Number
BAK Beginning of POA	BAK08 Reference Identification	Seller order number	Supplier Acknowledgment Number Each POA must have a unique number.
BAK Beginning of POA	BAK09 Date	Not applicable.	POA Document Date
MSG Message Text	MSG01 Free-Form Message Text	Not applicable.	Memo
PO1 Baseline Item Data	PO101 Assigned Identification	Not applicable.	Line Number
PO1 Baseline Item Data	PO102 Quantity Ordered	Number	Quantity Ordered
PO1 Baseline Item Data	PO103 Unit or Basis for Measurement Code	Not applicable.	Unit of Measure
PO1 Baseline Item Data	PO104 Unit Price	Not applicable.	Not Applicable
PO1 Baseline Item Data	PO106 Product/Service ID Qualifier	CO (CAS Number) HC (HCPCS) MF (Manufacturer) MG (Part Number of Manufacturer) MN (Model Number) UK (GTIN-14) UX (UPN) VN (Item Number of Vendor) VP (Part Number of Vendor) (Supplier Identifier in Workday)	AIID Type
PO1 Baseline Item Data	PO107 Produce Service ID	Not applicable.	AIID
PID Product/Item Description	PID05 Description	Not applicable.	Item Description
ACK Line Item Acknowledgment	ACK01 Line Item Status Code	The normalized element status follows	Acknowledgment Status

Segment Name	Segment Code and Element Name	Code (Definition)	Workday Field
		<p>these code definitions and uses the stored PO101 value:</p> <p>AA (Item Accepted - Order Forwarded to Alternate Supplier Location) - Accepted</p> <p>AC (Item Accepted and Shipped) - Accepted</p> <p>AR (Item Accepted and Released for Shipment) - Accepted</p> <p>BP (Item Accepted - Partial Shipment, Balance Backordered) - Partial Quantity Backordered</p> <p>DR (Item Accepted - Date Rescheduled) - Accepted with Changes</p> <p>IA (Item Accepted) - Accepted</p> <p>IB (Item Backordered) - Fully Backordered</p> <p>IC (Item Accepted - Changes Made) - Accepted with Changed</p> <p>ID (Item Deleted) - Rejected</p> <p>IE (Item Accepted - Price Pending) - Accepted with Changes</p> <p>IF (Item on Hold - Incomplete Description) - Rejected</p> <p>IH (Item on Hold) - Rejected</p> <p>IP (Item Accepted - Price Changed) Accepted with Changes</p> <p>IQ (Item Accepted - Quantity Changed) Accepted with Changes</p> <p>IR (Item Rejected) - Rejected</p>	

Segment Name	Segment Code and Element Name	Code (Definition)	Workday Field
		IS (Item Accepted - Substitution Made) - Accepted with Changes IW (Item on Hold - Waiver Required) - Rejected R1 (Item Rejected - Not a Contract Item) - Rejected R2 (Item Rejected - Invalid Item Product Number) - Rejected R3 (Item Rejected - Invalid Unit Issue) - Rejected R4 (Item Rejected - Contract Item Not Available) - Rejected R5 (Item Rejected - Reorder Item as a Just In Time (JIT) Order) - Rejected R6 (Item Rejected - Reorder Item as an Extended Delivery Order)(EDO) - Rejected R7 (Item Rejected - Reorder Item as a Drop Shipment) - Rejected R8 (Item Rejected - Reorder Item as a Surge Order) - Rejected SP (Item Accepted - Schedule Date Pending) - Accepted	
ACK Line Item Acknowledgment	MSG01 Free-Form Message Text	Workday appends the supplier status code to the <i>Memo</i> value on the purchase order acknowledgment line in the format <i>EDI Status Code: ACK01 Code</i> .	Memo
ACK Line Item Acknowledgment	ACK02 Quantity	The difference between this value and the value for PO102 determine	Quantity

Segment Name	Segment Code and Element Name	Code (Definition)	Workday Field
		the acceptance status. Applicable statuses are: accepted, accepted with changes, or fully or partially backordered.	
ACK Line Item Acknowledgment	ACK03 Unit or Basis for Measurement Code	UOM Codes	UOM
ACK Line Item Acknowledgment	ACK05 Date	Not applicable.	Date
ACK Line Item Acknowledgment	ACK07 Product / Service ID Qualifier	CO (CAS Number) HC (HCPCS) MF (Manufacturer) MG (Part Number of Manufacturer) MN (Model Number) UK (GTIN-14) UX (UPN) VC (Catalog Number of Vendor) VN (Item Number of Vendor) VP (Part Number of Vendor) (Supplier Item Identifier in Workday)	AIID Type
ACK Line Item Acknowledgment	ACK08 Product / Service ID	AIID Code	AIID

## Reference: Valid Element Codes for Inbound EDI 856 Files

Integrations based on the *Create Supplier Invoice from EDI File Template* integration template can import files in the EDI 856 file format. The *EDI 856* integration supports these codes for the corresponding segment/element pairs:

Segment Name	Segment Code and Element Name	Codes (Definition) or Derived Comments	Workday Field
ISA Interchange Control Header	ISA01 Authorization Information Qualifier Description	00	Not applicable.
ISA Interchange Control Header	ISA02 Authorization Information	If ISA01 is 00, leave the code blank (10 Spaces).	Not applicable.
ISA Interchange Control Header	ISA03 Security Information Qualifier	Not applicable.	Not applicable.

Segment Name	Segment Code and Element Name	Codes (Definition) or Derived Comments	Workday Field
ISA Interchange Control Header	ISA04 Security Information	If ISA01 is 00, leave the blank (10 Spaces).	Not applicable.
ISA Interchange Control Header	ISA05 Interchange ID Qualifier	ZZ (Mutually Defined)	Not applicable.
ISA Interchange Control Header	ISA06 Interchange Sender ID	Sender ID	Trading Partner ID
ISA Interchange Control Header	ISA07 Interchange ID Qualifier	01 (Sender ID) ZZ (Mutually Defined)	Not applicable.
ISA Interchange Control Header	ISA08 Interchange Receiver ID	Not applicable.	Not applicable.
ISA Interchange Control Header	ISA09 Interchange Date	Not applicable.	Not applicable.
ISA Interchange Control Header	ISA10 Interchange Time	24H	Transmission Time
ISA Interchange Control Header	ISA11 Repetition Separator	Not applicable.	Not applicable.
ISA Interchange Control Header	ISA12 Interchange Control Reference Number	Not applicable.	Not applicable.
ISA Interchange Control Header	ISA13 Interchange Control Number	Not applicable.	Not applicable.
ISA Interchange Control Header	ISA14 Acknowledgment Requested	1 (True)	Not applicable.
ISA Interchange Control Header	ISA15 Interchange Use Indicator	P (Production) T (Test Data)	Not applicable.
ISA Interchange Control Header	ISA16 Component Element Separator	Not applicable.	Not applicable.
ST Transaction Set Header	ST01 Transaction Set Identifier Code	856	Not applicable.
ST Transaction Set Header	ST02 Transaction Set Identifier Code	Not applicable.	Not applicable.
BSN Beginning Segment for Ship Notice	BSN01 Transaction Set Purpose Code	00	Not applicable.
BSN Beginning Segment for Ship Notice	BSN02 Shipment Identification	Not applicable.	Shipment Number
BSN Beginning Segment for Ship Notice	BSN03 Date	CCYYMMDD	Shipping Date

Segment Name	Segment Code and Element Name	Codes (Definition) or Derived Comments	Workday Field
BSN Beginning Segment for Ship Notice	BSN04 Time	Not applicable.	Shipping Time
HL Hierarchical Level	HL01 Hierarchical ID Number	Not applicable.	Not applicable.
HL Hierarchical Level	HL02 Hierarchical Parent ID Number	Not applicable.	Not applicable.
HL Hierarchical Level	HL03 Hierarchical Level Code	S O I	Not applicable.
HL Hierarchical Level	HL04 Hierarchical Child Code	Not applicable.	Not applicable.
GS Functional Group Header	GS01 Functional Identifier Code	PO (Purchase Order)	Purchase Order
GS Functional Group Header	GS02 Application Senders Code	Sender ID	Sender Trading Partner ID
GS Functional Group Header	GS03 Application Receivers Code	Currently Same as ISA08	Receiver Trading Partner ID
GS Functional Group Header	GS04 Date	CCYYMMDD	Transmission Date
GS Functional Group Header	GS05 Time	Not applicable.	Transmission Time

## Troubleshooting: EDI Integrations Complete with Warnings or Errors

An EDI integration completes with warnings or errors and the integration fails to create the transaction in Workday.

Cause: The EDI file contains incorrect data.

You can resolve this issue in 1 of 3 ways. Alternatively, for inbound EDI files, you can ask the sender to correct the errors and resend the file.

Solution: Correct the EDI file manually, upload it to the relevant location, and run the integration again.

### Steps

1. Access the Process Monitor report.

From the Process Type prompt, select *Integration*.

From the Process prompt, select your EDI integration system.

From the Status prompt, select:

- *Completed With Errors*
- *Completed with Warnings*

Security: *My Reports* domain in the System functional area.

2. In the Background Processes grid, locate the integration run.

3. In the Request column, drill down on the integration event.

4. On the View Background Process report, access the Messages tab and review the warnings and errors.

Make a note of any problems to correct.

Security: *Background Process Management* in the Tenant Non-Configurable functional area.

5. On the Integration Details tab, drill down on the Parent Event.

Review the files processed during this integration event. For inbound EDI 810 files, Workday displays the modified file. For inbound EDI 855 and 856 files, Workday displays the raw file.

Download the EDI files that have warnings or errors.

Note: Workday stores the files for the number of days you configured on the integration system. You can't download the files after this period.

6. Open the EDI files in a text editor and correct the problems.

7. Upload the corrected files to the SFTP location configured on your EDI integration.

8. [Launch an Integration on page 24](#).

Run the integration again.

Solution: Create a copy of your EDI integration on which you can add files as attachments, then:

- Correct the EDI file manually.
- Run the duplicate integration.
- Attach the corrected file.

### Steps

1. Access the Process Monitor report.

From the Process Type prompt, select *Integration*.

From the Process prompt, select your EDI integration system.

From the Status prompt, select:

- *Completed With Errors*
- *Completed with Warnings*

Security: *My Reports* domain in the System functional area.

2. In the Background Processes grid, locate the integration run.
3. In the Request column, drill down on the integration event.
4. On the View Background Process report, access the Messages tab and review the warnings and errors.  
Make a note of any problems to correct.  
Security: *Background Process Management* in the Tenant Non-Configurable functional area.
5. On the Integration Details tab, drill down on the Parent Event.  
Review the files processed during this integration event. For inbound EDI 810 files, Workday displays the modified file. For inbound EDI 855 and 856 files, Workday displays the raw file.  
Download the EDI files that have warnings or errors.  
Note: Workday stores the files for the number of days you configured on the integration system. You can't download the files after this period.
6. From the related actions menu of your integration system, select Integration System > Clone.  
Create a duplicate of your original EDI integration.  
Security: *Integration Build* domain in the Integration functional area.
7. Create a business process definition for the cloned integration.  
See [Create Integration Business Process](#) on page 1950.
8. Configure a document retrieval step on the business process to manually add attachments.  
Select user groups from the Group to Manually Attach File(s) prompt.  
See [Set Up Integration Retrieval](#) on page 1957.
9. [Launch an Integration](#) on page 24.  
Run the duplicate integration and attach the corrected EDI file.

Solution: For inbound EDI files, manually create the transaction in Workday.

## Steps

1. Access the Process Monitor report.  
From the Process Type prompt, select *Integration*.  
From the Process prompt, select your EDI integration system.  
From the Status prompt, select:
  - *Completed With Errors*
  - *Completed with Warnings*
 Security: *My Reports* domain in the System functional area.
2. In the Background Processes grid, locate the integration run.
3. In the Request column, drill down on the integration event.
4. On the View Background Process report, access the Messages tab and review the warnings and errors.  
Make a note of any problems to correct.  
Security: *Background Process Management* in the Tenant Non-Configurable functional area.
5. On the Integration Details tab, drill down on the Parent Event.  
Review the files processed during this integration event. For inbound EDI 810 files, Workday displays the modified file. For inbound EDI 855 and 856 files, Workday displays the raw file.  
Download the EDI files that have warnings or errors.  
Note: Workday stores the files for the number of days you configured on the integration system. You can't download the files after this period.

## 6. Manually create the EDI transactions in Workday.

## Electronic Invoice Connector

### Steps: Set Up Electronic Invoice Connector

#### Context

You can create an integration to export custom electronic invoices to a vendor or payment portals in XML format.

#### Steps

##### 1. Access the Create Integration System task and enter *Core Connector: Electronic Invoice Connector* at the New Using Template prompt.

- To configure to common European data model for transmitting electronic invoices from business to government, set the New Using Template prompt to *UBL 2.1 Electronic Customer Invoice*.
- To transmit electronic invoices through cXML for automating the procurement process, set the New Using Template prompt to *cXML Electronic Customer Invoice*.
- Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

##### 2. Select Integration System > Configure Integration Attributes as a related action on the integration system and configure the integration attributes that you want to deliver.

To include the binary invoice PDF along with its supporting data, enable the *FileContent* on the *InvoicePDF* field attribute. To restrict the size of the PDF, configure the *Max PDF Size in Kilobytes* attribute.

##### 3. Select Integration System > Configure Integration Field Attributes as a related action on the integration system and configure the fields you would like to include in the output.

Disable any field attributes that you don't want included in the xml output file.

##### 4. (Optional) Access the Configure Integration Field Overrides task from the related actions menu of the desired integration system.

- Add custom fields, calculated fields, and Workday delivered report fields that aren't part of the delivered field attributes to the Extended Fields section for a given level. This enables you to include customer specific fields in the XML output file.
- To avoid performance issues, Workday doesn't sort the invoice lines when you generate electronic invoices. Therefore, the order of electronic invoice lines can be different from the order that the lines display on the standard customer invoice.

##### 5. (Optional) [Steps: Configure UBL Version 2.1 Electronic Customer Invoice Integration Service Map](#) on page 825.

When you use the *UBL 2.1 Electronic Customer Invoice* template, configure any field overrides as needed.

