## Australian Superannuation (SuperStream) Integration

### Steps: Set Up SuperStream Integration

#### Prerequisites

Security: *Integration Build* in the Integration functional area.

#### Context

Set up an integration to pay superannuation guarantee contributions to your employees using the SuperStream system.

## Steps

1. Access the Create Integration System User task and create an Integration System User (ISU).  
See: [.../.../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#)
  2. Access the Create Security Group task. Select the *Integration System Security Group (Unconstrained)* in the Type of Tenanted Security Group field. Add the ISU you created in step 1 to the Integration System Users field.
  3. From the related actions menu on the security group, select Security Group > Maintain Domain Permissions for Security Group
  4. In the Integration Permissions section, add these 2 domains to the Domain Security Policies permitting Put access, and the Domain Security Policies permitting Get access fields:
    - *Process: SuperStream (Run) - AUS*
    - *Process: SuperStream (Reports) - AUS*
- See: [.../.../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#)
5. [Create Integration System](#) on page 1967  
From the New Using Template prompt, select *SuperStream (Australia)*.
  6. On the Integration System > Configure Integration Services step, set these attributes:
    - SAFF - Generic No Defined Benefits to *Enabled*.
  7. From the related actions menu of the integration system, select Workday User > Edit. Enter the Integration System User you created.
  8. [Launch an integration](#).  
Schedule how often the integration runs.

## Next Steps

You can set up rules for naming the SuperStream file. See: [Set Up Integration Sequence Generators](#) on page 1969.

Related Information

### Steps: Set Up SuperStream Integration

[Concept: SuperStream Integration](#) on page 1861

## Concept: SuperStream Integration

The SuperStream integration transforms the SuperStream reports into the SuperStream Alternative File Format (SAFF). You then provide the SAFF file to your Superannuation Clearing House.

### Launch Parameters

Select a SuperStream report to launch the integration.

### Integration Files and Reports

Every time the integration runs, Workday generates these files:

- *SuperStream Data Transformation Report*, which reports on any data changes or transformations that were done.
- A SAFF CSV file for each SuperStream report that you launch the integration with.

You can find these files in the Output Files section of the Integration Event.

Note: Because actual data is included in the *SuperStream Data Transformation Report* file, consider securing this file separately.

## Related Information

### Steps: Set Up SuperStream Integration

[Steps: Set Up SuperStream Integration on page 1860](#)

## Australian Taxation Office STP Integration

### Steps: Set Up ATO STP Integration

#### Prerequisites

- Security: *Integration Build* in the Integration functional area.
- Contact Workday Support to request your Ozedi Customer Client ID.

#### Context

Set up an integration to send STP data to the Australian Taxation Office (ATO).

Note: The integration will only send data to the ATO when configured in production environments. Configurations in non-production environments won't send data to the ATO due to ATO restrictions.

#### Steps

1. Access the Create Integration System User task and create an Integration System User (ISU).
2. Access the Create Security Group task. Select the *Integration System Security Group (Unconstrained)* in the Type of Tenanted Security Group field. Add the ISU you created in step 1 to the Integration System Users field.
3. From the related actions menu on the security group, select Security Group > Maintain Domain Permissions for Security Group
4. In the Integration Permissions section, add these 2 domains to the Domain Security Policies permitting Put access, and the Domain Security Policies permitting Get access fields:
  - *Process: STP (Run) - AUS*
  - *Process: STP (Reports) - AUS*

See: [..../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#)

5. [Create Integration System on page 1967](#)

From the New Using Template prompt, select *Single Touch Payroll (Australia)*.

6. On the Integration System > Configure Integration Services step, set these attributes:

Set these attributes:

- STP Generic Service to *Yes*.
  - Enable Message Auditing to *No*.
  - DIS - Performance Log to *No*.
7. Select Integration System > Configure Integration Attributes as a related action on your integration system. Set these attributes:
    - Pay Load Delivery Method: Select the *Override Default Values* checkbox. In the Value field, enter *Ozedi*.
    - Ozedi Customer Client ID: Add a new row, and in the Value field enter your client Id.
  8. From the related actions menu of the integration system, select Workday User > Edit. Enter the Integration System User you created.
  9. [Launch an Integration](#).

Schedule how often the integration runs.

## Example

### Concept: ATO STP Integration

The STP integration enables you to send payroll data to the Australian Taxation Office. The integration records any error messages returned by the STP endpoint in the integration audit files.

#### Launch Parameters

Select an STP report with the *Approved* status to launch the integration.

Note: You can't select an STP report that has been in the *Received* status more than once.

#### Integration Files and Reports

Every time the integration runs, Workday generates these files:

- *STP Field Validation Report*, which reports on any data changes or transformations that were done. A single report is generated for all STP reports in the run.
- *STP Pay Event*.
- *ATO Response*, which reports on the response to the submission from the ATO.

You can find these files in the Output Files tab of the Integration Event.

Note: Because actual data is included in the *STP Field Validation Report* and *STP Pay Event* files, you might need to secure them separately.

The STP online service sends a response record each time the integration runs. Use the All STP Reports task to view the status of all submitted STP reports.

Workday updates the status of the STP report to *Received* when the ATO acknowledges that the report is received.

## Canada Annual Tax Filing Integrations

### Steps: Set Up Canadian Revenue Agency T4 Integration

#### Prerequisites

An external server that can receive delivered integration files.

#### Context

Create an integration system that generates a year-end T4 *Statement of Remuneration Paid* file for reporting payroll tax data for Canadian workers to the Canadian Revenue Agency (CRA). Once generated, you then submit the T4 files manually to the CRA; this integration doesn't support sending files directly to the CRA.

#### Steps

1. Access the Create Integration System task and enter *Annual Tax Filing - CRA (T4)* at the New Using Template prompt.  
Security: *Integration Build* and *Integration Configure* security domains.
2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:
  - *Integration Event*
  - *Process: Year End (Run) – CAN*

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

3. As a related action on the integration system, select Integration System > Configure Integration Maps.  
Map values for report type codes in Workday to the report type code for the T4 format.  
Security: *Integration Build* and *Integration Configure* security domains.
4. [Set Up Integration Sequence Generators](#) on page 1969.
5. [Set Up Integration Delivery](#) on page 1952.
6. [Launch an Integration](#) on page 24.

## Steps: Set Up Canadian Revenue Agency T4A Integration

### Prerequisites

An external server that can receive delivered integration files.

### Context

Create an integration system that generates a year-end T4A statement for submission to the Canadian Revenue Agency (CRA). The T4A statement reports payroll tax data for Canadian workers. The statement includes pension, retirement, annuity, and other income data. Once generated, you then submit the T4A files manually to the CRA; this integration doesn't support sending files directly to the CRA.

### Steps

1. Access the Create Integration System task and enter *Annual Tax Filing - CRA (T4A)* at the New Using Template prompt.  
Security: *Integration Build* and *Integration Configure* security domains.
2. As a related action on the integration system, select Integration System > Configure Integration Maps.  
Map internal values for report type codes in Workday to the report type code for the T4A format.  
Security: *Integration Build* and *Integration Configure* security domains.
3. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:
  - *Integration Event*
  - *Process: Year End (Run) – CAN*
 See: [Steps: Grant Integration or External Endpoint Access to Workday](#).
4. [Set Up Integration Sequence Generators](#) on page 1969.
5. [Set Up Integration Delivery](#) on page 1952.
6. [Launch an Integration](#) on page 24.

## Steps: Set Up Canadian Revenue Agency NR4 Integration

### Prerequisites

An external server that can receive delivered integration files.

### Context

Create an integration system that generates a year-end NR4 *Non-Resident Tax Withholding, Remitting, and Reporting* file for reporting payroll tax data for Canadian workers to the Canadian Revenue Agency (CRA). Once generated, you then submit the NR4 files manually to the CRA; this integration doesn't support sending files directly to the CRA.

## Steps

1. Access the Create Integration System task and select *Annual Tax Filing - CRA (NR4)* in the New Using Template prompt.
- Security: *Integration Build* and *Integration Configure* security domains.

2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

- *Integration Event*
- *Process: Year End (Run) – CAN*

See [Steps: Grant Integration or External Endpoint Access to Workday](#).

3. On the related actions menu on the integration system, select **Integration System > Configure Integration Maps**.

Map values for report type codes in Workday to the report type code for the NR4 format.

Security: *Integration Build* and *Integration Configure* security domains.

4. [Set Up Integration Sequence Generators](#) on page 1969.
5. [Set Up Integration Delivery](#) on page 1952.
6. [Launch an Integration](#) on page 24.

## Steps: Set Up Revenue Agency Quebec RL-1 Integration

### Prerequisites

An external server that can receive delivered integration files.

### Context

Create an integration that generates a year-end RL-1 statement of employee taxes file for reporting payroll tax data. You then submit the RL-1 files manually to Revenue Quebec Agency (RQA). This integration doesn't support sending files directly to the RQA.

## Steps

1. Access the Create Integration System task and enter *Annual Tax Filing - RQA (RL-1)* at the New Using Template prompt.

Security: *Integration Build* and *Integration Configure* security domains.

2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Process: Year End (Run) – CAN* security domain.

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

3. As a related action on the integration system, select **Integration System > Configure Integration Maps**.

Map values for report type codes to the report type code for the RL-1 format.

Security: *Integration Build* and *Integration Configure* security domains.

4. [Set Up Integration Sequence Generators](#) on page 1969.
5. [Set Up Integration Delivery](#) on page 1952.
6. [Launch an Integration](#) on page 24.

## Steps: Set Up Revenue Agency Quebec RL-2 Integration

### Prerequisites

An external server that can receive delivered integration files.

## Context

Create an integration that generates a year-end RL-2 statement of employee taxes file for reporting retirement and annuity income. Once generated, you then submit the RL-2 files manually to the Revenue Quebec Agency (RQA). This integration doesn't support sending files directly to the RQA.

## Steps

1. Access the Create Integration System task and enter *Annual Tax Filing - RQA (RL-2)* at the New Using Template prompt.  
Security: *Integration Build* and *Integration Configure* security domains.
2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Process: Year End (Run) – CAN* security domain.  
See: [Steps: Grant Integration or External Endpoint Access to Workday](#).
3. As a related action on the integration system, select Integration System > Configure Integration Maps.  
Map values for report type codes in Workday to the report type code for the RL-2 format.  
Security: *Integration Build* and *Integration Configure* security domains.
4. [Set Up Integration Sequence Generators](#) on page 1969.
5. [Set Up Integration Delivery](#) on page 1952.
6. [Launch an Integration](#) on page 24.

## Concept: Canada Annual Tax Filing Integrations

To generate year-end tax forms for your Canadian workers, use the Canada Annual Tax Filing Integrations. The Canada Annual Tax Filing Integrations can generate forms in these formats:

- T4 (statement of pay) for the Canadian Revenue Agency (CRA)
- T4A (statement of pension, retirement, annuity, and other income) for the CRA
- NR4 (statement of amounts paid or credited to non-residents) for the CRA
- RL-1 (employee taxes) for Revenue Quebec (RQA)
- RL-2 (retirement and annuity income) for Revenue Quebec (RQA)

## Integration Templates for Canadian Annual Tax Filing

Workday provides a separate integration template for each supported Canadian tax form:

- Annual Tax Filing - CRA (T4)
- Annual Tax Filing - CRA (T4A)
- Annual Tax Filing - CRA (NR4)
- Annual Tax Filing - RQA (RL-1)
- Annual Tax Filing – RQA (RL-2)

Create separate integration systems only for the forms that you must generate. Example: If you don't send RL-1 forms to the RQ, you don't need to create an integration system based on the Annual Tax Filing - RQA (RL-1) template.

## Integration Launch Parameters

You can use these launch parameters to control output for each type of integration:

Parameter	Value Type	Notes
Tax Year	Specify Value	Don't leave this field empty.
Company	Specify Value	If you select more than 1 company, Workday generates a separate file for each company.

Parameter	Value Type	Notes
<i>Override BN15 (optional)</i>	<i>Specify Value</i>	<p>Available on these Canada Year-End Integrations:</p> <ul style="list-style-type: none"> <li>• T4</li> <li>• T4A</li> <li>• NR4</li> </ul> <p>Use to override the existing business number on the XML integration forms in the T619 section if you use MyBA, Web Access Code (WAC), or Represent a Client (RAC) for year end tax filing. The value you enter for Override BN15 (optional) needs to match the company you log in with for Canada Revenue Agency, but doesn't need to match the company business number you are filing for that's listed in the integration launch parameters.</p>
<i>Transmitter Rep ID (optional)</i>	<i>Specify Value</i>	<p>Available on these Canada Year-End Integrations:</p> <ul style="list-style-type: none"> <li>• T4</li> <li>• T4A</li> <li>• NR4</li> </ul> <p>When using Represent a Client (RAC) for year end tax filing, enter your 7-character Transmitter Rep ID to display on the XML forms in the T619 section. Only one Transmitter Rep ID (optional) entry is required, even when you select multiple companies. If you use Transmitter Rep ID (optional) for year end tax filing, you will also need to update the Override BN15 (optional) with the BN15 you use to login with Canada Revenue Agency.</p>
<i>Last Successful Run Time</i>	<i>Specify Value or Determine Value at Runtime</i>	<p>Specify the last time the integration ran. Select a value before the moment that you generated the T4, T4A, RL-1, RL-2, and NR4 Data and Forms.</p>

## Integration File Generation and Delivery

Each integration template includes a Delivery Service that exports one or more files to an external server that you specify. The files are all in XML and formatted according to the specifications for each form type (T4, T4A, RL-1, RL-2, or NR4). Send the files on to the required agency (either CRA or RQ) depending on the type of file. These integrations don't support direct delivery of integration output files to CRA or RQ.

Each integration generates and delivers multiple files, splitting data as required by the CRA and RQ:

- Each file contains data for only a specific tax year.
- Each file contains data for only a specific report type (*Original, Canceled, and Amended*).
- Each file is for a specific payroll company.
- Workday compresses files in ZIP format depending on file size and type:
  - T4, T4A, and NR4: files larger than 150 MB
  - RL-1 and RL-2: files larger than 300 MB

## Integration Audit Files

Every time the integration runs, Workday generates these files:

- The *Messages Audit* includes response messages from the integration system:
  - Launch Integration Event response
  - Integration system response

- The *Diagnostic Audit* is designed to help you troubleshoot integration errors:
  - The Annual Tax Filing Summary section lists:
    - Tax Year
    - Included Payroll Companies
    - Start and finish time for the integration
  - The Annual Tax Filing Details section includes details for each error, including severity level, error summary, and affected worker.

You can find these files in the Reports and Other Output Files section of the Integration Event for each integration run.

## Ceridian Print Service Integration

### Steps: Set Up Ceridian Print Service Integration

#### Prerequisites

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

#### Context

Send employee information, earnings and hours, deductions, taxes, accrual codes, and direct deposit information to Ceridian Payroll Services using the *Ceridian Check Print Service* integration.

#### Steps

1. Access the Create Integration System task and enter *WPN - Ceridian Check Printing* in the New Using Template prompt.
2. As a related action on your *Ceridian Check Print Service* integration, select Integration System > Configure Integration Attributes and enter attributes required by the integration template.
3. Access the *Outsourced Payment Release Event* business process that launches the integration. Add an Integration step that refers to the integration system that you created in this procedure.
4. Configure the Integration step that you created in Step 3 and set the Integration Criteria:

Option	Description
Field	<i>Outsourced Payment Group ID</i>
Value Type	<i>Determine Value at Runtime</i>
Value	<i>Outsourced Payment Group ID</i>

5. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

- *Integration Event*
- *Process: Payroll Settlement*
- *Process: Settlement*

## Set Up Banking for Ceridian Print Service Integration

### Prerequisites

Security: *Set Up: Bank Entity* domain in the Banking and Settlement functional area.

### Context

The *Ceridian Print Service* integration uses the Workday banking and settlement infrastructure. To ensure that the integration system receives the correct payroll data, configure:

- Outsourced Bank Provider: Defines the provider (Example: Ceridian) and the integration system used for that provider.
- Bank Account. The bank account defines settlement rules by which Workday routes the payroll payment to an outsourced bank provider.

### Steps

- Access the Create Outsourced Bank Provider task and define the check print outsource vendor and related integration system:
  - In the Outsourced Bank Provider Name field, enter a name (such as *Ceridian*) to use when referring to the outside vendor.
  - From the Integration System prompt, select the Ceridian Check Print Service integration system that you created.
  - (Optional) From the Cut Off Time prompt, enter the cut-off time for including payments from this account in an electronic payment file. This field is informational only; Workday doesn't use this field value otherwise.
  - (Optional) In the Maximum Payments per Group field, specify the maximum number of payments that can be included in a single *payment group* originating from this account. If a file exceeds this number, Workday automatically separates the payments into multiple groups.
- Access the Create Bank Account task and create a record for the bank account (either your bank or Ceridian). Set these options for your bank account, depending on the type (your bank or Ceridian bank).

Option	Description
Bank Account Type	If Ceridian will issue checks drawn from a Ceridian bank account, select <i>Outsourced Account</i> . If Ceridian will issue checks drawn from your organization bank account, select <i>Bank Account</i> .
Account Number	If Ceridian will issue checks drawn from a Ceridian bank account, enter your Ceridian account number. If Ceridian will issue checks drawn from your organization bank account, enter your bank account number.
Outsourced Bank Provider	Select the outsourced bank provider that you created for Ceridian in step 7.

## Set Up Payslips and Printing for Ceridian Print Service Integration

### Prerequisites

Security: *Integration Build Custom Services*, *Integration Build*, and *Integration Configure* domains in the Integration functional area.

## Context

Configure payslip data and related information in Workday and Ceridian. These configurations define what Ceridian prints on payslips, and how Ceridian sorts and split check output:

- Organization-level field overrides: Ceridian can sort paychecks and pay advice stubs to 4 levels. Example: by level 1, then by level 2, and so on, using any of the Employee Master record data elements. Workday also provides 4 user-defined data fields for use in sorting. Assign the desired data elements to each of the Organization Fields then provide sorting codes to Ceridian. Example: you could sort by:
  - Cost Center ID (level 1).
  - Location (level 2).
  - Company (level 3).
  - Supervisory organization (level 4).

You can configure the Ceridian Print Service integration to include this sorting information on the integration file.

- Overflow page limits. The integration provides settings for the number of earnings and deductions that Ceridian prints per page on paychecks and advice stubs. These split-wrap settings match the maximum amounts defined by Ceridian. You can reduce the limits below the automatically populated amounts. Don't increase the limits above the automatically populated limits.
- Marital status maps. Ceridian Print Service integration can map different marital status values from values stored in Workday to values accepted by Ceridian.
- For each payslip group, define which payslip calculations to include and add a descriptive name for the payslip group, if desired.
- Define which workers or groups don't receive printed payslips, and if workers can override these restrictions for their payslips.
- Sort and split levels. Ceridian can sort and split using any of the Employee Master data elements defined on the header file. Define your sort and split levels in Ceridian.

Map Workday data using field overrides in the Employee Master file to sort on one of the 4 generic Organization level elements.

## Steps

- As a related action on your *Ceridian Check Print Service* integration, complete these tasks:

Option	Description
Integration System > Configure Integration Sequence Generators	Complete this task only if you enabled the WPN - Payment Name File Generator service. If a process generates multiple requests for the next sequence number very close together, Workday attempts to generate the sequence numbers. This action can result in skipped, nonconsecutive numbers.
Integration System > Configure Integration Field Overrides	Select up to 4 levels of fields that Workday uses to sort and split-wrap checks. These fields can be report fields or calculated fields. If you use this option, set the sorting and split-wrapping criteria in your Ceridian account.
Integration System > Configure Integration Maps	Map internal Workday values to marital status codes for Federal and Work State marital status codes.

2. Access the Maintain Payroll Payslip Configuration task and create payslip groups, and their related calculations.

The *Taxable Wages* payslip group is required, but isn't mapped directly to the payslip. The payslip groups *Employer Paid Benefits* and *Absence Plans* are optional. If defined, Ceridian prints these groups on the payslip.

3. (Optional) To suppress check and advice printing for one or more workers in a pay group, access the Company Payroll Printing Options task and enter selection criteria.
4. Access your Ceridian account and define your sort and split levels.

## Concept: Ceridian Check Print Service

The Ceridian Check Print Service integration enables you to outsource printing of payroll checks and payroll advice slips, or outsource complete banking services, to Ceridian. The integration can create checks drawn on either your bank account, or a bank account managed by Ceridian. You can configure the integration to provide additional data to enable Ceridian to sort and wrap output across multiple pages. The integration uses your existing payslip configuration in Workday to provide additional formatting instructions to Ceridian.

### Outsourced Banking and Print-Only Services Compared

The Ceridian Check Print Service integration can support either outsourced check printing only, or complete outsourcing of check printing and banking. This table summarizes the differences and similarities between the 2 options:

Feature	Outsourced Banking	Outsourced Print Services
Run payroll and determine distributions.	Your organization	Your organization
Funding of Payroll Bank Account	Your organization funds a Ceridian account	Your organization funds your own account
Assign Check Numbers	Your organization (Reference)	Your organization (Actual)
Print Checks	Ceridian (Actual)	Ceridian
Print Advice Slips	Ceridian	Ceridian
Checks drawn against bank	Ceridian	Your organization
ACH File sent to bank.	Your organization creates and sends ACH file to Ceridian; Ceridian sends ACH file to their bank.	Your organization
Reconciliation	Ceridian reconciles individual employee payments as the payments clear. Your organization reconciles lump sum payments to Ceridian. Your organization can optionally reconcile the lump sum transaction with the individual payments recorded against the Ceridian account in Workday.	Your organization reconciles individual employee payments as the payments clear.

### Data Included on Ceridian Payslips

The Ceridian payslip format provides a standard set of sections to display earnings, deductions, gross and net wages, taxes, and other information. Workday automatically populates the label on the Ceridian payslip with the name of the payslip. If you provide a label override, Workday uses the label override as the description label instead.

This table lists each section of the Ceridian payslip, and the corresponding data elements in Workday used to populate them:

Ceridian Payslip Section	Derived From
Header	Worker name, address, ID, and tax exemption information. ID Number value is stored in Ceridian and mapped from the Social Security Number (SSN) for the worker.
Hours and Earnings	Earnings (Payslip Group)
Taxes	Employee Taxes (Payslip Group)
Special Information	Employer Paid Benefits (Payslip Group); Absence Plans (Payslip Group)
Pre-Tax Deductions	Pre Tax Deductions (Payslip Group)
After-Tax Deductions	Post Tax Deductions (Payslip Group).
Net Pay Distribution	Direct deposit payment distribution.
Gross wages	Workday payroll output.
Pre-Tax	Workday payroll output.
FIT Taxable	Workday payroll output.
Taxes	Workday payroll output.
Ded/Other	Workday payroll output.
Net Pay	Workday payroll output.

## Integration Process Flow

When configured, the Ceridian Print Service integration launches and runs using this process:

1. The Settlement process calls a bank routing rule.
2. The bank routing rule ties payments for a specified pay group to a bank account.
3. The bank account specifies the outsourced bank provider to use to generate checks.
4. The outsourced bank provider specifies the Ceridian Check Print Service integration system to use.
5. The Ceridian Print Service integration produces an output file and posts it to an FTP server controlled by your organization.

Note: You can configure the Ceridian Print Service integration to use SSH authentication to access the FTP server.

6. You access your Ceridian account (using a Ceridian web site) and upload the output file to Ceridian.
7. Ceridian prints paychecks and payroll advice slips based on your configuration options and mails them to your workers.

### Concepts

[Concept: Workday Connectors](#) on page 524

## Check Printing Connector

### Steps: Set Up Check Printing Connector Integration

#### Prerequisites

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

#### Context

To export payroll data from Workday to an external check printing service, you can create a *Check Printing Connector* integration.

Note: If you need to create a new integration system to replace one that uses the Core Connector: Payroll Check Printing Connector (DO NOT USE) template, you can save time by using the Migrate Check Print Integration Configuration for Data Initialization Service task.

## Steps

1. [Create Integration System](#) on page 1967.

Select *Core Connector: Payroll Check Printing (Enhanced Performance)* at the New using Template prompt.

2. (Optional) Enable 1 or more of these integration services.

Workday displays all integration services, including required services that you can't edit.

Option	Description
Enable Message Auditing	Enables Workday to generate service log files for troubleshooting purposes.
DIS - Performance Log	Enables Workday to generate performance logs.

3. From the related actions menu on your *Core Connector: Payroll Check Printing (Enhanced Performance)* integration, select Integration System > Configure Integration Attributes.

For maximized performance, select a value for the Payslip Printing Option attribute, otherwise the integration will pull all payments by default.

Option	Description
Checks and Advices	Returns workers whose payment type is check or advice.
Checks and Advices and Payments	Returns all workers, but only returns payment data for workers receiving electronic payslips.
Checks Only	Returns workers whose payment type is check.

4. From the related actions menu on the integration, select Integration System > Configure Integration Maps.
5. From the related actions menu on the integration system, select Integration System > Configure Integration Field Attributes. Review and configure any fields you want to include and exclude from the integration output.
6. (Optional) From the related actions menu of the integration, select Integration System > Configure Integration Field Overrides to configure custom fields.

Configure these context levels on the Extended Fields grid:

- Payslip\_Data
- Payroll Worker Data
- Payment Data
- Originating Party
- Originating Bank
- Receiving Party
- Receiving Bank

7. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

- *Integration Event*
- *Process: Payroll Settlement*

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

8. [Set Up Integration Sequence Generators](#) on page 1969.

9. [Select and Set Up Connector Output Fields](#) on page 1977.

10. [Create Integration Business Process](#) on page 1950.

Configure the Outsourced Payment Release Event business process to send payments to an outsourced check printing service after settlement. See [Reference: Settlement Business Processes](#).

11.(Optional) [Steps: Set Up Document Transformation Connector](#) on page 594.

12.[Launch an Integration](#) on page 24.

## Concept: Check Printing Connector

To enable you to send checking data to banks that don't support existing checking integrations, Workday provides the *Core Connector: Payroll Check Printing (Enhanced Performance)* integration template. Using this integration template, you can select from a wide variety of basic data elements that third-party banking endpoints can require. You can configure the connector output to select just the fields that the external bank endpoint requires, and send those fields in simple DIS XML format.

The integration includes a configurable set of payroll check-related data. You can select which fields to include or exclude, which ones you want to require, and which fields to truncate.

For improved performance, configure the *Payslip Printing Option* integration attribute to filter output to:

- *Checks Only*.
- *Checks and Advices*.
- *Checks and Advices and Payments*.

Otherwise the integration pulls all payments by default.

## Launch/Schedule Options

Workday provides these launch schedule options for the Check Printing Connector integration:

- Scheduled Run Frequency. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration collects all qualifying changes based on the launch parameters. You can schedule a Core Connector: Check Printing Connector integration to run several times per day; launching the integration frequently doesn't affect performance.
- Run Now. You can launch the integration manually. Workday prompts you to enter launch parameters.

For each launch schedule option, consider these launch parameters:

Launch Parameter	Description
Outsourced Payment Group Id	The payment ID generated from the settlement run.
Payment Interval Start Date / Payment Interval End Date	The integration returns payments between the selected dates that are within the Outsourced Payment Group ID.

## Integration Audit Files

Every time the integration runs, Workday generates the *Diagnostic Audit* file to help you troubleshoot integration errors. You can find the file in the Reports and Other Output Files section of the Integration Event.

## Reprinting Checks

When you outsource payroll check printing for a payment group, you can't use Workday to reprint those checks. Contact the bank or vendor for reprints.

## Déclaration Sociale Nominative Integrations

### Set Up DSN Deposit (Machine to Machine) Integration

#### Prerequisites

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

#### Context

You can create an outbound integration that sends DSN submissions to the net-entreprises.fr portal.

#### Steps

1. Create Integration System on page 1967.

Select *DSN Deposit (Machine to Machine)* from the New using Template prompt.

2. Select Integration System > Configure Integration Attributes from the related actions menu on the integration system, and enter integration service attributes.

Workday recommends that you use the Restricted to Environment integration attribute to restrict the integration system to specific production environments.

3. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

- *Integration Event*
- *Process: DSN (Submission) - FRA*

See [..../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).

## Next Steps

Add an Integration Step for this integration to the *DSN Submission Event* business process.

Related Information

### Tasks

[Steps: Set Up DSN Deposits \(FRA\)](#)

### Examples

[Example: Set Up the DSN Submission Event Business Process \(FRA\)](#)

## Set Up DSN Polling (Machine to Machine) Integration

### Prerequisites

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

### Context

You can create an integration to retrieve:

- The status of a deposited DSN submission from the net-entreprises.fr portal.
- Income tax withholding rates from the Direction Générale des Finances Publiques (DGFiP) and upload them to worker tax elections.

### Steps

1. [Create Integration System](#) on page 1967.

Select *DSN Polling (Machine to Machine)* from the New using Template prompt.

2. Select *Integration System > Configure Integration Attributes* as a related action on the integration system, and enter integration service attributes.

Workday recommends that you use the *Restricted to Environment* integration attribute to restrict the integration system to specific production environments.

Workday recommends that you set *Polling Retry Interval (ms)* to retrieve messages several times each day to automatically import comptes rendus métiers (CRMs).

3. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains:

- *Integration Event*
- *Process: DSN (Submission) - FRA*

See [..../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).

## Next Steps

Launch the *DSN Polling (Machine to Machine)* integration.

To view income tax withholding rates imported by the integration, view the *DSN Polling (Machine to Machine)* integration event in the Process Monitor report. In the Child Processes tab, click the number of imported instances in the Target Instance column to view the uploaded tax rates.

## Electronic Income Withholding Order Integration

### Steps: Set Up Inbound Electronic Income Withholding Order Integration

#### Prerequisites

- Complete and submit a profile application to the Federal Office of Child Support Enforcement (OCSE). OSCE requires an application for approval to participate in the system-to-system e-IWO program.
- Set up an account with the OCSE.
- Know the SFTP security credentials required to access records for your organization at the OCSE web portal.

#### Context

Implement an integration to import electronic Income Withholding Orders into Workday from the Federal Office of Child Support Enforcement (OCSE) portal.

#### Steps

1. Access the Create Integration System task and enter *Electronic Income Withholding Order Inbound* at the New Using Template prompt.  
 Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.  
 The Configure Integration Services task displays all integration services, including required services. Required integration services aren't editable.
2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Process: Payroll (Income Withholding Orders)* security domain.  
 See: [Steps: Grant Integration or External Endpoint Access to Workday](#).
3. Select Integration System > Configure Integration Attributes as a related action on the integration system and enter integration service attributes.  
 Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
4. [Set Up Integration Retrieval](#) on page 1957.  
 The Federal Office of Child Support Enforcement (OCSE) web portal requires the SFTP transport protocol.
5. [Launch an Integration](#) on page 24.  
 Schedule how often the integration system runs.

### Steps: Set Up Outbound Electronic Income Withholding Order Integration

#### Prerequisites

- Complete and submit a profile application to the Federal Office of Child Support Enforcement (OCSE). OSCE requires an application for approval to participate in the system-to-system Federal e-IWO program. See [Electronic Income Withholding Orders \(e-IWO\) Enhancement in WD25](#).
- Set up an account with the OCSE.
- Know the SFTP security credentials required to access records for your organization at the OCSE web portal.

## Context

Create an integration system that generates electronic Income Withholding Order acknowledgment records and sends those records to the Federal Office of Child Support Enforcement (OCSE) web portal.

## Steps

1. Access the Create Integration System task and enter *Electronic Income Withholding Order Outbound* at the New Using Template prompt.  
Security: *Integration Build* and *Integration Configure* security domains.
2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Process: Payroll (Income Withholding Orders)* security domain.  
See: [Steps: Grant Integration or External Endpoint Access to Workday](#).
3. Select Integration System > Configure Integration Attributes as a related action on the integration system and enter integration service attributes.  
Security: *Integration Build* and *Integration Configure* security domains.
4. As a related action on the integration system, select Integration System > Configure Integration Maps.  
Security: *Integration Build* and *Integration Configure* security domains.
5. [Set Up Integration Sequence Generators](#) on page 1969.  
Specify this format: *[yyyy][MM][dd][h][m][s].xml*
6. [Set Up Integration Delivery](#) on page 1952.  
The Federal Office of Child Support Enforcement (OCSE) web portal requires the SFTP transport protocol.
7. [Launch an Integration](#) on page 24.

## Concept: Electronic Income Withholding Order Integrations

Use the Electronic Income Withholding Order (e-IWO) integrations to exchange data with the Federal Office of Child Support Enforcement (OCSE) web portal:

- Retrieve valid electronic Income Withholding Orders from participating state government agencies from the federal OCSE web portal.
- Update the corresponding income withholding orders in your tenant.
- Send acknowledgments informing State government agencies of accepted or rejected records.

## Integration Templates

Workday provides 2 integration templates to support exchanging data with the OCSE portal:

Integration Template	Description
Electronic Income Withholding Order Inbound	Imports electronic Income Withholding Orders into Workday from the Federal Office of Child Support Enforcement (OCSE) portal. Generates a PDF of each record in the file that you can access from the Income Withholding Order in Workday.
Electronic Income Withholding Order Outbound	Generates electronic Income Withholding Order acknowledgment records and sends those records to the Federal Office of Child Support Enforcement (OCSE) web portal.

## Launch/Schedule Options

Workday provides these launch schedule options for the e-IWO integrations:

- Launch with an Integration step on a business process.
- Launch on schedule. You specify a run frequency, and Workday launches the integration automatically. Upon launch, the integration sends or retrieves any data from the OCSE web portal.
- Launch immediately. You can launch the integration manually.

### Test File Format

When testing your integration in an Implementation tenant, ensure that the sample PDF filenames have the correct name format. See: [How do we generate the Test Acknowledgement file that the government is requesting?](#)

## External Payroll Documents for Workday Payroll

### Steps: Set Up External Payroll Documents Integration for Workday Payroll

#### Prerequisites

Create external payroll document types for importing these documents into Workday from your external vendor:

- Tax documents.
- Other payroll documents.

#### Context

You can create an integration based on the *External Payroll Documents* integration template to upload these externally generated Workday payroll documents:

- Payslips.
- Tax documents.
- Other payroll documents.

The integration can import payroll documents in these formats:

- Manifest files in the Workday-defined XML or CSV format.
- Archive files in ZIP format that contain the attachment files.

#### Steps

1. [Create Integration System](#) on page 1967.  
Select *External Payroll Documents* on the New Using Template prompt.
2. From the related actions menu on your *External Payroll Documents* integration, select Integration System > Configure Integration Services.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
3. From the related actions menu on your *External Payroll Documents* integration, select Integration System > Configure Integration Attributes.

As you configure the integration attributes, consider:

- Organization Code is the default value for the *Organization Identifier Type* integration attribute.
- Document Name is the default value for the *Document Identifier Type* integration attribute.
- The default *Tax Document Version* is 1. Select 2 to use the CSV manifest file version that has additional fields for tax documents issued outside of the United States.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

4. (Optional) From the related action menu on your *External Payroll Documents* integration, select Integration System > Configure Integration Maps.

As you complete this task, consider:

Option	Description
Organizations	You can map organizations in Workday to organizations in your third-party vendor system.
Run Category	Required if you select Version 2 for the <i>Payslip Version</i> integration attribute. You can map run categories in Workday to run categories for third-party payroll systems.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

5. [Set Up Integration Sequence Generators](#) on page 1969.

Enable and configure the *External Payroll Documents Sequence Generator* service to generate a batch ID for each group of uploaded external payroll documents.

6. [Create Integration Business Process](#) on page 1950.

As you complete this task, consider:

Option	Description
Business Process Type	Select None of the above.
Business Process Steps	Add a step before the <i>Fire Integration</i> step: <ul style="list-style-type: none"> <li>For Type, select <i>Service</i>.</li> <li>For Specify, select <i>Document Retrieval</i>.</li> </ul>

7. [Set Up Integration Retrieval](#) on page 1957.

Add entries for *XML* and *CSV* in the File Name/Pattern prompt.

- An XML file can contain all document categories.
- The integration requires a separate CSV file for each document category.

8. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these domains in the Integration functional area:

- *Integration Event*.
- *Payroll Interface*.
- *Set Up: Payroll - Pay Group Specific*. Access to this domain is necessary only if you import external payslips.

See [Steps: Grant Integration or External Endpoint Access to Workday](#).

9. Assign the ISU to the integration.

- From the related actions menu, select Workday Account > Edit.
- Click Workday Account. Select Integration System Users and select the ISU you created.
- (Optional) In the Global Preferences area, select a locale and display language.

These settings control the language that Workday uses for the integration data. If left blank, Workday uses the default locale and display language.

Security: *Integration Security* in the Integration functional area.

10. [Define Payslips](#).

Select the Hide Payslips option.

11. Configure access to externally generated payroll documents you upload into Workday.

See [Steps: Set Up Access to Uploaded External Payroll Documents](#) on page 1888.

[12. Launch an Integration on page 24.](#)

## Result

Administrators and employees can view externally generated Workday payroll documents you uploaded.

External Payroll Document	Workers	Administrators
Payslips	From the My Payslips task. From the Pay profile group of the worker profiles on the Payslips tab.	From the Payslips for Worker report. From the Pay profile group of the worker profiles on the Payslips tab.
Tax Documents	From the My Tax Documents task. From the Pay profile group of the worker profiles on the Tax Documents tab.	From the related action Payroll > Tax Documents for a worker. From the Pay profile group of the worker profiles on the Tax Documents tab.
Other External Payroll Documents	From the My Other External Documents task. From the Pay profile group of the worker profiles on the Additional Documents tab.	From the Other External Payroll Documents for Worker report. From the Pay profile group of the worker profiles on the Additional Documents tab.

## Steps: Set Up Access to Uploaded External Payroll Documents

### Context

You can set up access to these externally generated payroll documents uploaded into Workday:

- Payslips.
- Tax documents.
- Other payroll documents such as garnishment letters.

### Steps

1. Access the Configure Profile Group task.

Security: *Set Up: System* domain in the System functional area.