6. (Optional) [Steps: Configure cXML Electronic Customer Invoice Template](#) on page 831.  
When you use the *cXML Electronic Customer Invoice* template, configure any field overrides or field attributes as needed.
  7. [Set Up Integration Delivery](#) on page 1952.  
Configure the *Integration Process Event* business process and add a *Service* step for document delivery to an external entity.
  8. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:
    - *Integration Event*
    - *Process: Electronic Invoices*
- See: [Steps: Grant Integration or External Endpoint Access to Workday](#).
9. [Set Up Integration Sequence Generators](#) on page 1969.
  10. [Launch an Integration](#) on page 24.
    - To limit the invoices to include in the XML output, define filters such as Company, Customer, Invoice Number, Invoice Status before launching the integration.
    - For UBL 2.1 integration, we recommend that you launch it from the *Customer Invoice Event* business process. Add a new *Service* type step and set the Specify to Integration in the business process to launch the new integration after the appropriate person approves the invoice.
    - Add condition rules on the Integration step to ensure that the electronic invoice integration launches only:
      - When Workday generates an invoice PDF after the last printing run. Set the report field to Does PDF Exist for Last Printing Run and the relational operator to *Is not blank*.
      - For specific customer invoices within a given company. Use the Customer Invoice or Adjustment launch parameter to define a unique customer invoice or adjustment instance.
  - 11.(Optional) [Create Integration Notifications](#) on page 31.

## Steps: Configure UBL Version 2.1 Electronic Customer Invoice Integration Service Map

### Prerequisites

- Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
- Security: *Process: Electronic Invoices* domain in the Customer Accounts functional area.

### Context

After you create an electronic invoice integration system and define the integration attributes, configure the integration maps to map values in Workday to corresponding external values for invoice type, payment type, tax codes, and unit of measure. You only need to define mappings for the data elements that you want to include in the output file.

When an integration map has at least 1 row of data:

- Workday uses the map values to convert your tenant values to external values.
- When you don't define a tenant value in the map, Workday uses the default value of the map.

When the default value is blank, Workday issues an error or a warning message and the external value is empty.

## Steps

1. From the related actions menu on the integration system, select Integration System > Configure Integration Maps.
2. In the Integration Maps grid, add a row for each tenant value. Select the Internal Value and enter the External Value for the output file.
3. As you complete the task, consider:

Integration Maps	Description	Internal Value	External Value	EU Code List
<i>Invoice Type to InvoiceTypeCode</i>	Associates Workday Invoice Types to the external value for <i>InvoiceTypeCode</i> or <i>CreditNoteTypeCode</i> . Configure this map only when you set the <i>Use Invoice Type</i> or <i>Statutory Invoice Type for InvoiceTypeCode</i> attribute to Invoice Type.	Example: Credit Invoice	Example: 381	Use the <a href="#">UNTDID1001-inv</a> EU list to conform with the EN-16931 semantic data model.
<i>Statutory Invoice Type to InvoiceTypeCode</i>	Associates Workday Statutory Invoice Types to the external value for <i>InvoiceTypeCode</i> or <i>CreditNoteTypeCode</i> . Configure this map only when you set the <i>Use Invoice Type</i> or <i>Statutory Invoice Type for InvoiceTypeCode</i> attribute to Statutory Invoice Type	Example: Statutory Type	Example: 380	Use the <a href="#">UNTDID1001-cn</a> EU list to conform with the EN-16931 semantic data model.
<i>Payment Type to PaymentMeansCode</i>	Associates Workday	Example: Cash	Example: 10	Use the <a href="#">UNCL4461</a>

Integration Maps	Description	Internal Value	External Value	EU Code List
	Payment Types to the external value for <i>PaymentMeansCode</i> .			EU list to conform with the EN-16931 semantic data model.
<i>Tax Code to TaxCategory ID</i>	Associates Workday Transaction Tax Codes to the external value in the UBL invoice output for <i>TaxCategory ID</i> .	Example: FR VAT Output (10%)	Example: S	Use the <a href="#">UNCL5305</a> EU list to conform with the EN-16931 semantic data model.
<i>Tax Code to TaxExemptionReason</i>	Associates Workday Transaction Tax Codes to the external value for <i>TaxExemptionReasonCode</i> . Configure this map only when you set the <i>Use Tax Code or Tax Applicability for TaxExemptionReasonCode</i> attribute to Tax Code.	Example: FR VAT Output (0%)	Example: VAT-EU-G	Use the <a href="#">Vatex</a> EU list to conform with the EN-16931 semantic data model.
<i>Unit of Measure to InvoicedQuantity</i>	Associates Workday Unit of Measures value to the external value for the attribute <i>unitCode</i> on <i>InvoicedQuantity</i> .	Example: Box	Example: XBX	Use the <a href="#">UMCode List</a> to conform with the EN-16931 semantic data model.
<i>Company Tax ID Type to UBL Target Field</i>	Associates the company Tax IDs to an external value in a specific XML target output field in the UBL file.  All Company Tax IDs and non Transaction Tax ID Types are persisted on the customer	Example: FRA - SIREN	Example: AccountingSupplierParty / PartyTaxScheme / CompanyID	Use the <a href="#">PEPPOL-PARTY-COMMON-R045</a> to conform with the EN-16931 semantic data model.

Integration Maps	Description	Internal Value	External Value	EU Code List
	invoice are included in the AccountingSupplierParty / Party / PartyIdentification / ID target field as a default.			
<i>Customer Tax ID Type to UBL Target Field</i>	Associates the customer Tax IDs to an external value in a specific XML target output field in the UBL file.  Ensure to configure buyer and seller Company and Customer Tax IDs for customer invoices using Maintain Transaction Tax Codes and Maintain Tax ID Grouping tasks.	Example:FRA - SIREN	Example: AccountingCustomerParty / Party / PartyTaxScheme / CompanyID	NA
<i>Company Tax ID Type to schemeID</i>	Associates the company Tax IDs to an external value as schemeIDs in an output field in the UBL file.	Example:FRA - SIREN	Example:0009	Use the ISO 6523 ICD list to conform with the EN-16931 semantic data model.
<i>Customer Tax ID Type to schemeID</i>	Associates the customer Tax IDs to an external value as schemeIDs in	Example:FRA - SIREN	Example: 0009	Use the ISO 6523 ICD list to conform with the EN-16931 semantic data model.

Integration Maps	Description	Internal Value	External Value	EU Code List
	an output field in the UBL file.			

See the [UBL Field Mapping Output Samples](#) PDF file for examples of the output XML file for *AccountingSupplierParty* sections when you:

- Define an integration map.
- Define field overrides.
- Do not configure an integration map or field override.

See the [UBL Field Mapping to Workday Customer Invoice Fields](#) Excel file for detailed mapping of UBL fields to Workday Customer Invoice fields.

Ensure to observe these additional configuration behaviors to include the invoice data:

- Billable Project Name is included in output file only when there's 1 unique project reference across all customer invoice lines.
- Contract Number is included in output file only when there's 1 unique contract reference across all customer invoice lines.
- We use the original invoice number for the rebill and adjustments in the output file.
- The company and customer TaxID integration maps output to the *PartyLegalEntity / CompanyID* target field and they override the *GovernmentIssuedCompanyID* field in case you have any prior mappings.

Note: The [EU lists](#) includes code values from third-party websites. Workday isn't affiliated with and doesn't manage or update the information in these third-party sites. These lists are for reference only and you should validate your XML files.

4. (Optional) From the related actions menu on the integration system, select Integration System > Configure Integration Field Attributes.
  - Select the **Include all in Output** check box to include all the invoice fields .
  - We provide these configurable field attributes:
    - Company
    - CompanyAddress
    - BillToCustomer
    - BillToCustomerAddress
    - ShipToCustomer
    - ShipToCustomerAddress
    - SoldToCustomer
    - InvoiceDetail
    - AdditionalDetail
    - AmountSummary
    - TaxSummary
    - PaymentDetail
    - InvoicePDF
    - InvoiceLine
  - Certain fields might contain additional parameters that you can configure to include in the output field for meeting the electronic invoicing requirements.
  - To include the tax exemption reason description from the external tax mapping list in Workday into the XML output file, enable these attributes under **TaxSumary** for both grouped and ungrouped tax codes *mapTax Code to Tax Exemption Reason Code*:
    - *TransactionTaxCodeData/ExternalTaxCodeSubclassificationDescription*
    - *GroupedTransactionTaxCodeData/TaxExemptionReasonDescription*
  - To include the additional mandatory fields for supporting Tier-1 country specific invoicing requirements, after you configure the Company and Customer Tax ID integration maps, you can include these additional TaxID fields in the output file:
    - NationalTaxIDCode
    - Number
    - Type
  - You can also include fields for:
    - Additional Details such as DocumentLink, DueDate,FromDate,ToDate. Ensure to enable the *Customer Invoice Document Link* by using the Maintain External Link Validation task.
    - Payment Details such as BankAccountNumber, IBAN, BankID. When you enable the Payment Account identifiers:
      - The Bank Account Number takes precedence over the IBAN.
      - The Bank Identification Code takes precedence over the Bank ID.
5. (Optional) From the related actions menu on the integration system, select Integration System > Configure Integration Field Overrides.
 

Configure field overrides to change the Workday data to your custom data for the desired fields.

## Result

Workday saves the attribute map service on the integration.

## Example

You need to provide a value for the electronic invoice that is part of the invoice type code EU list (UNCL1001) to meet the requirements of the European Union. Since Workday doesn't store these values, use the Statutory Invoice Type to InvoiceTypeCode map to associate the Workday instance to the external EU list value.

To do so, set the *Use Invoice Type or Statutory Invoice Type for InvoiceTypeCode* integration attribute to **Statutory Invoice Type**. For the *Statutory Invoice Type to InvoiceTypeCode* integration map, set the Internal Value to *Statutory Type* and the External Value to code 380 from the [UNTDID1001-inv](#) list.

## Next Steps

- After the integration system setup is complete, test the xml file against the EU validator <https://ecosio.com/en/peppol-and-xml-document-validator/>.
  - When you have multiple tax total elements in the file, use this validator <https://www.itb.ec.europa.eu/invoice/upload>. This validator goes down for maintenance in the evening PDT.
- Note: The validator links are for third-party websites. Workday isn't affiliated with and doesn't manage or update the information in these third-party sites. This information is for reference only. Your access and use of these third party sites are subject to separate terms of use.
- When validating the file:
    - Create a calculated field and use a field override to obtain the company ID when the *VatCategoryTax* code is O.
    - Enable the Transaction Tax IDs.
    - Map values for InvoiceType code to include UBL 2.1 credit note.

### Reference

[2021R2 What's New Post: Universal Business Language \(UBL\) Version 2.1 Electronic Customer Invoice Template](#)

## Steps: Configure cXML Electronic Customer Invoice Template

### Prerequisites

Security:

- *Integration Build* and *Integration Configure* domains in the Integration functional area.
- *Process: Electronic Invoices* domain in the Customer Accounts functional area.

### Context

The outbound cXML Electronic Customer Invoice template improves your collection cycles and reduces manual effort and payment processing time. It enables you to:

- Set up an integration system for generating an electronic invoice for third party external suppliers that accept cXML.
- Attach or automatically post the cXML output file to the supplier portal endpoint.
- Provide a portal response to the customer invoice in Workday.

This template leverages the existing generic Electronic Customer Invoice – Core connector service and automatically enables all of the integration services, excluding these 2 optional services:

- *cXML Electronic Customer Invoice / Electronic Customer Invoice Core Service*: Enable to include additional output tags with the integration file.
- *cXML Electronic Customer Invoice / Integration Document Retention*: Enable to define the duration for storing the resulting output file in Workday.

You must configure the connections for posting to a supplier portal endpoint. To launch the integration automatically, you must define the document delivery rules and the associated document delivery types.

## Steps

- From the related actions menu of the cXML integration system you created, select Integration System > Configure Integration Maps.

In the Integration Maps grid, add a row for each tenant value. When you don't define a tenant value in the map, Workday uses the default value of the map. When the default value is blank, Workday issues an error or a warning message and the external value is empty.

Integration Maps	Description	Internal Value	External Value	EU Code List
<i>Unit of Measure to UnitOfMeasure</i>	Associates Unit of Measure in Workday to the external UN/CEFACT UnitOfMeasure value for invoice detail item.	Example: Each UN/CEFACT UnitOfMeasure	Example: EA BE BX	Use the UNECE code list to conform with the cXML list.

You only need to define mappings for the data elements that you want to include in the output file.

This mapping translates the Workday unit of measure to a different set of external values in the XML invoice output file. After you set up the integration, for UOM details, we recommend that you refer to a third-party tool such as <https://unece.org/trade/cefact/UNLOCODE-Download>.

Note: Workday isn't affiliated with the third-party sites and doesn't manage or update their information. These lists are for reference only and you should validate your XML files.

- (Optional) From the related actions menu on the integration system, select Integration System > Configure Integration Field Attributes.

Option	Description
<i>cXML File Delivery</i>	Enable the <i>cXML File Delivery</i> attribute to determine the file delivery option of attaching the file or posting it to an endpoint.  When you attach the file to an event, it's not posted to an endpoint and you will not receive an invoice acknowledgment.
<i>Company Tax ID</i>	Enable the <i>Company Tax ID</i> attribute to include supplier tax IDs in the electronic customer invoice cXML files.  To configure this attribute: <ol style="list-style-type: none"> <li>Access the Customer Invoices for Electronic Invoicing section.</li> <li>In the Company section, select the <b>Include in Output</b> check box for:               <ul style="list-style-type: none"> <li>• <i>TaxID</i>.</li> <li>• <i>Number</i>, in the <i>TaxID</i> section.</li> </ul> </li> <li>In the CompanyRemitToAddress section, select the <b>Include in Output</b> check box.</li> </ol>

3. (Optional) From the related actions menu on the integration system, select Integration System > Configure Integration Field Overrides.  
Configure field overrides to change the Workday data to your custom data for the desired fields. Workday provides a PO Line field attribute and it's enabled by default. To populate this number on the customer invoice, setup a field override for the Memofield. When creating a customer invoice in Workday, use the Memo field to add the PO line number .
4. Access the Create Integration System User task.  
Create a new separate ISU account for each vendor. Example: Create an account for Ariba\_ISU.  
Security: *Set Up: Integration Security* domain in the Integration functional area.
5. Access the Edit Integration System Security Group (Unconstrained) task.  
Add the new ISU account to the *E-Invoice Unconstrained Integration Security Group*.
6. From the related actions menu of the desired integration system, access Workday Account > Edit.  
Add the new ISU account to the integration system.

### Next Steps

Configure integration connections and document delivery rules to automate the process of posting the cXML file to the supplier portal endpoint and launching the integration from the business process. See [Steps: Automate Electronic Invoice Document Delivery for cXML](#).

Related Information

#### Reference

[2023R2 What's New Post: cXML Electronic Customer Invoice](#)

## Steps: Automate Electronic Invoice Document Delivery for cXML

### Prerequisites

- Create a cXML integration system.
- Create a separate ISU account and add it to the security group and to the cXML integration system.

### Context

You can configure the billing company credentials and document delivery rules to automatically post the customer invoices through a cXML file to the external supplier portal endpoint.

### Steps

1. Access the Maintain Electronic Invoice Integration Connections task.
  - For the *cXML Configuration Type* , enter a connection *Name* . You can set up multiple connections to support accounts for each of the third-party supplier portals you plan to have an integration with.
  - For each connection, configure these attributes:

Option	Description
From Domain	The From Credential Domain in the cXML file. Example, the Supplier Network ID or DUNS.
From Identity	The From Credential Identity in the cXML file. Example: AN005555.
Sender Domain	The Sender Credential Domain in the cXML file. Example, the Supplier Network ID or DUNS.

Option	Description
Sender Identity	The Sender Credential Identity in the cXML file. Example: AN005555.
Sender Shared Secret	Enter the password provided by your supplier network.
Endpoint	Specify the endpoint URL where the cXML file will be posted.

- Also, grant access to the Security: *Process: Electronic Invoices* domain in the Customer Accounts functional area to users or user groups who will define the cXML credentials and endpoint.
  - Security: *Process: Electronic Customer Invoice - cXML Connection* domain in the Customer Accounts functional area.
2. Access the Maintain Document Delivery Types task.
- Add *Integration* Delivery Method for the *Customer Invoice* Document Type.
  - Enter a supplier name in the Delivery Type Name field.
  - Workday uses the Document Delivery Types that you define here for the external suppliers on the customer profile, and in the delivery rules to initiate the integration system when creating invoices.
  - Security: *Set Up: Customer Accounts* and *Set Up: Sponsor Accounts* domains in the Customer Accounts and Grants Management functional area.
3. Access the Maintain Document Delivery Rules task.
- Add cXML document delivery rules for each supplier to map the document delivery type to integration connection credentials for the integration system.
  - Select *Integration* from the Document Delivery Type prompt for the *cXML Integration System*. Specify the *Integration Connection*.
  - External Tax Codes column is associated with the specified statutory invoices and displays only when you have configured a statutory invoice type for a given country through the *Maintain Invoice Types by Country* task.
  - Security: *Set Up: Customer Accounts* domain in the Customer Accounts functional area.
4. Access the Edit Document Delivery Options task.
- Select *Integration* from the Delivery Type prompt for the *Customer Invoice* Document.
  - This indicates that the customer is using an integration delivery type for customer invoices.
  - Security: *Set Up: Customer* domain in the Customers functional area.
5. Access the *Customer Invoice Event* business process and from the related actions menu, select *Edit*.
- To launch your integration system based on the document delivery rules, add a step and Specify *Electronic Invoicing Via Document Delivery Rules* for Service Type .
  - To include the printed PDF with the cXML, add the *Print Customer Invoice* service.

## Result

When you submit the customer invoice, Workday initiates the *Customer Invoice Event* business process and launches the cXML integration system to post the invoice in cXML file format to the supplier endpoint.

## Next Steps

When the business process completes, you can view:

- The supplier portal integration process details on the *Process* tab of the invoice.
- The successful response back on the *Electronic Invoice Acknowledgement* tab.

## Concept: Electronic Invoice Connector

The Electronic Invoice Connector integration:

- Sends invoice data electronically to external entities in XML format.
- Enables you to create custom configuration to meet local government requirements, or to integrate with third-party e-invoice business solutions.

Workday provides these electronic invoice integration templates:

Template	Considerations	Requires Access to Security Domain
<i>Core Connector: Electronic Customer Invoices</i>	<p>Use this Workday defined template to generate a generic XML output file for sending e-invoicing data out of Workday.</p> <p>You can configure the integration field attributes to define the fields to include in the output file.</p> <p>You can also add launch parameters to help narrow the selection of invoices to include in the XML output.</p>	<i>Process: Electronic Invoices.</i>
<i>UBL 2.1 Electronic Customer Invoice</i>	<p>Use this template to configure invoice data according to the local authorities that don't support standard invoice data formats. Example: the EN-16931 semantic data model for business-to-government transactions in Europe.</p> <p>Configure invoice type codes, tax codes, or tax applicability attributes to map Workday values to external values for populating the data in the UBL invoice output format. You can also change the attributes to populate data in another output format to suit your business needs.</p> <p>To change the Workday data to your custom data for desired fields, use Field Overrides. Example: UBL file has a field for <i>Profile ID</i> that defines the profile for the customization of UBL in use. You can use the field override to include a calculated field to specify the exact profile. Workday uses this calculated field in the UBL output.</p>	<i>Process: Electronic Invoices</i>

Template	Considerations	Requires Access to Security Domain
	To include the binary file in the XML file output, print the customer invoice before running this UBL 2.1 integration.	
<i>cXML Electronic Customer Invoice</i>	<p>Use this template to configure generation of an electronic invoice in cXML format and send it to your end customers that use third party external suppliers portals who accept cXML as a method, and record their response in the invoice acknowledgement.</p> <p>To specify the duration (in days) that the integration output should be available for, enable the <i>cXML Electronic Customer Invoice / Integration Document Retention Service</i> and configure the Document Retention Policy attribute.</p> <p>To add tags associated with the electronic customer invoice output file, enable the <i>cXML Electronic Customer Invoice / Electronic Customer Invoice Core Service</i> and configure the Output Document Tags attribute.</p>	<i>Process: Electronic Invoices</i>

### Core Connector: Electronic Customer Invoices

The template includes these configurable integration services:

Integration Service	Integration Attribute	Description
Customer Invoices for Electronic Invoicing DIS	NA	Provides all the global launch parameters.
PDFs for Electronic Invoicing DIS	<i>Max PDF Size in Kilobytes</i>	<p>Enables you to output the invoices in PDF format. You can define the maximum size of the PDF file to restrict the file size.</p> <p>When you set the PDF FileContent to <i>Required</i> and the PDF file exceeds the limit, then Workday excludes the PDF from the final output file.</p>
Electronic Customer Invoice Core Service	<i>Output Document Tags</i>	Associates the tag with the output <i>Electronic Customer Invoice</i> file, to help you easily

Integration Service	Integration Attribute	Description
		identify the specific documents you might need later.
Integration Document Retention	<i>Document Retention Policy</i>	Retains integration files for audit and troubleshooting purposes. You can specify the duration (in days) that integration output should be available.

## UBL 2.1 Electronic Customer Invoice

In addition to the integrations services provided with the core connector, this template also includes 1 more configurable integration service.

Integration Service	Integration Attribute	Description
UBL 2.1 Electronic Customer Invoice Service	<i>Codes to Generate UBL 2.1 Credit Note Format</i>	Specify the invoice codes. Workday generates a UBL 2.1 credit note format file when the values you specify match the <i>CreditNoteTypeCode</i> external value defined on the <i>Invoice Type</i> or <i>Statutory Invoice Type</i> maps. When the values don't match, Workday generates a UBL 2.1 invoice format file.
	<i>CustomizationID</i>	Workday sets the code to a string of 81,83,381,396,532 that are the <i>InvoiceTypeCodes</i> for credit note according to the European Union. Identifies a user-defined customization of UBL for a specific use.
	<i>Use Invoice Number or Gapless Invoice Number</i>	Select the invoice numbers to populate the ID field in the output file.
	<i>Use Invoice Type or Statutory Invoice Type for InvoiceTypeCode</i>	Workday automatically sets it to <i>Gapless Invoice Number</i> . When you aren't using this feature, set the <i>Workday Invoice Number</i> as the output option. Select a map to populate the <i>InvoiceTypeCode</i> or <i>CreditNoteTypeCode</i> in the output file.
		Workday automatically sets it to <i>Statutory Invoice Type</i> . When you aren't using this feature, set the <i>Workday Invoice Type</i> as the output option.

Integration Service	Integration Attribute	Description
	<i>Enable Tax Code Grouping</i>	Select the flag to group the different Workday transaction tax codes that have the same tax percentage and map to the same external tax code value.
	<i>Enable Tax Mapping Lists for Invoices</i>	Select the flag for the desired environment to determine the external TaxCategoryID and TaxExemptionReasonCode values in the output file using the configurations you define on the Maintain External Tax Code List Mappings task to . When you don't enable this attribute, Workday uses the integration maps associated with this integration system to determine the TaxCategoryID and TaxExemptionReasonCode.
	<i>Use Tax Code or Tax Applicability for TaxExemptReasonCode</i>	Note: This is applicable only when you include an external tax list in the document delivery rules for the Integration System. Select a map to populate the TaxExemptReasonCode field in the output file. Workday automatically sets it to <i>Tax Code</i> .
	<i>Concatenate Additional Address Line</i>	Select the Value check box to include additional addresses from Lines 3 to 9 in a single third line, separated by spaces, in the UBL output file.
		See the <a href="#">Sample Output of Concatenate Additional Address Line PDF</a> file for examples of XML output.

You can validate the results of your file to see if they conform with the UBL syntax and EN-16931 semantic data model by testing with any of the third-party tools available. Example: [Ecosio Document Validator](#) or [Interoperability Test Bed Validator](#).

Note: Workday isn't affiliated with, or manages, or updates the information provided in these third-party sites. Your access and use of these third-party sites are subject to separate terms of use.

### cXML Electronic Customer Invoice

In addition to the integrations services provided with the core connector, this template also includes these configurable integration services:

Integration Service	Integration Attribute	Description
cXML Electronic Customer Invoice Service	<i>cXML File Delivery</i>	Specify the cXML file delivery option. You can post the cXML File to an endpoint or attach it.
	<i>Use Vendor Issued ID or Customer DUNS Number</i>	When you attach the file to an event, you won't receive an invoice acknowledgment.
	<i>To Credential Domain for Customer Identifier</i>	Default value is <i>Post cXML file Externally</i> .
	<i>Use Invoice Number or Gapless Invoice Number</i>	Specify the source of the customer data for the To Credential Identity field associated with the customer receiving the invoice.
	<i>XML Language</i>	Specify the domain associated with the To Credential Domain value. For example: DUNS, Network ID. Default value is <i>Network ID</i> .
Enable Message Auditing	NA	Select the invoice identifier to use for populating the invoice number in the output file. Possible option is: Invoice Number, or Gapless Invoice Number. Default value is <i>Invoice Number</i> .
		Specify the language identifier for text elements that require a language attribute. Default value is <i>eng</i> .
		Optional service that you enables you to record and store additional audit messages in the integration output.
		Workday recommends that you enable this service only when you first implement the integration, or when you diagnose an issue.

To configure the third-party supplier portal connections, define credentials on the Maintain Electronic Invoice Integration Connections task.

The Configure Integration Services task displays all integration services, including required services. Required integration services aren't editable.

## Launch/Schedule Options

Workday provides these launch schedule options for the Electronic Invoice Connector integration:

- Launch with an Integration step on a business process.
- Run Now. You can launch the integration manually. The integration prompts you to enter launch parameters.
- Scheduled Run Frequency. You can specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration collects all qualifying changes from the endpoint based on the launch parameters. You can schedule the integration to run several times per day.

For each launch schedule option:

- You can specify any launch criteria that an integration requires. Example: As Of Entry Moment enables you to retrieve future-dated data changes. Or Effective Date defines the end of a date range during which changes became effective. The integration extracts the data with changes made on or before this date.
- You can also have Workday determine the values when you run the integration by using a report field or calculated field. The report or calculated field must have a Value Type of *Determine Value at Runtime*.

## Processing Notes

- When you run the integration, Workday generates a separate XML file for each customer invoice. There's a maximum limit of 5,000 invoices per integration event. See [Reference: Integrations and Web Service Limits](#).
- We recommend that you:
  - Launch the UBL 2.1 integration from the *Customer Invoice Event* business process.
  - Configure the *Customer Invoice Event* business process by adding Integration Type as a new step. Workday launches the new integration after the appropriate person approves the invoice. You can also add condition rules on the Integration step to ensure that the electronic invoice integration launches only:
    - For specific customer invoices within a given company.
    - When Workday generates an invoice PDF after the last printing run.

## Integration Audit Files

When you run this integration, Workday generates a *Diagnostic Audit* file to help you identify invoices not included in the output file along with the associated error. The audit also enables you to view the invoices included in the output but with warnings due to missing PDF. Workday provides 1 audit for each run.

You can find the file in the Reports and Other Output Files section. This section displays on the Integration Event for each integration run.

## Electronic Invoicing Acknowledgments

You can also receive acknowledgments sent back by external entities. The acknowledgments provide full visibility to the invoice status, processing date, and related messages.

Workday provides these web services to process the acknowledgments:

- *Get Electronic Invoicing Acknowledgments*
- *Put Electronic Invoicing Acknowledgment*

## Electronic Payment Integrations

### Steps: Set Up Bank Integrations for Settlement Processing

#### Context

You can integrate Workday with bank accounts for settlement processing and check printing to specify:

- Which payment protocol to use.
- How to format the payment data to meet bank requirements.
- Whether to encrypt the file or generate a unique filename each time the integration runs.
- Where to deliver the payment file.

To generate payment files for settlement processing, you can:

- Create 1 or more integration systems for each combination of bank and electronic payment type.
- Assign multiple integration systems to a single bank account. Example: You want to process payments that are of the same type but in different categories or countries.
- Use the same integration for each account in the same bank with the same payment type.

Use a Document Transformation integration step to deliver output files in bank-specific protocol formats or you'll get errors when sending the output file.

## Steps

1. Create ID Definitions and Sequence Generators.

Configure the payment sequence generator to format the ID that Workday generates for each payment.

Note:

Your integration can fail unless you always configure:

- ACH payment sequences as numeric.
- Outsourced payment group sequences with at least 1 non-numeric character when you enable payment acknowledgments for outsourced check payments.

2. Access the Edit Tenant Setup - Financials task.

Select the gapless sequence generator from the ID Generator for Payment External EFT ID prompt.

Security: *Set Up: Tenant Setup - Financials* domain in the System functional area.

3. Create Integration System on page 1967.

Workday recommends that you use the enhanced performance templates for faster processing.

Workday supports enhanced performance with these templates:

- *Core Connector: Payments Outbound V2 (Enhanced Performance)*
- *WPN – ABA Payment (Enhanced Performance)*
- *WPN - ACH CCD Payment (Enhanced Performance)*
- *WPN - ACH CTX Payment (Enhanced Performance)*
- *WPN - ACH IAT Payment (Enhanced Performance)*
- *WPN - ACH PPD Payment (Enhanced Performance)*
- *WPN – BACS Standard 18 Payment (Enhanced Performance)*
- *WPN - ISO 20022 V2 Direct Debit (Enhanced Performance)*
- *WPN - ISO 20022 V3 (Enhanced Performance)*
- *WPN - Zengin (Enhanced Performance)*

Workday also provides these templates:

- *Core Connector: Payments Outbound*
- *WPN - ISO 20022 V2* for files in PAIN 001.001.02 format.
- *WPN - ISO 20022 V9 Credit Transfer* for files in PAIN.001.001.09 format to support global payment processing.