Select the profile group *Pay for Worker Profile*.

Add a row in the Display in Profile grid for each type of payroll document you import:

- Payslips.
- Tax Documents.
- Additional Documents. Use this type for other payroll documents.

2. [Edit Domain Security Policies](#).

Configure these security domains to enable employees to view their own externally generated payroll documents.

<i>Self-Service: Payroll (My Payslips) in the Core Payroll functional area.</i>	Enables access to view externally generated payslips.
<i>Self-Service: Payroll (My Tax Documents - USA) in the USA Payroll functional area.</i>	Enables access to view externally generated tax documents for the U.S.

<i>Self-Service: Payroll (My Tax Documents - CAN) in the CAN Payroll functional area.</i>	Enables access to view externally generated tax documents for Canada.
<i>Self-Service: Payroll (My Tax Documents - UK) in the UK Payroll functional area.</i>	Enables access to view externally generated tax documents for the UK.
<i>Self-Service: Payroll (My Other Payroll Documents) in the Core Payroll functional area.</i>	Enables access to view other externally generated payroll documents.

Configure these security domains to enable payroll administrators to view externally generated payroll documents for employees.

<i>Reports: Pay Calculation Results for Worker (External Payroll Documents) in the Core Payroll functional area.</i>	Enables access to view all externally generated payroll documents.
<i>Reports: Pay Calculation Results for Worker (Payslips) in the Core Payroll functional area.</i>	Enables access to view externally generated payslips.
<i>Reports: Pay Calculation Results for Worker (Tax Filing/W-2s) - USA in the USA Payroll functional area.</i>	Enables access to view externally generated tax documents for the U.S.
<i>Reports: Results for Worker (Pay Calculation) - CAN in the CAN Payroll functional area.</i>	Enables access to view externally generated tax documents for Canada.
<i>Reports: Results for Worker (Pay Calculation) - UK in the UK Payroll functional area.</i>	Enables access to view externally generated tax documents for the UK.
<i>Reports: Pay Calculation Results for Worker (Other Payroll Documents) in the Core Payroll functional area.</i>	Enables access to view other externally generated payroll documents.

## Result

The Pay tab of the worker profile can now display uploaded external payroll documents.

## Set Up External Payroll Document Types for Workday Payroll

### Prerequisites

Security: *Set Up: Payroll* domain in the Core Payroll functional area.

### Context

You can create document types for tax documents and other payroll documents you want to import into Workday from your external vendor. Example: Create a W-2 tax document type to import externally generated W-2 documents into Workday.

Note: Workday ignores spaces and hyphens when matching imported tax documents and other documents to document types you create. Example: Workday matches both W-2 and W2 to the tax document type W-2 you create.

Workday automatically creates a new document type for external payroll documents imported without a document type. Workday creates the new type for documents imported by an *External Payroll Documents* integration or the *Import External Payroll Document* web service.

### Steps

1. Access the Maintain External Payroll Document Types task.

2. As you complete the Tax Documents Type section, consider:

Option	Description
Name	You can change the name of a tax document type, but the combination of name and country must be unique.  When you change the name of a tax document type, any existing document with the same document type and country combination displays the new name.
Country	Select the country where the tax document type applies.
Show to Employee	Select to enable employees to see tax documents of this type.  Workday automatically selects this option for tax document types created by integrations or web services.
Show Comments to Employee	Select to enable employees to see any additional information for the type of document.  Workday doesn't automatically select this option for tax document types created by integrations or web services.
In Use	Workday sets this option when an integration or web service imports a document of this type. You can't delete tax document types that are in use.

3. As you complete the Other Document Types section, consider:

Option	Description
Name	You can change the names of other document types, but the combination of name and country must be unique.
Country	Select the country where the other document type applies.
Show to Employee	Select to enable employees to see documents of this type.  Workday doesn't automatically select this option for other payroll document types created by integrations or web services.
Show Comments to Employee	Select to enable employees to see any additional information for the type of document.  Workday doesn't automatically select this option for other payroll document types created by integrations or web services.
In Use	Workday sets this option when an integration or web service imports a document of this type. You can't delete other payroll document types that are in use.

## Next Steps

Import external payroll documents into Workday.

## Upload Individual External Payroll Documents

### Prerequisites

Security:

- For third-party payroll customers: *Worker Data: Payroll Interface (External Payroll Documents)* domain in the Payroll Interface functional area.
- For Workday Payroll customers: *Reports: Pay Calculation Results for Worker (External Payroll Documents)* domain in the Core Payroll functional area.

### Context

You can use the Upload External Payroll Documents for a Worker task to upload externally generated payroll documents for individual workers into Workday. This task helps you upload external payroll documents outside of your scheduled integration.

Example: You set up your *External Payroll Documents* integration so that the integration automatically uploads payslips. In the latest integration run, 2 payslips failed to upload. You don't want to run your integration again, so you use the Upload External Payroll Documents for a Worker task to upload the 2 failed payslips manually.

### Steps

1. Access the Upload External Payroll Documents for a Worker task.

2. As you complete the task, consider:

Option	Description
~Worker~	Select the worker for whom you want to import external payroll documents.
Document Category	Select the type of document that you want to import. You can select only 1 type.

3. As you complete this task to upload payslips, consider:

Option	Description
Pay Group	Select the Workday Reference ID for the pay group.
Run Category	For a Workday Payroll pay group with multiple run categories, select the run category for determining the pay period for the uploaded payslips.
Period	Select the pay period for attaching the uploaded payslip.
Payment Date	Enter the payment date for the uploaded payslip.
Check Number	Enter the number of the check for the payment associated with the payslip.
Gross Amount	(Optional) Enter the gross payment amount for the payslip.

Option	Description
Net Amount	(Optional) Enter the net payment amount for the payslip.
Currency	(Optional) Enter the currency code for the pay amounts.
Display Date	Enter the date to display when you view the payslip details in Workday.
File Name	Enter the filename for the uploaded payslip file.

4. As you complete this task to upload tax documents, consider:

Option	Description
Organization	Enter the name of the organization for which the tax document is issued.
Serial ID	Enter the serial ID of the document in string format. Applies only to Tax Document Version 2.
Year	Enter the year for the tax document in date format.
Tax Form	Select the type of tax document or create a new one.
Region	Select the region for which the tax document is issued. Applies only to Tax Document Version 2.
Form Classification	Select the type of form that you're uploading. Applies only to Tax Document Version 2.
Issued Frequency	Select the scheduled release of the tax document. Applies only to Tax Document Version 2.
Issued Date	Enter the date that the tax document was issued.
Comments	Use this field for any additional information that you require for the document. Applies only to Tax Document Version 2.
Display Date	Enter the date to display when you view the tax document details in Workday.
File Name	Enter the filename for the uploaded tax document.

5. As you complete this task to upload other payroll documents, consider:

Option	Description
Organization	Enter the name of the organization for which the document is issued.
Serial ID	Enter the serial ID of the document in string format.

Option	Description
Document Type	Select the type of document or create a new one.
Year	Enter the year for the document in date format.
Issued Date	Enter the date that the document was issued.
Issued By	Enter the external entity that issued the document. Example: The IRS issues a federal tax levy garnishment.
Received Date	Enter the date that the document was received.
Comment	Use this field for any additional information that you require for the document.
Display Date	Enter the date to display when you view the document details in Workday.
File Name	Enter the filename for the uploaded document.

6. In the Attachment section, add the external payroll files you want to upload for the worker.

## Concept: External Payroll Documents for Workday Payroll

You can use an *External Payroll Documents* integration to upload these externally generated payroll documents into Workday:

- Externally generated payslips.
- External tax documents. Example: To import Canadian tax documents into Workday, create a T4 external payroll document type.
- Other payroll documents. You can define additional external payroll documents to import and grant access to in Workday. Example: You can upload a garnishment letter you received for an employee.

You also have the flexibility to upload these external payroll documents through the *Import External Payroll Document* web service.

You can upload payslips for pay periods if the period end date is within 7 years from the current date.

You can upload 1000 external tax documents and other payroll documents for each worker. The 1000 maximum applies to the combined number of external tax documents and other external payroll documents. When a worker has 1000 uploaded documents, you need to remove some documents before you can upload new documents.

Uploaded external payroll documents remain in Workday until you remove them. External payslips are available to view up to 7 years from the end date of the current pay period. External tax documents and other external payroll documents are available to view until removed.

You can upload external payroll documents for terminated employees and enable access within Workday. When you purge data for terminated employees, the purge includes any external payroll documents in Workday.

### Pay Periods for External Payroll Documents

The *External Payroll Documents* integration determines the pay period to attach a payslip to based on the *Pay Period End Date* value in the integration manifest file. For Workday Payroll, multiple run categories could be associated with a pay group. These run categories could have pay periods with the same pay period end date. Example: A Workday Payroll pay group has a Regular run category and a Bonus run category. The Regular run category has period 03/01/21 to 03/31/21. The Bonus run category has period 01/01/21 to 03/31/21. For both run categories, the pay periods have the same end date of 03/31/21.

Note: Third-party payroll pay groups can have only 1 run category.

You can use the *Payslip Version* integration attribute to indicate how the integration determines the pay period end date for payslips.

- Version 1 doesn't consider the Run Category. This choice is the default.
- Version 2 considers the Run Category for the pay period end date.

Workday recommends selecting Version 2 for integrations that handle payslips for Workday Payroll pay groups.

For the *Tax Document Version* and *Other Payroll Document Version* integration attributes, Version 1 is the only option.

You can view the *Payslip Version* choice for an integration in the manifest files:

- In the Run\_Category column in the CSV manifest file.
- In the Run\_Category parameter in the XML manifest file.

The data audit file for an integration run also includes the *Run Category* value.

## Removal

Workday provides these options for removing external payroll documents:

- Use the Delete by Batch ID task (secured to the *Process: Delete Payroll Input by Batch ID - batch/Initialize Reference IDs* domain in the Core Payroll functional area). The *Delete External Payroll Document* option removes all external payroll documents associated with the selected batch ID.
- Use the *External Payroll Documents* integration or the *Import External Payroll Document* web service to delete documents that match these key fields:
  - *Delete\_External\_Payroll\_Document* parameter.
  - *Delete* option set to True for CSV and XML files.
- Use the Delete External Payslips task secured to these domains in the Core Payroll functional area:
  - *Reports: Pay Calculation Results for Worker (External Payroll Documents)*.
  - *Set Up: Payroll*.
- Use the Delete External Payroll Documents task (secured to the *Reports: Pay Calculation Results for Worker (External Payroll Documents)* domain in the Core Payroll functional area) to remove uploaded external payslips, tax documents, and other payroll documents.

To delete a single external payroll document, access the Find External Payroll Documents report. Use the External Payroll Document > Delete related action on a selected external payroll document.

## Reference: External Payroll Documents Reporting

### Standard Reports

You can use these reports to view specific external payroll documents in Workday.

Role	Report	Security
Employees	My Payslips	<i>Self-Service: Payroll (My Payslips)</i> domain in the Core Payroll functional area.
	My Tax Documents	<ul style="list-style-type: none"> <li>• <i>Self-Service: Payroll (My Tax Documents) - USA</i> domain in the USA Payroll functional area.</li> <li>• <i>Self-Service: Payroll (My Tax Documents) - CAN</i></li> </ul>

Role	Report	Security
		domain in the CAN Payroll functional area. <ul style="list-style-type: none"><li>• <i>Self-Service: Payroll (My Tax Documents) - UK</i> domain in the UK Payroll functional area.</li></ul>
	My Other External Payroll Documents	<i>Self-Service: Payroll (My Other Payroll Documents)</i> domain in the Core Payroll functional area.
Administrators	Find External Payroll Documents	<i>Reports: Pay Calculation Results for Worker (External Payroll Documents)</i> domain in the Core Payroll functional area.
	Payslips for Worker	<i>Reports: Pay Calculation Results for Worker (External Payroll Documents)</i> domain in the Core Payroll functional area.
	Other External Payroll Documents for Worker	<i>Reports: Pay Calculation Results for Worker (External Payroll Documents)</i> domain in the Core Payroll functional area.

## Report Data Sources

You can use these report data sources to create custom reports on external payroll documents.

External Payroll Documents	Report Data Source	Security
All documents	All External Payroll Documents	<i>Reports: Pay Calculation Results for Worker (External Payroll Documents)</i> domain in the Core Payroll functional area.
Payslips	External Payslips	These domains in the Core Payroll functional area: <ul style="list-style-type: none"><li>• <i>Self-Service Payroll: My Payslips</i>.</li><li>• <i>Reports: Pay Calculation Results for Worker (External Payslips)</i>.</li><li>• <i>Reports: Pay Calculation Results for Worker (External Payroll Documents)</i>.</li></ul>
Tax Documents	External Tax Documents	<ul style="list-style-type: none"><li>• <i>Reports: Pay Calculation Results for Worker (Tax Filing/W-2s) - USA</i> domain in the USA Payroll functional area.</li><li>• <i>Reports: Results for Worker (Pay Calculation) - CAN</i></li></ul>

External Payroll Documents	Report Data Source	Security
		<p>domain in the CAN Payroll functional area.</p> <ul style="list-style-type: none"> <li>• <i>Reports: Results for Worker (Pay Calculation) - UK</i> domain in the UK Payroll functional area.</li> <li>• <i>Reports: Pay Calculation Results for Worker (External Payroll Documents)</i> domain in the Core Payroll functional area.</li> </ul>
	Other External Payroll Documents	<ul style="list-style-type: none"> <li>• <i>Reports: Pay Calculation Results for Worker (Other Payroll Documents)</i> domain in the Core Payroll functional area.</li> <li>• <i>Reports: Pay Calculation Results for Worker (External Payroll Documents)</i> domain in the Core Payroll functional area.</li> </ul>

## Reference: External Payroll Documents File Schema

### File Descriptions

The *External Payroll Documents* integration supports CSV or XML format for manifest files. Manifest files contain the data for payslips, tax documents, and other external payroll documents.

- You can use 1 CSV manifest file to upload external payroll documents for a single document category. Example: 1 manifest CSV file for external payslips, 1 manifest CSV file for external tax documents, and 1 manifest CSV file for other external payroll documents.

Note: The header for the CSV file format is case-sensitive.

- A single XML manifest file can contain data for all document categories: external payslips, external tax documents, and other external payroll documents.

Archive ZIP files contain the PDF attachment files for the external payroll documents.

### CSV File Format

The CSV file input supports a single Document\_Category field value for the type of external payroll documents included. Document\_Category values are:

- External payslips = payslip.
- External tax documents = tax.
- Other external documents = other.

File format for payslips:

- Document\_Category
- Batch\_ID
- Delete
- Worker\_ID
- Pay\_Group

- Run\_Category
- Period\_End\_Date
- Payment\_Date
- Check\_Number
- Gross\_Amount
- Net\_Amount
- Currency
- Display\_Date
- File\_Name

File format for tax documents:

- Document\_Category
- Batch\_ID
- Delete
- Worker\_ID
- Organization
- Serial\_ID
- Year
- Tax\_Form
- Country
- Region
- Form\_Classification
- Issued\_Frequency
- Issued\_Date
- Comments
- Display\_Date
- File\_Name

File format for other external payroll documents:

- Document\_Category
- Batch\_ID
- Delete
- Worker\_ID
- Organization
- Serial\_ID
- Document\_Type
- Country
- Year
- Issued\_Date
- Issued\_By
- Received\_Date
- Comments
- Display\_Date
- File\_Name

## XML Elements and Schema

The XML schema for external payroll documents manifest files includes these elements.

Element	Level	Details and Validations
External_Payroll_Documents	1	Top level of the document.

Element	Level	Details and Validations
Document_Category	2	Required for external payslips. Value = payslip. Container for these level 3 elements for a single external payslip.
Batch_ID	3	Must be in <i>string</i> format.
Delete	3	Must be in <i>boolean</i> format.
Worker_ID	3	Required; key field. Must be in <i>string</i> format.
Pay_Group	3	Required; key field. Must be in <i>string</i> format.
Run_Category	3	Required if integration attribute Payslip Version = 2; key field. Must be in <i>string</i> format.
Period_End_Date	3	Required; key field. Must be in <i>date</i> format.
Payment_Date	3	Required; key field. Must be in <i>date</i> format.
Check_Number	3	Required; key field. Required; key field. Must be in <i>string</i> format.
Gross_Amount	3	Must be in <i>string</i> format.
Net_Amount	3	Must be in <i>string</i> format.
Currency	3	Must be in <i>string</i> format.
Display_Date	3	Must be in <i>date</i> format.
File_Name	3	Required only for new records. Must be in <i>string</i> format.
Document_Category	2	Required for external tax documents. Value = tax. Contains all elements for a single external tax document.
Batch_ID	3	Must be in <i>string</i> format.
Delete	3	Must be in <i>boolean</i> format.
Worker_ID	3	Required; key field. Must be in <i>string</i> format.
Organization	3	Key field. Must be in <i>string</i> format.
Serial_ID	3	Key field. Must be in <i>string</i> format. Only applies when the Tax Document Version integration attribute = 2.
Year	3	Required; key field. Must be in <i>date</i> format.

Element	Level	Details and Validations
Tax_Form	3	Required; key field. Must be in <i>string</i> format.
Country	3	Required; key field. Must be in <i>string</i> format.
Region	3	Key field. Must be in <i>string</i> format. Only applies when the Tax Document Version integration attribute = 2.
Form_Classification	3	Key field. Must be in <i>string</i> format. Only applies when the Tax Document Version integration attribute = 2.
Issued_Frequency	3	Key field. Must be in <i>string</i> format. Only applies when the Tax Document Version integration attribute = 2.
Issued_Date	3	Must be in <i>date</i> format.
Comments	3	Must be in <i>string</i> format. Only applies when the Tax Document Version integration attribute = 2.
Display_Date	3	Must be in <i>date</i> format.
File_Name	3	Required only for new records. Must be in <i>string</i> format.
Document_Category	2	Required for other external documents. Value = other. Contains all elements for a single other external document.
Batch_ID	3	Must be in <i>string</i> format.
Delete	3	Must be in <i>boolean</i> format.
Worker_ID	3	Required; key field. Must be in <i>string</i> format.
Organization	3	Required; key field. Must be in <i>string</i> format.
Serial_ID	3	Required; key field. Must be in <i>string</i> format.
Document_Type	3	Required; key field. Must be in <i>string</i> format.
Country	3	Required; key field. Must be in <i>string</i> format.
Year	3	Must be in <i>string</i> format.
Issued_Date	3	Must be in <i>date</i> format.
Issued_By	3	Must be in <i>string</i> format.

Element	Level	Details and Validations
Received_Date	3	Must be in <i>date</i> format.
Comments	3	Must be in <i>string</i> format.
Display_Date	3	Must be in <i>date</i> format.
File_Name	3	Required only for new records. Must be in <i>string</i> format.

This schema applies when the Tax Version integration attribute is set to 1.

## HM Revenue & Customs Incoming Notifications

### Steps: Set Up HM Revenue & Customs-Incoming Notifications Integration

#### Prerequisites

Record your HM Revenue & Customs (HMRC) account ID and password.

#### Context

Implement an integration based on the *HMRC Incoming Notifications* template to:

- Send these types of tax notifications to HMRC:
  - P6.
  - P9.
  - SL1.
  - SL2.
  - PGL1.
  - PGL2.
- Receive responses from HMRC for each tax and loan notification.

#### Steps

1. Access the Create Integration System task and enter *HMRC Incoming Notifications* at the New using Template prompt.  
Security: *Integration Build* in the Integration functional area.
2. [Set Up HM Revenue & Customs-Incoming Notifications Integration Attributes](#) on page 1903.
3. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Process: HMRC Notifications (Run) - UK* and *Integration Event* domains.  
See: [Steps: Grant Integration or External Endpoint Access to Workday](#).
4. Select Integration System > Configure Integration Maps as a related action on your integration system.
  - Map Sender ID and Password values for each company using the *HMRC Account Configuration* integration map.
  - Map Student Loan Plan Types 1 and 2 to HMRC values using the *Student Loan Plan Type* integration map.
5. [Launch an Integration](#) on page 24.  
Set up a separate schedule for each notification type. For each schedule, specify the Notification Type in the Value field.

## Set Up HM Revenue & Customs-Incoming Notifications Integration Attributes

#### Prerequisites

Security: *Integration Configure* domain in the Integration functional area.

#### Context

Configure endpoint access to HM Revenue & Customs for your integration.

#### Steps

1. Access the View Integration System report and find your integration system.

2. Select Integration System > Configure Integration Attributes as a related action on your integration system.
3. Configure attributes for your integration:

Option	Description
Version	Overrides the automatically populated HMRC Data Provisioning Service (DPS) web service version.
Gateway Test	Receive tax notifications from the HMRC test endpoint. Always set this attribute to No.
Document Retention Policy	Specify the number of days that Workday retains integration output files.

## Concept: HM Revenue & Customs Incoming Notifications Integration

The HM Revenue & Customs Incoming Notifications integration enables you to retrieve these files from HM Revenue & Customs (HMRC) using the Data Provisioning Service (DPS) online service:

- P6 and P9 (tax code notices for employees).
- SL1 and SL2 (student loan notices).
- PGL1 and PGL2 (postgraduate loan notices).

The *HMRC Incoming Notifications* integration template enables you to receive tax and loan notifications directly from the DPS. The integration records any error messages returned by the DPS endpoint in the integration audit files.

### Integration Services

The *HMRC Incoming Notifications* integration template consists of these integration services:

**Table 3: HMRC Incoming Notifications Integration Services**

Integration Service	Required/ Optional	Description
HMRC Incoming Notifications ESB Service	Required	Extracts worker data from your Workday tenant.
HMRC Incoming Notifications Service	Required	Manages configuration of your HMRC Incoming Notifications integration, including attribute values.
Integration Document Retention	Required	Defines how long the integration stores output files for auditing purposes.

### Integration Output by Company

You can control integration output by company for integrations based on the *HMRC Incoming Notifications* integration template. To run the integration for specific companies:

- Define Sender ID and Password values for each company in the HMRC Account Configuration integration map.
- Use the Company launch parameter when you schedule or launch the integration.

If you hold a single online account with the HMRC, you can set the Sender ID and Password as the Default Value in the integration map.

### Integration Files and Reports

Every time the integration runs, Workday generates these files:

- *Data Changes Audit* file, which is a readable version of the integration output file.
- *Diagnostic Audit* file, which helps you troubleshoot integration errors.

You can find these files in the Reports and Other Output Files section of the Integration Event for each integration run.

Note: Because actual data is included in the *Data Changes Audit* file, you might need to secure this file separately.

The DPS online service sends a response record each time the integration runs. Use the Match HMRC Notifications task to view and process notifications received from HMRC.

## HM Revenue & Customs RTI Employer Payment Summary

### Steps: Set Up HM Revenue & Customs RTI Employer Payment Summary Integration

#### Prerequisites

Record your HM Revenue & Customs (HMRC) Real Time Information (RTI) account ID and password.

#### Context

Implement an integration based on the *HMRC Real Time Information- Employer Payment Summary* template to send an Employer Payment Summary (EPS) file to RTI for tax purposes.

#### Steps

1. Access the Create Integration System task and enter *HMRC Real Time Information- Employer Payment Summary* at the New using Template prompt.  
Security: *Integration Build* in the Integration functional area.
2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Set Up: Payroll (RTI)* and *Process: RTI (Reports) – UK* domains.

Note: The Integration Security Group requires access to the Integration Permissions and Task Permissions parts of the security domain.

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

3. Select Integration System > Configure Integration Attributes as a related action on your integration system.  
Specify the number of days to retain integration output files.  
Security: *Integration Configure* domain in Integration functional area.

4. Select Integration System > Configure Integration Maps as a related action on your integration system.  
Map Sender ID and Password values for your company using the *HMRC Credentials for UK Employer Reference* integration map.

5. [Launch an Integration](#) on page 24.  
Specify how often and when the integration runs.

### Concept: HM Revenue & Customs RTI Employer Payment Summary Integration

The HM Revenue & Customs RTI Employer Payment Summary integration enables you to send an Employer Payment Summary (EPS) file to HM Revenue & Customs (HMRC) using the Real Time Information (RTI) online service. The *HMRC Real Time Information- Employer Payment Summary* integration template enables you to extract EPS data for a defined group of workers from your tenant and send it directly to the RTI site. The integration records any error messages returned by the RTI endpoint in the integration audit files.

## Launch Parameters for HMRC RTI Employer Payment Summary Integration

Workday provides various options for launching the HMRC RTI Employer Payment Summary integration. After you create an integration, access the Launch/Schedule Integration task for the integration to see a complete list and descriptions.

### Integration Files and Reports

Every time the integration runs, Workday generates these files:

- *Data Changes Audit* file, which is a readable version of the integration output file.
- *Diagnostic Audit* file, which helps you troubleshoot integration errors.

You can find these files in the Reports and Other Output Files section of the Integration Event for each integration run.

Note: Because actual data is included in the *Data Changes Audit* file, you might need to secure this file separately.

The Real Time Information (RTI) online service sends a response record each time the integration runs. Use the View UK RTI Submission Responses report to view summary and detail information for the results of each EPS file submission.

## HM Revenue & Customs RTI

### Steps: Set Up HM Revenue & Customs RTI Integration

#### Prerequisites

Record your HM Revenue & Customs (HMRC) Real Time Information (RTI) account ID and password.

#### Context

Implement an integration based on the *HMRC Real Time Information* template to send a Full Payment Submission (FPS) file with payroll results to RTI for tax purposes.

#### Steps

1. Access the Create Integration System task and enter *HMRC Real Time Information* at the New using Template prompt.  
Security: *Integration Build* in the Integration functional area.
2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Set Up: Payroll (RTI)* and *Process: RTI (Reports) – UK* domains.  
Note: The security group requires access to the Integration Permissions and Task Permissions parts of the security domain.  
See: [Steps: Grant Integration or External Endpoint Access to Workday](#).
3. Select Integration System > Configure Integration Attributes as a related action on your integration system.  
Specify the number of days to retain integration output files.  
Security: *Integration Configure* domain in Integration functional area.
4. [Launch an Integration](#) on page 24.  
Schedule how often the integration runs.

## Concept: HM Revenue & Customs Real Time Information (RTI) Integration

The HM Revenue & Customs RTI integration enables you to send a Full Payment Submission (FPS) file with payroll results to HM Revenue & Customs (HMRC). The integration submits data using the Real Time Information (RTI) online service. The *HMRC Real Time Information* integration template enables you to send payroll data for a defined group of workers and pay results directly to the RTI site. The integration records any error messages returned by the RTI endpoint in the integration audit files.

### Integration Services

The *HMRC Real Time Information* integration template consists of these integration services:

Integration Service	Required/Optional	Description
HMRC RTI ESB Service	Required	Extracts worker data from your Workday tenant.
HMRC RTI Service	Required	Manages configuration of your HMRC RTI integration, including attribute values.
HMRC RTI FPS Request	Required	Provides launch parameters and attributes for FPS requests.
Integration Document Retention	Required	Defines how long the integration stores output files for auditing purposes.

### Launch Parameters for HMRC Real-Time Information Integration

Workday provides these options for launching the HMRC Real-Time Information integration:

Launch Parameter	Source report field for Prompt	Description
RTI FPS Calculation Run	RTI FPS Calculation Run	The calculation run from which the integration retrieves data to generate the FPS file.
UK Employer Reference	UK Employer Reference	The UK Employer Reference for which to generate the FPS file.
Pay Period	Period	The pay period for which to generate the FPS file.
Submission Number	N/A	The submission number for the pay period. Start with number 1 and continue with 2 after HMRC accepts the first submission for the pay period. Continue until you reach the maximum number of submissions. To see the maximum number of submissions, use the View Advanced UK RTI FPS Exceptions or View Advanced UK RTI FPS Data reports.
Workers	Workers	Workers to include or exclude from the FPS file. If you enable Exclude Workers, the integration

Launch Parameter	Source report field for Prompt	Description
		doesn't include workers that you select in this launch parameter.
Exclude Workers	N/A	Excludes workers that you select in the Workers launch parameter from the FPS file.
Submission for Off Cycle	N/A	Includes only off-cycle pay results in the FPS file.
After RTI integration event	N/A	For manual launch only. Select the event that you want to use as a starting point for the integration reporting range.
Pay Calculation Status	N/A	For manual launch only. Select a pay calculation status and send test files for incomplete pay periods.
Test In Live	N/A	Specifies if the integration sends test data to the production endpoint.
Final Submission Because Scheme Ceased	N/A	Sends record for Data Item 108.
Final Submission for Year	N/A	Sends record for Data Item 109.
Free of Tax Payments Made to Employee	N/A	Sends record for Data Item 111. Use this parameter only for Final Submissions. Final submissions are for either the last submission of the Tax Year, or for the last submission before the scheme ends.
Expenses Voucher or Benefits from Others	N/A	Sends record for Data Item 112. Use this parameter only for Final Submissions. Final submissions are for either the last submission of the Tax Year, or for the last submission before the scheme ends.
Person Employed Outside UK Worked for 30 Days or More	N/A	Sends record for Data Item 113. Use this parameter only for Final Submissions. Final submissions are for either the last submission of the Tax Year, or for the last submission before the scheme ends.
Pay to Someone Else	N/A	Sends record for Data Item 114. Use this parameter only for Final Submissions. Final submissions are for either the last submission

Launch Parameter	Source report field for Prompt	Description
		of the Tax Year, or for the last submission before the scheme ends.
P11D Forms Due	N/A	Sends record for Data Item 115. Use this parameter only for Final Submissions. Final submissions are for either the last submission of the Tax Year, or for the last submission before the scheme ends.
Service Company	N/A	Sends record for Data Item 117. Use this parameter only for Final Submissions. Final submissions are for either the last submission of the Tax Year, or for the last submission before the scheme ends.
Late PAYE Reporting Reason	N/A	<p>Use this parameter if you're submitting the FPS late:</p> <ul style="list-style-type: none"> <li>• For an entire Company.</li> <li>• For a group of workers specified in the launch parameters.</li> </ul> <p>If you provide a Reason in this launch parameter, the launch parameter overrides the Reason value provided for each worker in the Worker UK RTI Details task.</p>

## Integration Files and Reports

Every time the integration runs, Workday generates these files:

- *Data Changes Audit* file, which is a readable version of the integration output file.
- *Diagnostic Audit* file, which helps you troubleshoot integration errors.

You can find these files in the Reports and Other Output Files section of the Integration Event.

Note: Because the *Data Changes Audit* file includes actual data, you might need to secure this file separately.

The RTI online service sends a response record each time the integration runs. Use the View UK RTI Submission Responses report to view summary and detail information for the results of each FPS file submission.

## Irish Incoming Notifications

### Steps: Set Up Irish Incoming Notifications Integration

#### Prerequisites

- Register your company with the National Automatic Enrolment Savings Authority (NAERSA).
- Ensure this configuration for the *IRL RPN records to apply?* condition rule on the *IRL Incoming Notification* business process definition:
  - An *Or* condition for the IRL RPN submission event has applicable RPNS source external field.
  - An *Or* condition for the Source External Field or Condition Rule field, select the IRL AEPN submission event has applicable AEPNs report field.

Note: If you don't configure the *IRL Incoming Notification* business process to exchange data with NAERSA, Workday may still receive AEPN data from NAERSA, but you won't be able to use them in off-cycle payroll or on-demand additional payment calculations.

- To use AEPN data from NAERSA in on-cycle and off-cycle payroll calculations, we recommend that you edit your run categories to add the Workday-delivered IRL MyFutureFund EE [IRL] and IRL MyFutureFund ER [IRL] deductions as Pay Components to Calculate on these tabs:

- Nonactive (On Cycle, On Demand Replacement)

You must also select:that you edit your run categories to add the Workday-delivered IRL MyFutureFund EE [IRL] and IRL MyFutureFund ER [IRL] deductions as Pay Components to Calculate on these tabs:

- *IRL Post Tax Deduction [IRL]* as the Pay Component Group to Calculate.
- *Terminated* on the Status column.
- Off Cycle (On Demand Additional, Manual)

You must also select:

- *IRL Post Tax Deduction [IRL]* as the Pay Component Group to Calculate.
- *Manual Payment and On Demand Payment* for Type of Run.
- Both *Active* and *Terminated* on the Status column.

#### Context

Implement an integration based on the *IRL RPN Incoming Notification* template to receive responses from:

- NAERSA for workers' Automatic Enrolment Payroll Notifications.
- Revenue for workers' tax and related notifications.

#### Steps

1. Access the Create Integration System task and enter *IRL RPN Incoming Notification* at the New using Template prompt.

Security: *Integration Build* in the Integration functional area.

2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Setup: PAYE Modernisation - IRL* and *Integration Event* domains.

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

3. Select Integration System > Configure Integration Attributes as a related action on your integration system.

In Document Retention Policy, specify the number of days that Workday retains integration output files.

Security: *Integration Configure* domain in Integration functional area.

4. Run the *IRL Incoming Notification* business process to retrieve notification details from Revenue and NAERSA.

Related Information

### Tasks

[Process AEPN Data \(IRL\)](#)

## Concept: Irish Incoming Notifications Integration

The Irish Incoming Notifications integration enables you to retrieve:

- Tax information, for active and non-active workers (such as workers on leave of absence), from Revenue.
- MyFutureFund auto-enrolment pensions information from the National Automatic Enrolment Retirement Savings Authority (NAERSA).

Note: Details are only requested for workers who have both a PPS Number and an employment identifier. We don't request details from NAERSA for workers who aren't eligible for the MyFutureFund auto-enrolment pensions scheme.

The *IRL RPN Incoming Notification* integration template enables you to create an integration that receives:

- Income tax, universal social charge, and local property tax notifications directly from Revenue.
- Automatic Enrolment Payroll Notifications (AEPNs) directly from NAERSA.

The integration records any error messages returned in the integration audit files.

### Launch Parameters for IRL Revenue Incoming Notifications Integration

You can't use the Launch / Schedule Integration task to run the integration. You must use the *IRL Incoming Notification* business process.

### Integration Files

There are 4 primary files associated with the integration:

- *NAERSA\_Request.xml*, which contains what Workday sends to NAERSA.
- *NAERSA\_Response.xml*, which contains what Workday receives from NAERSA.
- *Revenue\_Request.xml*, which contains what Workday sends to Revenue.
- *Revenue\_Response.xml*, which contains what Workday receives from Revenue.

In addition, the integration generates a *MessagesAudit\_System* folder containing additional information. Example: This might be useful for troubleshooting any integration issues.

You can find these files in the Reports and Other Output Files section of the integration event. Select the integration event from the Process column of the Process and Documents tab.

Related Information

### Concepts

[Setup Considerations: MyFutureFund Auto-Enrolment Pensions \(IRL\)](#)

## Irish Payroll Submission

### Steps: Set Up Irish Payroll Submission Integration

#### Prerequisites

- Record your Employer Registration Number and create a P12 certificate.
- Register your company with NAERSA.

- Ensure you have this configuration for the *IRL Payroll Submission* business process definition:
  - On the *Integration* step, update the *Submit to Revenue is true* condition rule with:
    - An *Or* condition for the Submit to Revenue source external field.
    - An *Or* condition for the Submit to NAERSA report field.
  - Configure the *Integration* step to include a Value Type of *Determine Value at Runtime* for these fields:
    - Submit to Revenue
    - Submit to NAERSA

## Context

Implement an integration based on the *IRL Revenue Payroll Submission* template to send a file with payroll results to:

- Revenue for tax purposes.
- NAERSA for MyFutureFund auto-enrolment pensions purposes.

Note: When you have previously implemented the *IRL Revenue Payroll Submission* integration to receive data from Revenue alone, you must update it to exchange data with NAERSA. From related actions on your integration system, select Integration System > Configure Integration Services . Select the Enable All Services check box.

## Steps

1. Access the Create Integration System task and enter *IRL Revenue Payroll Submission* at the New using Template prompt.  
Security: *Integration Build* in the Integration functional area.
2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Set Up: Payroll - IRL* domain.

Note: The security group requires access to the Integration Permissions and Task Permissions parts of the security domain.

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

3. Select Integration System > Configure Integration Attributes as a related action on your integration system.

In Document Retention Policy, specify the number of days that Workday retains integration output files.

Security: *Integration Configure* domain in Integration functional area.

4. Run the *IRL Payroll Submission* business process to send details to Revenue or NAERSA.

Note: Workday recommends that you run the task separately for Revenue and NAERSA submissions. Don't select both check boxes at once.

If your organization uses a custom business process definition for the *IRL Payroll Submission* business process, you must update it manually to ensure the NAERSA integration correctly executes when you select the Submit to NAERSA check box on the Run IRL Payroll Submissions task.

Access the business process security policy for the *IRL Payroll Submission* business process.

Navigate to the Definition section and edit the conditional logic for the *Integration* step to include the *Submit to NAERSA is true* condition rule.

## Related Information

### Tasks

[Process AEPN Data \(IRL\)](#)

## Concept: Irish Payroll Submission Integration

The Irish Payroll Submission integration enables you to send a file with payroll results to Revenue and the National Automatic Enrolment Retirement Savings Authority (NAERSA). The integration submits data to Revenue using the Revenue Online Service. The *IRL Revenue Payroll Submission* integration template enables you to send payroll data for a defined group of workers and pay results directly to the Revenue site. The integration records any error messages returned in the integration audit files.

The integration also submits payroll data to NAERSA. When you complete the business process to submit data to NAERSA, Workday confirms whether the file has been successfully sent. To confirm the NAERSA submission status, you need to log on to the MyFutureFund employer portal.

### Launch Parameters for IRL Revenue Payroll Submission Integration

You can't use the Launch / Schedule Integration task to run the integration. You must use the *IRL Payroll Submission* business process.

### Integration Files and Reports

There are 4 primary files associated with the integration:

- *NAERSA\_Request.xml*, which contains what Workday sends to NAERSA.
- *NAERSA\_Response.xml*, which contains what Workday receives from NAERSA.
- *Revenue\_Request.xml*, which contains what Workday sends to Revenue.
- *Revenue\_Response.xml*, which contains what Workday receives from Revenue.