4. Create an integration system user (ISU) and grant the ISU *Get* and *Put* access to these domains:

- *Integration Event*
- *Process: Settlement*

See: [..../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#)

5. Select Integration System > Configure Integration Attributes from the related actions menu of your integration system.

Specify a value for the attributes you want to use.

6. (Optional) Set Up Integration Sequence Generators on page 1969.

Workday requires this step when you enable the *WPN - Payment File Name Generator* integration service.

7. Create Integration Notifications on page 31.

8. (Optional) From the related actions menu of your integration system, select Integration System > Configure Integration Maps.

When multiple companies use the same bank, map the companies and bank accounts to a bank-recognized value on an integration map.

For ISO 20022 payment integrations, some banks and countries require that you include the bank branch code as a suffix to the Credit Agent ID. To use this map, enable the *WPN - ISO 20022 Payment* integration service. To add the suffix, add the bank branch code to the Clearing System Member Identification element on the *SuffixBranchCodeToCreditorAgent* integration map. To enable the suffix for a particular country, add a map and enter:

- The country as the internal value.
- Any nonblank value as the external value.

Security: *Integration Build* domain in the Integration functional area.

9. [Set Up Integration Delivery](#) on page 1952.

## Next Steps

Assign the integration system to the appropriate payment type in each bank account you want to use for settlement processing.

Configure integration delivery by adding the *Document Delivery* step on the integration business process.

## Steps: Set Up Electronic Filing 1099 Integration

### Prerequisites

- Obtain a transmitter control code from the IRS.
- Review setup considerations for 1099 Reporting.

### Context

You can create an integration system for Workday to generate 1099 electronic files, which you then:

- Download from the 1099 Work Area report.
- Manually upload to the US Internal Revenue Service (IRS) FIRE web site.

### Steps

1. Create an *Electronic Filing 1099* integration system:

- From the New Using Template prompt, select *Electronic Filing 1099*.
- On the Configure Integration Services page, leave the *Electronic Filing 1099 Delivery Service* disabled.

See [Create Integration System](#) on page 1967.

Note: The delivery service can't export files directly to the IRS. You don't need the delivery service to retrieve 1099 files from the 1099 Work Area report.

2. (Optional) From the related actions menu of the *Electronic Filing 1099* integration system, select Integration System > Configure Integration Attributes.

You can specify how many days Workday retains 1099 files by selecting a retention period of up to 180 days on the *Document Retention Policy* attribute.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

3. Grant the integration system user *Get* and *Put* access to these domains:
  - *Integration Event* in the Integration functional area.
  - *Reports: Supplier Accounts 1099* in the Supplier Accounts functional area.

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).
4. Create an integration business process from the *Electronic Filing 1099* integration system.  
You don't need a document delivery *Service* step to download 1099 files from the 1099 Work Area report.  
See [Create Integration Business Process](#) on page 1950.
5. Configure the *1099 Electronic Filing Run Event* business process.  
See [Steps: Set Up 1099 Electronic Filing Run Event Business Process](#) on page 852.

## Result

When you run the Generate 1099 Electronic Filing task, Workday launches the *Electronic Filing 1099* integration system.

## Next Steps

- Add your IRS transmitter control code to your tax IDs. See [Set Up Company Tax Details for 1099 Reporting](#).
- [Generate 1099 Electronic Files](#).

[Steps: Set Up 1099 Reporting](#)

## Steps: Set Up 1099 Electronic Filing Run Event Business Process

### Prerequisites

- Set up an *Electronic Filing 1099* integration system.
- Security: These domains in the System functional area:
  - *Business Process Administration*
  - *Manage: Business Process Definitions*
- Configure the *1099 Electronic Filing Run Event* business process and security policy in the Supplier Accounts functional area.

### Context

You can configure the *1099 Electronic Filing Run Event* business process to launch *Electronic Filing 1099* integrations.

### Steps

1. Access the Edit Business Process Definition task for the *1099 Electronic Filing Run Event* business process.  
See [Edit Business Processes](#).
2. On the Business Process Steps grid, remove the document delivery *Service* step.
3. On the Business Process Steps grid, locate the *Integration* step and click Configure Integration System, then select the *Electronic Filing 1099* integration system in the Integration prompt.

4. On the Configure Integration Step page, select these values for the *Electronic Filing 1099 ESB Service*:

Field	Value Type	Value
<i>1099 Electronic Filing Run</i>	<i>Determine Value at Runtime</i>	By Category > IRS 1099 > 1099 Electronic Filing Run Event

## Convert Payment Integrations

### Prerequisites

Security: *Set Up: Migrate Payment Integration Systems to (Enhanced Performance)* domain in Banking and Settlement functional area.

### Context

You can convert your existing payment integrations to use enhanced performance integration templates. Enhanced performance integration templates use a Data Initialization Service (DIS) that:

- Enables you to customize the output of your payment integrations. You can configure which report fields Workday uses to add data for fields in the integration.
- Improves performance.

### Steps

1. Access the *Migrate Payment Integration systems to (Enhanced Performance)* task.
2. Select an integration template and the integration systems that you want to convert.

### Related Information

#### Concepts

[Concept: Data Initialization Service \(DIS\) on page 586](#)

#### Tasks

[Set Up Integration Field Overrides for DIS on page 1974](#)

## Concept: Electronic Payments

To create bank integrations for electronic payments made from or deposited to a particular bank account, use an Electronic Payments integration template. You can create more than 1 integration system for each combination of bank and payment type to support different payment categories or countries. Example: You could have separate integrations for:

- Direct deposit payroll in the U.S.
- Direct deposit payroll in Canada.

Electronic Payments supports these payment protocols and service providers:

- Automated Clearing House:
  - Cash concentration or disbursement with addenda (CCD+).
  - Cash concentration or disbursement without addenda (CCD).
  - Corporate Trade Exchange (ACH CTX).
  - ACH Transactions (ACH IAT).
  - Prearranged Payment and Deposit Entry (ACH PPD).
- Bankers' Automated Clearing Services (BACS).
- *CyberSource* credit card processing.
- International Organization for Standardization (ISO) 20022 (Version 2 and 3)
- Zengin payment file format.

Workday also provides electronic payment integration templates with enhanced performance to improve integration processing times using the Data Initialization Service.

After the initial creation and configuration of a bank integration, the integration routes payments through the Workday settlement engine. Workday provides these options for configuring payment routing to an endpoint or endpoints:

Number of Endpoints	Business Process for Delivery Configuration
Single	<p><i>Document Delivery Step on 1 of these business processes:</i></p> <ul style="list-style-type: none"> <li>• <i>Payment Release Event</i></li> <li>• <i>Outsourced Payment Release Event</i></li> </ul>
Multiple	<i>Document Delivery step on Integration Process Event business process for each integration.</i>

You base delivery on the bank account used in the settlement run. In addition, you can add one or more *Approval* steps to the business process.

## ELSTER Integrations

### Steps: Generate ELSTER Tax Declaration XML

#### Prerequisites

- [Create Tax Declaration Definitions](#).
- Security:
  - *Integration build* domain in the Integration functional area.
  - *Set Up: Tax* domain in the Common Financial Management functional area.

#### Context

You can generate an XML file based on a tax declaration run, according to the specifications of the German tax authority. You can upload the XML file to the ELSTER tax portal, and annually update the format of the tax declaration definition.

#### Steps

1. [Create Integration System](#) on page 1967.  
Select *German ELSTER Periodic VAT Return* from the New Using Template prompt.
2. Select Integration System > Configure Integration Attributes as a related action on the integration system and select *Steuernummer* for the *Tax ID Type for Company Tax Registration Number* attribute.  
Workday uses the Tax ID Type value from the *Company Tax Details* task to populate the XML file.
3. Access the Edit Tax Declaration Definition Task.  
On your tax declaration definition, select the *Enable XML Creation* check box and the relevant tax reporting integration system and VAT return year.

4. Select Integration System > Configure Integration Field Overrides as a related action on the integration system.
  - a) Access the Umsatzsteuervoranmeldung (Sales Tax Pre-Registration) tab.
  - b) On the Field Overrides table, select *Tax Declaration Result Line Amount* from the Override External Field prompt for each field you want to map.
  - c) Select tax declaration definition lines in the Value column to map them to the fields on the integration system.

Workday will populate the values from the tax declaration lines in the corresponding fields on the XML.

Example: Map the tax declaration line containing base taxable sales standard rate to the Kz81 field.

  - d) (Optional) You can configure additional fields as required on the Extended Fields table.  
Add extended fields to update the integration system with changes to the XML file format.
  - e) (Optional) You can configure additional field overrides and extended fields on these tabs:
    - DatenLieferant (Data Supplier)
    - Berater (Consultant)
    - Unternehmer (Entrepreneur)

5. (Optional) Select Integration System > Configure Integration Field Attributes as a related action on the integration system.

Disable fields as required, or set maximum lengths to truncate values when data exceeds the length permitted. To ignore any maximum lengths specified by Workday, set the maximum length to zero.

6. Access the Create Tax Declaration Run task.

See [Create Tax Declarations](#).

Select a company in the Primary Company field if you're creating a run for a VAT group. Workday uses the value in the Primary Company field to determine which company in the VAT group is the primary contact.

Enter a complete calendar month or quarter in the Start Date and End Date fields. Workday won't translate incomplete months or quarters to XML.

7. To generate the XML file, select Tax Declaration > Create XML File as a related action on the tax declaration.

Note: Your tax declaration run must be in an approved state to access Create XML File.

You can select or enter these submission parameters to include in the XML:

- Corrected Registration (Box 10)
- Offset Reimbursement (Box 29)
- Revoke SEPA Direct Debit (Box 26)
- Additional Information (Box 23)
- Additional Information on Tax Return (Box 23B)

See [Reference: Default Mappings for German ELSTER Periodic VAT Return Integrations](#) on page 855.

## Result

Workday generates the XML file for you to view and download under the Output Files tab.

## Reference: Default Mappings for German ELSTER Periodic VAT Return Integrations

You can use field override attributes to map your tax declaration definition result line amounts using the Workday delivered German ELSTER Periodic VAT Return Integration Template.

Element Name	English Name	Default Mapping
Anmeldungssteuern	Registration Taxes	
Erstellungsdatum	Creation Date	Creation date of the xml file.
DatenLieferant	DataSupplier	
Name	Name	Full legal name of the user who created the tax declaration run.
Strasse	Street	Street address and house number of the data supplier. Must be primary and public to include in the XML file.
PLZ	ZIP	Postal code of the data supplier. Must be primary and public to include in the XML file.
Ort	Location	City address of the data supplier. Must be primary and public to include in the XML file.
Telefon	Phone	Must be the primary work phone number of the data supplier to include in the XML file.
Email	Email	Must be the primary email of the data supplier to include in the XML file.
Steuerfall	Control Case	
Berater	Consultant	
Bezeichnung	Title	Not mapped by default.
Name	Name	Not mapped by default.
Vorname	First Name	Not mapped by default.
Namensvorsatz	Name Prefix	Not mapped by default.
Namenszusatz	Name Suffix	Not mapped by default.
Str	Street	Not mapped by default.
Hausnummer	House Number	Not mapped by default.
HNrZusatz	House Number Supplement	Not mapped by default.
AnschriftenZusatz	Address Supplement	Not mapped by default.
Ort	Location	Not mapped by default.
PLZ	PostCode	Not mapped by default.
AuslandsPLZ	PostCode - if address is abroad	Not mapped by default.
Land	Country - if address is abroad.	Not mapped by default.
PostfachOrt	Location PO Box	Not mapped by default.
Postfach	PO Box	Not mapped by default.
PostfachPLZ	PO Box Zip Code	Not mapped by default.

Element Name	English Name	Default Mapping
GKPLZ	Major Customer Zip Code	Not mapped by default.
Telefon	Phone	Not mapped by default.
Email	Email	Not mapped by default.
Unternehmer	Entrepreneur	
Bezeichnung	Designation	Company name as of the last day of the tax declaration run.
Str	Street	Primary public address of the company, Address Line 1.
Hausnummer	House Number	Primary public address of the company, Address Line 3.
AnschriftenZusatz	Address Supplement	Primary public address of the company, Address Line 2.
Ort	Location	City of the primary address of the company.
PLZ	PostCode	Postcode of the primary address of the company.
AuslandsPLZ	PostCode - if address is abroad.	Company postcode if the address isn't in Germany.
Land	Country - if address is abroad	Country of the company address if the address isn't in Germany.
Postfach	PO Box	Primary public address of the company, Address Line 4.
Telefon	Phone	Primary public phone number of the company.
Email	Email	Primary public email address of the company.
Umsatzsteuervoranmeldung	Sales tax pre registration (UStVA)	
Jahr	Year	Year of the tax declaration run end date.
Zeitraum	Period	Period based on the start date and the end date of the tax declaration run. It must be a full calendar month (01 for January, 02 for February etc.) or a full calendar quarter (41 for the first quarter, 42 for the second etc).
Steuernummer	Tax Number	Company tax ID based on the Tax ID Type for Company Tax Registration Number integration attribute and the value set for the Tax ID Type for the company tax details.

Element Name	English Name	Default Mapping
Kz09		Not in use.
Kz10	Corrected registration	Workday populates this field when you select the Corrected Registration (Box 10) check box when you generate the XML.
Kz22	Documents	Not in use.
Kz23		Workday populates this field when you select the Additional Information (Box 23) check box when you generate the XML.
Kz23_Begrueндung		Workday populates this field when you enter text in the Additional Information on Tax Return (Box 23B) field when you generate the XML.
Kz26		Workday populates this field when you select the Revoke SEPA Direct Debit (Box 26) check box when you generate the XML.
Kz29		Workday populates this field when you select the Offset Reimbursement (Box 29) check box when you generate the XML.
Kz21, Kz35-Kz98		Workday populates based on the tax declaration lines mapped to the individual fields.

## FEC Integration

### Steps: Set Up FEC Integration

#### Prerequisites

Enable journal sequencing for your company as required by the tax authority.

#### Context

You can create an integration to generate fichier des écritures comptables (FEC) audit files from accounting entries to present to French tax authorities.

## Steps

1. Create Integration System.

Select *FEC Template* on the New Using Template prompt.

Enable the optional document retrieval service when:

- You want to use a custom XSD to provide additional information on journal lines.
- The tax authority supplies a new XSD.

2. Create an Integration System User (ISU) and grant the ISU Get and Put access to the *Integration Event* domain.

See [..../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).

3. (Optional) Set Up Integration Retrieval on page 1957.

When you want to use a custom XSD or the tax authority supplies a new one, provide the schema to use.

4. (Optional) Select Integration System > Configure Integration Attributes as a related action on the integration system.

Enter integration service attributes. When you provide a different XSD, specify the schema that the XSD is designed to validate against.

Security: These domains in the Integration functional area:

- *Integration Build*
- *Integration Configure*

5. Launch an Integration on page 24.

When your company generates more than 5 million journal lines each month, Workday recommends that you:

- Schedule the integration to run outside normal business hours.
- Run the integration for each month separately.

## Next Steps

Submit your FEC file to the tax authority.

## Concept: FEC Integration

Workday provides the *FEC Template* integration template to enable you to generate fichier des écritures comptables (FEC) audit files. The FEC integration exports accounting entries in the XML format specified by the French tax authority.

## Integration Services

You can use the optional *FEC\_Schema\_Retrieval* integration service to configure document retrieval to provide an updated FEC schema if the tax authority changes its requirements. You can also use it to provide a custom XSD that includes additional information on journal lines.

## Output Files

Every time the integration runs, Workday generates a:

- ZIP file containing the FEC XML file.
- Message log HTML file.

You can use the message log to troubleshoot validation errors. It includes the first 500 errors found during the integration run.

You can find these files on the Output Files tab of the integration event. These files display for each integration run.

## Financial Journal Lines Outbound Connector

### Steps: Set Up Financial Journal Lines Outbound Connector

#### Context

You can create an integration to export high volumes of journal lines from Workday to a single CSV or XML file. You can also configure your integration to summarize and group your journal line data for an aggregated output file.

#### Steps

1. Access the Create Integration System task.
  - a. Select *Financial Journal Lines Outbound Connector* from the New using Template prompt.
  - b. (Optional) Enable all or some of the integration template services. As you complete the task, consider:

Option	Description
Accounting Date Filter Service	<p>Select to configure these integration launch parameters:</p> <ul style="list-style-type: none"> <li>• <i>Accounting Start Date</i></li> <li>• <i>Accounting End Date</i></li> </ul> <p>When you select this service, you can't select these services:</p> <ul style="list-style-type: none"> <li>• Aggregation and Summarization Service</li> <li>• Eliminations or Translations Filter</li> </ul>
Eliminations or Translations Filter	<p>Select to enable these additional integration launch parameters:</p> <ul style="list-style-type: none"> <li>• <i>Account Translation Rule Set</i></li> <li>• <i>Calculate Translation Gain or Loss</i></li> <li>• <i>Eliminations Only</i></li> <li>• <i>Perform Intercompany Elimination</i></li> <li>• <i>Perform Interworktag Elimination</i></li> <li>• <i>Translation Currency</i></li> </ul>
Aggregation and Summarization Service	Select to summarize journal line data by <i>Group By</i> dimensions when you run the integration.
Enable Message Auditing	Select to include audit details in the integration output. Example: <ul style="list-style-type: none"> <li>• The user launching the integration.</li> <li>• The integration launch details.</li> <li>• The configured launch parameters.</li> </ul>

Security: *Integration Build* domain in the Integration functional area.

2. (Optional) Select Integration System > Configure Integration Attributes from the related actions menu of the integration system.

As you complete the task, consider:

Option	Description
Output File Format	Configure to change the output file format from CSV to XML.
Compress Output	Configure to compress the output file.

Security: These domains in the Integration functional area:

- *Integration Build*
- *Integration Configure*

3. Select Integration System > Configure Integration Field Attributes from the related actions menu of the integration system.

Select the Include in Output check box for the fields to include in the output file.

Only configure Summary Journal Line Data integration attributes when you enable the Aggregation and Summarization Service integration template service.

Security: These domains in the Integration functional area:

- *Integration Build*
- *Integration Configure*

4. (Optional) Select Integration System > Configure Integration Field Overrides from the related actions menu of the integration system.

Add extended fields to include on the output file. Examples: Cost Center instances, Cost Center Manager calculated fields. When you use the Value as a group by launch parameter, you must specify a unique Name.

Security: These domains in the Integration functional area:

- *Integration Build*
- *Integration Configure*

5. [Launch an Integration](#) on page 24.

To generate an output file that uses:

Integration Attribute	Launch Parameter
Detailed Journal Line Data	Leave the Group By prompt blank.
Summary Journal Line Data	Select the same dimensions in the Group By prompt as in your integration attribute configuration.

## Financial Management Connector for Salesforce

### Steps: Set Up Financial Management Connector for Salesforce

#### Prerequisites

Note: The solutions described in this section are not part of the Workday Service. See [Legal Notice](#) for details.

- The Workday Financial Management Connector app in Salesforce requires separate purchase.
- For configuration details for Salesforce, access the Salesforce administrator documentation.

#### Context

Implement an integration to sync Salesforce sales data between Workday.

#### Steps

1. Access the [Workday Financial Management Connector](#) page on *AppExchange*.
2. Download and install the Financial Management Connector for Salesforce app.  
On the installation page, select *Install For Admins Only*.
3. In Salesforce.com, grant access to the permission sets for the applicable workers:

Option	Description
Workday System Admin Set	Has <i>Read</i> and <i>Edit</i> access for the app. Can perform <i>Sync Now</i> operation.
Workday Customer Support Set	Has <i>Read</i> access for the app. Can perform <i>Sync Now</i> operation.
Workday Others Set	Can perform <i>Sync Now</i> operation.

4. Add a tab for the Workday app in Salesforce.
5. Configure remote site settings in Salesforce. See the applicable data center page for your tenant data center for URLs and URL formats.

Name to Apply	Refers to this URL Name on Data Center page
URL	URL for Web Services
ESB URL	URL for Cloud Listener for Studio Integrations

6. Create a security certificate in your Salesforce site.
7. Configure page layouts for the account page and other pages in Salesforce.
8. Configure field-level permissions for all fields for *Sync Queue Field* and *Sync Queue Scenario table*.

9. Register API Clients.

As you complete the task, consider:

Option	Description
Client Grant Type	JWT Bearer Grant
x509 Certificate	Create an X.509 certificate using the security key that you created in Salesforce.
Access Token Type	Bearer
Allow Integration Messages	Yes
Scope (Functional Areas)	<ul style="list-style-type: none"> <li>• Customer Accounts</li> <li>• Customer Contracts</li> <li>• Customers</li> <li>• Integration</li> <li>• Project Tracking</li> <li>• Worktags</li> </ul>

Record the Client ID, Token Endpoint, and REST API Endpoint values. You use these values when you configure the integration.

10. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these security domains:

- (Optional) *Customer Banking Change Event* (business process)
- (Optional) *Customer Credit Change Event* (business process)
- (Optional) *Customer Payment Change Event* (business process)
- (Optional) *Customer Summary Change Event* (business process)
- *Customer Event* (business process)
- *Create Project* (business process)
- *Integration Event*
- *Integration Process*
- *Manage: Related Worktags*
- *Process: Opportunity*
- *Reports: Customer Accounts*
- *Set Up: Customer Maintenance*
- *View: Customer*

See: [.../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).

11. Start the Financial Management Connector for Salesforce, navigate to Integration Settings, and add a new environment. As you complete the task, consider:

Option	Description
Environment Name	Examples: <i>Production, Sandbox</i> .
User	Select the account that you created in Step 2.
Tenant	Enter the Workday tenant name (case-sensitive). Use the Test button to verify if you configured the endpoints correctly.
Token Endpoint	Value from Step 1.
Integration EndPoint	Full Uniform Resource Locator (URL) of your tenant endpoint for this integration. Access the

Option	Description
	Workday for Salesforce Connector Settings task to look up this value.
REST API Endpoint	Value from Step 1.
x509 Security Certificate Source	Select <i>Salesforce Certificate</i> .
Certificate Name	Enter a valid security certificate.
Client ID	Value from Step 1.

12. Configure the Salesforce Workday Sync settings in the Integration Settings section of the app.
13. Configure the Workday Salesforce Sync settings in the Integration Settings section of the app.
- 14.(Optional) Click Test and verify that the endpoints are configured correctly.
15. Access your Salesforce site and add the Workday endpoint to the remote site settings.
- 16.(Optional) Perform any of these configuration steps in your Salesforce tenant:
  - Add and configure custom fields. Examples: Customer Category, Currency, Company, Workday ID.
  - Add the Visualforce integration report to source objects.
  - Add a Sync Now button.
  - Configure the Financial Management Connector for Salesforce app as a tab in Salesforce.
17. [Set Up Salesforce Tenant for Financial Management Connector for Salesforce](#) on page 871.

## Set Up Salesforce Tenant for Financial Management Connector for Salesforce

### Prerequisites

Security: Not applicable.

Download the Financial Management Connector for Salesforce app from the Salesforce *AppExchange*.

### Context

Enter settings required by your Financial Management Connector for Salesforce integration.

### Steps

1. Access your Salesforce tenant and start the Financial Management Connector for Salesforce app.
2. Select an existing Scenario template or select + New Scenario to create a new Scenario.
  - a) Select the object to map.
  - b) Specify synchronization rules.
  - c) Add field mappings.
  - d) Add value mappings.

Tips:

- When configuring a scenario to create a Customer in Workday, include the Workday Customer Category field in the field mappings. You can add a custom field with field and value mappings, or specify a standard value.
- State and Country codes might need value mappings.

3. Repeat Step 2 for each additional Scenario.

You can create multiple scenarios sourced from the same Salesforce object that map to different objects in Workday. The scenario data syncs to Workday in alphabetical order by scenario name.

4. Connect the Financial Management Connector for Salesforce to Workday.
  - a) Select your Workday environment and select Connect Environment.
  - b) Select Enable Sync for each Scenario that you want to enable.

##### Reference

[2022R2 What's New Post: Customer Connection Map for Salesforce Workday Connector](#)

## Concept: Financial Management Connector for Salesforce

Note: The solutions described in this section are not part of the Workday Service. See [Legal Notice](#) for details.

You can use Financial Management Connector for Salesforce to:

- Import selected sales data from your Salesforce.com tenant into Workday.
- Display Workday customer activity data in Salesforce.

The Financial Management Connector for Salesforce is a prebuilt, configurable Salesforce app that reduces the time and effort necessary to integrate between Salesforce.com and Workday. The Financial Management Connector for Salesforce enables you to automate your sales processes by connecting an opportunity management service with Workday Financials processes. The integration enables you to view these Workday account transactions in Salesforce without a Workday account:

- Invoices
- Payments
- Adjustments
- Writeoffs
- Payment Returns
- Refunds
- Transfers In and Out

## About the Financial Management Connector for Salesforce App

Workday doesn't host the Financial Management Connector for Salesforce within your Workday tenant. The Financial Management Connector for Salesforce is a Salesforce app available on *AppExchange*. You install and manage the Financial Management Connector for Salesforce in your Salesforce tenant. The Financial Management Connector for Salesforce is a two-way integration that sends data back and forth between Workday and Salesforce. This Connector requires security configuration in your Workday tenant.

You can specify how often the Financial Management Connector for Salesforce sends data to your Workday tenant. The Financial Management Connector for Salesforce enables to create scenario-specific synchronization rules. Using Scenarios, you can:

- Define rules to specify when the Financial Management Connector for Salesforce sends data to Workday.
- Map fields and field values between Salesforce.com and Workday, including entering default values for fields.

## Integration Process

As events occur in Salesforce.com, the Financial Management Connector for Salesforce adds the events to an internal queue. At the scheduled synchronization time or on demand, the Financial Management Connector for Salesforce sends data to Workday.

If the synchronization fails, the Financial Management Connector for Salesforce attempts to reconnect using exponential back off. The Financial Management Connector for Salesforce attempts to reconnect for 24 hours.

The Financial Management Connector for Salesforce provides these reports in the Salesforce app:

- View Current Sync Item Status
- View Integration Logs

## GoBD Integration

### Steps: Set Up GoBD Integration

#### Prerequisites

Security: These domains in the Integration functional area:

- *Integration Build*
- *Integration Configure*

#### Context

You can use the GoBD integration template to extract tax-relevant data from Workday. The template generates audit files that you can give to German tax authorities under category Z3 of GoBD tax regulations.

#### Steps

1. Create Integration System.

Select *GoBD Template* from the New Using Template prompt.

2. (Optional) Set Up Integration Field Overrides for DIS on page 1974.

Specify additional fields to include or values to change in the output. You can only add fields related to:

- Customer invoices.
  - Expense reports.
  - Journals.
  - Supplier invoices.
3. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Integration Event* domain.

See: [..../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).

4. Launch an Integration on page 24.

As you prepare to launch the integration, consider:

Option	Description
Account Set	The set of accounts that provide the source data for your integration.
Ledger	The type of ledger that your integration uses to generate your audit files.
Book	The book of accounting standards that your integration uses to generate your audit files.
Time Period	The period of time that your integration references in your audit files.
Period	A specific interval of time within your Time Period value.

## Result

Your integration generates an output folder containing:

- Tax audit files in CSV format.
- An XML index file.
- A DTD validation file.

## Next Steps

Download and review your output files before sending them to your tax auditor.

## Concept: GoBD Integration

You can use the GoBD integration template to extract tax-relevant data from Workday and generate audit files to present to German tax authorities. Depending on the source data you provide in the launch parameters, the GoBD integration generates up to 4 output audit files:

- DEU Audit File Customer Invoices.
- DEU Audit File Expenses.
- DEU Audit File GL Entries.
- DEU Audit File Supplier Invoices.

### GoBD Output Files

The GoBD integration template generates CSV output files that display values up to 2 decimal places. Workday rounds off any values greater than 2 decimal places in your audit files.

The CSV output files of the GoBD integration template use a semicolon as a delimiter.

The GoBD integration template also generates a DTD validation file and an XML index file.

### Digital Audits

For digital audits under category Z3 of GoBD tax regulations, you must submit a zip folder containing:

- CSV audit files.
- A DTD validation file.
- An XML index file.

## Inventory Label Data Integrations

### Steps: Set Up Integrations for Inventory Label Data

#### Context

You can create integrations that can export inventory label data to a third-party application for easier printing.

Workday provides several integration templates that support inventory label data. Each template supports a different type of inventory label data. Perform this procedure once for each integration template.

## Steps

1. Access the Create Integration System task and enter the applicable template name at the New using Template prompt:

- *Inventory Label Printing Enabled Locations Template*
- *Inventory Label Printing Goods Delivery Groups Template*
- *Inventory Label Printing Goods Delivery Tickets Template*
- *Inventory Label Printing Inventory Locations Template*
- *Inventory Label Printing Locations Template*
- *Inventory Label Printing Par Locations Template*
- *Inventory Label Printing Receipts Template*

Security: *Integration Build* in the Integration functional area.