In addition, the integration generates a *MessagesAudit\_System* folder containing additional information. Example: This might be useful for troubleshooting any integration issues.

You can find these files on the Details tab of the integration event. Select the integration event from the Process column of the Process History tab.

#### Related Information

[Setup Considerations: MyFutureFund Auto-Enrolment Pensions \(IRL\)](#)

## Irish Revenue Check Payroll Submission

### Steps: Set Up Irish Revenue Check Payroll Submission Integration

#### Prerequisites

- Record your Employer Registration Number and create a P12 certificate.
- Generate and send a payroll submission to the Revenue.

#### Context

Implement an integration based on the *IRL Revenue Check Payroll Submission* template to verify a previously submitted payroll results file with the Revenue.

#### Steps

1. Access the Create Integration System task and enter *IRL Revenue Check Payroll Submission* at the New using Template prompt.  
Security: *Integration Build* in the Integration functional area.

2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Set Up: Payroll - IRL* domain.

Note: The security group requires access to the Integration Permissions and Task Permissions parts of the security domain.

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

3. Select Integration System > Configure Integration Attributes as a related action on your integration system.

In Document Retention Policy, specify the number of days that Workday retains integration output files.

Security: *Integration Configure* domain in Integration functional area.

4. [Launch an Integration](#) on page 24.

Schedule how often the integration runs.

## Concept: Irish Revenue Check Payroll Submission Integration

The Irish Revenue Check Payroll Submission integration enables you to verify your payroll results have been processed by the Irish Revenue. The integration submits data using the Revenue online service. The *IRL Revenue Check Payroll Submission* integration template enables you to verify payroll data directly on the Revenue site. The integration records any error messages returned in the integration audit files.

Note: To use this integration, you must have completed Payroll and successfully submitted it to Revenue.

### Launch Parameters for IRL Revenue Check Payroll Submission Integration

Workday provides these options for launching the IRL Revenue Check Payroll Submission integration:

Launch Parameter	Source report field for Prompt	Description
Employer Registration Number	IRL Employer Registration	The employer's Irish Revenue registration number that the integration uses to generate the check submission file.  Required for regular submissions.
IRL Payroll Submission Run	PAYE Modernisation Report Run Instance Submitted	IRL Revenue Payroll Submission Report Run Instance for Check Submission.  Required for regular submissions.
Payroll Run Reference	N/A	Identifies the Payroll event that the submission refers to.  This enables you to manually add a payroll run reference. Workday recommends you use this during implementation testing to ensure that the link between Workday and Revenue is working.
Submission ID	N/A	A unique submission identifier. This must be unique for submissions under an employer's registration number.

Launch Parameter	Source report field for Prompt	Description
		This enables you to manually add a submission ID. Workday recommends you use this during implementation testing to ensure that the link between Workday and Revenue is working.

## Integration Files

There are two primary files associated with the integration:

- *Request.xml*, which contains what Workday sends to Revenue.
- *Response.xml*, which contains what Workday receives from Revenue.

In addition, the integration generates a *MessagesAudit\_System* folder containing additional information.

Example: This might be useful for troubleshooting any integration issues.

You can find these files on the Output Files tab of the integration event View Background Process report.

## Service Canada ROE Integration

### Steps: Set Up Service Canada ROE Integration

#### Prerequisites

Have access to a computer (preferably an FTP server) that you can use for:

- Exporting ROE (Record of Employment) data from the integration.
- Downloading ROE files from the Service Canada web site.

#### Context

Set up outbound and inbound integrations for exporting and importing Service Canada ROE files.

Implement both outbound and inbound integrations to ensure correct original and amended ROEs for each ROE generated in Workday.

#### Steps

1. Create an outbound integration that generates an ROE file and exports it to a server for upload to Service Canada.  
See: [Steps: Set Up Outbound Service Canada ROE Integration](#) on page 1916.
2. Create an inbound integration that retrieves and imports an ROE file that you previously downloaded from Service Canada.  
See: [Steps: Set Up Inbound Service Canada ROE Integration](#) on page 1916.

#### Next Steps

Launch the integration to generate ROE files, or import ROE files returned by Service Canada.

For instructions, see [Launch Service Canada ROE Integrations](#) on page 1917.

## Steps: Set Up Outbound Service Canada ROE Integration

### Prerequisites

You must have a server accessible by any of the transport protocols provided by the Delivery Service for this integration.

### Context

Create an integration system that generates an ROE (Record of Employment) file and delivers it to a computer accessible to the integration system. The integration doesn't support direct connection to Service Canada. Once the integration system generates an ROE file, access the Service Canada website and manually upload the ROE file.

Since you generate ROE files for workers as needed, you don't need to schedule this integration.

### Steps

1. Access the Create Integration System task and enter *Service Canada ROE Outbound* at the New using Template prompt.  
Security: *Integration Build* and *Integration Configure* in the Integration functional area.
2. Create an Integration System User (ISU) and grant the ISU access to the *Reports: Results for Worker (ROE) - CAN* security domain.  
See: [Steps: Grant Integration or External Endpoint Access to Workday](#).
3. As a related action on the integration system, select Integration System > Configure Integration Attributes.  
For the Document Retention Policy attribute, set the number of days to retain output documents. If not specified, Workday keeps integration files for 30 days.  
Security: *Integration Build* and *Integration Configure* in the Integration functional area.
4. [Set Up Integration Delivery](#) on page 1952.  
Specify how the integration system delivers integration output files to a server accessible to you. You can't configure the Delivery Service to deliver output files directly to Service Canada; upload the files manually.
5. [Set Up Integration Sequence Generators](#) on page 1969.  
Configure the integration so that it generates a unique filename and number for each integration output document. Unique filenames and numbers are for your convenience; Service Canada has no file naming requirements.

## Steps: Set Up Inbound Service Canada ROE Integration

### Prerequisites

You must have a server accessible by any of the transport protocols provided by the Retrieval Service for this integration.

### Context

Create an integration system that retrieves an ROE (Record of Employment) file from a computer accessible to the integration. The integration loads the data into Workday. The integration doesn't support direct connection to Service Canada. You retrieve an ROE file from Service Canada website manually. Then you save the file to a computer accessible to the integration, and run the integration to load the ROE file.

Since you retrieve ROE files for workers from Service Canada as needed, you don't need to schedule this integration.

## Steps

1. Access the Create Integration System task and enter *Service Canada ROE Inbound* at the New using Template prompt.  
Security: *Integration Build* and *Integration Configure* in the Integration functional area.
2. As a related action on the integration system, select Integration System > Configure Integration Attributes.  
For the Document Retention Policy attribute, set the number of days to retain output documents. If not specified, Workday keeps integration files for 30 days.  
Security: *Integration Build* and *Integration Configure* in the Integration functional area.
3. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Reports: Results for Worker (ROE) - CAN* security domain.  
See: [Steps: Grant Integration or External Endpoint Access to Workday](#).
4. [Set Up Integration Retrieval](#) on page 1957.  
Specify how the integration system retrieves the ROE files from a server accessible to you.  
You can't configure the Retrieval Service to import ROE files directly from Service Canada. You download the ROE files manually.

## Launch Service Canada ROE Integrations

### Prerequisites

Security: *Integration Event* domain in Integration functional area.

### Context

Launch the Service Canada ROE Outbound integration to:

1. Generate the ROE Payroll Extract files and export the files to a computer accessible to you.
2. Upload the files manually to the Service Canada web site.

## Steps

1. Access the Launch / Schedule Integration task.
2. Select the outbound ROE integration system from the Integration prompt.
3. Select options from Integration Criteria:
  - Pay Group
  - Company
  - Worker

Workday includes all Approved ROEs in the integration file if you don't select any options from Integration Criteria.
4. Select OK to launch the integration.
5. Check the computer with the integration configured to deliver the ROE file or files. Verify that they arrived.  
The integration generates a separate ROE payroll extract file for groups of 750 records. Each additional file has a unique numerical suffix.
6. Sign in to the *ROE on the Web* Service Canada web site. See: <https://www.canada.ca/en/employment-social-development/programs/ei/ei-list/ei-roe/access-roe.html>
7. Upload the ROE payroll extract file or files to Service Canada.
8. After Service Canada has processed the files, generate an ROE file to import back into Workday.

Note: Workday recommends that you only import ROEs from Service Canada that have been updated to a status of *Issued*. If you import ROEs with a status of *Passed*, *Failed*, or *Rejected*, you must

delete or recreate the ROE in Workday and set it back to *Approved* status before resubmitting them to Service Canada. For ROEs with a status of *Passed*, continue the submission process until Service Canada changes the status to *Issued*.

9. Download the ROE file from Service Canada to the computer with the configured integration to retrieve the ROE file.
10. Access the Launch / Schedule Integration task.
11. Select the inbound ROE integration system from the Integration prompt.
12. Select OK to launch the integration.

#### Related Information

##### Reference

[2022R2 What's New Post: Record of Employment Outbound Integration](#)

## Concept: Service Canada ROE Integration

Use Workday to integrate with the Service Canada ROE (Record of Employment) website. Using this integration, you can:

- Generate ROE files for manual upload to Employment and Social Development Canada (ESDC).
- Import Record of Employment status files generated by Service Canada into Workday.

### Integration Templates

The Service Canada ROE integration includes 2 templates:

- *Service Canada: ROE Outbound* generates and delivers one or more ROE Payroll Extract files in *.blk* format to a computer that you specify.
- *Service Canada ROE Inbound* retrieves and loads an ROE file that you previously downloaded from the Service Canada ROE website.

The Service Canada ROE integration templates don't support direct upload and download of ROE files to and from the Service Canada ROE website. Both templates require that you have an intermediate computer from which the integrations deliver and retrieve files. You upload and download ROE files manually using the Service Canada ROE website.

### Integration Process

The Service Canada ROE integrations exchange data with the ROEWEB website using this process:

1. You manually launch the ROE Outbound integration to generate the ROE files.
2. You access the Service Canada website and upload the files generated in Step 1.
3. You process the files on the Service Canada website.
4. You download the completed files from Service Canada.
5. You manually launch the ROE inbound integration to import the ROE results into Workday.

## FAQ: Service Canada ROE Integration

Does the Service Canada ROE integration interact directly with the Service Canada ROE web site?

No. Manually upload and download ROE files from Service Canada.

What file format does the integration support for ROE files?

The Service Canada ROE integration generates files in *.blk* format.

Where can I find out more about the Service Canada *ROE on the Web* service?

Service Canada provides information at:  
<https://www.canada.ca/en/employment-social-development/programs/ei/ei-list/ei-roe/roe-web.html>.

## U.S. Tax Filing Integration

### Concept: Tax Filing Integration Launch Options

#### Tax Filing Integration Launch Setup Notes

Before you launch a tax filing integration, verify you have completed the following prerequisites for the type of integration you want to launch:

Prerequisites	Related Information	Periodic Tax Filing	Monthly Tax Filing	Quarterly Tax Filing	Annual Tax Filing
Maintain your tax filing configuration for payroll taxes.	<a href="#">Steps: Set Up Payroll Taxes (USA)</a>	X	X	X	X
Complete the relevant pay period or periods.	<a href="#">Steps: Process Payroll</a>	X	X	X	X
Configure the year-end form boxes for U.S. states and territories.	<ul style="list-style-type: none"> <li><a href="#">Map Earnings and Deductions to W-2 Boxes (USA)</a></li> <li><a href="#">Map Earnings and Deductions to Year-End Forms for U.S. Territories (USA)</a></li> </ul>			X	X
Create data for the: <ul style="list-style-type: none"> <li>W-2 or W-2C forms.</li> <li>U.S. territory year-end forms.</li> </ul>	<ul style="list-style-type: none"> <li><a href="#">Steps: Set Up, Audit, and Print Year-End Tax Forms (USA)</a></li> <li><a href="#">Steps: Set Up, Audit, and Print Year</a></li> </ul>			X	X

Prerequisites	Related Information	Periodic Tax Filing	Monthly Tax Filing	Quarterly Tax Filing	Annual Tax Filing
	End Tax Correction Forms (USA)				

You must have an External ID for:

- Each company that you process with the integrations.
- Each company for each tax filing integration.

See [Concept: Integration IDs](#) on page 2304.

You can send a quarterly or annual tax file to your service provider multiple times. However, after you successfully transmit a periodic tax file, resend it only if processing fails in the external service. When you relaunch a quarterly or annual integration, Workday always sends current quarter-to-date and year-to-date balances for all employees.

If your service provider is Ceridian, you must perform separate integrations for fourth quarter and annual data. Coordinate your Q4 and annual tax filing integrations so that you avoid a timing difference, as a delay between these integrations can cause a balance discrepancy.

### Tax Filing Integration Launch Parameter Notes

Integration Type	Integration Parameters
Periodic Tax Filing	<ul style="list-style-type: none"> <li>• Select one or more companies in the Company field.</li> <li>• For ADP, verify the Sequential Run Number and the Prior Sequential Run Number. Workday resets the Prior Sequential Run Number to zero at the beginning of the year. Workday determines the numbers by adding 1 to the run number of the last successful integration event. Changing the preconfigured values is unnecessary unless you wish to use a different numbering sequence.</li> <li>• To prevent reconciliation issues with your tax filing service: <ul style="list-style-type: none"> <li>• If you're new to Workday: Only include pay results in Workday with payroll payment dates as of your Workday implementation date.</li> <li>• If you're changing providers: Only submit pay results with payroll payment dates as of the date you start with your new provider. If your pay results have payroll payment dates before the new provider start date, submit them to your old provider.</li> </ul> </li> <li>• To resend a periodic file, or to select individual pay runs to include in a transmission, select Override Launch Date</li> </ul>

Integration Type	Integration Parameters
	<p>Range. Then specify values in the Include Results Completed After and Include Results Completed On or Before fields. Base the date range on the last successful integration event or the date and time that the desired payroll results completed. Don't base the date range on the pay period.</p> <p>Overriding the launch date range can result in duplicating or omitting a run from your tax filing liability. Review the Tax Filing Integration Event Summary report first to verify the status of periodic tax integrations that Workday previously transmitted. When you override the launch date range, the value you use for the Include Results Completed On or Before field populates the Include Results Completed After field in the next run of the integration system.</p> <ul style="list-style-type: none"> <li>To include all related companies within a Single Legal Entity (SLE) relationship, select Include Related Companies for Legal Entity. To select whether to report taxes for related companies separately or together, access the Edit Company Relationship. Then, use the Payroll Tax Reporting option.</li> </ul>
Monthly Tax Filing	<p>Workday provides monthly tax filing integrations for ADP and <i>MasterTax</i> to report taxes for Illinois State Unemployment Insurance (SUI). Ceridian derives monthly data from periodic integrations, and doesn't require a separate monthly file.</p> <p>To report Pennsylvania local taxes for <i>MasterTax</i>, select Include Pennsylvania Local Taxes.</p>
Quarterly Tax Filing	<p>As you complete these fields for ADP or <i>MasterTax</i>, consider:</p> <ul style="list-style-type: none"> <li>Select a Calendar Quarter. The Q4 integration includes annual tax data.</li> <li>Select one or more companies in the Company field.</li> <li>For ADP only, define the File Subtype: <ul style="list-style-type: none"> <li><i>A - Amendment File</i>.</li> <li><i>E - Exception File (late original filing)</i>.</li> <li><i>W - W2 Management File (employee W2 printing)</i>. Don't use this option if you're sending a quarterly file.</li> </ul> </li> </ul>
Annual Tax Filing (Ceridian Only)	<ul style="list-style-type: none"> <li>Specify a Year.</li> <li>Select one or more companies in the Company field.</li> </ul> <p>The effective date for all data is the last day of the year that you selected. Example: If a worker</p>

Integration Type	Integration Parameters
	changes addresses after the end of the tax year, but before Workday generates the integration file, the address on the integration file is out-of-date.

### Tax Filing Integration Launch Parameter Example

A periodic tax file integration completes successfully on March 15 at 5:00 PM. The next integration launches successfully from Workday on March 31 at 5:00 P.M., but a failure occurs in the provider service. To resend the March 31 tax file, specify these values for the launch parameters:

1. Select the same company or companies in the Company field.
2. Keep the predefined Sequential Run Number and Prior Sequential Run Number.
3. Select the Override Launch Date Range check box.
4. In the Include Results Completed After field, specify a value of March 15, 2011 at 5:00 P.M.
5. In the Include Results Completed On or Before field, specify a value of March 31, 2011 at 5:05 P.M. Add a few minutes to the last integration time to ensure that you capture all changes.

#### Concepts

[Concept: Workday Scheduled Processes](#)

#### Tasks

[Manage Scheduled Future Processes](#)

[Create Integration Notifications on page 31](#)

[View Integration Events on page 27](#)

## Maintain Tax Filing Categories

### Prerequisites

Security: *Set Up: Payroll (Tax Filing/W-2s)* - USA domain in the USA Payroll functional area.

### Context

Workday automatically maps tax and wage *pay components* or *pay component groups* to most tax filing categories. You are responsible for mapping the additional pay components and pay component groups to other categories that pertain to your organization.

Tax filing categories are relevant to periodic and quarterly integrations.

### Steps

1. Access the Maintain Payroll Tax Filing Configuration task.
2. Add or remove tax filing categories.
3. For each category, specify which pay components or pay component groups to include for tax filing.

### Result

When you run the periodic or quarterly tax filing integration, the integration file pulls in values for the categories and pay components/pay component groups you configure.

### Example

To configure a tax filing category for a moving expense earning, add this row on the Maintain Tax Filing Configuration task:

Category	Pay Component Group(s)/Earning(s)/Deduction(s) to Include
<i>Moving Expense</i>	<i>Qualified Moving Expense</i>

The *Qualified Moving Expense* is reported in the integration as an earning.

#### Related Information

##### Tasks

[Steps: Set Up, Audit, and Print Year-End Tax Forms \(USA\)](#)

## Concept: Tax Filing Integration

To send periodic, quarterly, and annual tax information from Workday Payroll to a third-party service provider, use a tax filing integration. Workday hosts and maintains tax filing integrations to ADP, *MasterTax*, and Ceridian.

Workday provides templates and maps to configure each tax filing integration to meet your requirements:

- Periodic integrations provide payroll tax information for each pay period that requires tax filing.
- Monthly integrations provide payroll tax information for each month. Workday provides monthly tax filing integrations for ADP and *MasterTax*. Ceridian derives monthly data from periodic integrations, and doesn't require a separate monthly file.
- Quarterly integrations provide quarter-to-date and year-to-date totals for each worker. They supply state unemployment insurance (SUI) and other quarterly information. Third-party service providers might use this information to prepare quarterly tax filings.
- Annual integrations provide year-to-date wages, tax information, and W-2 data for each worker. ADP receives annual tax data in fourth quarter tax filings. Only Ceridian requires a separate integration for annual tax data.

Note: Tax filing integrations export data from Workday-delivered tax deductions. While you can include some tenant deductions using Maintain Payroll Tax Filing Configuration, you can't include tenant *tax* deductions.

To support tax filing of third-party sick pay, Workday separates employer wages and taxes from third-party wages and taxes. Separation is based on whether the employer or third party provides the W-2. ADP tax filing integrations include W-2 recap data, but Ceridian tax filing integrations don't. To find out if the external endpoint requires additional configuration to accommodate third-party sick pay, check with your vendor. Workday assumes that the employer provides the W-2 unless otherwise stated.

For a company configured for the third party to issue the W-2 when Workday sends taxes in the ADP quarterly integration, the integration reports taxes in a separate section under that company. Workday adds a 3 to the External ID for the Company.

ADP and Ceridian tax filing integrations also support W-2 printing. To find out if additional configuration is necessary, check with your vendor.

## Specification Updates

ADP, *MasterTax*, and Ceridian send emails for interface specification updates in advance of when they need to be completed. Workday receives the specification updates the same time you do, and modifies the existing templates as needed to comply with specification updates. Example: ADP sends out Q2 specification updates on 04-23. Workday updates the interface version in time for when you submit the integration output file to ADP, after the end of the quarter.

## Integration Processing

When launched, the integration sends payroll results to your service provider for remittance to the appropriate tax authorities. Payroll results include tax amounts and wages subject to withholding for each tax authority. The integration creates a data file in the prescribed format and optionally encrypts the data

file. Then the integration delivers the file the FTP endpoint of your service provider, where it's ready for import into their tax filing service.

You can send tax filing data for multiple companies in a single run, and you can also create interim runs for the same period or company. Workday gathers the results from any completed payroll calculation or on-demand calculation for the specified companies since the last successful integration event.

Workday uses actual dates rather than pay run dates for on-demand calculations in periodic integrations. To avoid late penalties, send interim tax files to your service provider whenever you make on-demand payments.

The integrations use the Payroll Result Completion Moment to determine which payroll results and associated tax information to include in your output files.

Workday doesn't include purged workers in integration outputs. File taxes for purged workers manually. You can view results for multiple workers based on company and year, access the Purged Workers with Completed Payroll Results report. The report won't return reversed pay results.

## **Data Validation**

Workday validates tax filing data in the:

- ADP quarterly integrations (includes annual).
- Ceridian periodic, quarterly, and annual integrations.

The validation process checks for:

- Missing required fields.
- Valid Social Security Number and zip code formats.
- Field lengths that exceed provider requirements.

Workday removes invalid characters from Social Security Numbers and zip codes, and truncates any field values that are too long. Workday reports these changes as warnings but integration processing continues. Data validation messages and output files are optionally attached to integration events so that you can verify the actual submission data.

## **Address Priority for Tax Filing**

For *MasterTax*, ADP, and Ceridian tax filing integrations, Workday selects the mailing address in priority order based on the Communication Usage Type:

1. Payroll Tax Address (Type = Payroll Tax Form) - *only for Q4 and annual*
2. Home Address for Pay check (Type = Home; Use For = Paycheck)
3. Work Address for Pay check (Type = Work; Use For = Paycheck)
4. Home Mailing Primary (Type = Home; Primary = TRUE; Use For = Mailing)
5. Home Mailing (Type = Home; Use For = Mailing)
6. Work Mailing Primary (Type = Work; Primary = TRUE; Use For = Mailing)
7. Work Mailing (Type = Work; Use For = Mailing)
8. Home Primary (Type = Home; Primary = TRUE)
9. Work Primary (Type = Work; Primary = TRUE)

## **Required Integration IDs**

Each Company record in your tenant must have an Integration ID that matches the client ID for your company.

For each integration system in the tenant, select the Company and select Integration Ids > Edit External Ids.

For each tax integration: add an External ID row, select the appropriate integration system, and enter the corresponding client ID.

## Available Integration Templates

Workday provides these integration templates for tax integrations:

- *ADP Tax Filing - Monthly*
- *ADP Tax Filing - Periodic*
- *ADP Tax Filing - Quarterly*
- *Ceridian Tax Filing - Annual*
- *Ceridian Tax Filing - Periodic*
- *Ceridian Tax Filing - Quarterly*
- *MasterTax Tax Filing - Monthly*
- *MasterTax Tax Filing - Periodic*
- *MasterTax Tax Filing - Quarterly*

## Security Domains Required for Integration Access to Workday Data

Tax filing integrations require *Get* and *Put* access to these domains:

- *Manage: Organization Integration*
- *Process: Tax Filing/W-2s (Run) - USA*
- *Worker Data: Compensation by Organization*
- *Worker Data: Current Staffing Information*
- *Worker Data: Public Worker Reports*

Related Information

### Concepts

[Concept: Integration IDs](#) on page 2304

## Reference: Tax Filing Reports

Review tax filing data and related events with these reports:

### Monthly Data Report

Report	Description
Tax Filing Monthly Data for Workers	<p>View worker tax filing data for a specific month for the selected company and tax authorities. Returns pay results by payment date within the specified month, and political subdivision (PSD) codes for Pennsylvania local taxes. You can use this report to:</p> <ul style="list-style-type: none"> <li>• Reconcile your monthly Illinois State Unemployment Insurance (SUI) tax liabilities.</li> <li>• Manage and report on monthly tax filing data for Pennsylvania local taxes.</li> </ul>

### Periodic Data Reports

Report	Description
Tax Filing Periodic Data for Event	<p>View periodic tax data by company for a specific integration event. Details include:</p> <ul style="list-style-type: none"> <li>• Completion date.</li> <li>• Number of results in the output.</li> </ul>

Report	Description
	<ul style="list-style-type: none"> <li>• Payment date.</li> <li>• Tax authority.</li> <li>• State.</li> <li>• Pay component.</li> <li>• Tax filing code.</li> <li>• Tax withheld.</li> <li>• Taxable wages.</li> </ul>
Tax Filing Periodic Data by Common Pay Agent	View periodic payroll tax data for the common pay agent, including taxable wages, subject wages, and gender count.
Tax Filing Periodic Data by Company	View tax filing data by company for selected periods, pay run groups, and pay groups. Returns all results and pay components mapped to tax filing categories, regardless of payment date. You can use this report to reconcile your periodic tax liabilities.
Tax Filing Periodic Data for Workers	<p>View tax filing data for workers for selected periods, pay run groups, and pay groups. Returns all results, regardless of payment date, for the pay periods selected. You can use this report to reconcile your periodic tax liabilities.</p> <p>See <a href="#">Concept: Intelligent Prompt Recommendations for Payroll</a> for details on intelligent prompt recommendations for this report.</p>

### Quarterly Data Reports

When you enter dates on the Completed within Date Range From / To prompts, Workday displays the associated data that was completed within the specified range only on the Data for Quarters/Completion Dates tab.

Report	Description
Tax Filing Quarterly Data by Common Pay Agent	<p>View quarterly payroll tax data for the common pay agent. Report includes:</p> <ul style="list-style-type: none"> <li>• QTD Withheld</li> <li>• Taxable Wages</li> <li>• Subject Wages</li> <li>• Gross Amount</li> <li>• YTD for Tax Withheld</li> </ul>
Tax Filing Quarterly Data by Company	View company tax filing data for selected companies and calendar quarters. Displays in-progress and completed pay results by payment date within the specified quarters and pay component amounts for each tax filing category. Workday automatically displays completed payroll results, but you can include in progress results or only in progress results. You can use this report to reconcile your quarterly tax liabilities

Report	Description
	<p>and to validate in-progress payroll results before completing them.</p> <p>You can also use this report for annual tax reporting because it returns year-to-date:</p> <ul style="list-style-type: none"> <li>Actual Taxable wages for New York City, New York State, and Yonkers.</li> <li>Actual Subject wages for New York State and Yonkers.</li> </ul> <p>When you select the <b>Include In Progress Results Only</b> check box, the report only displays results that are in progress or require recalculation.</p>
Tax Filing Quarterly Data for Workers	<p>View worker tax filing data for selected companies and calendar quarters. Displays in-progress and completed pay results by payment date within the specified quarters. Workday automatically displays completed payroll results, but you can include in progress results or only in progress results. You can use this report to reconcile your quarterly tax liabilities and validate in-progress payroll results before completing them.</p> <p>You can also use this report for annual tax reporting because it returns year-to-date:</p> <ul style="list-style-type: none"> <li>Actual Taxable wages for New York City, New York State, and Yonkers.</li> <li>Actual Subject wages for New York State and Yonkers.</li> </ul> <p>When you select the <b>Include In Progress Results Only</b> check box, the report only displays results that are in progress or require recalculation.</p>

### State Unemployment Insurance (SUI) Audit

Report	Description
Audit - Employee State Unemployment Week Wage Threshold	<p>View workers whose estimated state unemployment insurance (SUI) subject wages might fall below the weekly threshold of the state. You can use this report to identify workers whose number of weeks worked you might want to adjust on the <i>Get Quarterly Worker Tax Filing Data</i> web service. You can update weeks worked for multiple workers within multiple companies using the:</p> <ul style="list-style-type: none"> <li>Maintain Quarterly Tax Filing Overrides for Workers task.</li> <li><i>Put Worker Payroll Tax Filing Override</i> web service.</li> </ul> <p>You can retrieve quarterly tax filing overrides for multiple workers within multiple companies with</p>

Report	Description
	the <i>Get Worker Payroll Tax Filing Overrides</i> web service.

## Summary Report

Report	Description
Tax Filing Integration Event Summary	<p>View a summary of integration events for a selected tax filing integration. Event details include:</p> <ul style="list-style-type: none"> <li>Companies.</li> <li>Period or quarter.</li> <li>Completion date.</li> <li>Number of results in the output.</li> </ul>

### Related Information

#### Concepts

[Reconcile Tax Liabilities for Prior Period Adjustments \(USA\)](#)

## Example: Create Company State and Local Tax Custom Report

This example illustrates 1 way you can create a custom report to view different state and local US tax information for multiple companies.

### Context

You have over 50 active companies with multiple states and need to export state and local tax data to filter and validate your SUI deductions and EIN numbers and types with your external payroll tax vendor.

### Prerequisites

#### Security:

- Custom Report Creation* domain in the System functional area.
- Process: Tax Filing/W-2s (Run) - USA* domain in the USA Payroll functional area.

### Steps

- Access the Create Custom Report task.
  - Enter these values:
- | Option                    | Description                                       |
|---------------------------|---|
| Report Name               | Enter <i>Company State and Local Tax Report</i> . |
| Report Type               | Select <i>Advanced</i> .                          |
| Optimized for Performance | Clear the check box.                              |
| Data Source               | Select <i>Company State and Local Tax Data</i> .  |
- Click OK.
  - On the Columns tab, add rows with these values:

Business Object	Field
<i>Company Tax Data Reporting</i>	<i>Company</i>

Business Object	Field
<i>Company Tax Data Reporting</i>	<i>Payroll Tax Authority</i>
<i>Company Tax Data Reporting</i>	<i>Payroll State Authority</i>
<i>Company Tax Data Reporting</i>	<i>Payroll Local County Authority</i>
<i>Company Tax Data Reporting</i>	<i>Payroll Local City Authority</i>
<i>Company Tax Data Reporting</i>	<i>Deduction</i>
<i>Company Tax Data Reporting</i>	<i>Rate Type</i>
<i>Company Tax Data Reporting</i>	<i>Company Reporting Start Date</i>
<i>Company Tax Data Reporting</i>	<i>Applicable EIN</i>
<i>Company Tax Data Reporting</i>	<i>EIN Type</i>
<i>Company Tax Data Reporting</i>	<i>Applicable Rate</i>
<i>Company Tax Data Reporting</i>	<i>Rate Type</i>

5. Click OK.
6. Click Run.
7. (Optional) Enter the Effective Date.

Note: When you enter an effective date, the report displays the tax data applicable to the effective date. When you don't specify an effective date, the report displays all configured tax data. You can make the Effective Date prompt required when editing the report on the Prompts tab.

8. Click OK.

## Time Off Inbound and Payroll Input Connectors

### Steps: Set Up Time Off Inbound and Payroll Input Connectors

#### Prerequisites

Set up an external FTP server that your time and attendance service and your integration systems can access.

#### Context

Set up a Time Off Inbound Connector and a Payroll Input Connector to import time card data from an external time and attendance server into Workday:

#### Steps

1. Implement an integration system that imports time card data into Workday Absence.  
See: [Steps: Set Up Integration to Import Worker Time Card Data](#) on page 1930
2. Implement an integration system that imports time card data into Workday Payroll.  
See: [Steps: Set Up Integration for Worker Payroll Data Import](#) on page 1931

## Steps: Set Up Integration to Import Worker Time Card Data

### Context

You can create an integration system that imports time card data for your workers into Workday. The file must be in a format defined by Workday.

### Steps

1. Access the Create Integration System task and enter *Worker Time Off Inbound* at the New Using Template prompt.

Security: *Integration Build* and *Integration Configure* security domains.

2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these security domains:

- *Process: Enter or Correct Time Off*
- *Worker Data: Payroll (Payroll Input)*
- *Worker Data: Time Off (Adjustment)*
- *Worker Data: Time Off (Time Off)*

See: [.../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](#).

3. As a related action on your Worker Time Off Inbound integration, select Integration System > Configure Integration Attributes:

Option	Description
Input File Format	Indicates if the inbound file is in XML or CSV format.
Input Date Format	Specify the format for all dates on the time card file. Use Java simple date format.
Document Retention Policy	<p>Specify the location, authentication, and other options that the integration system uses to:</p> <ul style="list-style-type: none"> <li>• Sign in to an external FTP server.</li> <li>• Retrieve the file containing the time card data.</li> </ul> <p>Note: You can use SSH authentication when logging in to an external FTP server. In order to use SSH authentication, use the Create x509 Private Key Pair task to configure an X.509 private key pair.</p>

4. As a related action on the integration system, select Integration System > Configure Integration Maps and map time off codes to the Workday time off codes name.

5. (Optional) To transform the time card file as part of the integration, add a Document Transformation subintegration.

See: [Steps: Set Up Document Transformation Connector](#) on page 594.

If you don't perform this step, develop an external service to transform the time card file into the format required by Workday.

6. [Set Up Integration Retrieval](#) on page 1957.

Specify how the integration system retrieves the time card file.

7. [Launch an Integration](#) on page 24.

Schedule how often you want Workday to launch the integration.

## Steps: Set Up Integration for Worker Payroll Data Import

### Context

You can create an integration that imports files with worker payroll data from an external server into Workday. The files must be in a format defined by Workday.

### Steps

1. Access the Create Integration System task and enter *Worker Payroll Input Async* at the New Using Template prompt.  
Security: *Integration Build* and *Integration Configure* security domains.
2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to these security domains:
  - *Process: Enter or Correct Time Off*
  - *Worker Data: Payroll (Payroll Input)*
  - *Worker Data: Time Off (Adjustment)*
  - *Worker Data: Time Off (Time Off)*

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

3. As a related action on your Worker Payroll Data Import integration, select Integration System > Configure Integration Attributes:

Option	Description
Input File Format	Specify the file format of the payroll input file (CSV or XML).
Input Date Format	Specify the format for all dates on the payroll input file. Date must be in Java simple date format.
Document Retention Policy	Specify how many days Workday keeps the imported files. If not specified, the retention period is 30 days.

4. Select Integration System > Configure Integration Maps and map required external payroll values to the corresponding Workday values:

Option	Description
Deduction Code	Select a Payroll Deduction Code.  The deduction Calculation Details must have the <i>Input Amount Allowed</i> option selected, and the deduction Criteria must have the input <i>Run Category</i> selected in its Run Category Eligibility.  This field is required if Earning Code or Related Calculation isn't specified; otherwise, it must be left empty.
Earning Code	Select a Payroll Earning Code.  The earning Calculation Details must have the <i>Input Amount Allowed</i> option selected, and the earning Criteria must have the input <i>Run Category</i> selected in its Run Category Eligibility.

Option	Description
	This field is required if Deduction Code or <i>Related Calculation</i> isn't specified; otherwise, it must be left empty.
Position	Select a Position ID reference value to map an external Position ID to a Workday position ID reference value.  You only need to do this if the Position ID values don't match between the external system and Workday. You can add a default value when there isn't a value from the external system file. There are no restrictions on the external value, meaning it's free form text.
Related Calculation	Select a Payroll Pay Component Related Calculation.  The Pay Component Related Calculation must have the <i>Input Amount Allowed</i> option selected.  This field is required if Earning Code or Deduction Code isn't specified; otherwise, it must be left empty.
Run Category	Select a Payroll Run Category.  When using Earning Code or Deduction Code fields in the Payroll input, the earning or deduction must be eligible for use with the selected Run Category.

The integration template also provides optional mapping between external values and Workday worktags.

5. (Optional) To transform the payroll input file as part of the integration, add a Document Transformation sub integration.

See: [Steps: Set Up Document Transformation Connector](#) on page 594.

If you don't perform this step, develop an external service to transform the payroll input file into the format required by Workday.

6. [Set Up Integration Retrieval](#) on page 1957.

Specify how the integration system retrieves the payroll input file.

7. [Launch an Integration](#) on page 24.

Schedule how often you want Workday to launch the integration.

## Concept: Time off Inbound and Payroll Input Connectors

To import worker time and attendance data from an external application (such as Kronos Workforce Timekeeper) into Workday, use the Time Off Inbound Connector and Payroll Input Connector. Using either the Kronos Workforce Timekeeper Outbound integration (for Kronos only) or Core Connector: Worker and Core Connector: Organization Outbound (any other time and attendance application) along with the Time Off Inbound and Payroll Input Connectors, you can build a complete integration solution. Workday can synchronize information about workers and organizations with the external time and attendance application so that your employees can record time and attendance. When employees record their time worked, Workday retrieves timecard data to update Workday Payroll and Absence Management.

The Time Off Inbound and Payroll Input Connectors don't work directly with Payroll Interface. However, Workday can use time and attendance data imported into Workday to generate payroll data.

### File Formats for Time Off Inbound and Payroll Input Connectors

The Time Off Inbound Connector and Payroll Input Connector integrations import data in a Workday-defined CSV (Comma-Separated Value) or XML format (Time Off Inbound Connector only). Each Connector has its own file formats.

### Integration Process Flow

A Time Off Inbound Connector or Payroll Input Connector integration imports time and attendance data using this process:

1. Your external application generates a time and attendance data file and sends it to a file server known to the integration.
2. You launch the integration, either by schedule or manually.
3. The integration retrieves the file according to the Document Retrieval configuration on the Integration Process Event and applies document tags.  
If the file isn't in the Workday file format, configure a Document Transformation integration to convert the input file.
4. The integration processes the file, then imports the data into Workday:

### Troubleshooting Time Off Inbound and Payroll Input Connector Integrations

When you run each integration, Workday attaches one diagnostic audit report to the integration event for each time off and payroll input file.

## Concept: Time off Inbound and Payroll Input Data Mapping Examples

### Data Import Maps

When you create integration maps for the time off and payroll input data import files, you're mapping your time and attendance application values to Workday values. In this example, the External Values represent the time and attendance application values and the Internal Values represent the Workday values. If the integration finds an external value in the Integration Map, the integration returns the corresponding Workday value instead. If the integration doesn't find the external value in the Integration Map and the map contains a default value, the integration uses that value. Otherwise, the integration returns the time and attendance application values.