2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Integration Event* domain.

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

3. Select Integration System > Configure Integration Attributes as a related action on the integration system and enter integration service attributes.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

4. Select Integration System > Configure Integration Field Attributes as a related action on your integration system and select which fields to include on the integration output file.

5. [Set Up Integration Delivery](#) on page 1952.

Specify how Workday delivers integration output files to the external endpoint.

6. [Set Up Integration Sequence Generators](#) on page 1969.

7. [Create Integration \(Step\)](#).

Add and configure these *Integration* steps to the *Inventory Label Event* business process:

Integration Based on Template	Step	Integration Criteria
<i>Inventory Label Printing Locations Template</i>	<i>b</i>	<p><b>Value Type:</b> <i>Determine Value at Runtime</i></p> <p><b>Value:</b> <i>Inventory Label Location</i></p>
<i>Inventory Label Printing Goods Delivery Groups Template</i>	<i>c</i>	<p><b>Value Type:</b> <i>Determine Value at Runtime</i> (both fields).</p> <p><b>Value (Requested Goods Delivery Groups):</b> <i>Inventory Label Goods Delivery Group for Inventory Label Event</i></p> <p><b>Value (Requested Number of Copies):</b> <i>Inventory Label Number of Copies</i></p>
<i>Inventory Label Printing Par Locations Template</i>	<i>d</i>	<p><b>Value Type:</b> <i>Determine Value at Runtime</i> (both fields).</p> <p><b>Value (Requested Purchase Item):</b> <i>Inventory Label Par Item</i></p> <p><b>Value (Requested Inventory Par Location):</b> <i>Inventory Label Par Location</i></p>

Integration Based on Template	Step	Integration Criteria
<i>Inventory Label Printing Goods Delivery Tickets Template</i>	<i>e</i>	<b>Value Type:</b> Determine Value at Runtime <b>Value:</b> Inventory Label Goods Delivery Ticket
<i>Inventory Label Printing Inventory Locations Template</i>	<i>f</i>	<b>Value Type:</b> Determine Value at Runtime (all 3 fields). <b>Value (Requested Purchase Item):</b> Inventory Label Item <b>Value (Requested Location with Inventory Usage):</b> Inventory Label Location <b>Value (Requested Include Subordinates):</b> Inventory Label Include Subordinates
<i>Inventory Label Printing Receipts Template</i>	<i>g</i>	<b>Value Type:</b> Determine Value at Runtime <b>Value (Receipt Line):</b> Inventory Label Receipt Line

#### 8. Create Integration (Step).

Add the integration based on the *Inventory Label Printing Goods Delivery Groups Template* integration template to the *Goods Delivery Group* business process and configure integration criteria:

Field	Value Type	Value
<i>Requested Goods Delivery Groups</i>	<i>Determine Value at Runtime</i>	<i>Inventory Label Goods Delivery Group for Goods Delivery Group BP</i>
<i>Requested Number of Copies</i>	<i>Specify Value</i>	Enter the required number of labels.

#### 9. Create Integration (Step).

Add the integration based on the *Inventory Label Printing Goods Delivery Tickets Template* integration template to the *Goods Delivery Event* business process. Configure the same integration criteria as Step 8.

Add and configure these steps on the *Goods Delivery Event* business process:

Type	Step	Integration Criteria
<i>Service (Create Goods Delivery Run From Goods Delivery Ticket)</i>	<i>c</i>	N/A
<i>Inventory Label Printing Goods Delivery Tickets Template</i>	<i>d</i>	<b>Value Type:</b> Determine Value at Runtime <b>Value:</b> Goods Delivery Ticket Label

## 10. Create Integration (Step)

Add the integration based on the *Inventory Label Printing Receipts Template* integration template to the *Receipts* business process.

Add and configure these steps on the *Receipts* business process:

Type	Step	Integration Criteria
Service	Varies depending on your business process configuration.	<i>Label Printing with Receipt BP</i>
Integration	Varies, but must immediately follow step in previous row.	N/A

### Next Steps

Workday provides preconfigured field attributes for your integration system, but you can also configure field override and extension values for your integration fields on certain template types, enabling you to add specific data fields to your integration. After completing your integration template, access the View Integration System task. From the Related Actions menu, select Integration System > Configure Integration Field Override:

- Access the the fields you want to alter in the Field Overrides section at the header and/or line layer of your service.
- Use the External Fields section to add XML elements to your integration system.

## Concept: Inventory Label Data Integrations

Workday enables you to create integrations that export inventory label data in a Workday-defined file format. You can use these files with an external label printing service or application. Using configurable data sections or Workday-delivered report fields and calculated fields that you create, you can specify which data fields to include in the integration output files.

Workday provides integration templates that support different types of inventory labels:

- Inventory Label Printing Goods Delivery Tickets Template*
- Inventory Label Printing Goods Delivery Groups Template*
- Inventory Label Printing Inventory Locations Template*
- Inventory Label Printing Locations Template*
- Inventory Label Printing Par Locations Template*
- Inventory Label Printing Receipts Template*

### Integration Files and Reports

Every time an integration runs, Workday generates these files:

- Data Changes Audit* file, which is a readable version of the integration output file.
- Diagnostic Audit* file, which helps you troubleshoot integration errors.

You can find these files in the Reports and Other Output Files section of the Integration Event for each integration run.

Note: Because actual data is included in the *Data Changes Audit* file, you might need to secure this file separately.

## Reference: Inventory Label Data Integration Data Sections

Before you build an integration with one of the Inventory Label Data integration templates, familiarize yourself with each data section. Understand which fields are available for output and how the configuration options affect integration behavior.

### Inventory Label Printing Goods Delivery Groups Template

Section	Description/Notes	Fields
Goods Delivery Group Data	<p>Workday includes these fields in the integration output file automatically:</p> <ul style="list-style-type: none"> <li>• Number of Copies</li> <li>• Label Printer</li> <li>• Label Template</li> </ul>	<ul style="list-style-type: none"> <li>• Group Number</li> <li>• Description</li> <li>• Assigned To</li> <li>• Created Date</li> <li>• Number of Copies</li> <li>• Label Printer</li> <li>• Label Template</li> </ul>

### Inventory Label Printing Goods Delivery Tickets Template

Section	Description/Notes	Fields
Goods Delivery Ticket Data	N/A	<ul style="list-style-type: none"> <li>• Goods Delivery Ticket</li> <li>• Number of Copies</li> <li>• Label Printer</li> <li>• Label Template</li> </ul>
Goods Delivery Ticket	N/A	<ul style="list-style-type: none"> <li>• Just in Time Goods Delivery</li> <li>• Created Date</li> <li>• Created by Worker</li> <li>• Deliver-To</li> <li>• Deliver-To Address</li> <li>• Delivery Ticket</li> <li>• Origin</li> <li>• Originating Business Document</li> <li>• Requester</li> </ul>

### Inventory Label Printing Inventory Locations Template

Section	Description/Notes	Fields
Inventory Location Data	N/A	<ul style="list-style-type: none"> <li>• Location</li> <li>• Item Descriptor</li> <li>• Item Inventory Attributes</li> <li>• Is Preferred Picking Location</li> <li>• Is Default Put Away Location</li> <li>• Label Printer</li> <li>• Label Template</li> </ul>

Section	Description/Notes	Fields
Location	Includes single Inventory Location Attributes subsection.	<ul style="list-style-type: none"> <li>• Global Location Number - GLN</li> <li>• Location External Name</li> <li>• Location Identifier</li> <li>• Location Name</li> <li>• Inventory Location Attributes</li> </ul>
Inventory Location Attributes	Subsection of Location section.	<ul style="list-style-type: none"> <li>• Inventory Location</li> <li>• Inventory Location Chain</li> <li>• Inventory Location Usage Type</li> <li>• Inventory Site</li> <li>• Inventory Zone</li> </ul>
Item Descriptor	Includes single Manufacturers for Procurement Item subsection.	<ul style="list-style-type: none"> <li>• CAS Number</li> <li>• CDM Code</li> <li>• GTIN</li> <li>• HPCPS Code</li> <li>• Is Controlled</li> <li>• Is Energy Star</li> <li>• Is Green</li> <li>• Is Hazardous</li> <li>• Is Latex-Free</li> <li>• Is Patient Chargeable</li> <li>• Is Radioactive</li> <li>• Is Refrigerated</li> <li>• Is Reusable</li> <li>• Is Toxin</li> <li>• Item Description</li> <li>• Packaging String</li> <li>• Item Identifier</li> <li>• Item Name</li> <li>• Manufacturer String</li> <li>• Manufacturer Part ID</li> <li>• Manufacturers for Procurement Item</li> <li>• Spend Category for Item</li> <li>• UNSPSC</li> <li>• UPN</li> <li>• Unit Price</li> <li>• Default Ordering Unit of Measure</li> </ul>
Manufacturers for Procurement Item	Subsection of Item Descriptors section.	Item Manufacturer
Item Inventory Attributes	N/A	<ul style="list-style-type: none"> <li>• Replenishment Type</li> <li>• Base Reorder Point Quantity</li> <li>• Fixed Order Quantity</li> </ul>

Section	Description/Notes	Fields
		<ul style="list-style-type: none"> <li>• Fixed Order Unit of Measure</li> <li>• Inventory ABC Classification</li> <li>• Include in Count</li> <li>• Purchase Item</li> <li>• Replenishment Unit of Measure</li> <li>• Inventory Site</li> <li>• Lead Time</li> <li>• Base Maximum Quantity</li> </ul>

### Inventory Label Printing Locations Template

Section	Description/Notes	Fields
Location Data	This section includes a <i>Manufacturer</i> subsection with a single field <i>Item Manufacturer</i> .	<ul style="list-style-type: none"> <li>• Global_Location_Number-GLN</li> <li>• Location_Attributes</li> <li>• Location_External_Name</li> <li>• Location_Hierarchies_included_with_Allo...</li> <li>• Location_Identifier</li> <li>• Location_Name</li> <li>• Superior_Location</li> <li>• Worksite_ID_Code</li> <li>• Location Inventory Attributes</li> <li>• Label Printer</li> <li>• Label Template</li> </ul>
Location Inventory Attributes	N/A	<ul style="list-style-type: none"> <li>• Inventory Location</li> <li>• Inventory Location Chain</li> <li>• Inventory Site</li> <li>• Source Inventory Site</li> <li>• Inventory Zone</li> </ul>

### Inventory Label Printing Par Locations Template

Section	Description/Notes	Fields
Par Location Data	N/A	<ul style="list-style-type: none"> <li>• Location</li> <li>• Par Location</li> <li>• Bin</li> <li>• Item</li> <li>• Item_Description</li> <li>• Item_Identifier</li> <li>• Par_Company</li> <li>• Par_Level</li> <li>• Par_Location</li> <li>• Just In Time</li> <li>• Replenishment_Source</li> </ul>

Section	Description/Notes	Fields
		<ul style="list-style-type: none"> <li>• Required</li> <li>• Par_Unit_Of_Measure</li> <li>• Item Specific Data</li> <li>• Label Printer</li> <li>• Label Template</li> </ul>
Location	This section includes a <i>Manufacturer</i> subsection with a single field <i>Item Manufacturer</i> .	<ul style="list-style-type: none"> <li>• Global_Location_Number-GLN</li> <li>• Location_Attributes</li> <li>• Location_External_Name</li> <li>• Location_Hierarchies_included_with_Allo</li> <li>• Location_Identifier</li> <li>• Location_Name</li> <li>• Superior_Location</li> <li>• Worksite_ID_Code</li> </ul>
Par Location	N/A	<ul style="list-style-type: none"> <li>• Inventory_Stock_Request_Type</li> <li>• Par_Company</li> <li>• Par_Count_Option</li> <li>• Par_Location</li> <li>• Requisition_Type</li> <li>• Source_Inventory_Site</li> <li>• Source_Requisition_Company</li> </ul>
Item Specific Data	N/A	<ul style="list-style-type: none"> <li>• CAS_Number</li> <li>• CDM_Code</li> <li>• GTIN</li> <li>• HCPCS_Code</li> <li>• Is_Controlled</li> <li>• Is_Energy_Star</li> <li>• Is_Green</li> <li>• Is_Hazardous</li> <li>• Is_Latex-Free</li> <li>• Is_Patient_Chargeable</li> <li>• Is_Radioactive</li> <li>• Is_Refrigerated</li> <li>• Is_Reusable</li> <li>• Is_Toxin</li> <li>• Item_Description</li> <li>• Item_Identifier</li> <li>• Item_Name</li> <li>• Packaging_String</li> <li>• Manufacturer_Name</li> <li>• Manufacturer_Part_Id</li> <li>• Manufacturer</li> <li>• Spend_Category_for_Item</li> <li>• UNSPSC</li> <li>• UPN</li> <li>• Unit_Price</li> <li>• Default_Ordering_Unit_of_Measure</li> </ul>

Section	Description/Notes	Fields
Manufacturer	N/A	Item Manufacturer

### Inventory Label Printing Receipts Template

Section	Description/Notes	Fields
Receipt Line Data	<p>Includes subsections:</p> <ul style="list-style-type: none"> <li>• Worktags</li> <li>• Receipt</li> <li>• Item Descriptor</li> </ul>	<ul style="list-style-type: none"> <li>• Receipt Date</li> <li>• Purchase Order for Receipt Line</li> <li>• Quantity Shipped</li> <li>• Item Description</li> <li>• Spend Category</li> <li>• Unit Cost</li> <li>• Delivery Type</li> <li>• Ship-to address</li> <li>• Ship-to contact</li> <li>• Deliver-to (Location)</li> <li>• Deliver-to (Address)</li> <li>• Put Away Location</li> <li>• Worktags</li> <li>• Receipt</li> <li>• Item Descriptor</li> <li>• Number of Copies</li> <li>• Label Printing Unit of Measure</li> <li>• Label Printer</li> <li>• Label Template</li> </ul>
Worktags	Subsection of Receipt Line Data section.	Worktag
Receipt	Subsection of Receipt Line Data section.	<ul style="list-style-type: none"> <li>• Receipt Number</li> <li>• Company</li> <li>• Supplier</li> <li>• Tracking ID</li> <li>• Received By</li> <li>• Just In Time Purchase Order</li> </ul>
Item Descriptor	Subsection of Receipt Line Data section.	<ul style="list-style-type: none"> <li>• Item Identifier</li> <li>• Packaging String</li> <li>• Unit Price</li> <li>• Item Name</li> <li>• Default Ordering Unit of Measure</li> <li>• Item Lead Time</li> <li>• CAS Number</li> <li>• UNSPSC</li> <li>• Manufacturer Name</li> <li>• Manufacturer Part Id</li> <li>• Manufacturer URL</li> </ul>

Section	Description/Notes	Fields
		<ul style="list-style-type: none"> <li>• GTIN</li> <li>• UPC</li> <li>• NIGP</li> <li>• Is Toxin</li> <li>• Is Radioactive</li> <li>• Is Radioactive Minor</li> <li>• Is Hazardous</li> <li>• Is Select Agent</li> <li>• Is Controlled</li> <li>• Is Green Product</li> <li>• Is Green</li> <li>• Is Energy Star</li> <li>• Is Patient Chargeable</li> <li>• Is Recycled</li> <li>• Is Reusable</li> <li>• Is Latex-Free</li> <li>• Is Refrigerated</li> <li>• Manufacturers for Procurement Item</li> <li>• UPN</li> <li>• CDM Code</li> <li>• HCPCS Code</li> </ul>
Manufacturers of Procurement Item	Subsection of Item Descriptor section.	Item Manufacturer

## Payment Connector

### Steps: Set Up Payment Connector Integration

#### Prerequisites

Security: These domains in the Integration functional area:

- *Integration Build*
- *Integration Configure*

#### Context

You can export payment data from Workday to an external financial institution using a payment connector integration.