Time Off Inbound Data Import Map Samples

Map	Description	External Value (Time and Attendance System)	Internal Value (Workday)
<i>Time Off Code</i>	Mapping between external time off code and Workday Time Off Type Name.	022	PTO - Vacation Time Off

Map	Description	External Value (Time and Attendance System)	Internal Value (Workday)
<i>Absence Category Type</i>	Mapping for combining Absence Category and Absence Category Type to Workday Time Off Type Name.	025	FHO
<i>Absence Category Type</i>	Mapping for combining Absence Category and Absence Category Type to Workday Time Off Type Name.	026	Personal Leave Time Off

#### Payroll Data Import Map Samples

Map	Description	External Value (Time and Attendance System)	Internal Value (Workday)
<i>Custom Worktag</i>	Maps external custom values to a Workday worktag value	60200	Facility A
<i>Deduction Code</i>	Maps external deduction code values to a Workday Deduction Name	401KER	401K ER Match

Map	Description	External Value (Time and Attendance System)	Internal Value (Workday)
<i>Earnings Code</i>	Maps external earning code values to a Workday Earnings Name	CELL	Cell Phone Allowance

## Reference: Worker Payroll Input File Schema

This table lists the required and optional fields that comprise the Worker Payroll Input file schema. The schema supports 2 formats:

- CSV: The inbound file is multiline, with pipe (|) delimited fields. Each row of the file represents a separate worker payroll record. Include separators for all fields, optional or mandatory, in a record. Use an empty string/value to represent an optional field or a field with no value.
- XML: Format the XML file according to the XML schema listed later.

Field Name	Required/Optional	Datatype	Integration Map/ Reference ID
Employee ID	Required	Text	
Position ID	Optional	Text	
Earning Code	Choice with Deduction Code	Text	Earnings / Earning_Code
Deduction Code	Choice with Earning Code	Text	Deductions / Deduction_Code
Related Calculation	Optional	Text	Related Calculation / Related_Calculation_ID
			Note: Specifies the Related Calculation Reference sent to the Submit Payroll Input Web Service Operation in addition to the Earning/Deduction Code. The Related Calculation Reference value is placed in the <i>Additional Input Details Data/Related Calculation Reference/ID</i> .
			When the Related Calculation Reference is used, the Input Value is placed in the <i>Additional Input Details Data/Input Value</i> element.

Field Name	Required/Optional	Datatype	Integration Map/ Reference ID
Input Value	Required	Decimal (26.6)	Note: When the Earning/Deduction Code is used on its own, Input Value is passed into the <i>Payroll Input Data/Input Value</i> element. When the Earning/Deduction Code is used with a Related Calculation Reference, Input Value is passed into the <i>Additional Input Details Data/Input Value</i> element. Related Calculation / Related_Calculation_ID
Related Calculation 2	Optional	Text	Note: Specifies an additional Related Calculation Reference sent to the Submit Payroll Input Web Service Operation. When specified, a value <i>must</i> also be present for the Input Value 2 field.
Input Value 2	Optional	Decimal (26.6)	Note: The additional Input Value associated with Related Calculation 2. When specified, a value <i>must</i> also be present for the Related Calculation 2 field.
Related Calculation 3	Optional	Text	Note: Specifies an additional Related Calculation Reference sent to the Submit Payroll Input Web Service Operation. When specified, a value <i>must</i> also be present for the Input Value 3 field.
Input Value 3	Optional	Decimal (26.6)	Note: The additional Input Value associated with Related Calculation 3. When specified, a value <i>must</i> also be present for the Related Calculation 3 field.

## Reference: Worker Time Off Inbound File Schema

To import time off data from an external time and attendance application into Workday, that data must be in either CSV (Comma-Separated Value) or XML format.

### CSV File Description

This table lists the required and optional fields that comprise the time off inbound file schema. The time off inbound file is multiline, with comma ',' delimited fields. Each row of the file represents a separate worker time off record. Include separators for all fields, optional or mandatory, in a record. Use an empty string/ value to represent an optional field or a field with no value.

Field Name	Required/Optional	Description
Time Off Entry ID	Optional	A unique ID such as a transaction ID that uniquely identifies the record. You can use this ID to look up the Time Off Entry record for corrections.
Employee ID	Required	An employee ID in the external application. This value maps to the Workday Employee WD-EMPLID Internal Integration ID value.
Date Absent	Required	The date the employee time off applies to.
Time Off Code	Required	Type of time off, such as PTO, Floating Holiday, and so on.
Units Requested	Required	Number of units of time off that the worker requested.
Absence Comments	Optional	Comments related to employee time off.
Position ID	Optional	Position ID for the worker position in Workday.

## XML Elements

The XML schema for inbound time off data includes these elements:

Element	Level	Description
<i>TimeOffInboundFile</i>	1	Contains all other elements. Only 1 element permitted per file.
<i>TimeOffEntry</i>	2	Contains 1 instance of all subsequent elements, except as noted. Unlimited number of elements permitted per file.
<i>TimeOffEntryID</i>	3	(Optional) A unique ID such as a transaction ID that uniquely identifies the record. You can use this ID to look up the Time Off Entry record for corrections. Must be in XSD <i>string</i> format.
<i>EmployeeID</i>	3	An employee ID in the external application. This value maps to the Workday Employee WD-EMPLID Internal Integration ID value. Must be in XSD <i>string</i> format.
<i>DateAbsent</i>	3	The date the employee time off applies to. Must be in XSD <i>date</i> format.
<i>TimeOffCode</i>	3	Type of time off, such as PTO, Floating Holiday, and so on. Must be in XSD <i>string</i> format.
<i>UnitsRequested</i>	3	Number of units of time off that the worker requested. Must be in XSD <i>decimal</i> format.
<i>Comment</i>	3	(Optional) Comments related to employee time off. Must be in XSD <i>string</i> format.

Element	Level	Description
<i>PositionID</i>	3	(Optional) Position ID for the worker position in Workday. Must be in XSD <i>string</i> format.

### XML Schema

```

<?xml version="1.0" encoding="UTF-8"?>

        </xsd:complexType>
    </xsd:element>
</xsd:schema>

```

## UK Civil Service Pension Files

### Steps: Set Up UK Civil Service Pension Files Integration

#### Prerequisites

Security: *Integration Build* domain in the Integration functional area.

#### Context

Implement an integration based on the *UK Civil Service Pension Files* template to extract payroll data from Workday to send to the Civil Service pension scheme administrator.

#### Steps

1. Access the Create Integration System task and enter *UK Civil Service Pension Files* at the New using Template prompt.

2. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Set Up: Payroll UK* and *Process: UK Government Civil Service Pension* domains.

Note: The security group requires access to the Integration Permissions and Task Permissions parts of the security domain.

See: [Steps: Grant Integration or External Endpoint Access to Workday](#).

3. Add an Integration Step for this integration to the *Generate UK Civil Service Pension Files* business process.

## Concept: UK Civil Service Pension Files Integration

The UK Civil Service Pension Files integration enables you to extract payroll data from Workday to send to the Civil Service pension scheme administrator.

### Launch Parameters for UK Civil Service Pension Files Integration

After you create an integration, add an Integration Step for the integration to the *Generate UK Civil Service Pension Files* business process.

If you run the integration from the Launch/Schedule Integration task, it only returns the previously generated files from the last Generate UK Civil Service Pension Files run.

### Integration Files and Reports

Every time the integration runs, Workday generates these files:

- *Data Changes Audit* file, which is a readable version of the integration output file.
- *Diagnostic Audit* file, which helps you troubleshoot integration errors.

You can find these files in the Reports and Other Output Files section of the Integration Event for each integration run.

Note: Because the *Data Changes Audit* file includes actual data, you might need to secure this file separately.

After the integration run finishes, Workday displays the View UK Civil Service Pension Files report. Download the individual files generated by the integration from this report.

## Worksite Reporting Integration

### Steps: Set Up Worksite Reporting Integration

#### Prerequisites

- Contact the Bureau of Labor Statistics (BLS) to determine:
  - If your organization meets the BLS minimum requirements to use electronic filing.
  - The best file transfer method to send the Multiple Worksit Report.
- If you select SFTP, request the SFTP address and access credentials from the BLS.

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

#### Context

Set up an integration to generate a Multiple Worksit Report (MWR) file for delivery to the BLS.

## Steps

1. Access the Create Integration System task and enter *BLS Electronic Data Reporting - MWR* in the New Using Template prompt.
2. If you want to deliver an output file directly from this integration system, enable BLS Electronic Data Reporting Delivery Service.
3. As a related action on the integration system, select Integration System > Configure Integration Attributes to configure the attributes required by the integration template.
4. Create an Integration System User (ISU) and grant the ISU *Get* and *Put* access to the *Integration Event* domain.  
<..../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita>
5. [Set Up Integration Sequence Generators](#) on page 1969.  
 Configure the sequence generator to create output filenames that identify the file to the BLS.
6. [Set Up Integration Delivery](#) on page 1952.
7. [Launch an Integration](#) on page 24.

## Concept: Worksite Reporting Integration

Use Workday to generate a multiple worksite report for quarterly submission to the United States Department of Labor, Bureau of Labor Statistics (BLS).

### Multiple Worksite Reports

The BLS requires the Multiple Worksite Report (MWR) form for most multilocation employers. The MWR form provides employment and wage data for all establishments covered under 1 Unemployment Insurance (UI) account in a State. Most multilocation employers with a total of 10 or more employees combined in their secondary locations must complete the MWR.

The BLS forwards data collected in this report to every state for which you submit data. The MWR enables you to send 1 report for all 50 U.S. states as a single action.

Note: Workday only counts workers active on the 12th of the month if they have State Unemployment Insurance (SUI) subject wages greater than zero for the pay period including the 12th of the month.

### Integration Launch Options

You can configure your integration system to filter output by:

- Company. If you have multiple Company organizations, select a group of workers for a single Company for inclusion in the output file.
- Calendar quarter. The BLS requires quarterly submission of the Multiple Worksite Report. You can specify the calendar quarter for which employment and wage data to include on the integration output file.
- Payroll tax authorities. You can specify one or more State tax authorities to include in the integration output file. The BLS can then forward the data for each State tax authority to the relevant State government agency.

In addition, you can add manual comments advising the BLS of any business events that led to significant changes in the current quarter. Example: you can include comments about layoffs, expansions, or other events that can affect the contents of the report.

Although you'll schedule most benefit provider integrations to run on a recurring basis, you can launch an integration manually. This situation occurs when:

- You submit final enrollment data for a new benefit plan year.
- You send the final file for the current benefit plan year.
- You test integrations in your sandbox before moving into production with a new Workday update.

To determine the contents of full files or change files, benefit provider integrations include some or all of these parameters:

Parameter	Description
Effective Date	The date when enrollments are valid. If not specified, Workday uses the current date. In most cases, specify the launch date unless you're sending enrollment data for the next plan year.
Last Update	The launch date. If not specified, Workday uses the current date and time. Always keep the original value to ensure that the integration uses the current snapshot of Workday.
From Effective Date	The effective date for enrollment changes to include in the file. If not specified, Workday uses the current date. Only applies to change files.
From Last Update	The date of the last successful change file integration. If not specified, Workday uses the current date and 1 hour before the current time. Only applies to change files.
Payroll Start Date and Payroll End Date	Defines a date range for payroll contributions reported by the integration. Only payroll period <i>end dates</i> or check payment dates that occur during this range are included in the integration output file. Only applies to Flexible Spending Account (FSA) and Retirement Savings Account (RSA) plans. The <i>Use Payment Date</i> integration attribute determines whether amounts are based on pay period dates or payment dates.
Employees	Select one or more employees to include in, or exclude from, the integration output file. Include and exclude behavior depends on the Exclude Members/Only Include Members launch parameter value. Workday displays this launch parameter only if you enabled the integration service <i>CCB - Debug Service</i> .
Exclude Members/Only Include Members	Specifies if the integration includes or excludes workers that you select in the Employees launch parameter. Workday displays this launch parameter only if you enabled the integration service <i>CCB - Debug Service</i> .

## Integration Business Processes

### Concept: Integration Business Processes

Workday supports integration-specific business processes using the Integration Process Event business process type. This business process type enables you to:

- Separate the execution of the integration itself from the act of retrieving or delivering files. Configuring the retrieval or delivery action separately enables you to add additional steps between these actions and the integration execution. Alternately, you can add multiple retrieval or delivery actions before or after the integration execution.
- Chain together several integration systems. This approach enables a subsequent integration system to consume the integration files produced by 1 or more earlier integrations. This approach enables you to create new integrations using Workday Studio that extend existing integrations such as Payroll Interface.

### Integration Process Event Default Definition

Workday delivers the default definition for the Integration Process Event with your tenant. The default Integration Process Event consists of 2 steps, *Initiation* and *Service (Fire Integration)*. If this business process has no default definition in your tenant, create the default definition, including the 2 steps. If this default definition and the Initiation and Fire Integration steps aren't present, you're unable to:

- Create an Integration Process Event for any integration system.
- Run any integration system, including EIBs.

### Integration Process Event Elements

The Integration Process Event provides these step types:

- **Initiation**
- **Approval**
- **To Do**
- **Integration:** This step triggers an additional integration process. This process can be of any type, including an EIB, Connector, or Workday Studio integration.
- **Service:** The Integration Process Event supports 3 service types:
  - *Document Delivery* delivers integration files from outbound integration systems to external endpoints. You can deliver all integration output files (referred to as Documents) produced by the current Integration Process Event. You can also deliver documents that you tag based on your specification.
  - *Document Retrieval* imports integration files either:
    - From an external endpoint (such as an FTP server).
    - By routing a request to a person with a Workday account. That person can manually upload files for use by the integration.
  - *Fire Integration* executes the integration system itself. This step either generates an output file (for outbound integrations) or loads data from a file into Workday (for inbound integrations). This step is always included by default in any Integration Business Process Event.

### Support for Multiple Integrations

You can include 2 or more Integration steps in an Integration Process Event. These steps:

- Can share order in the Integration Process Event. Workday executes each step in parallel before continuing to the next step in the parent Integration Process Event.
- Can each be in sequential order. Workday executes each integration to completion before launching the subsequent integration step. This option is useful for configuring 1 integration to consume the output file from one (or more) preceding integrations.

### Organizations and Integration Business Processes

Unlike other business process types, the Integration Process Event is associated with an integration system. You can also associate it with an organization. You can associate a single integration system with several business process definitions, 1 per organization. Other business process types can trigger

the Integration Process Event as a subprocess. When other business processes trigger the integration, Workday attempts to find an Integration Process Event defined for the same organization as the parent business process. If you haven't defined an Integration Process Event specifically for that organization, Workday navigates up the organization hierarchy to find a business process definition for that integration system. If one doesn't exist, Workday uses the default Integration Process Event.

**Note:** If you launch the integration using the *Launch Integration* or *Launch EIB* web service operations, you can't specify the organization whose workflow definition you want to trigger.

Alternately, you can associate an integration with 1 business process, with no associated organization.

## Troubleshooting Integration Process Events

The Integration Process Event by design separates the generation of an integration file (or multiple files) and the delivery of the file to an external endpoint. If the external endpoint doesn't receive an expected integration file, use these reports to determine what didn't work as expected:

- The Process Monitor lists all integration-related events. Integration Process Events that send an integration file outside of Workday generates at least 2 integration-related events in the Process Monitor:
  - An event for the Integration step.
  - An event for the Deliver Document step.

Both events must succeed in order for the external endpoint to receive an integration file. Sometimes the Process Monitor displays the integration as completing successfully, but the external endpoint doesn't receive a file. In that case, check for failed Deliver Document events. If you find one, use its related action menu to determine which Integration Process Event it belongs to. Then use the Full Process Record report to determine what happened.

- The Full Process Record displays the results of each step in a business process instance. This option enables you to determine if the external endpoint didn't receive an integration file due to:
  - Failure of the Document Delivery step.
  - An Integration step failing to produce a file for the Deliver Document step.

## Create Integration Business Process

### Prerequisites

Your tenant must have a default definition for the *Integration Process Event* business process containing these steps:

- *Initiation*
- *Service (Fire Integration)*

Without this definition, you can't access the Launch/Schedule Integration task. This restriction applies to all integration systems.

Create an integration system.

#### Security:

- *Business Process Administration* in the System functional area.
- *Integration Build* and *Integration Configure* domains in the Integration functional area.

## Context

You can create an integration business process to customize workflow when you exchange data between Workday and an external endpoint. Examples:

- Add additional approval or processing steps between file retrieval and integration launch.
- Chain integration systems together to allow subsequent integrations to consume the files produced by earlier integrations.

## Steps

1. Access the View Integration System report and select the primary integration system for this integration business process.
2. Select Business Process > Create, Copy, or Link Definition from the related actions menu of the integration system.
3. Enter an Effective Date.
4. (Optional) Select the organization to associate with the business process definition from the Business Object prompt.

Different organizations can have their own business process definition for this integration system. When you launch the integration, you can select the organization whose workflow definition you want to trigger.

Note: If you launch the integration using the *Launch Integration* or *Launch EIB* web service operations, you can't specify an organization.

When you leave this field blank, this business process becomes the top-level definition for the integration system. When you launch the integration without selecting an organization, Workday applies this definition.

5. From the Copy existing Definition prompt, select All Definitions for Business Process > Integration Process Event (Default Definition).
6. (Optional) Add *Service* steps to the business process:

Option	Description
Document Delivery	Delivers files for outbound integrations.
Document Retrieval	Retrieves files for inbound integrations
Fire Integration	Triggers the integration system associated with this business process definition.

7. (Optional) Add other steps to the business process to customize the workflow.

Examples:

- Add an *Approval* step to have someone review the output file for accuracy.
  - Add an *Integration* step to launch an additional integration process.
8. Reorder the integration steps to ensure that steps take place in the order that you want.
  9. Click OK to view the business process definition.
  - 10.(Optional) To configure document retrieval or delivery, select the button on the corresponding *Service* step.
  - 11.(Optional) To configure *Integration* steps, select Configure Integration System.

Note: You must use a different integration system to the one associated with this business process definition.

## Result

The View Integration System report displays the integration business process on the Business Process Definitions tab.

## Related Information

### Tasks

[Edit Business Processes](#)

# Set Up Integration Delivery

## Prerequisites

Security: These domains in the System functional area:

- *Business Process Administration.*
- *Manage: Business Process Definitions.*

## Context

Configure a business process that can deliver 1 or more integration files to an external location by configuring a *Document Delivery Service* step. The step describes file selection, transport, and encryption options for the integration file. You can add this step to the *Integration Process Event business process definition* for the integration system. Example: As the delivery method on an outbound EIB. Or, you can add this step to another business process (such as *Payment Release Event*) that includes 1 or more *Integration Process Event* business subprocesses. Which option you select depends on how you use your integration:

- *Integration Process Event:* Add the step here if:
  - The business definition isn't part of a larger business process.
  - The delivery configuration (such as destination file server) is unique for this integration system.
  - You want to have easy access to integration error message for this integration system.
- Parent (nonintegration) business process: Add the step here if the parent business process includes several *Integration Process Events* that share delivery configuration. In this case, the step collects all integration output files produced by the business subprocesses. The step then delivers them to the same destination as a single action.

## Steps

1. Access the business process definition where you want to add the step.
2. Add a *Document Delivery Service* step to the business process if the business process definition doesn't have one already.
3. Select Configure Document Delivery.
4. In the Document(s) section, select the source of the document you want to deliver:

Option	Description
From this Integration Process	Delivers document produced by the integration system in this business process.
Derived Using	Select a report field that specifies which combination of files from the integration system or its business process to deliver. Options are: <ul style="list-style-type: none"> <li>• <i>Deliverable Documents:</i> Delivers output documents marked as <i>deliverable</i> by the integration system.</li> <li>• <i>Non-Deliverable Documents:</i> Delivers supporting files such as reports or log files.</li> </ul>

Option	Description
	<ul style="list-style-type: none"> <li><i>Output Documents:</i> Delivers all files produced by the integration.</li> </ul>

5. In the Document Filter(s) section, specify tags that Workday should filter on when selecting documents to deliver. Available tags are specific to the integration template.

6. In the Delivery Settings section, specify the delivery configuration:

Option	Description
Delivery Attempts	<p>(For SFTP transport protocol only) Specify how many times to retry file delivery before stopping. Workday ignores the Delivery Attempts value for all other transport protocols.</p> <p>For the HTTPS Transport Protocol, Workday performs up to 5 retries automatically, with back-off periods of 3 seconds each, if the transport encounters a 302 HTTP response code. If the transport encounters a non-302 HTTP response code, the transport doesn't make further retries.</p> <p>For the Google Cloud Storage (GCS) transport:</p> <ul style="list-style-type: none"> <li>If the transport encounters a 5xx HTTP response code (Example: 503), Workday attempts an exponential back-off retry mechanism automatically. Workday performs up to 5 retries, with back-off periods of 1, 2, 4, 8, and 16 seconds.</li> <li>If Workday encounters a non-5xx HTTP response code during exponential back-off retry, it switches to the regular HTTP retry mechanism automatically. This mechanism consists of up to 5 retries with back-off periods of 3 seconds each.</li> </ul>
Existing Transport from	Select an existing integration delivery service.
Derive Transport using	Specify a report field that defines which integration delivery service Workday uses.
Define Transport Explicitly	Select to define the transport in the Transport, Payload, and Environment Restrictions sections of this task.

7. In the Transport section, select and configure a transport protocol:

Transport Protocol	Notes
Amazon Simple Storage Service (S3)	<p>Note: For S3 transports, add a tag to your IAM user with a key of <i>workday-type</i> and a value of <i>integration</i>. This tag is case sensitive and doesn't ignore whitespace.</p> <ul style="list-style-type: none"> <li>Enter a key alias for AWS KMS client-side encryption.</li> <li>Pretty Good Privacy (PGP) encryption isn't configurable for EIBs using Amazon Simple Storage.</li> </ul>

Transport Protocol	Notes
	<ul style="list-style-type: none"> <li>Select the Enable Transfer Acceleration check box to increase transfer speeds.</li> <li>When you select an option from the Object Storage Class prompt, you don't need to update the storage class manually in Amazon Simple Storage Service.</li> </ul>
AS2	<p>To specify a port number, add it to the end of the URL in the AS2 Endpoint field. When you don't specify a port number, Workday uses the default.</p>
Email	<ul style="list-style-type: none"> <li>Separate multiple email addresses with semicolons.</li> <li>This transport protocol requires you to encrypt the outbound file by selecting a PGP public key certificate in the Encrypt Using prompt. When you don't encrypt the output, you can save the EIB but need approval from your security administrator to run it. When your security administrator overrides this requirement, you can run the EIB an unlimited number of times. If you edit the EIB later, your security administrator must approve the override again.</li> </ul>
FTP	<ul style="list-style-type: none"> <li>Enter the address using this format (when you don't specify a port number, Workday uses the default): <i>ftp://x.x.x.x:port-number</i>.</li> <li>This transport protocol requires you to encrypt the outbound file by selecting a PGP public key certificate in the Encrypt Using prompt.</li> <li>Directory names are case-sensitive. Include a leading slash (/) only for a full path, not a relative path.</li> <li>Select the Use Temp File check box to write the output to a randomly named file, which Workday renames to the correct name when the data transfer is complete. This option prevents automatic scripts from retrieving the file from the FTP server before the data transfer completes.</li> </ul>
FTP/SSL	<ul style="list-style-type: none"> <li>Use these formats: <ul style="list-style-type: none"> <li>Implicit SSL: <i>ftpsi://x.x.x.x:port-number</i></li> <li>Explicit SSL: <i>ftpse://x.x.x.x:port-number</i></li> </ul> </li> </ul>

Transport Protocol	Notes
	<ul style="list-style-type: none"> <li>When you don't specify a port number, Workday uses port 990 for implicit SSL and port 21 for explicit SSL.</li> <li>Directory names are case-sensitive. Include a leading slash (/) only for a full path, not a relative path.</li> <li>Select the Use Temp File check box to write the output to a randomly named file, which Workday renames to the correct name when the data transfer is complete. This option prevents automatic scripts from retrieving the file from the FTP server before the data transfer completes.</li> </ul>
Google Cloud Storage	<ul style="list-style-type: none"> <li>Connects to a specific Google Cloud Storage bucket. The bucket must already exist in Google Cloud Storage. This transport can't manage buckets.</li> <li>Requires PEM-encoded Private Key for authentication.</li> </ul> <p>Note: The endpoint for this protocol is a cloud-based storage service that isn't part of the Workday service. Your use of Google products and services is subject to the applicable terms provided by Google. Workday recommends that you familiarize yourself with the Service Level Agreement (SLA) and Terms of Service for Google Cloud Storage.</p>
HTTPS	<ul style="list-style-type: none"> <li>To specify a port number, add it to the end of the URL in the HTTP Address field. When you don't specify a port number, Workday uses the default.</li> <li>Types of web service invocation: <ul style="list-style-type: none"> <li><i>Basic Auth:</i> Basic access authentication that encodes the user name and password.</li> <li><i>No Security:</i> Indicates that you trust the connection and that the connection doesn't need security.</li> <li><i>OAuth 2.0:</i> Authorizes access using Bearer tokens. Contact your OAuth service provider to obtain token values.</li> </ul> </li> </ul> <p>When the Access Token expires, Workday uses the Client ID, Client Secret, and Refresh Token values to reach your Refresh Token URL and generates a new access token. Workday then uses the</p>

Transport Protocol	Notes
	<p>new access token to deliver the files.</p> <ul style="list-style-type: none"> <li>• <i>WS-Security User Id/Password:</i> Applies security to web service messages through the Web Services Security protocol.</li> <li>• When you use an Outbound EIB with HTTP and select <i>WS-Security User Id/Password</i> or <i>No Security</i>, consider: <ul style="list-style-type: none"> <li>• When you configure an XSLT transformation, the XSLT must wrap the payload using a SOAP envelope.</li> <li>• When you use a custom report and the output isn't XML, add an XSLT transformation to wrap the payload using a SOAP envelope.</li> </ul> </li> </ul>
SFTP	<ul style="list-style-type: none"> <li>• Enter the address using this format (when you don't specify a port number, Workday uses the default): <i>sftp://x.x.x.x:port-number</i>.</li> <li>• Directory names are case-sensitive. Include a leading slash (/) only for a full path, not a relative path.</li> <li>• Select the Use Temp File check box to write the output to a randomly named file, which Workday renames to the correct name when the data transfer is complete. This option prevents automatic scripts from retrieving the file from the FTP server before the data transfer completes. You can also specify a Host Key Fingerprint to indicate the encryption key that the FTP server uses for SSH communications.</li> <li>• Set the Block Size to a block size that the SFTP endpoint supports. If not specified, Workday uses 32K. Increasing the block size can increase the delivery performance. If the endpoint doesn't support the block size that you select, the integration delivery fails. Workday strongly recommends that you test the block size using the Test Transport feature. After you find the optimal block size, update your Document Delivery configuration to use this block size.</li> </ul>

8. (Optional) To deliver the output file in ZIP format, select the Compressed check box.

9. (Optional) To encrypt the output file by using Pretty Good Privacy (PGP), select a certificate at the Encrypt using prompt and specify encryption details in the Payload section:

Option	Description
Ascii Armored	To encrypt the output file in printable ASCII characters, select this check box.
Containing Integrity Check	To verify that the encrypted file didn't become altered or corrupt during transport, select this check box.
Decrypted File Name	Enter a name for the decrypted output file. If you leave this field blank, the name of the decrypted file matches the original filename.
PGP 2.6 Compatible	To create an encrypted output file that supports public keys generated with PGP version 2.6 or earlier, select this check box.
Text Mode	To use PGP encryption with text mode, select this check box. PGP encryption with text mode must include the CRLF line endings.

- 10.(Optional) At the Restricted To prompt, select the target environment for this transport protocol.

If you leave this field empty, Workday applies the transport protocol to each environment in which the integration runs. Each environment can have only 1 transport protocol. To avoid inadvertently sending test data to or from a non-test endpoint, Workday strongly recommends that you:

- Create a separate transport for each environment.
- Restrict each transport to its intended environment.

## Result

After the integration runs, the *Integration Process Event* will deliver the selected output files to an external server based on these instructions.

[Bucket Restrictions and Limitations](#)

## Set Up Integration Retrieval

### Prerequisites

Security: *Business Process Administration* and *Manage: Business Process Definitions* domains in the System functional area.

### Context

To retrieve an integration document from an external location, add a *Document Retrieval* Service step to the integration business process. The step describes file selection, transport, and decryption options for the integration file.

Document Retrieval also enables you to retrieve the output of a custom report. In this case, Document Retrieval:

- Retrieves the data from within Workday.
- Stores the report output in the My Reports repository for use by a subsequent integration step.

## Steps

1. Access the *business process definition* where you want to add the step.
2. Add a *Document Retrieval Service* step to the business process if the business process definition doesn't have one already.
3. Select Configure Document Retrieval.
4. In the Document Retention Policy field, enter the number of days that Workday store the files imported by the business process.
5. In the Document Tags section, select any document tags that you want Workday to apply to the inbound files.
6. In the Retrieval Settings section, specify the retrieval configuration:

Option	Description
Group to Manually Attach File(s)	To attach 1 or more files manually for import, specify a segment security group that receives a business process request.
Retrieve File(s) from External Location	Select an existing integration delivery service.

7. Select the File Name Option for the retrieval:

Option	Description
File Name/Pattern	Enables Workday to search for files with a specific name pattern on a remote endpoint.
Sequence Generator	Enables Workday to search for files with a specific sequential filename pattern on a remote endpoint.

8. (File Name/Pattern only) In the File(s) section:

- a) Enter the filename, or filename pattern as a regular expression (regex), for the file that you'll upload into Workday from an external endpoint.

Note: This field is case-sensitive. Workday doesn't support full regex syntax for file retrieval. Workday only supports (\*) and (?) characters as wild cards in the filename pattern.

For Amazon Simple Storage Service (S3), Workday accepts (\*) and (?).

For S3 transports, you can retrieve files from folders using the format: *folder1/folderN/filename.format*.

- b) In the File(s) section, specify the MIME type using the Common Content Type prompt, specify a Custom Content Type, or select *None of the above*.

Workday applies the specified MIME type to all files retrieved by the integration system.

9. (Sequence Generator only) Specify filename sequence options.

If a process generates multiple requests for the next sequence number very close together, Workday attempts to generate the sequence numbers. This process can result in skipped, nonconsecutive numbers.

Option	Description
Increment Sequence ID By	Enter a nonzero value by which the sequence number increases each time Workday generates a new ID.
Padding	Use Padding to indicate the number of digits present in the sequence. Enter a large enough padding value so that the sequence doesn't encounter an overflow condition. Workday recommends a padding value of at least 6. If

Option	Description
	<p>the sequence exceeds the number of digits you enter here, the Sequence ID Overflow Behavior setting determines the next number in the sequence. When you enter 0, or don't enter a value in the Padding field:</p> <ul style="list-style-type: none"> <li>The sequence number increases indefinitely.</li> <li>Workday populates Sequence ID Overflow Behavior with Automatically Ignore Padding.</li> </ul>
Sequence ID Format	<p>Specify a format for the identifier. You can use any text string with these 4 special variables. The date-related values represent the date when the task generates the ID.</p> <ul style="list-style-type: none"> <li>[seq] - The sequence number. It increases by the value specified in the Increment Sequence ID By field, with the number of digits specified in the Padding field. Workday uses a separate sequence for each ID definition that uses this variable.</li> <li>[day] - Day of the month in two-digit format, 01 - 31.</li> <li>[month] - Month in two-digit format, 01 - 12.</li> <li>[year] - Year in four-digit format. Example: 2020.</li> </ul> <p>Note: If you set the Restart Frequency interval, ensure that the generated sequence number is unique by including the specific time period in the format. Example: If the Restart Frequency time period is <i>Month</i>, include [month] and [year] in the format. Make sure that the padding value is large enough that the sequence generator doesn't encounter an overflow condition during the time period.</p> <p>Example, you can define the filename format by entering:</p> <ul style="list-style-type: none"> <li>A string constant.</li> <li>A pattern for the date and time.</li> <li>A sequence number pattern.</li> <li>The file extension.</li> </ul> <p>Workday can dynamically generate only date values and a sequence number for use in the filename. Any other values are static; they're identical for all files generated by the integration. Hold your cursor over this field to</p>

Option	Description
	see the full list of valid sequence generator and date/time patterns.
Restart Frequency	<p>(Optional) To reset the [seq] value to an initial value at regular time intervals, specify how often Workday resets the sequence numbers.</p> <p>The options are <i>Day</i>, <i>Month</i>, or <i>Year</i>; leave the field blank if you want [seq] to be unique within this ID definition. Days start at 12:01 AM. Months start at 12:01 AM on the first of that month. Years start at 12:01 AM on the first of January.</p>
Restart Number	<p>(Optional) To reset the [seq] value to an initial value at regular time intervals, specify the number Workday uses when restarting sequence numbers. You can use this field with the Restart Frequency field.</p>
Time Zone Usage	<p>An alternate time zone on which to base the interval specified in the Restart Frequency field.</p> <p>This value doesn't indicate when the ID generation actually occurs. Workday uses it only to localize the date to the specified time zone. If you don't specify a time zone, Workday uses Pacific Standard Time/Pacific Daylight Time (PST/PDT).</p>
Sequence ID Overflow Behavior	<p>Configure how you want Workday to handle potential overflow conditions. As you complete the field, consider:</p> <ul style="list-style-type: none"> <li>• Allow Overflow with Truncated Sequences - Workday truncates the most significant digit of the sequence number when an overflow condition occurs. Example: With a Padding value of 3, the next sequence number after 999 is 1000, but the 1 gets truncated, so the next value displays as 000.</li> <li>• Automatically Ignore Padding - The sequence generator ignores the Padding value when an overflow condition occurs. Example: With a Padding value of 3, the next sequence number after 999 is 1000. If the Padding value is 0, Workday automatically selects this option.</li> </ul>
Override Tenant Setup Overflow Notification Group	<p>Specify security groups to override the Default Tenant Setup Overflow Notification Group. Workday automatically sends a notification to the overflow notification security groups when the sequence approaches the limit imposed by the Padding value. If you don't select security</p>

Option	Description
	<p>groups in this field, Workday sends these overflow notifications to:</p> <ul style="list-style-type: none"> <li>The security groups that you select in the Default Sequence Generator Notification Group field on the Edit Tenant Setup - System task.</li> <li>The default security groups that Workday specifies for overflow notifications when you don't select default overflow notification security groups on the Edit Tenant Setup - System task.</li> </ul>
Default Tenant Setup Overflow Notification Group	<p>Displays the Default Tenant Setup Overflow Notification Group. Workday automatically sends a notification to the overflow notification security groups when the sequence approaches the limit imposed by the Padding value.</p>
Last Sequence Used	<p>Manually sets the last sequence number. This option is useful if:</p> <ul style="list-style-type: none"> <li>You previously used a different ID generation application.</li> <li>You want to continue from where the ID ended.</li> </ul> <p>When you set the number, the initial sequence number will be your number plus the Increment Sequence ID by value.</p>
Last Date Used	<p>Specify this date, plus an interval for Restart Frequency to determine whether the date is before or after the last restart interval. Workday then sets the sequence number based on the date.</p>
Low Volume	<p>(Optional) Select to ensure that sequences generated by the sequence generator don't have gaps. Use this option when you experience both of these situations:</p> <ul style="list-style-type: none"> <li>You aren't using the sequence in high-volume transactions.</li> <li>You experience unwanted gaps in the generated sequence.</li> </ul>

10. In the Transport section, select and configure a transport protocol:

Transport	Notes
Amazon Simple Storage Service	<p>Note: For S3 transports, add a tag to your IAM user with a key of <i>workday-type</i> and a value of <i>integration</i>. This tag is case sensitive and doesn't ignore whitespace.</p>

Transport	Notes
	<ul style="list-style-type: none"> <li>Enter your S3 bucket name in the Bucket field. You can't specify a folder in this field.</li> <li>Enter a key alias for AWS KMS client-side encryption.</li> <li>Pretty Good Privacy (PGP) encryption isn't configurable for EIBs using Amazon Simple Storage.</li> <li>Select the Enable Transfer Acceleration check box to increase transfer speeds.</li> <li>When you select an option from the Object Storage Class prompt, you don't need to update the storage class manually in Amazon Simple Storage Service.</li> </ul>
Custom Report	<ul style="list-style-type: none"> <li>Any custom reports enabled as a web service display in the Custom Report prompt.</li> <li>Value Type and Value: <ul style="list-style-type: none"> <li><i>Specify Value</i>. Enter the value that you want Workday to use as the integration criteria each time it runs.</li> <li><i>Determine Value at Runtime</i>. Select the field that you want Workday to use to determine the value each time that it runs.</li> <li><i>Use System Default</i> uses the value configured in the Enterprise Interface definition.</li> </ul> </li> </ul>
FTP	<ul style="list-style-type: none"> <li>Enter the address using this format (when you don't specify a port number, Workday uses the default): <code>ftp://x.x.x.x:port-number</code>.</li> <li>This transport protocol requires you to encrypt the outbound file by selecting a PGP public key certificate in the Encrypt Using prompt.</li> <li>Directory names are case-sensitive. Include a leading slash (/) only for a full path, not a relative path.</li> <li>Select the Use Temp File check box to write the output to a randomly named file. Workday renames the file to the correct name when it completes the data transfer. This option prevents automatic scripts from retrieving the file from the FTP server before the data transfer completes.</li> </ul>

Transport	Notes
FTP/SSL	<ul style="list-style-type: none"> <li>• Use these formats:           <ul style="list-style-type: none"> <li>• Implicit SSL: <code>ftpsi://x.x.x.x:port-number</code></li> <li>• Explicit SSL: <code>ftps://x.x.x.x:port-number</code></li> </ul> </li> <li>• When you don't specify a port number, Workday uses port 990 for implicit SSL and port 21 for explicit SSL.</li> <li>• Directory names are case-sensitive. Include a leading slash (/) only for a full path, not a relative path.</li> <li>• Select the Use Temp File check box to write the output to a randomly named file. Workday renames the file to the correct name when it completes the data transfer. This option prevents automatic scripts from retrieving the file from the FTP server before the data transfer completes.</li> </ul>
REST	Enter the host name or server address in this format: <code>http://www.example.com/rest/</code> .
SFTP	<ul style="list-style-type: none"> <li>• Enter the address using this format (when you don't specify a port number, Workday uses the default): <code>sftp://x.x.x.x:port-number</code>.</li> <li>• Directory names are case-sensitive. Include a leading slash (/) only for a full path, not a relative path.</li> <li>• Select the Use Temp File check box to write the output to a randomly named file. Workday renames the file to the correct name when it completes the data transfer. This option prevents automatic scripts from retrieving the file from the FTP server before the data transfer completes. You can also specify a Host Key Fingerprint to indicate the encryption key that the FTP server uses for SSH communications.</li> <li>• Set the Block Size to a block size that the SFTP endpoint supports. If not specified, Workday uses <code>32K</code>. Increasing the block size can increase the delivery performance. If the endpoint doesn't support the block size that you select, the integration delivery fails. Workday strongly recommends that you test the block size using the Test Transport feature. After you find the optimal block size, update your Document Delivery configuration to use this block size.</li> </ul>

11.(Required only for *Custom Report Transport*) In the Report Options section, select the user whose credentials Workday uses to run the custom report.

Workday displays the Run Report(s) As User prompt in the Report Options section only if you selected Custom Report in the preceding step.

12.In the File Utilities section, specify 1 or more of these options:

Option	Description
Delete After Retrieval	If Workday is unable to delete the file from the source S/FTP/S server, the document retrieval fails.
Decompress	Select to decompress the incoming file.
Decrypt Using	(FTP, FTP/SSL, and SFTP only) If you want to decrypt the uploaded file by using Pretty Good Privacy (PGP), select the PGP private key of the key pair you generated to decrypt the inbound integration file.  When you use FTP, FTP/SSL, or SFTP protocols to encrypt an outbound integration file, you can also: <ul style="list-style-type: none"> <li>• Include an integrity check of the data in the file.</li> <li>• Digitally sign the file.</li> </ul>
Force Integrity Check	(FTP, FTP/SSL, and SFTP only) To verify that the encrypted file didn't become altered or corrupt during transport, select this check box.
Digital Signature Validation Using	(FTP, FTP/SSL, and SFTP only) To verify the origin of the encrypted inbound file, select a PGP public key provided by your trading partner.

13.(Optional) In the Environment Restrictions section, at the Restricted To prompt, select the target environment for this transport protocol.

If you leave this field empty, Workday applies the transport protocol to each environment in which the integration runs. Each environment (Production, Sandbox, Implementation, and so on) can have only 1 transport protocol. To avoid inadvertently uploading test data to or from a nontest endpoint, Workday strongly recommends that you:

- Create a separate transport for each environment.
- Restrict each transport to its intended environment.

## Result

After the integration runs, the Integration Process Event will retrieve the selected files from an external server based on these instructions.

[Bucket Restrictions and Limitations](#)

# Test Transport Configuration for an Integration

## Prerequisites

- Your integration system must:
  - Have a Delivery Service or Retrieval Service configured with SFTP, FTP, or FTP/SSL.
  - Be an EIB configured with SFTP, FTP, or FTP/SSL.
- Security: *View* access to any of these domains:
  - *Business Process Administration* in the System functional area.
  - *Integration Build* in the Integration functional area.
  - *Integration Event* in the Integration functional area.
  - *Manage: Business Process Definitions* in the System functional area.
- The integration must either have the transport explicitly defined, or use an existing transport. If you selected Derive Transport using when defining the transport, you can't test it using this task.

## Context

Test the configured Delivery Service, Retrieval Service, Outbound EIB, or Inbound EIB for an integration. Verify and troubleshoot connectivity to the external endpoint using the Test Transport task. When testing the configured transport for your integration system, you can either:

- Use a 10 KB test file.
- Select a file from a preceding integration event.

This task stops after 5 minutes. If the endpoint is slow due to network or performance issues, the test can take longer than 5 minutes and not complete.

## Steps

1. Select Integration > Test Transport as a related action on any of these items:

- The integration system.
- The Document Delivery or Document Retrieval Service step of the integration business process.

2. Select the Transport from the prompt.

The prompt selects the first configured EIB, Delivery Service, or Retrieval Service for the current environment automatically. You can select the transport for a different environment, service, or business process definition if more than one configured transport exists for the integration system.

3. Select one of the Available Actions for testing connectivity with the external endpoint:

Option	Description
Connect	The integration transport service attempts to connect to the external endpoint.
List Files	The integration transport service attempts to retrieve a list of files that corresponds to a filename pattern from the external endpoint.
Deliver Files (available for Delivery Service and Outbound EIBs only.)	The integration transport service attempts to deliver a file (either a 10 KB test file or a file from a preceding integration event).
Retrieve Files (available for Retrieval Service and Inbound EIBs only.)	The integration transport service attempts to retrieve files that correspond to a filename pattern. The Test Transport task deletes the

Option	Description
	test file after the test completes. If you enabled Delete After Retrieval on the integration retrieval configuration, Workday ignores that setting.

Note: This action isn't available in Production tenants. In non-Production tenants, this action isn't available if you restricted the transport to Production.

4. (Available for Deliver Files option) Select the SFTP transfer block size. If you don't select a block size, Workday uses 32K. The block size must correspond to a block size that the SFTP endpoint supports. If the endpoint doesn't support the block size that you select, the test fails.
5. (Available for List Files and Retrieve Files option). Enter a File Name/Pattern that you want to search for or retrieve on the external endpoint. This field is case-sensitive.  
Workday doesn't support full regex syntax for file retrieval. Workday only supports (\*) or (?) characters as wild cards in the filename pattern.  
For Amazon Simple Storage Service, Workday accepts (\*) and (?).

6. (Required for Deliver Files option) Select one of the Deliver Files Options:

Option	Description
Use Default Test File	The integration transport service sends a 10 KB test file to the external endpoint.
Deliverable Repository Document	The integration transport service sends the selected file (from a preceding integration event) to the external endpoint.

7. Select Include Debugging Information in Logs if you want to record information about the transport test.

As the transport test isn't an integration event, the Integration Event report returns no information about the test.

8. Select OK to start the test.

Workday performs the test and displays a report with test results and (optionally) additional debugging information.

## Integration Services

### Template-Based Integration Management Tasks

#### Steps: Set Up Template-Based Integration

##### Prerequisites

Security: these domains in the Integration functional area:

- *Integration Build*
- *Integration Configure*

##### Context

Create and configure an integration based on a Workday-delivered integration template.

## Steps

1. [Create Integration System](#) on page 1967.
2. Enable 1 or more optional integration services. The Configure Integration Services task displays all integration services, including required services. You can't edit required integration services.
3. As a related action on your integration, select Integration System > Configure Integration Attributes and enter attributes for integration services that you enabled in Step 2, as well as required attributes.
4. Select Integration System > Configure Integration Maps as a related action on your integration system.
5. (Optional) Set up integration field overrides:
  - [Set Up Integration Field Overrides for a Connector](#) on page 1973.
  - [Set Up Integration Field Overrides for DIS](#) on page 1974.
6. [Set Up Integration Sequence Generators](#) on page 1969.
7. (Optional) Select Integration System > Configure Integration Transaction Log as a related action on your integration and select the Workday transactions for monitoring.
8. (Optional) [Create Integration Notifications](#) on page 31.
9. (Optional) As a related action on your integration, select Integration System > Maintain Integration System Documents. Attach supporting documentation for design, usage, and change log purposes.  
Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
10. [Create Integration Business Process](#) on page 1950.
11. (Optional) To launch the integration from a business process, add a step to the business process.  
See: [Create Integration \(Step\)](#).
12. Configure the integration to import or export data to or from Workday:
  - [Set Up Integration Delivery](#) on page 1952.
  - [Set Up Integration Retrieval](#) on page 1957.
13. [.../.../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita](https://.../.../authentication-and-security/security-for-integrations/access-to-workday-data/dan1370797146076.dita).

## Create Integration System

### Prerequisites

- Access the Maintain Integration Tags task (security: *Integration Reports* domain) and define any tags that you want to apply to an integration system.
- Any person that you want to define as a contact for an integration must exist in Workday.
- Security: these domains in the Integration functional area:
  - *Integration Build*.
  - *Integration Configure*.

### Context

You can create an integration system based on a Workday-defined template to import and export data between Workday and external endpoints. Optionally, you can apply predefined tags to an integration and include contact information. Example: Consultant or internal project lead. You can then search for these contacts and tags using a custom report based on the *All Integration Systems* report data source.

## Steps

1. Access one of these tasks and reports:
  - Create Integration System task.
    - Use this task to create new integrations.
  - (Optional) View Integration System report.
    - You can use this report to find and update existing integrations. You can also use the *Create* option in the Integration System prompt to create new integrations.
2. As you complete the task, consider:

Option	Description
Integration Tags	Select 1 or more integration tags that you want to apply to the integration system. Workday limits each tag to a maximum length of 256 characters.
Comment	Free-form text description for a contact.
Contacts	Select workers that you want to associate with the integration system from the prompt.

[The Next Level: General Overview - Integration Handbook Part 2 of 2](#)

## Set Up Integration Subscriptions

### Prerequisites

- [Create Integration System](#)  
Create an integration system based on an integration template that doesn't include a Transaction Log integration service. If your integration system does have a Transaction Log service available, subscriptions aren't available for your integration.
- [Security: \*Integration Configure\* domain in the Integration functional area.](#)

### Context

You can configure your integration to:

- Subscribe to Workday business processes and transaction events.
- Send notifications to external endpoints.
- Launch automatically when the selected business process completes, or when the event lite/re-organization activity transaction occurs.

## Steps

1. As a related action on your integration system, select [Integration System > Edit Subscriptions](#).
2. In the Event Subscriptions section, select the range of business processes and transaction events.

3. (Optional) Configure external endpoint notifications:

- a) Click Add to add new external endpoint rows.
- b) Enter the URL, name, and password that Workday uses to access to the endpoint.
- c) If you've defined an endpoint already, select Use Deployed Service Endpoint.
- d) If you want to restrict this notification to a specific environment (Production, Sandbox, and so on), select it from the prompt.

Note: If you configure external endpoint notifications, ensure that the Disable Integration Subscriptions check box is unchecked on the Edit Tenant Setup - Integrations task.

Workday sends 1 notification message to each external endpoint per subscribed event. You can view these background processes in the process monitor by filtering on the Integration Subscription Notification process type. The notification message doesn't contain the actual data of the business process event. You can use the *Get\_Event\_Detail* WWS API to retrieve data about the business process event. The notifications aren't always directly related to the integration system itself, even though they're attached to a given integration system.

The reliability of the notifications depends on the availability of the external endpoints. If there are availability issues with your endpoint, it might receive messages out of order, more than once, or not at all. If the delivery of 2 consecutive notification messages fails for an external endpoint, Workday records the error, sends no further messages to that endpoint, and disables the endpoint. Workday doesn't implement the [WS-ReliableMessaging](#) standard for integration subscriptions.

If Workday disabled your endpoint: After you troubleshoot your endpoint, you can re-enable your subscriptions. To re-enable subscriptions, select Integration System > Edit Subscriptions as a related action on the integration system and clear Disable Endpoint.

You can run the Integration Exception Audit with *Warnings* selected to view all integration systems with disabled subscriptions.

To receive email notifications when your subscription disables, select Integration System > Configure Integration Notifications as a related action on the integration system.

4. (Optional) In the Conditions and Rules section, select a rule from the list or configure a new rule.

Example: You can configure a rule to notify the integration administrator when an event fails, launches, or terminates.

5. (Optional) Select Add in the Launch Integration section and configure integration launch options:

- a) (Optional) Select Run As and select an *Integration System User* account from which you want your integration system to inherit security permissions.  
If you leave this field empty, the integration runs with the permissions granted to its own *Integration System User* account.
- b) In the Request Name section, enter a request name for every integration run in the Static field. Or, select a report field or calculated field to use to generate a request name from the Dynamic Using prompt.
- c) Set launch parameters for the integration. To configure these launch parameters, you can access report fields starting from the Transaction Log business object.

## Set Up Integration Sequence Generators

### Prerequisites

- [Create Integration System](#)

Create an integration system based on an integration template.

- Security: *Integration Configure* domain in the Integration functional area.

### Context

Enable integrations to generate a unique, sequenced number each time they run.

If a process generates multiple requests for the next sequence number very close together:

- Workday attempts to generate the sequence numbers.
- Workday can generate skipped, nonconsecutive numbers.

## Steps

1. Select **Integration System > Configure Integration Sequence Generators** as a related action on your integration system.
2. As you configure the integration sequence generator, consider:

Option	Description
Increment Sequence ID By	Enter a nonzero value by which the sequence number increases each time Workday generates a new ID.
Padding	<p>Use Padding to indicate the number of digits present in the sequence. Enter a large enough padding value so that the sequence doesn't encounter an overflow condition. Workday recommends a padding value of at least 6. If the sequence exceeds the number of digits you enter here, the Sequence ID Overflow Behavior setting determines the next number in the sequence. If you enter 0 or don't enter a value in the Padding field:</p> <ul style="list-style-type: none"> <li>• The sequence number increases indefinitely.</li> <li>• Workday populates Sequence ID Overflow Behavior with Automatically Ignore Padding.</li> </ul>
Sequence ID Format	<p>Specify a format for the identifier.</p> <p>You can use any text string with these 4 special variables. The date-related values represent the date when the task generates the ID.</p> <ul style="list-style-type: none"> <li>• [seq] - The sequence number, increasing by the value specified in the Increment Sequence ID By field, with the number of digits specified in the Padding field. Workday uses a separate sequence for each ID definition that uses this variable.</li> <li>• [day] - Day of the month in two-digit format, 01 - 31.</li> <li>• [month] - Month in two-digit format, 01 - 12.</li> <li>• [year] - Year in four-digit format. Example: 2020.</li> </ul> <p>Note: If you set the Restart Frequency interval, ensure that the generated sequence number is unique by including the specific time period in the format. Example: If the Restart Frequency time period is <i>Month</i>, include [month]</p>

Option	Description
	<p>and [year] in the format. Make sure that the padding value is large enough that the sequence generator doesn't encounter an overflow condition during the time period.</p> <p>Example, you can define the filename format by entering:</p> <ul style="list-style-type: none"> <li>• A string constant.</li> <li>• A pattern for the date and time.</li> <li>• A sequence number pattern.</li> <li>• The file extension.</li> </ul> <p>Workday can dynamically generate only date values and a sequence number for use in the filename. Any other values are static; they're identical for all files generated by the integration. Hold your cursor over this field to see the full list of valid sequence generator and date/time patterns.</p>
Restart Frequency	<p>(Optional) To reset the [seq] value to an initial value at regular time intervals, specify how often Workday resets the sequence numbers.</p> <p>The options are <i>Day</i>, <i>Month</i>, or <i>Year</i>; leave the field blank if you want [seq] to be unique within this ID definition. Days start at 12:01 AM. Months start at 12:01 AM on the first of that month. Years start at 12:01 AM on the first of January.</p>
Restart Number	<p>(Optional) To reset the [seq] value to an initial value at regular time intervals, specify the number Workday uses when restarting sequence numbers. You can use this field with the Restart Frequency field.</p>
Time Zone Usage	<p>An alternate time zone on which to base the interval specified in the Restart Frequency field.</p> <p>This value doesn't indicate when the ID generation actually occurs. It's used only to localize the date to the specified time zone. If you don't specify a time zone, Workday uses Pacific Standard Time/Pacific Daylight Time (PST/PDT).</p>
Sequence ID Overflow Behavior	<p>Configure how you want Workday to handle potential sequence identifier overflow conditions. As you complete the field, consider:</p> <ul style="list-style-type: none"> <li>• Allow Overflow with Truncated Sequences - Workday truncates the most significant digit of the sequence number when an overflow condition occurs. Example: With a Padding value of 3, the next sequence number after</li> </ul>

Option	Description
	<p>999 is 1000, but the 1 gets truncated, so the next value displays as 000.</p> <ul style="list-style-type: none"> <li>Automatically Ignore Padding - The sequence generator ignores the Padding value when an overflow condition occurs. Example: With a Padding value of 3, the next sequence number after 999 is 1000. If the Padding value is 0, Workday automatically selects this option.</li> </ul>
Override Tenant Setup Overflow Notification Group	<p>Specify security groups to override the Default Tenant Setup Overflow Notification Group. Workday automatically sends a notification to the overflow notification security groups when the sequence approaches the limit imposed by the Padding value. If you don't select security groups in this field, Workday sends these overflow notifications to:</p> <ul style="list-style-type: none"> <li>The security groups that you select in the Default Sequence Generator Notification Group field on the Edit Tenant Setup - System task.</li> <li>The default security groups that Workday specifies for overflow notifications if you don't select default overflow notification security groups on the Edit Tenant Setup - System task.</li> </ul>
Default Tenant Setup Overflow Notification Group	<p>Displays the Default Tenant Setup Overflow Notification Group. Workday automatically sends a notification to the overflow notification security groups when the sequence approaches the limit imposed by the Padding value.</p>
Low Volume	<p>(Optional) Select to ensure that sequences generated by the sequence generator don't have gaps. Use this option when you experience both of these situations:</p> <ul style="list-style-type: none"> <li>You aren't using the sequence in high-volume transactions.</li> <li>You experience unwanted gaps in the generated sequence.</li> </ul>

Press TAB to view a sample value in the Example area. Verify that the sample meets your requirements.

### 3. Specify Last Sequence ID values:

Option	Description
Last Sequence Used	<p>Manually sets the last sequence number. This option is useful if:</p> <ul style="list-style-type: none"> <li>You previously used a different ID generator.</li> </ul>

Option	Description
	<ul style="list-style-type: none"> <li>You want to continue from where the ID ended.</li> </ul> <p>When you set the number, the initial sequence number will be your number plus the Increment Sequence ID By value.</p>
Last Date Used	Specify this date, plus an interval for Restart Frequency to determine whether the date is before or after the last restart interval. Then Workday sets the sequence number based on the date.

4. (Optional) Select 1 or more target environments for this sequence generator from the Restricted to Environment prompt.

If you select more than 1 environment, Workday doesn't synchronize the sequence numbers across environments.

### Example

Specify values that define a sequence definition that includes the current date and a string comprised of an external endpoint code and an employer ID:

Increment Sequence ID By	1
Restart Frequency	<i>leave blank</i>
Restart Number	0
Padding	0
Sequence ID Format	[yyyy][MM][dd]_[Seq]_ER-GMS.csv

Example: the integration first runs on January 1st, 2018, and runs on the 1st and 15th day of each month. The integration events for February 2018 generate output files named 20180201\_3\_ER-GMS.csv and 20180215\_4\_ER-GMS.csv.

#### Tasks

[Steps: Set Up Payroll Interface Configurable Output](#) on page 1659

#### Examples

[2023R1 What's New Post: Payroll Interface Configurable Output](#)

## Set Up Integration Field Overrides for a Connector

### Prerequisites

- [Create Integration System](#)

Create an integration system based on an integration template.

- Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.
- Verify that the calculated field or report field you want to use is based on the Worker *business object*.
- Run a custom report as an *Integration System User* account against the *All Workers* data source. Confirm that the calculated field returns the value you expect.

## Context

Add an Integration Field Override Service to a Connector. The Integration Field Override Service defines the fields that Workday includes on integration output files. You then configure integration field overrides for all integration services; the field overrides define which report fields Workday uses to add data for each field.

## Steps

1. As a related action on the Connector, select Integration System > Configure Integration Services.
2. Add a row to the Custom Integration Services grid and select an Integration Field Override Service from the Integration Service prompt. If you haven't already created one, do so now:
  - a) Access the Create Integration Field Override Service task.
  - b) Name your new Integration Field Override Services. Then, select the business object that includes the report fields that you want to map to the integration file.
  - c) Add 1 row for each field and provide a name for each field.
3. As a related action on the Connector, select Integration System > Configure Integration Field Overrides.
4. In the Field Configuration grid for the Eligibility service, add a Boolean report field or Calculated Field that defines which workers to include in the integration.
5. Scroll down to the Field Configuration grid for the Integration Field Override Service.
6. For each field, select a corresponding report field from the Override External Field prompt.
7. To test user access to the report fields, select Integration Field Override > Test Security for Document Field Overrides as a related action on the integration.

## Set Up Integration Field Overrides for DIS

### Prerequisites

- [Create Integration System](#)  
Create an integration system based on an integration template.
- You can use calculated fields and report fields. Verify that fields you want to use are based on the same *business objects* as the object used by the integration.
- Security: *Integration Configure* or *Integration Build* domains in the Integration functional area.

## Context

You can use the Configure Integration Field Overrides task to customize the output of Workday integrations. You can configure which report fields Workday uses to add data for fields in the integration. You can also create, configure, and use parameters from the Integration Event business object as well as any other business objects supported by the integration.

You can create parameters for integrations that have a Data Initialization Service (DIS), such as:

- *Core Connector: Worker* (if you enable the *Worker Data Initialization Service*).
- *Payroll Effective Change Interface*.
- *Worker Effective Change Interface*.

## Steps

1. As a related action on the integration system, select Integration System > Configure Integration Field Overrides.
2. Select the document where you want to apply field overrides and parameter assignments.

3. (Optional) As you complete the Parameters section, consider:

Option	Description
Data Type	Select the return type for the report field or calculated field. This prompt filters the fields available in the Value prompt. You can override the datatype returned by the report or calculated field.  For instances cast to text, Workday uses the display ID in the integration output.
Value Type	Select how you want to provide values in the Value field.
Value	Enter a value depending on the Value Type: <ul style="list-style-type: none"> <li><i>Determine Value at Runtime</i>: select a report field or calculated field based on the business object of the document. This prompt displays only:               <ul style="list-style-type: none"> <li>Report fields and calculated fields with a data type that matches the Value Type value.</li> <li>All fields if the Value Type field is empty.</li> </ul> </li> <li><i>Integration Attribute</i>: Select an integration attribute of the integration system. Available for Global Parameters only.</li> <li><i>Launch Parameter</i>: Select a launch parameter of the integration system. Available for Global Parameters only.</li> <li><i>Specify a Value</i>: select or enter a value based on the prompt.</li> </ul>
Value Type (External Parameter Assignments(s))	Select how you want to provide values for prompts that the report field or calculated field uses.
Value (External Parameter Assignments(s))	Enter a value depending on the Value Type: <ul style="list-style-type: none"> <li><i>Determine Value at Runtime</i>: select a report field or calculated field.</li> <li><i>Specify a Value</i>: select or enter a value based on the prompt.</li> </ul>

4. As you complete the Field Overrides section, consider:

Option	Description
Override External Field	Select a report field or calculated field based on the business object of the document. To access the value of a document parameter, select a report field or calculated field with a prompt and pass in the document parameter using the prompt.
Value Type (External Parameter Assignment(s))	Select how you want to provide values for prompts that the report field or calculated field uses.

Option	Description
Value (External Parameter Assignment(s))	<p>Enter a value depending on the Value Type:</p> <ul style="list-style-type: none"> <li><i>Determine Value at Runtime</i>: select a report field or calculated field.</li> <li><i>Document Parameter</i>: select a parameter that you defined in the previous step. Workday requires that you save the document parameter before you can use it here.</li> <li><i>Specify a Value</i>: select or enter a value based on the prompt.</li> </ul>

5. As you complete the Extended Fields section, consider:

Option	Description
Data Type	<p>Select the return type for the report field or calculated field. This prompt filters the fields available in the Value prompt. You can override the datatype returned by the report or calculated field.</p> <p>For instances cast to text, Workday uses the display ID in the integration output.</p>
Reference ID Type	<p>Applies only to fields that return Instances (plural). Select a reference ID that you want to include in the integration output. You must select a Reference ID Type. If you don't select a Reference ID Type, Workday won't include any reference IDs in the integration output.</p>
Value	<p>Select a report field or calculated field based on the business object of the document. To access the value of a document parameter, select a report field or calculated field with a prompt and pass in the document parameter using the prompt. This prompt displays only:</p> <ul style="list-style-type: none"> <li>Report fields and calculated fields with a data type that matches the Data Type value.</li> <li>All fields if the Data Type field is empty.</li> </ul>
Value Type (External Parameter Assignment(s))	<p>Select how you want to provide values for prompts that the report field or calculated field uses.</p>
Value (External Parameter Assignment(s))	<p>Enter a value depending on the Value Type:</p> <ul style="list-style-type: none"> <li><i>Determine Value at Runtime</i>: select a report field or calculated field.</li> <li><i>Document Parameter</i>: select a parameter that you defined in the previous step. Workday requires that you save the document parameter before you can use it here.</li> <li><i>Specify a Value</i>: select or enter a value based on the prompt.</li> </ul>

- To test account access to the report fields, select Integration Field Override > Test Security for Document Field Overrides as a related action on the integration.

## Select Workers to Include in Connector Output

### Prerequisites

- [Create Integration System](#)

Create an integration system based on an integration template.

- To use a calculated field for the eligibility criterion, create the calculated field.
- Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

### Context

Designate a report field or calculated field that identifies if a worker is or isn't eligible for the integration. The report field or calculated field must be available on the Worker *business object*, and it must return a Boolean true or false. A Boolean true includes the worker in the integration. A Boolean false excludes the worker.

### Steps

- As a related action on the Connector, select Integration System > Configure Integration Field Overrides.
- In the Field Configuration grid for *Define Eligibility / Eligibility criterion*, select a report field, or calculated field, from the Override External Field prompt

### Example

If your integration system monitors changes for all of your staff employees, select the *Worker is Employee* field. This field returns true for your employees, and returns false for your contingent workers.

If your integration system monitors changes for your sales staff in your Chicago office, create a calculated field that returns true if:

- The worker is an employee.
- The worker belongs to a sales organization.
- The worker belongs to the Chicago location.

## Select and Set Up Connector Output Fields

### Prerequisites

- [Create Integration System](#)

Create an integration system based on an integration template.

- Enable the integration service that manages each category of data.
- Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

### Context

Select fields to include or exclude from the Connector output file and specify whether the integration requires that the fields have a value or have a maximum length. When the integration runs, Workday:

- Searches for changes to the selected fields
- Validates that the required fields are present in the output file
- Truncates values that exceed the maximum field length
- Reports any errors or warnings in the audit files

Field attributes and integration attributes work together to determine output file contents. Field attributes specify what data to include, and integration attributes specify when to include the data.

## Steps

1. Access the View Integration System report.
2. As a related action on the integration system, select Integration System > Configure Integration Field Attributes.
3. (Optional) To include all fields in the Field Configuration grid in the Connector output file, select Include All Fields in Output.  
This option doesn't automatically include all fields in subsections. To exclude all fields, clear this check box. This action also clears any Required fields and sets the Maximum Length to 0. You can't exclude some fields from the Connector output file.
4. In the Field Configuration grid for each data section, select fields for output and define field attributes. As you complete the task, consider:

Option	Description
Required	Workday returns errors, warnings, or stops the integration, depending on your integration configuration.
Maximum Length	Truncates output values that exceed the specified length. Workday never truncates Boolean values.

## Add Custom Fields to Connector Output

### Prerequisites

- [Create Integration System](#)  
Create an integration system based on an integration template.
- [Security: Integration Build and Integration Configure domains](#) in the Integration functional area.

### Context

Add an unlimited number of custom fields to a Connector. You can use calculated fields or report fields to incorporate additional data elements into your output files.

## Steps

1. If your integration doesn't already support integration field overrides, create an integration field override service and define custom fields:
  - a) Access the Create Integration Field Override Service task.
  - b) Select the Business Object prompt to select the data source for the custom fields.
  - c) For each custom field that you want to create, add a row to the Fields grid, and enter the field Name.
2. Access the View Integration System report and access your integration.
3. If your integration doesn't already support integration field overrides, enable the custom integration service:
  - a) As a related action on the integration system, select Integration System > Configure Integration Services.
  - b) In the Custom Integration Services grid, add a row.
  - c) Select the Integration Service prompt, select *Integration Field Override Service (Audited)*, and then select the custom integration service that you created in step 1.

4. As a related action on the integration system, select Integration System > Configure Integration Field Overrides.
5. Configure the custom fields:
  - a) For each field in the grid, select the Override External Field prompt and select the report field or calculated field that provides the value you want.

You can save your changes only if:

  - Each Name value is unique within each section of a document.
  - Each Name value is unique within a document. The only exception is if the field override has the same data type as the associated Override External Field value.
6. (Optional) To map the custom field values to external values, create, and configure one or more integration maps:
  - a) As a related action on the integration system, select Integration System > Maintain Integration Maps.
  - b) For each field that requires a map, specify a map Name in these formats: ADD-<FieldName>. The ADD prefix indicates that the map pertains to the Additional Data section. The <FieldName> identifies the field that Workday maps.
  - c) Specify the Internal Value Type and External Value Type for each map. You can create an Enumeration with a list of valid values or select a report field at the Data Type prompt.
  - d) As a related action on the integration system, select Integration System > Configure Integration Maps, then scroll to the bottom of the grid to find the custom maps.
  - e) Add a row for each internal value, select the Internal Value, and enter the External Value for the output file.

## Result

Workday groups all custom fields into a record called ADD that displays on a separate line in the output file. By default, Workday includes custom fields in output files only when field values change.

## Reference: Validations on Extended Fields for DIS

	Boolean	Currency	Date	Date Time	Numeric	Text	Instances (Plural)
Report field Type							
Boolean	Allowed	Not allowed	Not allowed	Not allowed	Not allowed	Allowed	Not allowed
Currency	Allowed	Allowed	Not allowed	Not allowed	Allowed	Allowed	Not allowed
Date	Allowed	Not allowed	Allowed	Allowed	Not allowed	Allowed	Not allowed
Date Time	Allowed	Not allowed	Allowed	Allowed	Not allowed	Allowed	Not allowed
Numeric	Allowed	Not allowed	Not allowed	Not allowed	Allowed	Allowed	Not allowed
Text	Allowed	Not allowed	Not allowed	Not allowed	Not allowed	Allowed	Not allowed
Instances (plural)	Allowed	Not allowed	Not allowed	Not allowed	Not allowed	Allowed	Allowed

## General Integration Management

### Mass Update Integration Tags

#### Prerequisites

- Set up your integration systems.

- Create integration tags.
- Security: *Integration Build* domain in the Integration functional area.

## Context

You can build reports to see how your organization uses your integrations with integration tags. Mass updating integration tags enable you to search and modify multiple integration systems at once.

## Steps

1. Access the Mass Update Integration Tags task.

As you complete the task consider:

Field	Consideration
Integration System Name	Filters the integration systems that you want to apply tags to by name.
Integration Template	Filters the integration systems that you want to apply tags to by integration template.
Integration Tags	Filters the integration systems tags you want to modify based on their existing tags.

2. Select the integration tags in the Apply To All sections you want to apply to all of the integration systems you filter.
3. Select the integration systems to apply the integration tags to.
4. (Optional) Select one or more tags in the Integration Tags column for each integration system.

You can update a maximum of 1000 integration systems at a time.

## Set Up Integration Attachment Service

### Prerequisites

- (For Studio integrations) Deploy a custom integration from Workday Studio to your tenant.
- Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

## Context

You can use the integration attachment service to configure data-mapping documents, such as XSLT files, on your custom integrations. For Studio integrations, the integration attachment service enables you to update data-mapping documents in Workday without having to redeploy from the Studio application.

## Steps

1. Access the View Integration System report and select your custom integration from the Integration System prompt.  
You can also access the Create Integration System task and select *Cloud Integration Template* on the New using Template prompt.
2. On the related actions menu of your custom integration, select Integration System > Configure Integration Services.

3. On the Custom Integration Services section, add a row and select Create > Integration Attachment Service.  
Each integration attachment service only supports 1 attachment. To add multiple attachments on your custom integration, create multiple integration attachment services.
4. On the related actions menu of your custom integration, select Integration System > Configure Integration Attachment Service.
5. Select an attachment from the Attachment prompt.

## Result

Workday attaches the data-mapping documents to your custom integration.

### Related Information

#### Reference

[2020R1 What's New Post: Integration Attachment Service](#)

## Set Up Integration Custom Objects

### Prerequisites

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

### Context

To associate Custom Objects in Workday with Custom Object aliases defined in a Studio integration, configure an Integration Custom Object Service for the Studio integration.

### Steps

1. Access your integration system if you haven't already done so.
2. As a related action on your integration system, select Integration System > Configure Custom Objects.
3. For each Custom Object alias without a *default* Custom Object, select a Custom Object from the prompt.
4. For each Custom Object alias with a *default* Custom Object, you can override the *default* by selecting Override.

## Attach Supporting Documentation to Integrations

### Prerequisites

Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

### Context

You can use the Maintain Integration System Documents related action on your integrations to attach supporting documentation for design, usage, and change log purposes. These documents enable you to provide additional background information on integrations for future maintenance and support.

### Steps

1. [Create Integration System](#).  
You can also access the View Integration System report and select an existing integration.
2. On the related actions menu of your integration, select Integration System > Maintain Integration System Documents.

3. On the Maintain Integration System Documents page, select the documents to attach to your integration.

## Result

Workday attaches the documents and displays them on your integration.

# Change Transport Protocols

## Prerequisites

Security:

- *Integration Configure* in the Integration functional area.
- *Edit* access to the domain where the integration and protocols are secured.

## Context

You can view and edit transport configurations for multiple transport protocols as a single action.

## Steps

1. Access 1 of these tasks:

- Maintain Email Protocols For Integration Systems
- Maintain Transport Protocols for Integration Systems
- Maintain Amazon Simple Storage Service for Integration Systems

2. Define the range of protocols that you want to change:

Option	Description
Email Protocols	Specify the Email Address and Configuration Location.
Transport Protocols	Specify the Transport Protocol, Configuration Location, and (Optional) Transport Protocol Address.
Amazon Simple Storage Service	(Optional) Specify the Configuration Location, Bucket, Bucket Region, and Access Key ID.

3. Add, change, and remove transport details.

For Maintain Amazon Simple Storage Service Protocols for Integration Systems:

- Select protocols of the integration systems you want to update. Provide the details for Bucket, Region, Access Key ID, and Secret Access Key.
- The Name field lists the integration systems that share an S3 transport protocol if you use the Use Existing configuration option. You must have access to the owning integration system to make changes to a shared transport.
- You can't update the KMS Key Alias and Region with this task.

Note: These tasks only display protocols that you have security access to:

- Maintain Email Protocols For Integration Systems
- Maintain Transport Protocols for Integration Systems
- Maintain Amazon Simple Storage Service Protocols for Integration Systems

## Concept: Disable Integration Subscriptions

To disable integration subscriptions for a web service request, you set the *x-disable-subscriptions* header value to 1 in the HTTP request. In Workday Studio, you can use the *set-headers* component to set the header value before performing a web service request.

You can also use various languages to set the property. Example (Java):

```
// Create a new URL object and set the Workday Web Services endpoint
URL url = new URL("https://[Workday Web Services endpoint]");

// Create an HTTP URL connection object and open the connection to the URL
HttpURLConnection httpCon = (HttpURLConnection) url.openConnection();

// Disable the integration subscriptions by setting the x-disable-
// subscriptions
// property to 1 in the HTTP URL connection object
httpCon.setRequestProperty("x-disable-subscriptions", "1");
```

When *x-disable-subscriptions* is set to 1, all integration subscriptions are disabled for that request. You can't disable individual integration subscriptions. The default for *x-disable-subscriptions* is zero, which means integration subscriptions are enabled.

## Concept: Enumerations

Enumerations restrict an attribute value to a set of literal values, such as cost center codes. You can use enumerations to define a set of constants to use as literal values when you design integrations. This allows you to restrict the range of data your integration uses.

You can create and maintain enumeration definitions in Workday using these tasks:

- Create Integration Enumeration Definition
- Edit Integration Enumeration Definition
- Delete Integration Enumeration Definition
- View Integration Enumeration Definition

You can use enumerations in these elements:

- Launch parameters.
- Integration attributes.
- Integration maps.

You can assign enumerations:

- In Studio.
- Using the Create Integration Generic Service task in Workday.

You can assign enumerations in Studio integrations using 1 of these methods:

- Create an enumeration definition in Studio and deploy it to your tenant when you launch the Studio integration.
- Create an enumeration reference to an existing enumeration definition in your tenant.

You can use the same enumeration definition across multiple integrations by selecting 1 integration to provide the definition, and referring to it in the others.

## Reference: Preferred SFTP, FTP, and FTPS Endpoint Vendor Software

Workday validates integration transports with each update and patch with these vendors and versions. Using the software listed results in the best integration results and update/patch experience.

Note: Workday doesn't require that you use these vendors and versions. You can use any vendors or versions with your integrations. However, the Workday support policy limits our support to issues or errors

under the direct control of Workday. If you experience problems with software not on this list, your cost of supporting it can be greater. This cost can include increased time and resources for additional testing, implementation delays, and use of manual or other non-Workday solutions.

Workday validates integration transports with these vendors and versions:

**Table 4: Validated Vendors and Versions**

Vendor	Version	SFTP	FTP (Passive)	FTPSI (Passive)	FTPSE (Passive)
GlobalSCAPE EFT Server	Enterprise (1.82)	X	X	n/a	n/a
Microsoft FTP Service	7.5	n/a	X	n/a	n/a
WS_FTP	7.5	X	X	n/a	n/a
Cygwin with SSHD	n/a	X	X	n/a	n/a
OpenSSH	4.3/5.1	X	X	X	X
VSFTPD	2.0.1	X	X	X	X

## Recommendations

This list is based on well-known, widely used endpoint vendor software and official Workday-supported transport modes and security policies.

If you use one of our preferred vendors:

- If there is an issue, Workday can internally troubleshoot and reproduce the issue.
- If we find a solution to your issue, we can test and verify against the software provided by your vendor.
- We run automated testing every service update against the software provided by your vendor. This testing reduces your maintenance cost and risk.