## Steps

1. [Create Integration System](#) on page 1967.

From the New Using Template prompt, select *Core Connector: Payments Outbound V2 (Enhanced Performance)*.

Select the integration services for fields to include in the connector.

The *Enable Message Auditing* service provides the audit files attached to each integration event.

Note: Ensure that only authorized workers have access to the *Integration Event* domain because the audit files include payment data.

2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

- *Integration Event* in the Integration functional area.
- *Process: Settlement* in the Banking and Settlement functional area.

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

3. Select Integration System > Configure Integration Attributes from the related actions menu of your payment connector integration.

To configure your integration systems to output raw data, use the *Output File Format* attribute and select the *Raw Output* file format.

4. [Create Integration Business Process](#) on page 1950.

If you configure your payment connector integrations to use the raw output file format, select Configure Document Delivery on your business process.

Select:

- *Output Documents* from the Derived Using prompt in the Document(s) section.
- *Payments Data* from the Tagged prompt in the Document Filter(s) section.

5. Select Integration System > Configure Integration Maps from the related actions menu of your payment connector integration.

6. [Set Up Integration Sequence Generators](#) on page 1969.

7. [Select and Set Up Connector Output Fields](#) on page 1977.

8. (Optional) [Set Up Integration Field Overrides for DIS](#) on page 1974.

Available for integrations based on the *Core Connector: Payments Outbound V2 (Enhanced Performance)* template.

9. (Optional) Define how Workday transforms integration output documents using XSLT.

See: [Steps: Set Up Document Transformation Connector](#) on page 594.

10. [Launch an Integration](#) on page 24.

## Concept: Payment Connector

Workday provides Payment Connector integration templates. With the templates, you can send electronic payments data to regional banks that don't support standard payment data formats. Using this integration template, you can select from a wide variety of basic data elements that a third-party banking endpoint can require. You can configure the Connector outputs to select just the fields that the external bank endpoint requires, and send those fields in XML or CSV format.

Note: The *Core Connector: Payments Outbound V2 (Enhanced Performance)* integration template only supports XML.

The integrations include a configurable set of electronic payments-related data. You can select which fields to include or exclude, which ones require a value, and which ones to truncate.

## Launch/Schedule Options

Workday provides these launch schedule options for the Payment Connector integration:

- Scheduled Run Frequency. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration collects all qualifying changes based on the launch parameters. You can schedule a Payment Connector integration to run several times per day; launching the integration frequently doesn't affect performance.
- Run Now. You can launch the integration manually. The integration prompts you to enter launch parameters.

For each launch schedule option, you can enter these launch parameters:

- As Of Entry Moment enables you to retrieve future-dated data changes. You can enter a specific date in the future (using the *Specify Value* option). Enter the future data using the Run Now launch schedule option. When scheduling a recurring integration event, use the *Determine Value at Runtime* option. Select a date field from the Value prompt, such as *First Day of Next Month*.
- Effective Date defines the end of a date range during which changes became effective. The integration extracts all changes with effective dates on or before this date.

## Integration Audit Files

Every time the integration runs, Workday generates these files:

- The *Data Changes Audit* is a readable version of the integration output file.
- The *Diagnostic Audit* is designed to help you troubleshoot integration errors.

You can find these files in the Reports and Other Output Files section. This section displays on the Integration Event for each integration run.

Note: Because Workday includes actual data in the Data Change Audit file, you can secure this file separately (Example: if administrators can't have access to the data).

## Raw Output File Format

You can configure your integration systems using the *Core Connector: Payments Outbound V2 (Enhanced Performance)* integration template to output raw data without formatting it. Outputting raw data enables you to disperse funds more quickly for a large number of individual payments.

The raw output file format supports these integration attributes and maps only:

- Bank Account map.
- Bank Routing Number map.
- Company Tax ID map.
- Payee Alternate Name for Remit-To Supplier attribute.
- Receiving Party Email Logic for Remit-To Supplier attribute.

## Reference: Payment Connector Integration Data Sections

Before you build a Payment Connector integration, familiarize yourself with the data sections. Understand which fields are available for output and how the configuration options affect integration behavior.

Section	Description	Fields
Payment Group Data	<ul style="list-style-type: none"> <li>• This section has 1 record.</li> <li>• The <i>Currency</i> and <i>Currency Code</i> attributes use the applicable ISO-4217 code value.</li> </ul>	<ul style="list-style-type: none"> <li>• Group ID</li> <li>• Payment Date</li> <li>• Payment Type</li> <li>• Payment Method</li> <li>• Payment Category</li> <li>• Currency</li> <li>• Currency Code</li> <li>• Group Payment Count</li> <li>• Group Payment Sum</li> </ul>

Section	Description	Fields
Originating Party and Bank Data	<ul style="list-style-type: none"> <li>• This section has 1 record.</li> <li>• The <i>Address Line 1</i> and <i>Address Line 2</i> attributes refer to the originating party.</li> </ul>	<ul style="list-style-type: none"> <li>• Company Name</li> <li>• Tax ID</li> <li>• Contact Name</li> <li>• Contact Email</li> <li>• Address Line 1</li> <li>• Address Line 2</li> <li>• Address Line 3</li> <li>• Address Line 4</li> <li>• City</li> <li>• Address Line 1 in Local Script</li> <li>• Address Line 2 in Local Script</li> <li>• Address Line 3 in Local Script</li> <li>• Address Line 4 in Local Script</li> <li>• City in Local Script</li> <li>• State</li> <li>• Zip Code</li> <li>• Country</li> <li>• Phone Number</li> <li>• Bank Name</li> <li>• Account Name</li> <li>• Account Nickname</li> <li>• Account Number</li> <li>• Account Type Code</li> <li>• Bank Account</li> <li>• Bank Account Name</li> <li>• IBAN</li> <li>• Routing Transit Number</li> <li>• Bank Identification Code</li> <li>• Branch Name</li> <li>• Branch ID Number</li> <li>• Currency</li> <li>• Check Digit</li> <li>• Roll Number</li> <li>• Bank Address Line 1</li> <li>• Bank Address Line 2</li> <li>• Bank Address Line 3</li> <li>• Bank Address Line 4</li> <li>• Bank City</li> <li>• Bank Address Line 1 in Local Script</li> <li>• Bank Address Line 2 in Local Script</li> <li>• Bank Address Line 3 in Local Script</li> </ul>

Section	Description	Fields
		<ul style="list-style-type: none"> <li>• Bank Address Line 4 in Local Script</li> <li>• Bank City in Local Script</li> <li>• Bank State</li> <li>• Bank Zip Code</li> <li>• Bank Country</li> </ul>
Payment Data	<ul style="list-style-type: none"> <li>• This section has 1 record.</li> <li>• To configure the <i>Multiple On Behalf of Companies</i> field attribute on the <i>Payment Connector Core Connector: Payments Outbound</i> integration template, you must configure the <i>Web Service Version</i> attribute to update the <i>Get Payments</i> web service for the template to the most recent version. For version 31.0 and later, we automatically apply contextual security to the integration.</li> </ul>	<ul style="list-style-type: none"> <li>• Payment ID</li> <li>• Payment Status</li> <li>• Payment Memo</li> <li>• Payment Amount</li> <li>• Amount as Text</li> <li>• Discount Taken</li> <li>• Currency</li> <li>• Currency Code</li> <li>• Check or Advice Number</li> <li>• Check Number</li> <li>• EFT Payment ID</li> <li>• Prenote Flag</li> <li>• Company</li> <li>• On Behalf of Company</li> <li>• Multiple On Behalf of Companies</li> <li>• Tax Code</li> <li>• Additional Type Reference</li> </ul>
Receiving Party and Bank Data	<ul style="list-style-type: none"> <li>• This section has 1 record.</li> <li>• You can configure the <i>Web Service Version</i> attribute on the <i>Payment Connector Core Connector: Payments Outbound</i> integration template to update the <i>Get Payments</i> web service for the template to the most recent version. For version 31.0 and later, we automatically apply contextual security to the integration. You must configure the attribute</li> </ul>	<ul style="list-style-type: none"> <li>• ID</li> <li>• Name</li> <li>• Contact Primary Phone Number</li> <li>• Contact Phone Number</li> <li>• Contact Mobile Number</li> <li>• Contact Fax Number</li> <li>• Contact Pager Number</li> <li>• Contact Email</li> <li>• Address Line 1</li> <li>• Address Line 2</li> <li>• Address Line 3</li> <li>• Address Line 4</li> <li>• City</li> <li>• Address Line 1 in Local Script</li> </ul>

Section	Description	Fields
	<p>to configure these field attributes:</p> <ul style="list-style-type: none"> <li>• Bank Address Line 1</li> <li>• Bank Address Line 2</li> <li>• Bank Address Line 3</li> <li>• Bank Address Line 4</li> <li>• Bank City</li> <li>• Bank Address Line 1 in Local Script</li> <li>• Bank Address Line 2 in Local Script</li> <li>• Bank Address Line 3 in Local Script</li> <li>• Bank Address Line 4 in Local Script</li> <li>• Bank City in Local Script</li> <li>• Bank State</li> <li>• Bank Zip Code</li> <li>• Bank Country</li> <li>• Intermediary Bank Address Line 1</li> <li>• Intermediary Bank Address Line 2</li> <li>• Intermediary Bank Address Line 3</li> <li>• Intermediary Bank Address Line 4</li> <li>• Intermediary Bank City</li> <li>• Intermediary Bank Address Line 1 in Local Script</li> <li>• Intermediary Bank Address Line 2 in Local Script</li> <li>• Intermediary Bank Address Line 3 in Local Script</li> <li>• Intermediary Bank Address Line 4 in Local Script</li> <li>• Intermediary Bank City in Local Script</li> <li>• Intermediary Bank State</li> <li>• Intermediary Bank Zip Code</li> </ul>	<ul style="list-style-type: none"> <li>• Address Line 2 in Local Script</li> <li>• Address Line 3 in Local Script</li> <li>• Address Line 4 in Local Script</li> <li>• City in Local Script</li> <li>• State</li> <li>• Zip Code</li> <li>• Country</li> <li>• Bank Name</li> <li>• Bank Account Name</li> <li>• Account Nickname</li> <li>• Account Number</li> <li>• Masked Account Number</li> <li>• Account Type</li> <li>• IBAN</li> <li>• Routing Transit Number</li> <li>• Bank Identification Code</li> <li>• Branch Name</li> <li>• Branch ID Number</li> <li>• Currency</li> <li>• Check Digit</li> <li>• Roll Number</li> <li>• Bank Instructions</li> <li>• Bank Address Line 1</li> <li>• Bank Address Line 2</li> <li>• Bank Address Line 3</li> <li>• Bank Address Line 4</li> <li>• Bank City</li> <li>• Bank Address Line 1 in Local Script</li> <li>• Bank Address Line 2 in Local Script</li> <li>• Bank Address Line 3 in Local Script</li> <li>• Bank Address Line 4 in Local Script</li> <li>• Bank City in Local Script</li> <li>• Bank State</li> <li>• Bank Zip Code</li> <li>• Bank Country</li> <li>• Intermediary Bank Name</li> <li>• Intermediary Bank Country</li> <li>• Intermediary Bank Routing Transit Number</li> <li>• Intermediary Bank Branch ID</li> </ul>

Section	Description	Fields

## Payments Inbound Integrations

### Steps: Set Up Integration to Import Payment Status Reports

#### Context

You can load payment acknowledgments for different types of electronic payments using an integration. Banks provide payment acknowledgment files in ISO20022 format for most types of electronic payments.

Note: You can enable your bank to receive payment acknowledgments automatically during settlement with the Cybersource Workday integration. You can configure the automation if you accept credit card payments for customers in Workday.

#### Steps

1. Access the Create Integration System task and enter *Import Payment Status Report* at the New using Template prompt.  
Security: *Integration Build* in Integration functional area.
2. Enable the ISO20022 Payment Status Report integration service.
3. From the related actions menu of your Import Payment Status Report integration, select Integration System > Configure Integration Attributes and specify a value for each integration attribute.  
Security: *Integration Configure* domain in the Integration functional area.
4. (Optional) From the related actions menu of your Import Payment Status Report integration, select Integration System > Configure Integration Maps to specify values for status codes.

Set up external values for the map If your bank has different acceptance codes from these values:

Payment Status	Acceptance Code
Accepted	<ul style="list-style-type: none"> <li>• ACSC</li> <li>• ACWC</li> <li>• PART</li> </ul>
Rejected	<ul style="list-style-type: none"> <li>• ACCR</li> <li>• RJCT</li> </ul>
Received	<ul style="list-style-type: none"> <li>• ACCP</li> <li>• ACSP</li> <li>• ACTC</li> <li>• PNDG</li> <li>• RCVD</li> </ul>

Security: *Integration Configure* domain in the Integration functional area.

5. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Integration Event* security domain.

See: <..../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita>.