If you use an outside vendor:

- Many customers use a vendor outside our preferred list and their integrations work successfully.
- If you encounter an issue with S/FTP/S, you support, maintain, and troubleshoot with your vendor. Workday is unable to help because we don't have the software, tools, or familiarity with the vendor.

## Troubleshooting: SFTP Configuration Issues

### Integration displays SFTP errors when launched.

SFTP configuration issues can generate error messages on integrations. You can use the information here to help resolve common SFTP issues.

Cause	Solution
Workday was unable to locate an IP by hostname using DNS.	Ensure that the hostname is correct and the network settings are functional.

Cause	Solution
Connection reset issues.  Example: Your SFTP server is blocking connectivity to your Workday IP address.	<ul style="list-style-type: none"> <li>Allow the IP address on your firewall and ensure that the firewall accepts SFTP or SSH connections.</li> <li>Ensure that your cipher or SSH protocol is fully configured.</li> </ul>
Incorrect filename or filepath issues.	Use the full directory path for the file rather than the relative directory path. Add a trailing (/) as needed.
Timeout exception issues.	Ensure that the IP address is correct and that each application is working before you retry.
Directory issues.  Example: You have virtual directories on a file server that move once you place files in the directory, or the file doesn't exist.	Verify that the file directory is correct and that the file exists.
Packet size issues.  Example: The packet size exceeds the maximum amount permitted.	Ensure that you've configured the SSH protocol properly and reduce the packet size as needed.
Write error issues.  Example: You don't have permission to edit/ rename a file on the remote endpoint, or the server is deleting the file before you completely write the file.	Ensure that the Use Temp File check box is clear on the delivery/retrieval integration service and that you have edit/ rename permissions.
Channel request failure issues.  Example: The SFTP server isn't accepting SSH connections because the administrator set the SSH services as disabled.	Save the error from the SSH logs and restart SSH services.

## Integration APIs

### Set Up Web Service Operations for Studio Integrations

#### Prerequisites

- Integration must use the integration template *Cloud Integration Template*.
- Know the web services that the Studio integration uses.
- Security: *Integration Build* and *Integration Configure* domains in the Integration functional area.

#### Context

To more easily determine the security access required to launch a Studio integration, you can associate a Studio integration with the web services that it uses. Workday displays these web services in the *All Integration Systems* report. This association is for record-keeping purposes only. This association doesn't control which Workday Web Services the Studio integration uses.

#### Steps

- Access the View Integration System report and find the Studio integration.

2. Select Integration System > Maintain Web Service Operations as a related action on the Studio integration.
3. Add 1 row for each web service operation and select the Web Service Operation from the prompt.

## Concept: My Reports API

Use the My Reports API to access integration documents, such as output files, directly. Using the provided REST API, you can retrieve integration documents from the My Reports repository, or retrieve information about a specific document.

### My Reports Access

Your inbound web service Get operation must authenticate by including a Workday User ID (`<username>@<tenant_name>`) and password that corresponds to an existing Workday account. The `tenant_name` value is the name of the tenant that you're accessing. Workday controls access to My Reports using configurable security. The Workday account you use to access documents in My Reports must have permission to access those documents.

Each tenant has a My Reports repository with its own Uniform Resource Identifier (URI). This is where you direct web service Get requests. A My Reports repository is divided into 1 or more collections, each with a unique name. Each collection includes 1 or more documents, which are the actual data files produced by integrations.

The full address of a specific document takes this form:

- `host_URL/ccx/cc-blobitory/tenant_name/collection/document_ID`

Example: <https://wd5-enterprise-services1.myworkday.com/ccx/cc-blobitory/myTenant/myCollection/77441465-0b35-4773-303c-6d4456493462>

To access a collection rather than a document, use this form:

- `host_URL/ccx/cc-blobitory/tenant_name/collection`

This table summarizes the replaceable elements of the address:

Element	Description
<code>host_URL</code>	Specific to your tenant's data center. To find your host URL, download the spreadsheet attached to the Community post for your data center: <ul style="list-style-type: none"> <li>• US Region - Ashburn Data Center</li> <li>• US Region - Portland Data Center</li> <li>• US Region - WD12 Data Center</li> <li>• EU Region - Dublin Data Center</li> <li>• Canada Region - WD10 Data Center</li> <li>• Asia Pacific Region - WD102 Data Center</li> </ul> Example: the My Reports host URL for the Portland data center is <a href="https://wd5-enterprise-services1.myworkday.com">https://wd5-enterprise-services1.myworkday.com</a> .
<code>tenant_name</code>	Your tenant name.
<code>collection</code>	Specified by the integration that added the document to My Reports.
<code>document_ID</code>	A unique ID that Workday auto-generates when it creates a document.

You must know the *document\_ID* and associated *collection* for each document that you want to access. Use any of these lookup options to find that information:

- Integration IDs report.
- *Get\_Event\_Documents* web service operation.
- Write a custom report.

Include an HTTP Header *X-Tenant: tenant\_name* in your API call.

## Available Web Service Operations

The My Reports API provides Get operations to retrieve either a document, or information about the document (metadata):

Category	Value
Format Example	GET <i>My Reports URI/ CollectionID/EntryID</i> GET <URL>/ LetterBox/3160291f-404d-4856-3c03-427f2a296a1f
Response	Returns the specified document.
Category	Value
Format Example	GET <i>My Reports URI / CollectionID/EntryID.atom</i> GET <URL>/ LetterBox/3160291f-404d-4856-3c03-427f2a296a1f.atom
Response	Returns an XML document with information about the document. The XML document includes: <ul style="list-style-type: none"> <li>• Expiration date.</li> <li>• Published date.</li> <li>• Last update date.</li> <li>• Title.</li> <li>• File size.</li> <li>• Whether the file is encrypted and compressed.</li> <li>• File owner.</li> </ul>

## Concept: Integration Launch API

To launch integrations remotely, use the Integration Launch API. Using the provided REST API, you can launch a Studio integration using a simple URI in a more event-based manner. Using REST eliminates the need to use a SOAP API call.

### Integration Launch API Security

Your inbound web service GET operation must authenticate by 1 of 2 methods:

1. Basic Auth: Include a Workday user ID and password. The Workday user ID takes the form `username@tenant_name`, where `tenant_name` is the name of the tenant that you're accessing.
2. OAuth: Include a bearer access token, which you obtain using a cURL request. During the process, you require these values:
  - From your Workday API client: Client ID, Authorization Endpoint, and Token Endpoint.
  - From a PKCE code generator: Code Verifier and Challenge.
  - From a browser: Authorization Code.

For detailed steps, see [Launch Integrations Using OAuth 2.0 Bearer Tokens](#).

Note: Workday recommends that you use OAuth authentication for increased security.

When an ISU is assigned to the Integration System, the user account performing the Listener request must be a member of a security group that grants permission to launch the integration.

When no ISU is assigned, the user account performing the Listener request must be a member of security group or groups that grant permission to:

- Launch the integration.
- Access all data APIs used by the integration.

Each tenant has its own Uniform Resource Identifier (URI) to which you direct the web service Get requests. For the latest endpoints, and for information on how to determine your data center and endpoint URI, see the [Workday Data Centers](#) page on the Workday Community.

Include an HTTP Header *X-Tenant: tenant\_name* in your API call.

### Cloud Repository Structure

You launch Studio integrations that you've deployed to the Workday Cloud Repository. Workday organizes this repository into a hierarchy:

- Cloud Repository: Each tenant has a single Cloud Repository.
- Collection: Each Cloud Repository stores 1 or more Collections. Each Collection has a unique Collection name.
- Integrations: Each Collection includes 1 or more Studio integrations. Each integration has a unique name and *workday\_in\_id* value.

You specify a Studio integration using the URI:

*Tenant\_URI/ccx/cc-cloud-repo/launches/collection\_name/integration\_name/workday\_in\_id?launch\_parameter\_name=value*:

Where:

- *Tenant\_URI* is the URL for the tenant.
- *collection\_name* identifies the Collection.
- *integration\_name* is a specific Studio integration.
- *workday\_in\_id* is specific to the integration.

### Available Web Service Operation

The Integration Launch API provides a single Get operation to launch a Studio integration:

Category	Value
Format	GET <i>URI/ccx/cc-cloud-repo/collections/collection_name/integration_name/workday_in_id?launch_parameter_name=value</i>
Example	GET <a href="https://enterprise-services1.myworkday.com/ccx/cc-cloud-repo/collections&gt;HelloCloudCollection&gt;HelloCloud/StartHere?name=HelloCloud">https://enterprise-services1.myworkday.com/ccx/cc-cloud-repo/collections&gt;HelloCloudCollection&gt;HelloCloud/StartHere?name=HelloCloud</a>
Response	<p>Launches the <i>Hello Cloud</i> integration.</p> <p>Note: For a sample integration that uses the Listener Service, see the <a href="#">Listener Service</a> post on the Workday Community.</p>

### Concept: Listener Service API

To post messages to a Studio integration with an enabled Listener Service, use the Listener Service API. Using the provided REST API, you can post a custom message (defined by you or the external service you're integrating with) to a Studio integration. You can post a message as long as you've built the Studio integration to recognize and act upon the message.

## Listener Service API Security

Your inbound web service POST operation must authenticate by 1 of 2 methods:

1. Basic Auth: Include a Workday user ID and password. The Workday user ID takes the form `username@tenant_name`, where `tenant_name` is the name of the tenant that you're accessing.
2. OAuth: Include a bearer access token, which you obtain using a cURL request. During the process, you require these values:
  - From your Workday API client: Client ID, Authorization Endpoint, and Token Endpoint.
  - From a PKCE code generator: Code Verifier and Challenge.
  - From a browser: Authorization Code.

For detailed steps, see [Launch Integrations Using OAuth 2.0 Bearer Tokens](#).

Note: Workday recommends that you use OAuth authentication for increased security.

When an ISU is assigned to the Integration System, the user account performing the Listener request must be a member of a security group that grants permission to launch the integration.

When no ISU is assigned, the user account performing the Listener request must be a member of security group or groups that grant permission to:

- Launch the integration.
- Access all data APIs used by the integration.

Each tenant has its own Uniform Resource Identifier (URI) which you direct the web service Post requests to. For the latest endpoints, and for information on how to determine your data center and endpoint URI, see the [Workday Data Centers](#) page on the Workday Community.

Include an HTTP Header X-Tenant: `tenant_name` in your API call.

## Cloud Repository Structure

You access Studio integrations that you've deployed to the Workday Cloud Repository using this hierarchy:

- Cloud Repository: Each tenant has a single Cloud Repository.
- Collection: Each Cloud Repository stores 1 or more Collections. Each Collection has a unique Collection name.
- Integrations: Each Collection includes 1 or more Studio integrations. Each integration has a unique name and `workday_in_id` value.

You specify a Studio integration using the URI format:

`Tenant_URI/ccx/cc-cloud-repo/  
launches/collection_name/integration_name/workday_in_id?launch_parameter_name=value`:

Variable	Description
<code>Tenant_URI</code>	The URL for the tenant.
<code>collection_name</code>	Identifies the Collection.
<code>integration_name</code>	A specific Studio integration.
<code>workday_in_id</code>	ID specific to the integration.

## Available Web Service Operation

The Listener Service API provides a single Post operation to send a message to a Studio integration:

Category	Value
Format	<code>POST URI/ccx/cc-cloud-repo/ launches/collection_name/integration_name/workday_in_id</code>

Category	Value
Example	POST <a href="https://enterprise-services1.myworkday.com/ccx/cc-cloud-repo/collections&gt;HelloCloudCollection/HelloCloud/StartHere">https://enterprise-services1.myworkday.com/ccx/cc-cloud-repo/collections&gt;HelloCloudCollection/HelloCloud/StartHere</a>
Response	<p>Posts a message to the <i>Hello Cloud</i> integration.</p> <p>Note: For a sample integration that uses the Listener Service, see the <a href="#">Listener Service</a> post on the Workday Community.</p>

## Concept: Message Queue API

To retrieve and process messages enqueued by Studio integrations on the Message Queue Service, use the Message Queue Service API. Workday retrieves and processes messages in an ordered manner, and delivers them exactly once. Using the provided REST API, you can retrieve and manage messages on a Queue.

The Message Queue Service feature doesn't implement *WS-ReliableMessaging* or a similar standard.

### Message Queue API Security

Your inbound web service Get, Post, Put, and Delete operations must authenticate by including a Workday User ID (*username@tenant\_name*) and password that corresponds to an existing Workday account. The *tenant\_name* value is the name of the tenant that you're accessing. Workday controls access to the Queue using configurable security. The Workday account you use to authenticate with the REST API must have access to the *Message Queue (segmented)* domain as well as the Message Queue Segment.

Each tenant has its own Uniform Resource Identifier (URI) to which you direct the web service requests. For the latest endpoints, and for information on how to determine your data center and endpoint URI, see the [Workday Data Centers](#) page on the Workday Community.

Include an HTTP Header *X-Tenant: tenant\_name* in your API call.

### Message Queue API Access

You access the Message Queue for your tenant using the URI format:

*URI*/ccx/wd-queue/*queue\_name*:

Variable	Definition
<i>URI</i>	The URL for the tenant.
<i>queue_name</i>	The name of the Message Queue.

### Available Web Service Operations

The Message Queue API provides Get, Post, Put, and Delete operations to:

- Get information about the API schema and messages that are still in the queue.
- Retrieve a specific message.
- Delete 1 or all messages in a Message Queue.

Message Queues are subject to capacity and data retention limits.

Category	Value
Format	GET <i>URI</i> /ccx/wd-queue?xsd
Example	GET <a href="https://queue-services1.myworkday.com/ccx/wd-queue?xsd">https://queue-services1.myworkday.com/ccx/wd-queue?xsd</a>
Response	Retrieves the XML schema for the API.

Category	Value
Format	GET <code>URI/ccx/wd-queue/</code>
Example	GET <code>https://queue-services1.myworkday.com/ccx/wd-queue/</code>
Response	Retrieves information about all queues in the tenant.

Category	Value
Format	GET <code>URI/ccx/wd-queue/queue_name/fresh?maxMessages=nnn</code>
	<i>maxMessages</i> is optional; <i>nnn</i> is the number of messages. If not specified, Workday returns 100 messages.
Example	GET <code>https://queue-services1.myworkday.com/ccx/wd-queue/queue1/fresh</code>
Response	Retrieves the 100 most recent unretrieved messages from the <i>queue1</i> Message Queue. If there are no messages on queue1, Workday returns an empty XML document. If queue1 doesn't exist, Workday returns an HTTP 404 error code.

Category	Value
Format	GET <code>URI/ccx/wd-queue/queue_name/messages/message_number</code>
Example	GET <code>https://queue-services1.myworkday.com/ccx/wd-queue/queue1/messages/1234</code>
Response	Retrieves message <i>1234</i> from the <i>queue1</i> Message Queue.

Category	Value
Format	DELETE <code>URI/ccx/wd-queue/queue_name/messages/message_number</code>
Example	DELETE <code>https://queue-services1.myworkday.com/ccx/wd-queue/queue1/messages/1234</code>
Response	Deletes message <i>1234</i> from the <i>queue1</i> Message Queue.

Category	Value
Format	PUT <code>URI/ccx/wd-queue/queue_name/</code>
Example	PUT <code>https://queue-services1.myworkday.com/ccx/wd-queue/queue1/</code>
Response	Creates a Message Queue called <i>queue1</i> .

Category	Value
Format	POST <code>URI/ccx/wd-queue/queue_name/message</code>
Example	POST <code>https://queue-services1.myworkday.com/ccx/wd-queue/queue1/message</code>
Response	Enqueues <i>message</i> onto <i>queue1</i> . Returns a URI for the <i>message</i> . Example: <code>URI/wd-queue/queue1/messages/4321</code> . The newly allocated sequence number of the message is <i>4321</i> .

Category	Value
Format Example	POST URI/ccx/wd-queue/queue2 message POST https://queue-services1.myworkday.com/wd-queue/queue2 message
Response	Creates a queue called queue2 and enqueues message onto queue2.

## Launch Integrations Using OAuth 2.0 Bearer Tokens

### Prerequisites

### Context

When you launch an integration programmatically, you can authenticate using OAuth 2.0. To do so, you require a bearer access token, which you obtain using a cURL request to a token endpoint.

### Steps

1. Register an API client. As you complete this task, consider:

Client Grant Type	Authorization Code Grant.
Support Proof Key for Code Exchange (PKCE)	Select this checkbox.
Access Token Type	Bearer.
Redirection URI	Example: https://google.com
Grant Administrative Consent	Select this checkbox.
Scope	Select: <ul style="list-style-type: none"> <li>• Implementation</li> <li>• Integration</li> <li>• System</li> <li>• Tenant Non-Configurable</li> </ul>

Take note of these values for later use:

- Client ID. Example: MjEwNGVmNTgtZWFlNS00MTQ2LWAAZjctNWYxMjBlNTEwMmIz
- Authorization Endpoint. Example: https://<hostname>/super/authorize
- Token Endpoint. Example: https://<hostname>/ccx/oauth2/super/token

2. Generate a SHA-256 Code Verifier and a Code Challenge using a PKCE code generator website.

Take note of these values for later use:

- Code Verifier. Example: Ii-HfGHYN01J0EZtToJwg9Wmuqss8mNF7\_SE343tjMR7i\_00HbsPA8sJAfMxlLksnfPsAtBo4SyOkYaYov
- Code Challenge. Example: x8SJ\_t0WfmDB2JKvqwXAE8DxV7W\_gP\_jTDFVIBVvxYg

- To obtain an Authorization Code from a browser, create a URL using values you obtained earlier, in this format:

```
<Authorization Endpoint value>?client_id=<Client ID value>&response_type=code&code_challenge=<Code Challenge value>&code_challenge_method=S256
```

Example:

```
https://<hostname>/super/authorize?  
client_id=MjEwNGVmNTgtZWFkNS00MTQ2LWAAZjctNWYxMjBlNTEwMmIz&response_type=code&code_
```

Enter the URL in a browser and approve access to your tenant. Take note of the Authorization Code parameter in the resulting redirect.

Example: the redirect <https://www.google.com/?code=6ru2pkjr9k6jsd4e953fu8lu7> provides the code 6ru2pkjr9k6jsd4e953fu8lu7.

- To obtain a bearer access token, create a cURL POST request in this format:

```
curl --location --request POST <Token Endpoint value>  
--header "Origin: https://www.google.com" \  
--header "Content-Type: application/x-www-form-urlencoded" \  
-d "grant_type=authorization_code" -d "code=<Authorization Code value>" \  
-d "client_id=<Client ID value>" \  
-d "code_verifier=<Code Verifier value>" \  
-d "redirect_uri=https://www.google.com"
```

Example:

```
curl --location --request POST https://<hostname>/ccx/oauth2/super/token  
 \  
--header "Origin: https://www.google.com" \  
--header "Content-Type: application/x-www-form-urlencoded" -d  
"grant_type=authorization_code" \  
-d "code=6ru2pkjr9k6jsd4e953fu8lu7" \  
-d "client_id=MjEwNGVmNTgtZWFkNS00MTQ2LWAAZjctNWYxMjBlNTEwMmIz" \  
-d "code_verifier=Ii-  
HfGHYN01J0EZtToJwg9Wmuqss8mNF7_SE343tjMR7i_00HbsPA8sJAfMx1LksnfPsAtBo4SyOkYaY0vn1ne  
 \  
-d "redirect_uri=https://www.google.com"
```

The response returns a bearer access token. Example:{ "access\_token":

```
"eyJ0eXAiOiJhdCtKV1QiLCJhbGciOiJSUzUxMiJ9.eyJzdWIiOiIzNGNkNWZjYTE1ZGQ0MWQ2OTHiMDY2NzI2DYaf5s18q43w3gd0ONa93FT7UiJjkJyUgWK393CHa3KyaGLbb95rjLbldLB8W1sWuiWEC3Yh8ez-XargwVQiUDPaBw5aC65xtmryGGd9Pue6DPtKqQo6fSZPfOR93oc31aBPsxFABGMxoOq6wTkWpIOY9huiah6c  
"token_type": "Bearer" }
```

- To launch the integration, obtain an integration launch URL from Workday.

Create a cURL POST request in this format:

```
curl -X "POST" https://<launch URL> \  
-H 'Authorization: Bearer <Bearer Access Token value>' \  
-H 'X-Tenant: <tenantname>' \  

```

```
-H 'Content-Type: text/plain; charset=utf-8'
```

#### Example:

```
curl -X "POST" https://<hostname>/ccx/cc-cloud-repo/launches/retrieval_sample/RetrieveNStore/ProcessFirstRetrievedDoc \
-H 'Authorization: Bearer eyJ0eXAiOiJhdCtKV1QiLCJhbGciOiJSUzUxMiJ9.eyJzdWIiOiIzNGNkNWZjYTE1ZGQ0MWQ2OThiMDY2N
I2DYaf5s18q43w3gd0ONa93FT7UiJjkJyUgWK393CHa3KyaGLbb95rjLbldLB8W1sWuiWEC3Yh8ez-
XargwVQiUDPaBw5Ac65xtmryGGd9Pue6DPtKqQo6fSZPfOR93oc31aBPsxFABGMxoOq6wTkWpIOY9huiah6
\ \
-H 'X-Tenant: super' \
-H 'Content-Type: text/plain; charset=utf-8'
```

#### Result

Workday's XML response confirms that the integration has launched.

## Orchestration for Integrations

### Access Orchestrate for Integrations

#### Prerequisites

Note: You might need to take additional steps to enable this feature based on your organization's subscription service agreement. Your organization is either on the Main Service Agreement (MSA) or the Universal Main Service Agreement (UMSA). To determine your organization's subscription service agreement:

1. Select your profile avatar on [Workday Community](#).
2. Select Profile.
3. On your profile page, select your organization's name, which is beneath your name and next to your job title.
4. View your Subscription Service Agreement value.

If the value is:

- *UMSA*, the feature is automatically available. You can skip the Enable Innovation Services Features and Machine Learning Data Contributions for MSA Customers step. For more information on Machine Learning data contributions, see [Concept: Workday AI for Universal Main Subscription Agreement Customers](#).
- *MSA*, you must enable this feature through Innovation Services using the Enable Innovation Services Features and Machine Learning Data Contributions for MSA Customers step.

Note: UMSA customers don't have Innovation Services tasks and reports in their tenants as these are for MSA customers only. UMSA customers can ignore all information regarding Innovation Services.

Security: *Manage: Innovation Services* domain in the Innovation Services functional area.

#### Context

Before you can use Orchestration Builder to create integrations, you must:

- Opt in to Workday's Innovation Service Agreement.
- Create a company in the Workday Developer Site.

- Designate an administrator for the company.

## Steps

1. In your Workday Production tenant, access the Innovation Services and Data Selection Opt-In report.
2. On the Available Services tab, select the WCP section.
3. Select the Workday Orchestrate for Integration checkbox.
4. Click Next, then Next again, and finally click OK.
5. Access the Maintain Workday Build Company for Orchestrate for Integration task to specify administrator role information. The name and email address you enter should reflect who will act as the administrator for the company on the Workday Developer Site.

## Result

Your designated company administrator can now access the Workday Developer Site and begin tasks such as creating users. For more information, see: [Manage Users in Companies](#).

## Concept: Orchestrate for Integrations

Workday Orchestrate for Integrations enables you to design, build, manage, and share integrations between Workday and external systems.

Orchestrate for Integrations is secure, scalable, and extensible:

- Workday ensures that data is encrypted in transit and at rest, and that integrations comply with industry standards and regulations.
- The platform is designed to handle high volumes of data and complex integration patterns. It can scale to meet the growing needs of your organization without compromising performance.
- You can extend the functionality of your integrations by incorporating custom logic, third-party APIs, and Workday's extensive library of global functions and member functions.

The central Orchestrate for Integrations tool is Orchestration Builder, a drag-and-drop development environment that enables you to create complex workflows without writing code. These workflows, known as orchestrations, can automate business processes, transform data, and facilitate real-time, event-driven API interactions with third-party services.

Orchestration Builder is available on the Workday Developer Site. It's entirely browser-based. You don't need any additional downloads.

The Workday Developer Site also enables you to:

- Iteratively build, test, and verify your integration apps across multiple environments to ensure that they're working properly before you release them to production.
- Access tooling such as API explorers, which provide everything you need to know about the APIs you can use to access and manipulate Workday data.
- Manage users and tenants, and to monitor app performance.

Integrations powered by Workday Orchestrate for Integrations are called integration apps.

Some sample use cases for integration apps:

- Automate HR processes by integrating Workday with external HR systems for seamless data synchronization.
- Connect Workday to financial systems to facilitate real-time budgeting, expense management, and reporting.
- Integrate Workday with customer relationship management (CRM) systems to align sales, service, and HR data.

- Build integrations that support compliance with regulatory requirements by ensuring accurate data exchange between Workday and external reporting tools.

## Concept: Integration Events and Integration Process Events

### Integration Event

In Workday, an Integration Event is the top-level container for an integration execution within the Integration Framework. Integration Events are often referenced in the user interface. Each one contains:

- A reference to the job sent to the integration runtime.
- The status of the integration run.
- Messages associated with the integration run.
- Attached documents, also referred to as Output Files.
- Launch parameters.
- Initiated and Completed timestamps for the integration run.

An Integration Event may comprise a Main Orchestration Event and 0 or more Child Integration Events.

### Integration Process Event

An Integration Process Event provides a sequential view of the Business Process steps configured by the integration's developer. Think of it as the workflow side of the integration. You may see an Integration Process Event referred to as an Integration Event Business Process.

Typically, an integration's Business Process includes service steps, such as Retrieval and Delivery, and integration steps, such as the invocation of other Integration Systems.

The completion of a child integration, which triggers the callback to the parent orchestration, occurs only when the associated Integration Business Process completes execution of the configured steps.

In essence, an Integration Event is the wrapper for an integration run in Workday, while an Integration Process Event is the actual Business Process execution that defines and performs the steps involved in that run. Every Integration Event has an Integration Process Event.

## Workday Extend

### Setup Considerations: Workday Extend

You can use this topic to help make decisions when planning your configuration and use of Workday Extend. It explains:

- Why to set it up.
- How it fits into the rest of Workday.
- Downstream impacts and cross-product interactions.
- Security requirements and business process configurations.
- Questions and limitations to consider before implementation.

Refer to detailed task instructions for full configuration details.

### What It Is

Workday Extend is a toolset that enables developers to build, deploy, and share apps that extend the core Workday features. Custom apps run on Workday, render custom pages that follow the Workday UI standards, and interact with Workday data and external data sources. Custom apps can store data as unique business objects used with specialized business processes and security domains. Apps can

launch event-driven and automated processes across Workday and third-party systems. Apps can also be external applications that run outside the tenant and directly access Workday data.

## Business Benefits

Workday Extend enables your organization to:

- Build upon Workday core functionality to solve unique business requirements.
- Increase user productivity by providing simplified tasks and harmonized user experiences within Workday.
- Reduce IT costs incurred from maintaining a network of applications on separate technology stacks.
- Use existing domain and business process security policies within Workday.

## Use Cases

You can build a custom app in:

- Human Capital Management to foster employee engagement in programs that support corporate mission, values, and culture.
- Financials to enable supplier self-service to initiate transactions in the Workday Supplier Portal.
- Student to simplify the provision of student services and encourage student engagement in campus activities.
- Enterprise Frameworks to collect information from employees and managers for analysis, transaction processing, or integrations.

## Questions to Consider

Questions	Considerations
What development and administration resources do you have to build and manage apps?	<p>Account for these roles and responsibilities:</p> <ul style="list-style-type: none"> <li>• Company Administrator: Configures tenant settings. Also manages companies, users, tenants, and the custom apps for your organization on the Developer Site.</li> <li>• Business analyst: Defines the use cases and requirements, and understands Workday features and configuration options.</li> <li>• Developer: Builds and deploys custom apps. Though not required, Workday recommends that developers have experience with JavaScript Object Notation (JSON), REST APIs, and lightweight object-oriented languages like JavaScript.</li> <li>• Tester: Plans and performs test scripts for the custom apps during their lifecycle from Development to Production Release.</li> </ul>
Who do you want to use the app?	<p>Workday Extend apps currently only support users with Workday accounts, and don't support these external accounts:</p> <ul style="list-style-type: none"> <li>• Candidates on the External Career Site.</li> <li>• Student applicants on the External Student Site.</li> <li>• Prospective suppliers on the External Supplier Site.</li> </ul>

Questions	Considerations
	In addition to the worker (employee or contingent) and student account types, other user types with Workday accounts can access Workday Extend apps. Examples: In HCM, extended enterprise learner, external committee member, recruiting agency user, retiree, service center representative, terminee, and others. In Financials: customer contact, supplier contact, and others. In Student: academic affiliate, admissions counselor, student proxy, and others.
How do you want users to access the app?	<p>When you want users to access Workday through a custom app that runs in Workday, configure custom tasks. You can also configure worklets and dashboards to provide entry points to custom tasks in Workday.</p> <p>When you want users to access Workday through an external app, create an API client. To access Workday REST APIs, the external app must request access tokens using an OAuth authorization flow. When designing the custom UI of your app, consider the Workday UI styles in the Workday Canvas Design System.</p>
What types of data do you want the app to access?	<p>If your app needs to access Workday data, determine the potential Workday REST APIs you can call from the custom app.</p> <ul style="list-style-type: none"> <li>In addition to the Workday REST web services that provide access to Workday business objects, also determine whether you want to use web service-enabled custom reports and Workday Query Language (WQL) APIs.</li> <li>For adding, updating, or deleting Workday data, ensure that a Workday REST API is available.</li> </ul> <p>If your app needs to access external data sources, ensure that they provide third-party REST APIs with supported authentication types.</p>
Do you need to create unique objects for data storage in your app?	Workday enables you to create single-instance business objects for Extend apps. Determine the business objects you intend to use for data storage.
Do you need to create event-driven processes?	Workday Orchestration Builder enables you to create real-time, event-driven processes across Workday and other external systems. The processes you create with Orchestration Builder are called orchestrations. Each orchestration comprises a number of components that you link together to manipulate data. You can launch orchestrations from a custom app or an external app.

Questions	Considerations
Do you need the app to connect to non-Workday services?	<p>If your app needs to interact with services outside the Workday tenant, you can:</p> <ul style="list-style-type: none"> <li>Enable a custom report as a web service to integrate Workday with external business services. External reporting tools can access Workday data through the custom report URL.</li> <li>Create an API client for external applications such as Salesforce to access Workday data. Determine the OAuth authentication flow required by the external application.</li> </ul>

## Recommendations

- To explore custom app ideas and common themes that other customers have built with Workday Extend, browse the Workday Extend Application Themes and App Stories on Workday Community.
- To learn from Workday Extend reference apps, browse the Workday Extend App Catalog on Workday Community.
- Once you license Workday Extend, find tutorials, sample apps, and documentation to get you started and learn best practices on the Developer Site.

## Requirements

- Assign a Developer Support Contact (DSC). The Named Support Contact (NSC) for your organization must assign the first DSC, who automatically becomes your first Company Administrator. DSCs create and manage support cases on the Developer Site.
- Designate at least 2 Company Administrators and user membership on the Developer Site. The first Company Administrator must add Workday Extend users and assign their roles: Company Administrator, Developer, Member. Workday grants role-based access for members of a company to the Developer Site, Development tenants, and custom apps.
- Install IntelliJ IDEA by JetBrains. The Workday Extend Plugin for IntelliJ is the developer tool for building, validating, and deploying custom apps. You can use either the Community or Ultimate editions.
- Ensure that your sandbox tenant is available for testing apps before promoting them to Production Release. Workday Extend enforces sequential promotion levels of custom apps across the tenants:
  - Development
  - Implementation
  - Sandbox
  - Production

## Limitations

- Workday determines the allotted resources and usage thresholds for your organization based on your Workday Extend contract. You can view the Entitlements dashboard on the Developer Site for usage statistics and thresholds.

To protect the health of your tenant, Workday limits the number of API calls on a per-second basis. When your tenant exceeds this limit, the apps receive a 429 HTTP response code. When the number of requests per second drops below the limit, calls complete successfully.

- Presentation Services imposes certain guardrails on custom apps to optimize tenant performance and resources.
- If your apps use model components, be aware of the limits on model components.

- If your apps use orchestrations, be aware of the orchestration runtime limits.

## Tenant Setup

- Enable the *Workday Extend* security domain and its subdomains on non-Development tenants: Implementation, Sandbox, and Production tenants.
- Create and manage Development tenants on the Developer Site (Company Administrators only). Workday determines the maximum number of Development tenants allotted to your organization based on your Workday Extend contract.
- Configure any tenant settings required by the Workday REST web services invoked by your app.

## Security

Configure these security domains in the System functional area:

Domains	Considerations
<i>Custom Task</i>	Users can create custom tasks. Determine the domains to secure the custom tasks that run your app. App users need permissions to the domains that secure the custom tasks.
<i>Manage: App Manager</i>	Users can install and configure custom apps on the tenant.
<i>Workday Extend</i>	Users can access Workday Extend features. The <i>Workday Extend</i> domain is the parent domain.
<i>WQL for Workday Extend</i>	Users can invoke WQL queries.

For endpoint authentication:

- Workday REST APIs use Single Sign-On (SSO) endpoint authentication. For each Workday REST web service invoked by an app, configure the security domains for each endpoint in their respective functional area. The endpoint descriptions in the Workday REST API documentation specify the security domains.
- If your organization uses Integration System Users (ISUs), configure the ISUs and related security groups. If you want to save refresh tokens for the ISU in the External Client Credential Store, you can configure the WCPISU authentication scheme. Note that configuring the WCPISU authentication scheme involves a considerable number of steps.
- If the app calls third-party REST APIs, you can configure OAuth Authorization Code, OAuth Client Credentials, or Amazon Web Services Signature V4 authentication schemes on each endpoint.

To use Workday Extend API Clients in your non-Development tenants, ask your Developer Support Contact to open a case to allow the API Clients.

## Business Processes

Determine which Workday REST APIs initiate the business process events required by your use case. Configure the business processes used by the Workday REST APIs that the app invokes. Follow the recommended business process configurations for their respective functional areas.

Your apps can also call these business process REST APIs:

- The Request Framework REST APIs enable your apps to initiate, view, and close requests as part of a Workday business process.

- The Business Process REST APIs enable you to retrieve events and event steps. You can also call the Business Process REST APIs to approve, deny, or send back a step in the Request business process.

## Reporting

You can enable Reports-as-a-Service (RaaS) reports as web services, which provide access to custom reports as REST endpoints. You can display the search results on the faceted search widget.

Workday Extend also provides reports and dashboards for analyzing usage metrics:

Report or Dashboard	Considerations
Analytics dashboard on the Developer Site	View app usage, performance, and logging information. Developers can use the logs for debugging and troubleshooting custom apps.
Entitlements dashboard on the Developer Site	View statistics on app usage and thresholds determined by your Workday Extend contract.
WQL Performance logs	View performance logs in your tenant to troubleshoot performance issues in your WQL queries.

## Connections and Touchpoints

Workday offers a Touchpoints Kit with resources to help you understand configuration relationships in your tenant. Learn more about the [Workday Touchpoints Kit](#) on Workday Community.

## Workday Extend Fundamentals

### Install Extend Apps on Tenants

#### Prerequisites

- Add the Workday Extend App Manager worklet to your Workday Home page by accessing the settings menu.
- Enable all *Workday Extend* security domains in the System functional area and create security policies with Modify access for each domain.

## Context

You can use the Workday Extend App Manager worklet to install and configure Workday Extend apps in your Workday Extend-enabled tenant. You must install an app on each tenant to enable users to access the app on that tenant. You only need to install an app once for each tenant. You can configure the app once you install it.

You can't install an app with model components until the model components of the app deploy to the tenant as part of Workday's Weekly Service Update. As a consequence, you must promote your app before a weekly deadline for new or updated model components to deploy to your Workday tenant.

## Steps

1. Sign in to the tenant on which you want to install the app.
2. Select the app you want to install from the Ready to Install tab of App Manager, and then click **Install**.
3. Select **Confirm**.

**Note:** Once you install an app on a non-Development tenant, you can't remove the app from that tenant.

4. Select the app you want to configure from the Installed tab. Click **Configure** to manage your app.

**Note:** If the model components of your app aren't available when you attempt to configure the app, contact your organization's Developer Support Contact to determine if you need to run the Refresh Extend Model Components Cache task.

## Result

Workday installs and configures the app on your tenant. When you update the app, you don't need to reinstall it on the tenant.

Related Information

### Tasks

[Steps: Set Up People Experience](#)

## Create Custom Tasks

### Prerequisites

Set up your custom app that you want to access from Workday.

Security: *Custom Task* domain in the System functional area.

## Context

You can use custom tasks to enable users to access your Workday Extend app in Workday. You can build, deploy, and share apps that run on Workday and meet the specific business needs of your enterprise.

## Steps

1. Access the Create Custom Task task.
2. As you complete the section, consider:

Option	Description
Title	The task title that displays in Workday. This value is available in the {taskTitle} parameter.

Option	Description
Reference ID	When you don't enter a Reference ID, Workday creates one based on the task title and a unique identifier.
Application ID	Use the <code>applicationId</code> property in the App Metadata (AMD) file for your app.
Site ID	Use the <code>siteId</code> property in the Site Metadata (SMD) file for your app.
Route Path	<p>The route to the landing page in the custom app.</p> <p>The Route Path can contain a combination of path and query parameters. Examples:</p> <ul style="list-style-type: none"> <li>Path parameters: <code>/myCustomTask/pathParam1/pathParam2</code></li> <li>Query parameters: <code>/myCustomTask?queryParam1=value1&amp;queryParam2=value2</code></li> <li>Path and query parameters: <code>/myCustomTask/pathParam1?queryParam1=value1</code></li> </ul> <p>The Route Path must correspond to the <code>routingPattern</code> of the task definition in the <code>tasks[]</code> array in the AMD. Ensure that the root in the Route Path matches the root in the <code>routingPattern</code>.</p> <p>You can use these keywords in the Route Path:</p> <ul style="list-style-type: none"> <li><code>{customTaskObjectId}</code> - The ID of the current context instance. Example: If you enable the custom task as a related action on a worker, <code>{customTaskObjectId}</code> contains the Workday ID of the current worker.</li> <li><code>{taskTitle}</code> - The custom task title.</li> </ul> <p>If the Route Path has path parameters, append the positional path parameters in the <code>routingPattern</code>. Surround path parameters with curly braces, <code>{ }</code>.</p> <p>Example: The Route Path is <code>/myCustomTask/{customTaskObjectId}/{taskTitle}</code>. The corresponding <code>routingPattern</code> is <code>/myCustomTask/{workerID}/{title}</code>. To reference the path parameters in the landing page, use <code>routeParams.workerID</code> and <code>routeParams.title</code>. Use <code>routeParams</code> to persist the parameters after a page flow navigation.</p> <p>If the route to the default or home page contains no path parameters, specify</p>

Option	Description
	/ as the Route Path. Ensure that the routingPattern in the AMD also specifies /. If the Route Path has query parameters, don't include them in the routingPattern. You can reference query parameters in the landing page using queryParams.

3. As you complete the Business Object section, consider how to secure your selection:

Option	Description
Secured selection	Workday prompts the user for an instance of the selected business object when they run the custom task. Workday evaluates the contextual security of the custom task against the processing user at run time to determine the instances that are available when the user runs the task. Example: Select the Worker business object and secure the custom task to the <i>Employee as Self</i> security group. The app user can only run the custom task as a related action from their own worker profile.
Unsecured selection	Workday prompts the user for an instance of the selected business object when they run the custom task. Because Workday doesn't evaluate the contextual security of the custom task, all instances are available when the user runs the task. Example: You select the Worker business object and secure the custom task to the <i>Employee as Self</i> security group. The app user can run the custom task as a related action from any worker profile.
No selection	Workday doesn't prompt the user for an instance of the selected business object when they run the custom task. The task isn't available as a related action.  Note: You must select either Secured selection or Unsecured selection to ensure that the business object context is set consistently when you access the custom task from a profile group.

4. In the Usages section, select or create a custom dashboard if you want to enable the custom task as a worklet.

When you configure the worklet, you must add the custom task as a custom report.

Note: Custom dashboards don't provide a scroll bar. When you use a custom task to access an Extend app from a custom dashboard, the bottom of the app page might be cut off if the page size is too large to fit into the worklet.

You can't select a custom dashboard if the custom task is used as an initiating action for a custom business process.

Note: Custom dashboards are read-only. An edit page of a custom app renders as a view page on a custom dashboard.

5. In the Security section, select the security domains for the custom task.

When you select the Testing Mode Only check box, only permitted testers who meet the domain or event security permissions can view and run the custom task.

You can't select a domain if the custom task is used as an initiating action for a custom business process.

## Result

The user can run the custom task as a related action on the available instances of the business object except when you choose *No selection* to secure the business object. Workday makes the ID of the selected instance available in the `customTaskObjectId` parameter.

You can also select the category in which Workday displays the custom task from the related actions menu on the Related Actions Category Override prompt. When you don't select a category override, Workday uses the name of the business object as the category in which to display the custom task. Example: If an instance of the Employee business object is Logan McNeil, you can select the title of your custom task as a related action from Logan McNeil in the Employee category.

## Example

You can configure these values to work with an existing custom app:

Title	The title of your custom task.
Application ID	Use the <code>applicationId</code> property in the App Metadata (AMD) file for your app.
Site ID	Use the <code>siteId</code> property in the Site Metadata (SMD) file for your app.
Route Path	/MyCustomTask? <code>objectId={customTaskObjectId}&amp;title={taskTitle}</code>  You can also use the <code>routingPattern</code> in the <code>tasks[ ]</code> array in the AMD file for your app. Append the required parameters.
Business Object	Employee

Workday resolves the Application ID and Site ID parameters according to this pattern:

```
/<tenantname>/d/wday/app/<applicationId>/<siteId>/<routepath>
```

## Next Steps

You can configure different ways to access the custom task in Workday, such as the profile group, related actions menu, and others. You can also search for a custom task directly from the search bar.

If you have permissions to view and edit a custom task, and meet the security permissions applied to the task, you can also run the task as a related action from the task itself. Select Custom Task > Run to run the task.

Note: To delete a custom task, access the View Custom Task task and select the custom task you want to delete. As a related action, select Custom Task > Delete.

You can't delete a custom task that is applied to or utilized by an active custom business process, a menu on a dashboard, a profile group, or a worklet.

## Concept: Workday Extend

Workday Extend enables you to build, deploy, and share apps that run on Workday and are tailored to the specific business needs of your enterprise. To enable Workday Extend, contact your Customer Base Account Executive. Workday Extend is a separate product (SKU) that requires a separate license.

### App Lifecycle

Workday Extend enables you to iteratively develop, and then test your apps across multiple environments to ensure that apps are working properly before you install them in your production environment.

When you have an idea to solve a business problem for your organization, you iterate through these phases of the app lifecycle to put your idea into action:

- Build: Create an app that brings your idea to life.
- Test: Test your app and its configurations.
- Verify: Verify that your app works in a production-like environment.
- Release: Release your app to production.

Use the Workday Extend App Manager worklet on your Workday tenant to install and configure your apps on the tenant at each phase of the app lifecycle.

### App Components

These components enable you to build fully featured apps that meet your custom business needs:

- Presentation Components create the user interface and page interactions of an app, which provides familiar Workday user experiences.
- Model Components create data, logic, and security components that are consistent with the object model, business process framework, and configurable security model in Workday.
- Orchestration Components create event-driven processes across Workday and external systems. Orchestrations facilitate logic across several components to update Workday data, trigger business processes, send notifications, and connect to third-party APIs.

### Developer Tools

We provide these authoring tools for you to build and test your apps:

- App Builder.
- Development tenant.
- REST API Explorer.
- Graph API Explorer.
- SOAP API Explorer.
- Command Line Interface.
- Workday Extend Plugin for IntelliJ.

### Workday Extend Services

Workday Extend services include:

- Authentication for building, securing, and testing all components of your custom app, including integration with third-party services.

Note: All Workday Extend access tokens expire after 60 minutes.

- Data services for accessing, updating, and reporting on Workday and custom data.
- Workday Graph API that enables you to submit queries and mutations using a single endpoint.
- Workday REST APIs that enable you to access Workday functionality including Human Capital Management, Financials, Planning, and Student.

- Connect Service for managing collaboration and communications across your apps, Workday, and external components.

## **Workday Developer Site**

You can use the console on the Workday Developer Site to:

- Deploy apps to WCP Development tenants.
- Promote your apps from Development to Production environments.
- Install and manage apps on Implementation, Sandbox, and Production tenants.
- Manage users and tenants for your company.
- Monitor and log the usage of Workday Extend resources.
- Register API clients.

You can use the Analytics and Entitlements dashboards for monitoring app behavior and resource usage, and troubleshooting errors.

## **Developer Support**

Workday provides Workday Extend customers with a finite number of Developer Support Contacts (DSCs) per customer or partner organization. DSCs open cases to Workday Support to report potential issues or respond to Workday Extend inquiries. The Support section of the Workday Developer Site enables DSCs to take all actions in working with Workday Support. We also provide these developer resources to help you with your app development through its lifecycle:

- Get Started tutorials.
- Reference Apps.
- App Gallery.
- Developer forum.

### Related Information

#### **Reference**

[Workday Community: Workday Extend Information](#)

[Workday Community: Get Started with Workday Extend](#)

## **Concept: Extend App Components**

### **App Configurations**

- App Metadata (AMD): `amd` files containing data providers, task routing patterns, flow definitions, and custom app properties.  
  
Note: The `applicationID` is read-only. You can't modify it.
- Site Metadata (SMD): `smd` file containing authentication types and custom error pages for the app.
- Attributes: `attributes` file containing app attributes that you've defined in the Console.  
  
Note: When you download an app or deploy it to another organization or tenant, App Builder includes the app attributes.

### **Pages**

Pages are `pmd` files containing the user interface widgets and data bindings on view or edit pages.

### **Page Configurations**

Page Configurations are the components in your Extend app that you can reference in Pages:

- **Cards:** card files containing a snapshot that serves as the entry point to more detailed information. Cards hold a variety of content and actions about a single topic.

Note: Cards in the Page Configurations section are different from those in the Cards section. Cards in the Page Configurations section are used in Extend pages, while Cards in the Cards section are used in Workday Home Page and Workday-delivered Hubs.

- **Reusable Pods:** pod files containing reusable PMD code.
- **Scripts:** script files containing reusable PMD code.
- **Translations:** properties files that contain the translation keys that you've created in your app.

## **Tasks**

Tasks are task files that you can use to access your Extend app in Workday as a:

- Context-free task. A context-free task enables users to find the task in global search.
- Task in the context of a business object. A task with business object context enables users to access the task as a related action from the business object.

## **Queries**

### Graph Queries

Graph Queries are graphquery files that contain a query (for reading data) or mutation (for writing data) using Workday Graph API. Use a Graph Query component to:

- Simplify PMD endpoints that submit long or complex Graph API queries or mutations.
- Reuse queries or mutations across multiple PMDs.

### WQL Queries

WQL Queries are wqlquery files that contain a query that reads data using the Workday Query Language. Use a WQL Query component to:

- Simplify inbound endpoints that submit complex WQL API queries.
- Easily pass query parameters.
- Reuse WQL queries across multiple PMDs.

## **Cards**

Cards are carddefinition files that contain a snapshot that serves as the entry point to more detailed information. To enable these Cards in the Workday Home Page or Workday-delivered Hubs, configure a Card Tenant Setting for each Card.

Note: Cards in the Cards section are different from those in the Page Configurations section. Cards in the Cards section are used in Workday Home Page and Workday-delivered Hubs, while Cards in the Page Configurations section are used in Extend pages.

## **Card Tenant Settings**

Card Tenant Settings are cardtenantsetting files that are model components that access Cards in Workday.

To enable Cards in the Workday Home Page or Workday-delivered Hubs, configure a Card Tenant Setting for each Card.

## **Security Domains**

Security Domains are securitydomain files that secure all other model components in the same app. Each domain requires security policies for finer control.

## Attachments

Attachments are `attachment` files that you can use to:

- Associate file data with instances of a business object.
- Attach images to a business object.

## Business Objects

Business Objects are `businessobject` files that define the core of the data model for an app and are used to store app data. They can reference Workday-delivered business objects or other business objects that you define in your app.

## Business Processes

Business Processes are `businessprocess` files that enable you to extend the Workday-delivered business process framework by creating new business process types and event business objects. These artifacts enable you to manage the state of the business objects you define in your app.

## Reports

Reports are `report` files that you can use to analyze your app data.

## Orchestrations

Orchestration components enable you to develop real-time, event-driven processes across Workday and other external systems. You can use orchestrations to create and update Workday data, trigger Business Processes, send notifications, and connect to third-party APIs.

Click Add Orchestration to create a new orchestration in Orchestration Builder. After you save the orchestration to App Hub, click Refresh Orchestrations in App Builder to view the orchestration in App Builder. When you deploy the app, App Builder includes the orchestration files in the deployed app.

## Assets

Asset components include:

- Images: Custom image files. You can upload an image and use it as the icon in a Card header.

## Testing

Testing components enable you to:

- Quickly test logic and verify dynamic scenarios using realistic sample JSON responses without having to change the source code.
- Protect against changing data in your tenant or in external systems.

Testing components include:

- Mock Data : Contains a `MockResponse` object that simulates a JSON response.
- Mock Data Configuration: Contains mappings of endpoints to mock responses.

## Concept: App Authentication

When designing your app, it's critical that you consider security configurations to protect access to your app and data. You can configure security at these levels:

- Domain security policies for Workday services.
- Domain security policies for model components.
- Authentication credentials for orchestrations.
- Page level security.

- Endpoint authentication.
- Presentation component visibility.

Consider the security provided at broader levels that encompass data access and visibility at the widget level. This approach can reduce scattered security checks and simplify your app development.

## Service Domain Security Policies

An app that invokes Workday services inherits the Workday configurable security model, which provides the core security of your app. Workday services include the Workday REST APIs, Workday Query Language, and custom reports invoked as Reports-as-a-Service endpoints.

The domain security policies control who can read and write Workday data through your app. As such, configuring domain security policies is a fundamental task. For each Workday service invoked by your app, you or the Workday administrator must correctly configure the appropriate domain security policies. Note that the endpoint descriptions in the Workday REST API documentation include the domains that secure the endpoints.

Domain security policies grant access to security groups, which can be:

- User-based.
- Role-based.
- Job-based.
- Integration groups.
- Other context-sensitive groups.

Based on the security groups of users and their configured security policies, the Workday services:

- Return only the data that the user has permission to read.
- Create, update, or delete only the data that the user has permission to write.
- Return permission errors if the user doesn't have access to an object.

Collaborate with your Workday functional experts who understand the business roles, security groups, and the functional configurations in your tenant. Instead of hard-coding security checks in your app, you can leverage existing tenant security configurations that can help drive the app functionality.

Here are a few examples of how service-level security can help with your app design:

- Invoke custom reports (through Reports-as-a-Service) that retrieve restricted data based on user roles. Example: To enable supervisors to get worker data only within the organization they supervise, a custom report can use the *Workers By Role* data source filter. On a calculated field, you can use a role prompt that limits the results based on the user role.
- Intercept a permission error or a 403 HTTP status code from a Reports-as-a-Service endpoint and display a user-friendly custom error page.
- Create different pages based on unconstrained and constrained user roles.

## Security Domains as Model Components

When you create business objects and business processes in your app, you can create security domains that protect access to your custom data and business processes. These security domains extend the Workday configurable security model, which enables you to use the same security groups in the tenant.

When you create a business process in your app, consider the security in context with the routing requirements of the business process. You can route a business process to constrained security groups.

## Orchestration Authentication

You can select the type of authentication credentials for sending API requests from orchestrations in your app. Examples:

- Basic Authentication - Requires a username and password.

- API Key - Requires a key-value pair containing an API key as a query parameter or header value.
- Integration System User - Requires an ISU username to store refresh tokens in the Workday credential store.

## Page Security

To control access to the pages in your app, use the security domains of your app. Only users whose security group has permission on the assigned security domain can access the page.

By default, any user in the tenant can access all pages in a custom app. If a page requires security, Workday recommends that you secure access to the page by using the security domains in your app.

Note: If you've assigned a security domain to a custom task that opens a page, that security domain doesn't apply to the other pages in the app.

## Endpoint Authentication

You can specify an authentication scheme for each endpoint invoked by a page. The default endpoint authentication scheme on a page is Workday Single Sign-On (SSO). This authentication scheme applies to Workday REST APIs, which authenticate the signed-in user using the security configuration on the tenant. The SSO authentication scheme automatically provides the service-level security in your app.

The WCP Integration System User (WCPISU) endpoint authentication scheme is also available with Workday REST APIs. However, you must take caution and add security checks in your app when using WCPISU authentication.

Note: The WCPISU authentication scheme is always a security exception.

The WCPISU authentication scheme uses ISU access to enable end users to read and write data. Because the ISU access doesn't typically align with the tenant configurations for end users, you must consider additional security checks in your app. In general, we recommend using the security domains in your app to secure a page. However, if your app needs to use WCPISU authentication, you'll need to code business logic to check the roles and security groups of the current user. This check typically includes additional API calls to run a custom report about the user security details, which can affect page performance.

If the pages in your app invoke external endpoints, specify the appropriate authentication scheme for each endpoint. Examples: OAuth2 Authorization Code, OAuth2 Client Credentials, and Amazon Web Services Signature.

## Presentation Components

In general, avoid using widget visibility as a substitute for securing the data on a page. To protect the data displayed or entered on a page, ensure that you've considered the security mechanisms provided at the service and page levels. After you've applied these security mechanisms, your app might still need to apply business rules based on worker role, position type, and others. In these cases, you can apply business rules to set these attributes conditionally:

- `visible` - Displays or hides the widget.
- `render` - Renders or excludes the widget from the page load.
- `enabled` - Enables or disables the edit mode of the widget.

## Concept: Custom Objects

Custom objects are sets of custom fields that you can create to capture data that's unique to your organization. You can configure security domains for custom objects, and you can use custom objects in business processes and reports.

Note: You can only use custom objects with Workday-delivered business objects. To define your own, standalone business objects in Workday Extend apps, add business objects in App Builder.

You can configure sets of custom fields to suit your environment. There are 6 different field types:

- Currency
- Decimal
- Integer
- List
- Paragraph Text
- Text

Custom lists enable you to enter a unique set of values. You can share custom lists across multiple custom objects. You can:

- Add or remove custom fields as needed.
- Create single- or multi-instance instance custom objects.
- Create your own user-defined validation rules.
- Provide help text.
- Specify the custom field order.
- Use delivered validations (Example: Required).

Each custom object has its own security.

To determine the web service alias of a custom object definition in Workday, access the View Custom Object task. You can use the web service alias to access the *customObjects* REST API.

## Custom Objects and Security Domains

Users and groups with access on the *Custom Object Management* domain can view and modify custom object definitions.

You manage security for custom objects and fields at the custom object level. Custom fields for a custom object inherit their security from the custom object.

When you create a custom object, you must secure it to a domain. When you register your API client, verify that the selected Scope (the Functional Area) includes the security domains for the custom objects.

## Permissions Affecting Custom Objects

Users with view permission on security domains for a custom object can view:

- Custom fields on a report.
- Custom object data.
- Custom fields on the Additional Data tab on these profiles:
  - Academic unit
  - Academic unit hierarchy
  - Job profile
  - Job requisition
  - Position restriction
  - Worker

Users with modify permission can edit custom object data.

Integration permissions control whether an integration can get or put data. You can create an integration when you don't have access on the custom object integration domains.

Example: An integration partner can create and run an inbound Enterprise Interface Builder (EIB) that includes custom fields that the partner can access. However, the inbound EIB updates values only for:

- Custom fields for which the worker has put access.
- Workers in organizations the worker has access to through a constrained integration system security group (Constrained).

To view the security policy on a custom object, select Security > View Security as a related action on the custom object. When you view a security domain, Workday displays any custom objects that the domain secures. To view the associated custom fields, select the custom object.

Related Information

## Tasks

[Steps: Set Up Custom Objects](#)

## Reference

[Reference: Custom Object Definitions on page 2113](#)

[Reference: Custom Objects \(Single-Instance\) on page 2115](#)

[Reference: Custom Objects \(Multi-Instance\) on page 2120](#)

## Concept: Custom Tasks

Custom tasks are entry points for users of Workday Extend apps. When you associate a custom app with a custom task, users don't have to remember a long URL to access the app. You can:

- Use a custom task as the initiating action for a custom business process.
- Enable custom tasks as worklets.
- Configure profile groups to display custom tasks.

Enable access to the *Custom Task* domain in the System functional area to use this feature.

Related Information

## Tasks

[Create Custom Tasks on page 2002](#)

## Concept: Custom Tasks and Apps in Workday

A custom task opens a custom app in the Workday application. This topic summarizes the configurations that enable various entry points to custom apps in Workday.

### Profile Group

You can add a custom task as a tab on a profile group of a business object.

On the Configure Profile Group task, select the profile group for the custom task. When you add a Report to the profile group, select Allowed Custom Tasks, and select the custom task.

You can only select custom tasks configured on a business object that is relevant to the selected profile group. Example: You can only select custom tasks configured on the Worker business object to add to the Career for Worker Profile group.

### Related Actions Menu

You can add a custom task as an item on the related actions menu of a business object.

On the Create Custom Task or Edit Custom Task task, select either Secured selection or Unsecured selection. Select the Related Actions Category Override. Click Configure Related Actions Menu.

By default, custom tasks display in alphabetic order within their category. You can change the order in which a custom task displays within its category on the related actions menu. On the View Custom Task task, click Configure Related Actions Menu. On Configure Related Actions Menu for Custom Tasks, reorder the custom tasks as needed.

### Global Search

You can enable users to enter the custom task title in global search.

On the Create Custom Task or Edit Custom Task task, enter a user-friendly title that's easy to remember. Select the domains that secure the custom task. Users can find custom tasks in global search if they have access to the security domain governed by the custom task.

Note: If you selected either Secured selection or Unsecured selection on the business object, the custom task will prompt users to select a business object. If the custom task is an employee self-service task, users need to select themselves before proceeding to the custom app.

## **Custom Dashboard**

You can enable a custom task on a custom dashboard.

On the Create Custom Task or Edit Custom Task task, select or create a custom dashboard on Allowed on Custom Dashboards. Edit the custom dashboard to add the custom task to the Worklets on the Content tab.

Note: Custom dashboards don't provide a scroll bar. When you use a custom task to access an Extend app from a custom dashboard, the bottom of the app page might be cut off if the page size is too large to fit into the worklet.

## **Workday-Delivered Worklet**

You can add a custom task as a custom report on a Workday-delivered worklet.

On the Configure Worklet task, add a custom task to the Custom Report grid for a selected worklet.

## **Quicklink**

You can add a Quicklink that opens the custom app URL from custom worklets and dashboards in Workday.

Get the custom app URL from the App Manager task. On the Maintain Quicklinks task, add a Quicklink using the custom app URL.

Note: When you migrate the Quicklinks across tenants, ensure that you update the custom app URLs in each tenant.

You can also use Quicklinks to provide access to an external application through Workday Single Sign-On.

[Steps: Set Up Custom Dashboards](#)

[Steps: Display a Quicklinks Worklet on a Dashboard](#)

## **Concept: Orchestration Processes**

An orchestration doesn't always execute as a whole. Instead, Orchestrate may divide each orchestration into smaller execution units called processes, which follow each other seamlessly. Every orchestration has at least 1 process, created by Orchestrate at launch.

Each process has these characteristics:

- Can execute for up to 20 minutes.
- Has its own unique ID to enable tracking.
- Can automatically save its state when complete.
- Passes control to the next process in the sequence.

You can think of processes as relay runners passing a baton. Each runner completes their segment, then hands off to the next runner to continue the race.

Orchestrator creates a new process when it encounters a step that triggers a potentially long-running operation. This is known as checkpointing. The components that create checkpoints are:

- Send Workday RaaS Request.
- Trigger PDF Generation.
- Trigger Business Process.
- Trigger Integration.
- Send HTTP Request (when used with polling).

This is the sequence of events that occurs when Orchestrator reaches one of these checkpoints:

- The current process saves its data and state.
- The long-running operation executes.
- When the long-operation completes, a new process begins.
- The new process loads the saved data and state and executes.
- The 20 minute timeout resets.

### Design Considerations

Always bear in mind that the maximum time allowed for any single process to complete is 20 minutes, while the entire orchestration is subject to its own separate timeout: For more information, see: [Reference: Orchestration Runtime Limits on page 2029](#).

Avoid timeouts by using checkpointing steps strategically for operations that might take a long time. Remember that each checkpoint step preserves data while providing a new 20-minute processing window.

### Monitoring and Troubleshooting

Use the Orchestration Activity dashboard to view details about your process chain and identify issues, paying particularly attention to process execution time.

When monitoring your orchestrations, the key pieces of data are:

- Run ID: The unique instance ID for an orchestration run.
- Process IDs: The unique ID for an individual process. Use this to identify specific processes that are causing issues.
- Common Request ID: An ID that links all the processes in an orchestration.
- Process Status: Shows which process is currently running or completed.

## Concept: Integration Events and Integration Process Events

### Integration Event

In Workday, an Integration Event is the top-level container for an integration execution within the Integration Framework. Integration Events are often referenced in the user interface. Each one contains:

- A reference to the job sent to the integration runtime.
- The status of the integration run.
- Messages associated with the integration run.
- Attached documents, also referred to as Output Files.
- Launch parameters.
- Initiated and Completed timestamps for the integration run.

An Integration Event may comprise a Main Orchestration Event and 0 or more Child Integration Events.

### Integration Process Event

An Integration Process Event provides a sequential view of the Business Process steps configured by the integration's developer. Think of it as the workflow side of the integration. You may see an Integration Process Event referred to as an Integration Event Business Process.

Typically, an integration's Business Process includes service steps, such as Retrieval and Delivery, and integration steps, such as the invocation of other Integration Systems.

The completion of a child integration, which triggers the callback to the parent orchestration, occurs only when the associated Integration Business Process completes execution of the configured steps.

In essence, an Integration Event is the wrapper for an integration run in Workday, while an Integration Process Event is the actual Business Process execution that defines and performs the steps involved in that run. Every Integration Event has an Integration Process Event.

## Reference: Use Model Tasks to Access Extend Apps in Workday

You can use context-free model tasks to open Extend apps in the Workday application. Context-free model tasks enable various entry points to Extend apps in Workday. You can also add a Quicklink to the Extend app URL in your Workday tenant.

Note that you can only access model tasks with business object context as a related action from that business object.

**Note:** For information about how to use custom tasks to access Extend apps in Workday, see [Concept: Custom Tasks and Apps in Workday](#) on page 2013.

### Announcements

Access your task as an Announcement on the Workday home page, or on any other Workday landing page. Select a landing page from the prompt on the Configure Announcements task. Add a row to the grid, and then select your task from the Task prompt.

**Note:** You must first configure the task as an allowed worklet task. On the Task prompt, select Create Custom Allowed Worklet Task, and then select your task. You can optionally add a custom name for the task that will display on the announcement.

You can also use the Create Bulletin Worklet task to add your task as an Action to a landing page. Once you create the worklet, use the Maintain Dashboards task to add the worklet to that dashboard or landing page.

### Configurable Alerts

When you access the Configure Alert task to create a configurable alert, you can add your task as an Included Task. This is the task that you expect the recipient of the alert to do in response to the alert.

### Dashboards

To add your task to a Workday-delivered dashboard:

1. Access the Maintain Dashboards task in Workday. Edit the dashboard that you want to add your task to.
2. On the Content tab, add a Menu section.
3. Enter a Section Label, then add an item.
4. From the Task prompt, select Create Custom Allowed Worklet Task, then select your task from the prompt. You can optionally add a custom name for the task that will display on the dashboard.

### Journeys

**Note:** You might need to take additional steps to enable this feature depending on your organization's subscription service agreement. For more information, see this [Community](#) article.

You can distribute tasks to users in Journeys if you've configured People Experience on your tenant.

To enable Journeys on your tenant, you must also enable the Journeys functional area and these security domains:

- *Self-Service: Journeys*
- *Set Up: Journey Administration*

Now you can create a journey builder to distribute your task as a Journey to selected recipients.

1. Access the Create Journey Category task to create a category for your journey. Be sure to select the Functional Area that you created on the domain group of your Workday Extend app.
2. Access the Create Journey Step Group task, and select your Journey Category from the prompt.
3. Select Task from the Step Type prompt.
4. From the Step prompt, select All > Tasks by Functional Area, and then select the Functional Area that you created on the domain group of your Workday Extend app.
5. Select your task from the prompt, and update the Display Name if necessary.
6. Access the Create Journey Builder task, and select your Journey Category from the prompt.
7. Select your Step Group from the prompt.
8. Access the Distribute Journeys task.
  - a. Select your Journey Category.
  - b. Select *Single Builder* from the Distribute By prompt.
  - c. Select your Journey Builder from the prompt.
  - d. Select the Recipients who you want to receive the journey builder. You can select up to 100 recipients.

Workday distributes the journey builder to all recipients. Recipients can open the Journey on their home page, and access your task. To run the task, recipients must be on the domain security policy of the task.

## Landing Pages

To add your task to a landing page, you must first add your task to a custom dashboard. You can then add your custom dashboard to a worklet, and add the worklet to a landing page.

Note: Although you can add a tenanted custom task directly to a custom dashboard as a worklet, Workday doesn't support model tasks as worklets. You can add context-free model tasks to custom dashboards as menu items.

1. Access the Create Custom Dashboard task. Enter a name for your dashboard, then edit the custom dashboard settings as needed.
2. As a related action from your custom dashboard, select Dashboard > Edit.
3. On the Content tab, enter a Tab Name, then add a Menu section.
4. Enter a Section Label, then add an item.
5. From the Task prompt, select Create Custom Allowed Worklet Task, then select your task from the prompt. You can optionally add a custom name for the task that will display on the dashboard.
6. Add the custom dashboard to a landing page.
  - a. Access the Maintain Dashboards task.
  - b. Select a landing page and click Edit. Example: Home.
  - c. On the Content tab, add a Worklet.
  - d. Add the custom dashboard that you created.
  - e. On the selected landing page, click the Configure Applications (gear) icon.
  - f. Add a row to the Optional Worklets grid, and select the custom dashboard you added.

## Profile Groups

Workday doesn't currently support tasks on Profile Groups.

## Quicklinks

You can add a Quicklink that opens the Extend app URL from custom worklets and dashboards in Workday.

Get the Extend app URL from the App Manager task. On the Maintain Quicklinks task, add a Quicklink using the Extend app URL.

Note: When you migrate a Quicklink across tenants, ensure that you update the Extend app URL in each tenant.

You can also use Quicklinks to provide access to an external application through Workday Single Sign-On.

## Shortcuts

You can add your task to the Shortcuts tab of the Global Navigation menu on the far left of the top navigation bar.

On the Shortcuts tab, click Add Shortcuts. Type the name of the Extend task in the search bar, and then click the plus sign (+) next to the task to add the task to the Shortcuts tab. You can add up to 10 Shortcuts to the menu.

You must belong to a security group on the domain securing the Extend task in order to add the task to the Global Navigation menu.

To view the Shortcuts tab, users must belong to a security group on the *Self Service: Quick Access Shortcuts* security domain in the System functional area.

## To Dos

Access the Maintain To Dos task to add your task to the grid as a To Do. You can then use your task in a *To Do* step of any Workday business process.

## Reference: Workday Developer Site Glossary

### A

#### Aggregations

The process of condensing data items into a single output item by applying a function called an aggregation strategy to each iteration of a loop.

#### AMD file

JSON file containing the App Metadata of a custom app that uses Presentation Components. The AMD contains global properties about an app and information about how pages interact.

#### Amazon Web Services Integration

An Extend Integration with Third Party Platform Services that's available to Extend Professional customers. The Extend Integration with AWS includes:

- Workday-provided AWS accounts that work optimally with AWS storage and ML-related services.
- Orchestrate components that get and store Amazon S3 objects, invoke AWS Lambda functions, and put events on Amazon EventBridge.

#### AMU

Alma Mater University: Less common than GMS tenants, this tenant is a Workday tenant with staged

Analytics dashboard	data of a typical higher education customer. Only AMU tenants support Student APIs.
API client	Standard sign-in user: bking (Dean, Enrollment Services). Other common users: pwhitcomb (President), jjones (Vice President), kmartinez (Manager, Public Safety).
API Gateway	A tool on the Developer Site that provides statistics, graphs, and logs that developers and administrators can use to gain insight into their apps. Administrators can view data usage statistics, page and API performance, and transaction logs.
App attributes	A named credential that's registered on the Developer Site, which generates a client ID and secret necessary for OAuth authentication and authorization to access Workday REST APIs in your tenant. External apps, orchestrations using OAuth, and Extend ISUs need to create API clients to authenticate REST API calls.
App Builder	Workday Extend component that provides a common endpoint for APIs.
App Hub	App-level custom attributes with tenant-specific values that apps can access during runtime. You can reference attributes in your app components.
App Preview	Example: An app attribute named resourceLocation stores the URL of some resource or file used by an app. In each tenant where the app is installed, you can assign the appropriate resource location that applies to the specific tenant.
Attachment objects	An integrated development environment (IDE) on the Developer Site that enables you to build app components, validate, view logs, upload to App Hub, and deploy to Development tenants. In App Builder, you can build pages using App Preview and visual mode (also known as Page Builder).
Authentication and Authorization Service	Workday's tool for end-to-end application lifecycle management.
	A tool in App Builder that enables you to view and interact with PMDs without having to deploy to a tenant, helping you to iterate on app development much more quickly.
	A type of business object that you can use to store file data and images. Also known as attachments, model attachments.
	Workday Extend component that provides an endpoint for authorization.

**B**

## Business objects

Business objects extend Workday's single object model to create new objects. You can use business objects to persist and store app data, and to create sophisticated data models by relating objects to each other and to Workday-delivered objects. When you create business objects, Extend automatically provides report data sources and REST API endpoints.

Also known as model component business objects (MCBO).

## Business processes

Business processes extend Workday's Business Process Framework to create new business process types, and intelligently process app data by capturing approvals, triggering orchestrations, and more. You can report on and audit business process events, you can also use Extend business process of the subprocess of Workday delivered business processes.

Also known as Extend BPs, Extend business processes, model business processes.

**C**

## Canvas Design System

An open source design system that consists of reusable UI components, assets, and guidelines that enable teams to create scalable, unified experiences in Workday's look and feel. External Extend apps that don't use the Extend presentation components can use Canvas Kit to create user experiences consistent with Workday's design principles.

## Code mode

A toggleable mode in App Builder that enables a developer to build an Extend app using a coding interface.

## Company

A group of Developer Site users that are associated with or employed by the same organization. You must belong to a company to develop or deploy apps.

## Console for PMD debugging

A PMD Scripting object that receives logging messages and sends them to the Extend app's log.

## Context-free task

Context-free model tasks enable users to directly access Workday Extend apps in a tenant, either by searching the task name from Global Search Bar, or allowing end users to access Workday Extend apps from various Workday User Interfaces, such as Hub, Journeys, Configurable Alerts, Dashboards, Landing Pages, Shortcuts, To-Dos, Announcements.

## Custom app

An app type that runs in Workday using the Extend app components.

**D****Developer Forum**

A space for Workday Developers to directly collaborate, ask and answer questions, and share solutions with each other. In the Developer Forum, you can find answers, find contributed solutions, provide feedback, and directly engage with Workday product managers, engineers, and developer relations. Developers sign in to the Developer Forum using the same Workday Community login account.

**Development tenant**

Workday-issued tenant for Extend developers to build and test apps, before they promote the apps to Implementation, Sandbox, Sandbox Preview, then Production.

Development tenants are issued to customers with Workday Extend subscriptions. Only Company Administrators can create and delete Development tenants. The Company Administrator who created the tenant will receive access information by email, and can then share this information with the rest of their team.

Development tenants contain only staged data for testing purposes and do not contain any customer data.

See also: GMS, AMU, GOV.

**E****Enterprise Interface Builder (EIB)**

A simple, secure no-code data import and export integration tool for Workday functional administrators. EIB enables scalable mass imports, exports, and initiation of business processes within Workday, streamlining data management for all enterprise functions.

**Entitlements dashboard**

A tool on the Developer Site that enables administrators to view and manage your usage of Workday Extend. The dashboard provides usage statistics as well as thresholds that are determined by your Workday Extend contract.

**Expression Builder**

Orchestration Builder's tool for defining and evaluating simple expressions.

**Extend app**

An app that may contain presentation, model, and orchestration components.

**External app**

An app type that runs outside of Workday with data provided by Workday APIs.

**G****GMS**

Global Modern Services: A Workday tenant with staged data of a typical global corporate customer.

		Standard sign-in user: lmcneil (CHRO). Other common users: smorgan (CEO), tserrano (CFO), jlee (VP of Sales).
GOV		Green Oak Valley: Less common than GMS tenants, this tenant is a Workday tenant with staged data of a typical government customer. Standard sign-in user: jjones (Director of HR).
Graph API Explorer		A Developer Site tool for Extend app developers to explore the Graph API schema and to run queries and mutations.
<b>I</b>		
Inbound endpoint		A REST API endpoint in Extend presentation components that fetches data.
Integration apps		An app that may contain only BP and Integration System triggered orchestration templates.
Integrations		The general name for Workday technology that enables you to streamline data exchange between Workday and external systems, or within Workday itself. Integrations enable efficient data flow, reducing manual data entry. Example: you can extract worker information from Workday and populate it automatically into external systems for demographic data updates. Additionally, you can build automated processes entirely within Workday, further enhancing efficiency and productivity.
ISU authentication		Authenticates data access with an Integration System User (ISU), which is a type of Workday user account that apps can use to access data as a system user. ISU access might not align with regular user permissions, so developers need to implement extra security checks within their apps to ensure data security. In App Manager, you can assign ISUs to your app and create an API client for that ISU.
		Also known as Simplified ISU. Note that the previous version of ISU authentication is the legacy WCPISU.
<b>J</b>		
JSON		JavaScript Object Notation: A standard file format for data that uses a human-readable notation.
Journeys		A toolset that enables you to guide your employees through their critical professional and personal milestones through an immersive experience. It includes the Journeys and Cards workspaces that enable you to distribute and manage both Journeys

and External Cards for your users. You can create custom cards using Orchestration Builder.

## M

### Model Components

Enable Workday Extend app developers to create data, logic, and security components for apps that are:

- Standalone.
- Relatable to other Business Objects.
- Native to the Workday stack.

## O

### Orchestrate for Integrations

Workday technology that enables you to design, build, manage, and share integrations between Workday and external systems.

### Orchestration

A real-time, event-driven process created with Orchestration Builder. An Orchestration can be part of an Extend App or an Integration App.

### Orchestration Builder

A Developer Site tool that enables you to create orchestrations for use in apps.

### Outbound endpoint

A REST API endpoint in Extend presentation components that adds, updates, or deletes data.

## P

### Page flow

A sequence of edit pages that provides users a guided experience for completing a multistep transaction in an Extend app. A flow definition in the Application Metadata (AMD) defines the page sequence and transitions.

### Page widget

A runtime object that displays data on a view page or enables user interaction on an edit page in an Extend app. A widget's characteristics and runtime behavior depends on its corresponding PMD tag definition.

### People Experience

A suite of features that provides employees with a central place to engage with company information. You can customize each employee's experience so that they can view relevant information when they need it. Features included in People Experience include Workday Home and Workday Journeys.

### PMD file

JSON file containing the Page Metadata of a custom app. The PMD defines the page layout and content, including:

- How to get and display data on a view page.
- How to persist data from an edit page.