In addition, when the integration invokes the *Put Payment Acknowledgment Message* web service, grant access to 1 of these security domains based on the payment type:

- *Process: Ad Hoc Payment Settlement* in the Banking and Settlement functional area.
- *Process: Bank Account Transfer* for Settlement/Settlement in the Banking and Settlement functional area.
- *Process: Customer Invoice Payment/Settlement* in the Customer Accounts functional area.
- *Process: Customer Refund Settlement* in the Customer Accounts functional area.
- *Process: Expense Report Payment/Settlement* in the Expenses functional area.
- *Process: Intercompany Payment/Settlement* in the Financial Accounting functional area.
- *Process: Miscellaneous Payment Request Settlement* in the Miscellaneous Payments functional area.
- *Process: Payroll Settlement* in the Core Payroll functional area.
- *Process: Procurement Card Payment/Settlement* in the Procurement functional area.
- *Process: Student Sponsor Refund/Settlement* in the Student Financials functional area.
- *Process: Supplier Invoice Payment/Settlement* in the Supplier Accounts functional area.

For all payment types, grant access to the *Process: Settlement* security domain in the Banking and Settlement functional area.

6. Set Up Integration Retrieval on page 1957.
7. Launch an Integration on page 24.

## Next Steps

Launch the integration and upload payment acknowledgments into Workday.

## Steps: Set Up Credit Card Payment Integrations

### Prerequisites

- Obtain the security key for your CyberSource account so that you can configure the integrations with your sign-in credentials.
- Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

### Context

Create 2 integrations with CyberSource to support processing credit card payments:

- An integration that creates and maintains customer profiles and requests payment authorization.
- An integration that sends payment data to CyberSource for transaction processing.

### Steps

1. Create Integration System on page 1967.

Enter the template name at the New using Template prompt:

Template	Use Case
<i>Workday to CyberSource Customer Profile and CC Auth</i>	Creates and maintains customer profiles and requests payment authorization.

Template	Use Case
<i>WPN - CyberSource Credit Card Payment Processing</i>	Sends payment data to CyberSource for transaction processing.

2. In the Configure Integration Services task, enable these services:

Template	Services
<i>Workday to CyberSource Customer Profile and CC Auth</i>	<ul style="list-style-type: none"> <li><i>WPN - CyberSource Credit Card Processing</i>.</li> <li><i>Integration Event Data - DIS</i> (to configure integration launch based on event subscription).</li> </ul>
<i>WPN - CyberSource Credit Card Payment Processing</i>	<i>Enable Message Auditing (Optional)</i> .

3. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

Template	Domains
<i>Workday to CyberSource Customer Profile and CC Auth</i>	<ul style="list-style-type: none"> <li><i>Integration Event</i></li> <li><i>Process: Customer Invoice Payment/ Settlement</i></li> <li><i>Set Up: Customer Settlement</i></li> </ul>
<i>WPN - CyberSource Credit Card Payment Processing</i>	<ul style="list-style-type: none"> <li><i>Integration Event</i></li> <li><i>Process: Payroll Settlement</i></li> <li><i>Process: Settlement</i></li> </ul>

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

4. (*Workday to CyberSource Customer Profile and CC Auth* only) As a related action on the integration system, select **Integration System > Configure Integration Maps**.

Map	Notes
<i>CBLoginCredentialsMap</i>	Specify your CyberSource user name in the Internal Value column and your password in the External Value column.
<i>ReasonCodeDescriptionMap</i>	Optional map. Change the descriptions of the reason codes that CyberSource returns.

5. (*Workday to CyberSource Customer Profile and CC Auth* only) [Set Up Integration Subscriptions](#) on page 1968.

Subscribe to *Create Credit Card Authorization - Event Lite Type*, *Customer Change - Event Lite Type*, and *Update Merchant Customer Profile – Event Lite Type*.

In the External Endpoints section, select Remove if there's any existing API Version value for CyberSource.

To enable launch of the integration by subscription, select Add below Launch Integration and keep the default values.

Note: Don't edit any fields under Add External Endpoint.

6. (*WPN - CyberSource Credit Card Payment Processing* only) [Create Integration \(Step\)](#).

Add the integration to the *Payment Release Event* business process.

## Next Steps

- Assign the payment integration system to the bank account that will receive deposits for credit card payment.
- Establish a merchant account with CyberSource and create profiles for customer credit cards.

# Payroll Journal Line Export Connector

## Steps: Set Up Payroll Journal Outbound Connector

### Prerequisites

Set up an external endpoint that can receive and transform the integration XML output files.

### Context

You can create an integration to export payroll journal entries, including payroll accounting details, from Workday to an external endpoint.

### Steps

1. Access the Create Integration System task and enter *Payroll Journal Outbound Connector* at the New Using Template prompt.

**Security:** *Integration Build* and *Integration Configure* domains in the Integration functional area.

2. (Optional) Enable optional integration services:

Option	Description
Payroll Journal Outbound Filter Service	Enables these additional integration launch parameters: <ul style="list-style-type: none"> <li>• <i>Journal Source</i></li> <li>• <i>Reversed Journal</i></li> <li>• <i>Pay Cycle Type</i></li> <li>• <i>Pay Off-cycle Type</i></li> </ul>
Payroll Journal Outbound Pay Period Filter Service	Enables the <i>Payment Period</i> integration launch parameter.
Payroll Journal Outbound Pay Period Date Filter Service	Enables these additional launch parameters: <ul style="list-style-type: none"> <li>• <i>Payment Period Date Option</i></li> <li>• <i>From</i></li> <li>• <i>Start</i></li> </ul>
Payroll Journal Entry DIS	Enables you to define additional fields that Workday adds to integration output in the <i>Journal_Entry</i> or <i>Journal_Lines</i> data sections.

3. Select Integration System > Configure Integration Attributes as a related action on the integration system and enter integration service attributes.

**Note:** Enable the Enable Parallel Processing integration attribute to improve integration performance by generating concurrent output files for larger integration runs. Workday recommends you enable this if you're exporting 50,000 journal entries or more.

**Security:** *Integration Build* and *Integration Configure* domains in the Integration functional area.

4. Select Integration System > Configure Integration Field Overrides as a related action on the integration system and enter integration service attributes.  
Define additional fields that Workday adds to integration output in the *Journal\_Entry* or *Journal\_Lines* data sections.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
  5. Set Up Integration Delivery on page 1952.
  6. Launch an Integration on page 24.
  7. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:
    - *Integration Event*
    - *Process: Journals*
    - *Worker Data: Position and Employee Worktag*
- See: [Steps: Grant Integration or External Endpoint Access to Workday](#).
8. (Optional) Create Integration Notifications on page 31.

## Concept: Payroll Journal Outbound Connector

The Payroll Journal Outbound Connector enables you to export payroll journal entries, include payroll accounting details, from Workday to an external endpoint. Workday provides the *Payroll Journal Outbound Connector* integration template. The integration template supports export of journal entries and journal lines in a Workday-defined XML format.

### Integration Services

The *Payroll Journal Outbound Connector* integration template includes these integration services:

Integration Service	Required/ Optional	Description
Payroll Journal Outbound Deployed Service	Required	Launches the integration.
Payroll Journal Outbound Request	Required	Provides standard launch parameters: <ul style="list-style-type: none"> <li>• <i>Company</i></li> <li>• <i>Journal Date Query Option</i></li> <li>• <i>From Date</i></li> <li>• <i>To Date</i></li> <li>• <i>Pay Group</i></li> </ul>
Payroll Journal Outbound Filter Service	Optional	Enables these additional integration launch parameters: <ul style="list-style-type: none"> <li>• <i>Journal Source</i></li> <li>• <i>Reversed Journal</i></li> <li>• <i>Pay Cycle Type</i></li> <li>• <i>Pay Off-cycle Type</i></li> </ul>
Payroll Journal Outbound Pay Period Filter Service	Optional	Enables the <i>Pay Period</i> integration launch parameter.
Payroll Journal Outbound Pay Period Date Filter Service	Optional	Enables these additional launch parameters: <ul style="list-style-type: none"> <li>• <i>Pay Period Date Option</i></li> <li>• <i>From</i></li> <li>• <i>To</i></li> </ul>
Filename Sequence Generator	Required	Enables the integration to generate a unique filename for each integration output file.

## Launch/Schedule Options

Workday provides these launch schedule options for the Payroll Journal Outbound Connector integration:

- Launch using an Integration step on a business process.
- Launch using schedule. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration retrieves any files from the endpoint.
- Launch immediately. You can launch the integration manually.

## Reference: Payroll Journal Outbound Connector XML Schema

```
<?xml version='1.0' encoding='UTF-8'?>

## PSA Inbound Connector

### Steps: Set Up PSA Inbound Connector Integration

#### Prerequisites

Set up an external endpoint that your Workday integration can access. Your external endpoint must be able to generate change data for organization assignments in the defined XML format.

Ensure that the Workday Core Financials solution exists in Workday.

Ensure to configure relevant business processes, countries, locations, job profiles, employee types, time type, and termination reasons.

#### Context

You can set up the Professional Services Automation (PSA) Inbound Connector to import worker data from an external endpoint into Workday. You can create an integration that:

- Accesses an external server.
- Retrieves a data file containing worker data.
- Imports worker data into Workday.

## Steps

1. Configure your external endpoint so that it can generate data for organization assignment changes. The data must be in one of the formats supported by the Professional Services Automation Inbound Connector.
2. [Create Integration System](#) on page 1967.  
Enter *Core Connector: Professional Services Automation Inbound* at the New using Template prompt.
3. Enable one or more optional integration services. The Configure Integration Services task displays all integration services, including required services that aren't editable.  
You can enable the Financials Document Delivery Service to deliver 1 or more integration files to an external location.
4. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Manage: Organization Update Integration* domain.  
See: <..../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita>
5. (Optional) [Create Integration Business Process](#) on page 1950.  
Create an event to manage the workflow of document delivery and retrieval for the Connector.
6. [Set Up Integration Retrieval](#) on page 1957.  
Specify how the integration system retrieves data files containing addition or changes to HCM data from your external server.
7. [Launch an Integration](#) on page 24.  
Schedule how often the integration system runs.

## Set Up PSA Inbound Connector Integration Attributes

### Prerequisites

Security: *Integration Build and Integration Configure* domain in the Integration functional area.

### Context

Configure integration attributes for an integration based on the *Core Connector: Professional Service Automation Inbound* template.

## Steps

1. As a related action on your Professional Service Automation (PSA) Inbound Connector integration, select Integration System > Configure Integration Attributes.
2. Add a row for each attribute and specify a value:

Option	Description
Input File Retrieval Label	Specify a value to retrieve the document using this label instead of the default Retrieved label.
Include Web Service Requests in Message Audit	Select the check box to include the web service requests in the message audit file to help you debug. When you enable this attribute, the size of the message audit file can increase significantly.
Create Errors Only File	Select the check box to create a file with input records that failed to load into Workday.
Configure Files for External Delivery	Select the check box to deliver the Errors Only File to an external location. To configure this

Option	Description
	attribute, you must enable the Create Errors Only File integration attribute.
Document Retention Policy	Specify the number of days that integration output should be available for viewing. When you don't override this value, Workday sets the retention period to 30 days.

3. Enable 1 or more of these integration services:

Option	Description
Core Connector: Professional Services Automation Inbound - Deployed Service	Enables your integration system to import certification achievements for 1 or more workers into their corresponding records in Workday.
Core Connector: Professional Services Automation Inbound Connector Service	Launches the integration.
Professional Services Automation Inbound Connector - Supervisory Organizations DIS	Imports supervisory organization data for one or more workers into Workday.
Professional Services Automation Inbound Connector - Workers DIS	Imports worker data into Workday.
Core Connector: Professional Services Automation Inbound - Document Retrieval Service	Retrieves an integration document from an external location.
Professional Services Automation Inbound Post-Processing Service	Performs additional processing after the integration loads the integration file into Workday.
Integration Document Retention	Stores the copy of each integration file for the number of days you specify.
Financials Document Delivery Service	Delivers 1 or more integration files to an external location based on the file selection, transport, and encryption options you specify. This service is optional.
Enable Message Auditing	Records and stores additional audit messages.

## Concept: PSA Inbound Connector

Use the PSA Inbound Connector to import worker data from an external endpoint into Workday enabling you to use and execute PSA applications. You can use a non-Workday application as your source-of-truth for worker data, then synchronize that data with Workday. The Connector can:

- Create and update Supervisory organizations.
- Assign organizational roles for Supervisory organizations.
- Hire and terminate employees and contingent workers.
- Change worker data for employees and contingent workers.
- Deactivate Workday account.

Note: PSA Inbound Connector works with HCM in Workday. You'll need HCM functional consultant expertise when you're setting up the integration.

## Feature Prerequisites

- Workday Core Financials solution must exist in Workday.
- Ensure that the listed business processes complete automatically:
  - Add Update Supervisory Organization (Default Definition)
  - Assign Roles (Default Definition)
  - Change Organization Assignments for ~Worker~ (Default Definition)
  - Contact Change (Default Definition)
  - Contract ~Contingent Worker~ (Default Definition)
  - Edit Position (Default Definition)
  - End ~Contingent Worker~ Contract (Default Definition)
  - Hire (Default Definition)
  - Hiring Restrictions (Default Definition)
  - Legal Name Change (Default Definition)
  - Legal Name Change (Non-Worker)
  - Move ~Workers~ (By Organization) (Default Definition)
  - Preferred Name Change (Default Definition)
  - Preferred Name Change (Non-Worker)
  - ~Termination~ (Default Definition)
- Before the first integration run, manually configure and upload the listed HCM data:
  - Countries
  - Employee Type
  - Job Profiles
  - Locations
  - Reason for terminating employee
  - Reason for ending contingent worker contract
  - Time Type
- The PSA integration uses specific web services. Make sure you have access to them.
- When there's a change in the data since the last integration run, you must provide that information before the next run.

## Feature Limitations

You can't rescind or correct the business processes with PSA Inbound Connector. Workday requires a System administrator when you need a correction.

## File Format for PSA Inbound Connector Data

The integration imports data in a Workday-defined XML format.

## Integration Process Flow

The integration imports HCM data using this process:

1. The external endpoint generates a file (in the Workday-defined XML format) and sends it to a file server known to the integration.
2. Launches the integration, either by schedule or manually.
3. The integration retrieves the file according to the Document Retrieval configuration on the *Integration Process Event* and applies document tags.

When the file isn't in Workday-defined XML format, configure a Document Transformation integration to convert the input file.

4. The PSA Inbound Connector calls multiple web services in the given sequence.
5. The integration processes the file, then imports the data into Workday.

## PSA Inbound Connector Audits

The PSA Inbound Connector integration generates audit files each time it runs. You can view these audit files:

- DataChangesAudit.html
- DiagnosticAudit.html: Includes all errors in the integration run in 1 file.
- Errors Only File: Includes error data. You can update this XML input file to resolve the errors and load it back into the connector.
- MessageAudit.html: Includes information about the previous integration runs in a zip file.

## Reference: PSA Inbound Connector File Schema

### PSA Inbound Connector XML Schema