### PMD Scripting

A server-side scripting language that enables you to embed multiline scripts or invoke functions in

	shared script modules in an Extend app. Use scripts to call PMD functions, widget methods, and event handlers.
PMD tag	A JSON tag definition containing attributes that customize the appearance and behavior of the widget on an Extend page. The PMD tag also enables you to bind its value to the data you want to display on the widget. Its valueOutBinding attribute enables you to send the widget value to an outbound endpoint.
Pod	A unit of PMD code containing reusable PMD tags, which can be referenced in multiple pages of an Extend app.
Predefined app variables	A set of default variables that provide useful runtime information to Extend apps, such as attrstore, endpoints, environment, queryParams, self, site, and others.
Presentation Components	A set of building blocks that create the user interface and page interactions of an app. Presentation Components include metadata tags that define Workday UI widgets and other components that interact with Workday and external data. Also known as UI components.

**R**

Reports-as-a-Service (RaaS)	A tool that enables custom reports within your tenant to be available as web services, which you can access as SOAP or REST APIs.
REST API Explorer	A Developer Site tool for app developers to explore and run Workday REST APIs. To access data on a specific tenant, you must sign in, connect to the tenant, and have the appropriate permissions to run the API operations.

**S**

Script module	An Extend app component containing PMD Scripts, which you can define a single time and invoke multiple times from different pages.
Security domains	Security domains extend Workday's configurable security model to secure app data confidently. You can use security domains to secure a page of Workday Extend app, secure accessing app and app data of a Extend business objects, secure Extend business processes, and secure orchestrations. The process of configuring Extend security domain is the same as configuring other Workday delivered security domains. Also known as Extend domains, model domains.

SMD file	JSON file containing the Site Metadata of a custom app that uses Presentation Components. The SMD contains global properties about a site, which is a logical collection of pages within a custom app.
SOAP API Explorer	A Developer Site tool for app developers to explore and run Workday SOAP Web Services. To access data on a specific tenant, you must sign in, connect to the tenant, and have the appropriate permissions to run the API operations.
Suborchestrations	A series of steps that you can reuse across multiple orchestrations in the same app.

**T**

Tasks	Tasks enable users to directly access Workday Extend apps in a tenant, either by searching for the task by name, or by navigating to the task.  Tasks authored in App Builder are native to a Workday Extend app, and don't need to be recreated in each tenant on which the app is installed.  Also known as model tasks.
Tenant alias	The tenant alias uniquely identifies the tenant in the API Gateway. Use the tenant alias when you sign in to your tenant through the API Gateway. Example: When you use API Explorer.  Tenant aliases use the naming convention for the environment of the tenant: <ul style="list-style-type: none"><li>• Production: <code>tenantname</code></li><li>• Sandbox: <code>tenantname-sb</code></li><li>• Sandbox Preview: <code>tenantname</code></li><li>• Implementation: <code>tenantname</code></li></ul>

**V**

Visual mode	A toggleable mode in App Builder that enables a developer to build an Extend app using point-and-click interface.
-------------	---

**W**

Workday AI Gateway	A set of REST APIs that provide Workday Illuminate capabilities to Extend Professional customers, in turn enabling access to Workday-delivered and curated intelligence to manage your people and money.  AI Gateway is available in: <ul style="list-style-type: none"><li>• Development tenants for all Extend customers.</li></ul>
--------------------	---

	<ul style="list-style-type: none"> <li>Non-Development tenants for Extend Professional customers.</li> </ul>
Workday Cloud Platform API Gateway	<p>The entry point for Workday APIs and serves Workday API traffic for Extend and Integration Apps.</p> <p>Also known as Extend API Gateway.</p>
Workday Extend	<p>A set of tools and services that enable developers to build, manage, and monitor apps that run on Workday.</p>
Workday Extend app	<p>An app built using Workday Extend tools and services.</p>
Workday Extend Developer Copilot	<p>A generative AI tool that provides code generation, chat, natural language search, and summarization capabilities, enabling Extend Professional customers to supercharge development throughout the entire app lifecycle.</p>
Workday Extend Plugin for IntelliJ	<p>An alternative Workday-provided tool for developing custom apps. The IntelliJ plugin is less user-friendly than App Builder.</p>
Workday Orchestrate	<p>The general name for Workday technology that enables you to build and coordinate real-time, event-driven processes across Workday and other external systems. Orchestrate's primary tool is Orchestration Builder. The processes you create with Orchestration Builder are called orchestrations.</p>
Workday Graph API	<p>An API that submits GraphQL queries and mutations in a unified schema that provides access to Workday data and business objects. Using Graph API, you can ask for the exact data you need in a single request, optimizing performance and resource usage for interactive, small-scale transactions.</p>
Workday Marketplace	<p>The <a href="https://marketplace.workday.com">https://marketplace.workday.com</a> website is where customers can find trusted apps and solutions delivered by industry experts to meet their evolving business needs.</p>
Workday Query Language	<p>A SQL-like query language used to access Workday data directly from data sources and their fields.</p> <p>Also known as WQL.</p>
Workday REST APIs	<p>The REST (Representational State Transfer) APIs that provide access to Workday services and data through the API Gateway and exchange of JSON data. Workday REST APIs enable self-service, interactive transactions with Extend apps.</p> <p>Also known as REST APIs.</p>
Workday SOAP Web Services	<p>The SOAP (Simple Object Access Protocol) APIs that provide access to most Workday functionality and data through the exchange of XML data.</p>

Workday tenant	Workday SOAP Web Services enable integrations with Workday for data transfers and orchestrations. Also known as Workday SOAP APIs, SOAP APIs. A customer's existing Workday tenant.
	Also known as: Customer Tenant, Implementation Tenant, Preview Tenant, Sandbox Tenant, and Production Tenant.

## Reference: Limits on Model Components

We enforce these limits when you create model components for your Workday Extend app.

### Limits on Apps

Model Component	Limit
Number of business objects.	20 per app.
Number of security domains.	10 per app.
Number of business processes.	5 per app.
Number of attachments.	5 per app.
Number of tasks.	20 per app.
Number of reports.	10 per app.
Number of TEXT fields that are enabled for search in prompts.	3 per app.
Number of SINGLE_INSTANCE and MULTI_INSTANCE fields where the target is a Workday-delivered business object.	25 per app.
Number of SINGLE_INSTANCE fields where enableReportingFromTarget is set to true.	5 per app.

### Limits on Fields for All Model Components

Field	Limit
name	100 characters.
id	Zero to Short.MAX_VALUE (32767).
label	150 characters.

## Limits on Business Objects

Description	Limit
Number of instances.	<p>10 million instances per tenant for Extend Essentials and Extend legacy customers, excluding purged or deleted instances. This limit is shared across all Extend business objects and attachment objects in the tenant.</p> <p>100 million instances per tenant for Extend Professional customers, excluding purged or deleted instances. This limit is shared across all Extend business objects and attachment objects in the tenant.</p> <p>A purged instance is a row where all of the user defined fields have been removed.</p> <p>To display the instance count for Extend business objects and attachments in a tenant, access the Extend Object Instance Count report, secured by the <i>Manage: App Manager</i> domain in the System functional area.</p>
Number of fields.	50 per business object.
Number of derived fields.	40 per business object.
Number of fields you can index.	5 per business object, in addition to SINGLE_INSTANCE fields that Extend indexes automatically. You can't index derived fields or MULTI_INSTANCE fields.
Number of SINGLE_INSTANCE and MULTI_INSTANCE fields.	10 per business object.

## Limits on Business Processes

Field	Limit
description	500 characters.

You can only create 1 default business process definition for each business process.

## Limits on Attachment Objects

Description	Limit
Number of instances.	10 million instances per tenant for Extend Essentials and Extend legacy customers, excluding purged or deleted instances. This limit is shared across all Extend business objects and attachment objects in the tenant.  100 million instances per tenant for Extend Professional customers, excluding purged or deleted instances. This limit is shared across all Extend business objects and attachment objects in the tenant.  A purged instance is a row where all of the user defined fields have been removed.  To display the instance count for Extend business objects and attachments in a tenant, access the Extend Object Instance Count report, secured by the <i>Manage: App Manager</i> domain in the System functional area.
Number of fields you can index.	5 per attachment object, in addition to SINGLE_INSTANCE fields that Extend indexes automatically. You can't index derived fields or MULTI_INSTANCE fields.
Maximum size of attachment.	30 MB

## Limits on Profile Groups

Description	Limit
Number of model profile groups.	An app can have up to 10 model profile groups.

## Limits on Decimal Fields

Description	Limit
Number of decimal places.	10

## Limits on Integer Fields

Description	Limit
Number of digits.	99 (positive or negative).

Note: Underlying EIB limits might apply.

## Limits on Derived Fields

Description	Limit
Length of expression.	1000 characters.

## Reference: Orchestration Runtime Limits

Note:

- The time limits described here relate to total orchestration processing time, including API connection and response time. The maximum time allowed for an orchestration API connection and response alone is 5 minutes. See [Concept: Workday Cloud Platform API Gateway](#) for more details.

## Process Execution Timeouts

Type	Limit	Description
Individual process	20 minutes	The maximum time allowed for any continuous process. For more information, see: <a href="#">Concept: Orchestration Processes</a> on page 2014.
Synchronous orchestration runtime duration (Extend apps only)	5 minutes	The total processing time allowed for a synchronous orchestration.
Asynchronous orchestration runtime duration (Extend apps only)	20 minutes	The total processing time allowed for an asynchronous orchestration.
Workday Home Card orchestration runtime duration (Extend apps only)	20 minutes	The total processing time allowed for a Home Card orchestration.

## Orchestration Execution Timeouts

Type	Limit	Description
Workday Integration System orchestration runtime duration	48 hours	The total processing time allowed for an Integration System orchestration.
Workday Business Process orchestration runtime callback period	90 days	The period during which a Business Process triggered by an orchestration must complete.

## Data and Memory Limits

Type	Limit	Description
Concurrent data in memory	200 MB	<p>The maximum amount of data an orchestration can have in memory at the same time.</p> <p>The figure includes the data held by all in-scope values in memory as well as any temporary values created while evaluating expressions. It doesn't include the heap space taken up by an orchestration.</p> <p>Note that Workday manages large data items on disk in file-backed data structures. This feature means that an orchestration can have many</p>

Type	Limit	Description
		values that are larger than the 20 MB limit in scope concurrently because they're not held in memory.
Concurrent data on disk	2 GB	The maximum amount of data an orchestration can have on disk in file-backed data structures at the same time.  Note that once values go out of scope, they're cleaned up by the runtime. Any associated data on disk no longer counts towards this limit.

### Message Size Limits

Type	Limit	Description
Launch message size	20 MB	The maximum size of the request message used to launch an orchestration.
Response message size	500 MB	The maximum size of an individual HTTP message response returned from an HTTP API call.

### Orchestration Structure Limits

Type	Limit	Structure
Synchronous orchestration triggered by a presentation page	25 seconds	The total processing time allowed for a synchronous orchestration triggered by a presentation page. Takes precedence over any timeouts you configured on the orchestration itself. If you anticipate a total processing time of longer than 25 seconds, Workday recommends that you use an asynchronous orchestration.
Orchestrations and suborchestrations in an app	150	The total number of orchestrations and suborchestrations allowed in a single app. Extend warns you when the total reaches 125.
Steps in an orchestration	300	The total number of steps allowed in an individual orchestration. Extend warns you when the total reaches 200.

## Reference: Limits on Presentation Components

### Limits on Presentation Components

We enforce these limits when you create presentation components for your Workday Extend app.

Limit	Maximum Value
Number of pages per app.	75
Endpoint timeout.	24 seconds
<code>fileUploader</code> attachment file size.  To override the default maximum file size, set the <code>maxFileSize</code> attribute of <code>fileUploader</code> to the maximum number of bytes.	10 MB
Number of inbound endpoints.	30 non-deferred inbound endpoints in PMDs and Pods.
Number of outbound endpoints.	30
PMD request timeout. A request can include initial page loads, page submissions, and remote validations. A single request can call multiple endpoints.	60 seconds
<code>richText</code> text limit.	5 MB
Size of presentation files ( <code>.pmd</code> , <code>.amd</code> , <code>.smd</code> , <code>.pod</code> , <code>.script</code> files).	100 KB
Size of response payload from an endpoint.	25 MB
Number of characters on the <code>text</code> widget and the <code>label</code> attribute on all widgets.	255
Number of <code>editWizard</code> widgets per app.	25 (combined limit with flow definitions).
Number of flow definitions per app.	25 (combined limit with <code>editWizard</code> widgets).

### Limits on PMD Scripting

Limit	Maximum Value or Recommendation
Call frames.	The number of levels in a program stack execution, such as recursive function calls, has a maximum of 25.
CPU time.	The CPU time consumed for each script execution has a maximum of 5 seconds. This limit doesn't include endpoint invocation and widget API calls because these calls are executed in separate threads.
Levels of nested script modules.	The maximum number of levels of nested script modules is 2. Example of 2 levels of nested scripts: script1 that includes script 2 that includes script 3. If script 3 includes another script, it exceeds the limit, and receives a validation error.

Limit	Maximum Value or Recommendation
Memory usage.	We allocate memory to accommodate each script execution while we protect our service regarding memory usage. If your script exceeds the allocated memory threshold, the script will throw an error.  Note: We highly recommend that you follow best practices for proper memory management in your PMD scripts. See PMD Scripting Memory Management in <a href="#">Concept: PMD Best Practices</a> .
Script size.	The script size limit within the maximum PMD file size, which is 100 KB.

### Limits on Card Components (Extend Cards)

Limit	Maximum Value or Recommendation
Number of Card components per app.	3
Number of Card Tenant Settings components per app.	3
Number of non-deferred inbound endpoints per Card component.	2

### Tenant Limits on Extend Cards

To protect the integrity of your Home Page and tenant, Workday Home Page has these timeouts:

Limit	Maximum Value
Inbound endpoint timeout on a Card.	5 seconds
Card load timeout on the Workday Home Page.  Note: If the Card load reaches the timeout limit, the Home Page doesn't display the card.	15 seconds

If you plan to configure your Card on the Workday Home Page, we strongly suggest you test the response time of your endpoints prior to building the Card.

All of these limits are enforced in the tenant during configuration.

Limit	Maximum Value
Extend Cards on Home Page across the tenant (regardless of Security group).	4
Extend Cards per Hub.	4
Extend Card per Custom Search Result.	1
Extend Card per Journey Step.	1

Note: You can deploy a single Extend Card to your tenant and configure it on multiple entry points in Workday.

## Reference: Limits on Graph API

Limit	Maximum Value or Recommendation
Response page limit	Default is 20. Maximum is 100.
Request body limit	Maximum is 1 MB. The request body is the full HTTP JSON body payload, including both query and variables.
Graph API request timeout	3 minutes  If the processing time exceeds the limit, the query or mutation returns an error, and the response includes only the processed fields.
Query complexity	Errors can occur if a query or mutation operation is overly complex. An operation can be complex if it has too many nested levels of requested data or it takes too long to process.
Query depth maximum	Query depth adds increasing complexity and latency. Deeply nested queries require longer execution times.
Rate limiting	We rate limit requests when we determine that the number or complexity of queries and mutations start to impact the overall tenant health.  A Graph API request returns an HTTP response code of 429 Too Many Requests when other requests overload the resources on your tenant. If you encounter this response code, we recommend that you implement: <ul style="list-style-type: none"><li>• An exponential back-off retry mechanism for the process that generates the API requests.</li><li>• Caching.</li></ul>
Related business objects	When you query a multi-instance field as a related business object, the query returns a limit of 500 related business object instances. The request returns an error if there are more than 500 instances in the related business object.
File attachment size	30 MB maximum per file attachment. Graph API supports the file types that have been configured on the tenant. See the System Setup section in <a href="#">Administrator Guide: Reference: Edit Tenant Setup - System</a> .  Note: If you use Graph API with the <code>fileUploader</code> widget in an Extend app, the limits imposed by the <code>fileUploader</code> overrides the Graph API limits. See the <code>fileUploader</code> limits in <a href="#">Reference: Limits on Presentation Components</a> on page 2032.

## Tenants

### Concept: WCP Development Tenants

Workday provides Workday Extend customers with Workday Cloud Platform Development tenants. Workday optimizes WCP Development tenants for app development, so you can build Extend apps quickly and easily. In addition, you can avoid these challenges inherent to developing apps on Implementation tenants:

- Access: Developers require assistance from Workday to gain access to the IMPL environment.
- Customer data: Customers might not want developers to access their data to develop apps.
- No code: Workday doesn't enable users to update metadata in the IMPL environment.
- No visibility: Developers can't access logs for debugging.

Workday enables Company Administrators to create a number of new WCP Development tenants as specified in the contract signed with Workday Extend. You can create 1 of these tenant types:

- AMU
- GMS
- GOV

Workday sends an email message containing sign-in information to the Company Administrator who creates the new tenant. Workday assigns a tenant alias according to the naming convention `tenantPrefix_wcpdev#`, where Workday assigns `tenantPrefix` to your company.

Example: `acme_wcpdev1`

The status of a WCP Development tenant can include:

- *Deleted*
- *Deleting*
- *Error*
- *Initiated*
- *In progress*
- *Running*

Workday's Weekly Service Update takes effect on WCP Development tenants according to the standard [Workday Scheduled Maintenance](#).

If your WCP Development tenant is in the WD104 Data Center, refer to [WD104 WCP Development Tenants Weekly Service Update and Maintenance Schedule](#).

You can't access or create new WCP Development tenants until the maintenance is complete. Workday patches WCP Development tenants with the Service Update from the preceding Friday, which includes the latest Workday metadata at Production confidence level. GMS tenants receive data at the Preview confidence level.

Note: WCP Development tenants are optimized for app development and testing, and should only be used for this purpose. Workday recommends that you use only sample data (and never use PII data) in WCP Development tenants.

When you create a new WCP Development tenant, Workday reuses the alias for the new tenant only after you fully delete the original tenant.

- When you create a new tenant before fully deleting the original tenant, Workday assigns the lowest available number for the new tenant alias.
- When you use more than 1 WCP Development tenant, Workday assigns the lowest available number for the new tenant alias.

Example: Your company uses 1 WCP Development tenant with the alias `acme_wcpdev1`.

- When you create a new tenant while Workday is deleting the original tenant, Workday assigns acme\_wcpdev2 as the new tenant alias.
- When you fully delete the original tenant and create a new tenant, Workday assigns acme\_wcpdev1 as the new tenant alias.

Example: Your company has 5 WCP Development tenants with the aliases acme\_wcpdev1 through acme\_wcpdev5, and the alias acme\_wcpdev4 isn't in use.

- When you delete acme\_wcpdev5 and create a new tenant, Workday assigns acme\_wcpdev4 as the new tenant alias.
- When you create a new tenant while Workday is deleting acme\_wcpdev2, Workday assigns acme\_wcpdev4 as the new tenant alias.
- When you fully delete acme\_wcpdev2 and create a new tenant, Workday assigns acme\_wcpdev2 as the new tenant alias.

#### Related Information

##### Tasks

[Enable Proxy Access on WCP Development Tenants](#) on page 2037

## Enable Non-Development Tenants for Workday Extend

### Prerequisites

Work with your Named Support Contact to enable Workday Extend at the tenant level in Customer Center.

### Context

When your company purchases Workday Extend, Workday automatically enables these non-Development tenants for Workday Extend:

- Implementation
- Production
- Sandbox
- Sandbox Preview

The Workday Developer Site displays all tenants belonging to your company that are enabled for Workday Extend under Other Tenants. These tenants aren't WCP development tenants, and display for convenience only. Use these tenants to test your Workday Extend apps and prepare them for use in Production environments.

Note: Your NSC enables Workday Extend on your tenant using the Manage Workday Cloud Platform task, secured to the *Security Administration* domain in the System functional area. You must enable the same setting on the Manage Workday Cloud Platform task in your Sandbox and Production tenants.

### Steps

1. Access the Create Security Policy for Domain task.
2. Make these selections:

Option	Description
For Domain	<i>Workday Extend</i>
Confirm	Select the check box.

3. Add security groups to the Report/Task Permissions grid, and set View or Modify permissions as needed.

4. Enable and create security policies for these security domains:
  - *Custom Business Process*
  - *Custom Task*
  - *Manage: App Manager*
  - *WQL for Workday Extend*
5. Access the Activate Pending Security Policy Changes task.

## Result

You can now migrate Workday Extend apps to your tenant.

## Next Steps

View the Domain Security Policies for Functional Areas report to verify that the System functional area includes the security policies.

Related Information

### Tasks

[Activate Pending Security Policy Changes](#)

## Enable Proxy Access on WCP Development Tenants

### Prerequisites

Security: *Security Configuration* domain in the System functional area.

### Context

You can provide proxy access to WCP Development tenants for specified users. Proxy access policies specify:

- The non-Production environments to which the proxy access policy applies.
- The security groups whose members have proxy access to the tenant.
- The security groups containing members on whose behalf users can act when they're signed in to the tenant.
- (Optional) The security groups containing members who can't have proxy access to the tenant.

### Steps

1. Access the Create Proxy Access Policy task.
2. As you complete the task, consider:

Option	Description
Restricted to Environment	The environments to which the proxy access policy applies. Select the WCPDEV environment.
Do Not Allow Proxy on Behalf Of	(Optional) The security groups containing members on whose behalf another user can't sign in to the tenant as a proxy user.
Groups That Can Proxy	The security groups containing members for whom you want to enable proxy access according to that rule. You can only enable proxy access to unconstrained security groups. Example: To grant proxy access to all HR Partners, create a Role-Based security group

Option	Description
	(Unconstrained) for the HR Partner role and select that security group from the prompt.
On Behalf Of	The security groups containing members on whose behalf users belonging to the Groups That Can Proxy will be able to act.

## Result

Eligible users can now act as proxies on behalf of members of the selected groups based on your configuration.

## Next Steps

Start and stop proxy sessions by accessing the Start Proxy and Stop Proxy tasks.

During a proxy session:

- The tenant displays On Behalf of and the name of the user on whose behalf you're acting.
- You can perform actions in the tenant that the user you're proxying for is authorized to perform.

You can view details about users starting and stopping proxy sessions on the Signons and Attempted Signons report.

# Workday REST API

## REST API Fundamentals

### Concept: Workday REST APIs

Workday REST APIs provide a consistent access to Workday data from website or mobile applications. REST APIs quickly return a small set of frequently used information for user-initiated, self-service transactions. You can integrate Workday REST APIs into your enterprise web portal or mobile applications.

Workday REST APIs exist alongside our public SOAP-based web services. For transferring large sets of data, use the SOAP web services. SOAP web services best support batch transactions for external enterprise applications.

The Workday REST API base path format is:

```
https://{{tenantHostname}}/api/{{serviceName}}/{{version}}/{{tenant}}
```

Where:

`{{tenantHostname}}`

The hostname of the Workday REST web service. You can use the View API Clients task to get the hostname. Example: If the Workday REST API Endpoint on View API Clients displays `https://services1.myworkday.com/ccx/api/v1/gms`, the hostname is `services1.myworkday.com`.

{serviceName}

The name of the Workday REST web service. You can find the service names in the Workday REST Services Directory.

{version}

The version of the Workday REST web service. You can find the service versions in the Workday REST Services Directory.

{tenant}

The name of the tenant. Example: *gms*.

Example: The URL of the `GET /workers` endpoint in the Staffing v2 REST service on a Global Modern Services (*gms*) tenant is:

```
https://services1.myworkday.com/api/staffing/v2/gms/workers
```

Note: This base path doesn't apply to Workday Extend apps that call Workday REST APIs through the Extend API Gateway.

You can try Workday REST APIs on the Workday REST Services Directory. The Try button enables you to run REST APIs with Global Modern Services (GMS) test data. Note that the Try button is available currently only on REST APIs that have test data.

### Concepts

[Concept: Custom Objects in Solutions and Integrations](#)

[Workday Community: Resources to Getting Started with REST API](#)

### Reference

[Workday REST Services Directory](#)

## Concept: Workday REST API Date, Time, and Time Zone Handling

Workday REST APIs support dates, datetimes, and datetimes with time zones.

### Dates

Request and response date fields:

- Don't have a time component or time zone offset.
- Uses the format `yyyy-mm-dd`.
- Can use the same format as a datetime but without a time component or time zone offset.

### Datetimes

In general, the date request fields in the POST, PATCH, and PUT endpoints of the Workday REST APIs that don't require the time zone are `dateTime` fields.

Request `dateTime` fields:

- Must use the ISO 8601 format.
- Can specify any time zone offset from Coordinated Universal Time (UTC).

Example: This `dateTime` is in UTC with `-0700` offset. This `dateTime` value is equivalent to `2023-07-25T16:43:15.000` (PDT).

```
"dateTime" : "2023-07-25T16:43:15.000-0700"
```

- Must have minutes and seconds in the time component. Seconds can have an optional fraction.

Response `dateTime` fields:

- Use the ISO 8601 format.

- Use the Coordinated Universal Time (UTC) with no offset.

Example:

```
"dateTime": "2023-07-25T23:43:15.000Z"
```

## Datetimes and Time Zones

Some Workday REST APIs that require the time zone use `dateTimeZone` fields.

Request `dateTimeZone` fields:

- Must always contain the `timeZone` and `dateTime` fields. Example:

```
{
  "dateTimeZone": {
    "timeZone": "US/Eastern",
    "dateTime": "2023-11-02T10:00:00.000"
  }
}
```

The `timeZone` field:

- Is required.
- Supports all the [Standard Time Zone Names](#).
- Defaults to the GMT time zone and applies offset accordingly, if the given `timeZone` is invalid. If you've opted in to the Workday 32 - Time Zones feature and don't use an ISU, then Workday uses the user's local time zone.

The `dateTime` field:

- Is required.
- Must use the [ISO 8601 date and time formats](#).
- Precision must be in milliseconds of format YYYY-MM-DDTHH:mm:ss.SSSTZD.

Examples:

```
"2023-11-02T10:00:00.000"
"2023-11-02T10:00:00.000-0700"
"2023-11-02T10:00:00"
```

- If given, the time zone offset in the `dateTime` field must be in +/- HHmm or HH:mm format.

Example: -0800 or -08:00

The request throws an exception if the `timeZone` doesn't match the given offset in `dateTime`. If `dateTime` doesn't include an offset, the request uses the `timeZone` offset.

Response `dateTimeZone` fields:

- Always include the `timeZone` and `dateTime` fields.

Example:

```
{
  "dateTimeZone": {
    "timeZone": "US/Eastern",
    "dateTime": "2023-11-02T10:00:00.000-0400"
  }
}
```

- The `timeZone` uses the [Standard Time Zone Name](#), as specified in the request.
- The `dateTime` includes the offset using the format +/- HHmm, which matches the `timeZone` in the request.

## Examples: date and dateTime

Datetime or Date Format	Example	Description
YYYY-MM-DDThh:mm:ss.fffZ	2013-02-26T19:06:57.493Z	Date with zero offset from UTC. <ul style="list-style-type: none"> <li>fff represents a fractional second.</li> <li>T indicates a time.</li> <li>Z indicates zero offset.</li> </ul>
YYYY-MM-DDThh:mm:ss.fff-hh:mm	2014-04-15T19:06:57.493-08:00	Date with a time zone offset of -08:00 hours from UTC.
YYYY-MM-DDThh:mm:ss.fff+hh:mm	2014-04-15T19:06:57.493+03:30	Date with a time zone offset of +03:30 hours from UTC.
YYYY-MM-DD	2014-02-26	date

Note: For an example REST API call that displays a date and a datetime, see [Reference: Inbox Tasks](#) on page 2145.

## Examples: dateTimeZone

Use cases	Request	Response
Non-UTC dateTimeZone with offset  Example: 02 November 2023 10:00 am US/Eastern	<pre>"dateTimeZone": {     "timeZone": "US/Eastern",     "dateTime": "2023-11-02T10:00:00.000-0500" }</pre>	<pre>"dateTimeZone": {     "timeZone": "US/Eastern",     "dateTime": "2023-11-02T10:00:00.000-0500" }</pre>
Non-UTC dateTimeZone without offset  Example: 02 November 2023 10:00 am US/Eastern	<pre>"dateTimeZone": {     "timeZone": "US/Eastern",     "dateTime": "2023-11-02T10:00:00.000" }</pre>	<pre>"dateTimeZone": {     "timeZone": "US/Eastern",     "dateTime": "2023-11-02T10:00:00.000-0500" }</pre>
UTC dateTimeZone without offset  Example: 02 November 2023 10:00 am US/Eastern	<pre>"dateTimeZone": {     "timeZone": "UTC",     "dateTime": "2023-11-02T10:00:00.000" }</pre>	<pre>"dateTimeZone": {     "timeZone": "UTC",     "dateTime": "2023-11-02T10:00:00Z" }</pre>

The occurrence of DayLight Savings is a special use case that handles date and time zone where there's an overlap of time. Example: Consider PDT to PST, 5th Nov 2023 1:30 am occurs twice (PDT ends and PST starts.) Both offsets -0800 and -0700 are acceptable during the special hour. When the request includes the offset during the special hour, the response returns the same offset. Otherwise, if the

request doesn't contain the offset during this hour, the response returns the earlier offset. In this case, the response defaults to -0700. These examples illustrate the Daylight Savings for PDT/PST:

Use cases	Request	Response
dateTime includes -0700 offset	<pre>"dateTimeZone": {     "timeZone": "America/Los_Angeles",     "dateTime": "2023-11-05T01:30:00.000-07:00" }</pre>	<pre>"dateTimeZone": {     "timeZone": "America/Los_Angeles",     "dateTime": "2023-11-05T01:30:00.000-07:00" }</pre>
dateTime includes -0800 offset	<pre>"dateTimeZone": {     "timeZone": "America/Los_Angeles",     "dateTime": "2023-11-05T01:30:00.000-08:00" }</pre>	<pre>"dateTimeZone": {     "timeZone": "America/Los_Angeles",     "dateTime": "2023-11-05T01:30:00.000-08:00" }</pre>
dateTime without offset	<pre>"dateTimeZone": {     "timeZone": "America/Los_Angeles",     "dateTime": "2023-11-05T01:59:00.000" }</pre>	<pre>"dateTimeZone": {     "timeZone": "America/Los_Angeles",     "dateTime": "2023-11-05T01:59:00.000-07:00" }</pre>
dateTime without offset	<pre>"dateTimeZone": {     "timeZone": "America/Los_Angeles",     "dateTime": "2023-11-05T02:00:00.000" }</pre>	<pre>"dateTimeZone": {     "timeZone": "America/Los_Angeles",     "dateTime": "2023-11-05T02:00:00.000-08:00" }</pre>

## Concept: Workday REST API Pagination

### Pagination

Pagination is the mechanism by which an application retrieves a data collection 1 page at a time. The application sends a series of paginated requests until the application receives all of the requested data.

Use pagination to:

- Avoid reaching timeout and resource limits when requesting data collections with large amounts of data.
- Avoid missing data when the full data set might exceed the 100 default, 1000 maximum, or a specified limit.
- Enable quick responses with clients that have scrollable user interfaces. A client can initially load an appropriate number of items into the scrollable list or grid. Then the client can use the returned total to determine how many additional empty rows are necessary. As a user scrolls, the client can send additional paginated requests to fetch and populate the data for additional rows.

Pagination is available with GET collection endpoints that provide the `limit` and `offset` query parameters. To determine whether a GET collection endpoint supports pagination, see the GET collection endpoint in the REST API documentation.

To request paginated data from a GET collection endpoint, specify the `limit` and `offset` query parameters:

Pagination parameter	Description
<code>limit</code>	<p>The maximum number of items to include in a single response.</p> <ul style="list-style-type: none"> <li>• The default value is 20, and the maximum is 100.</li> <li>• Some REST APIs override this value with a maximum of 1000.</li> <li>• Nested prompt endpoints have a default and maximum of 1000.</li> </ul>
<code>offset</code>	<p>The index position of the first object in a response collection.</p> <p>The default is 0, which points to the first object in the collection.</p>

Workday sorts the paginated data in ascending instance ID order. The default sort order ensures that applications get consistently ordered data collections across paginated REST API calls. Any sort parameters provided by a REST web service take precedence over the default sort order.

## Pagination Example

These examples use pagination with the GET `/workers` endpoint:

```
GET https://{{hostname}}/staffing/{{version}}/{{tenant}}/workers
```

Paginated request	Description
<code>GET /workers</code>	<p>The initial request, with default pagination.</p> <p>Returns the first 20 workers in the result set, or all workers if there are fewer than 20. It's equivalent to this request:</p> <pre>GET /workers?limit=20&amp;offset=0</pre> <p>The response includes the total number of items in the entire result set. The <code>total</code> helps you to determine the number of subsequent requests.</p>
<code>GET /workers?limit=20&amp;offset=20</code>	<p>The second page request.</p> <p>Returns the next 20, which are the 21st through 40th workers.</p>
<code>GET /workers?limit=20&amp;offset=40</code>	<p>The third page request.</p> <p>Returns the next 20, which are the 41st through 60th workers.</p>

Related Information  
**Reference**  
[Workday REST Services Directory](#)

## Concept: Workday REST API File Attachments

Several Workday REST services provide POST endpoints that enable you to attach files to business objects. These POST endpoints support multipart/form-data requests containing both file attachment and metadata. The form-data request body depends on whether the POST endpoint creates the file attachment on an existing or new business object.

### Endpoints That Create an Attachment on an Existing Business Object

Some Workday REST services provide POST endpoints with the attachments subresource on a specific business object. These attachment endpoints attach a file to an existing business object and typically require only the file attachment in the request body.

Examples:

REST Service	Attachments Endpoint
Accounts Payable	POST /supplierInvoiceRequests/{ID}/attachments
Expense	POST /entries/{ID}/attachments
Procurement	POST /requisitions/{ID}/attachments
Recruiting	POST /prospects/{ID}/resumeAttachments

To submit a POST endpoint that creates an attachment to an existing business object:

1. Set the Content-Type HTTP header to multipart/form-data.
2. Specify the ID of the existing business object as a path parameter.
3. In the request body, specify form-data, and add:

Key	Value
attachmentContent	The file attachment and location.

Sample request using Postman

POST endpoint:

```
POST https://{{hostname}}/api/procurement/v3/{{tenant}}/requisitions/
{{requisitionId}}/attachments
```

HTTP header:

```
Content-Type: multipart/form-data
```

form-data body:

```
Key: attachmentContent
Value: {{selectedFile}}
```

In Postman, select File on the attachmentContent key, and select the file attachment on the attachmentContent value.

### Sample curl request

```
curl --location --request POST 'https://{{hostname}}/api/procurement/v3/{tenant}/requisitions/{requisitionId}/attachments' \
--header 'Authorization: bearer 74hkgmmqb01pqfw7qkjy1lgd1' \
--header 'Content-Type: multipart/form-data' \
--form 'attachmentContent=@"/C:/temp/sampleFile.txt'"
```

### Sample response

```
{
  "id": "9c3e89353ef4010023f8b71bla6c0000",
  "descriptor": "sampleFile.txt",
  "contentType": {
    "descriptor": "text/plain - mime_plain",
    "id": "d9ae6950446c11de98360015c5e6daf6"
  },
  "fileLength": 845,
  "fileName": "sampleFile.txt"
}
```

## Endpoints That Create Attachments with a New Business Object

Some Workday REST services provide POST endpoints that create a business object with file attachments.

Examples:

REST Service	Attachments Endpoint
Request	POST /requests
Staffing	POST /workers/{ID}/checkInTopics

In addition to the request fields for the new business object, the request body for these POST endpoints includes file attachments. Example: The request body of the `POST /requests` endpoint includes `questionnaireAttachments`:

```
{
  . . .
  "questionnaireAnswers": [
    {
      "questionnaireAttachments": [
        {
          "fileName": "string": {
            "id": "string",
            "descriptor": "string",
            "href": "string"
          },
          "fileLength": 0,
          "id": "string",
          "descriptor": "string"
        }
      ],
      . . .
    }
  ],
  . . .
}
```

To submit a POST endpoint that creates a new business object with file attachments:

1. Set the Content-Type HTTP header to multipart/form-data.
2. In the request body, specify form-data, and add:

Key	Value
<i>file1</i>	<p>The file attachment and location.</p> <p>You can use any name as the <i>file1</i> key.</p> <p>If the POST endpoint supports multiple attachments in an array, you can add another file key. Example: <i>file2</i>.</p>
<i>jsonData</i>	<p>The JSON request body that specifies the request fields for the new business object.</p> <p>In the attachment portion of the JSON request body, specify "file": "cid:<i>file1</i>". Example:</p> <pre>"questionnaireAttachments": [   { "file": "cid:file1" } ]</pre> <p>If you used a different <i>file1</i> key name, replace <i>file1</i> in <i>cid:file1</i> with the appropriate file key.</p> <p>If you specified multiple file keys, add the corresponding file items in the array. Example:</p> <pre>"questionnaireAttachments": [   { "file": "cid:file1" },   { "file": "cid:file2" } ]</pre>

Sample request using Postman

POST endpoint:

```
POST https://{{hostname}}/request/v1/{{tenant}}/requests
```

HTTP header:

```
Content-Type: multipart/form-data
```

form-data body:

```
Key: file1
Value: {selectedFile}
```

```
Key: jsonData
Value: {
  "comment": "Please review.",
  "description": "Review request",
  "requestType": {
    "id": "8aae3f174909012f50f2ff5e505f5a09"
  },
  "questionnaireResponses": {
    "questionnaireAnswers": [
      {
        "questionnaireQuestion": {
          "id": "8aae3f174909012f50f2ff5e505f5a09"
        },
        "value": "Approved"
      }
    ]
  }
}
```

```
        "answerNumeric": 10,
        "questionItem": {
            "id": "8aae3f174909011301757039505f4d09"
        },
        "questionnaireAttachments": [
            {
                "file": "cid:file1"
            }
        ]
    }
}
```

In Postman, select File on the `file1` key, and select the file attachment on the `file1` value.

## Sample curl request

```
curl --location --request POST 'https://{{hostname}}/api/request/v1/{{tenant}}/requests' \
--header 'Content-Type: multipart/form-data' \
--header 'Authorization: Bearer {{74hkmmqb01pqfw7qkjy1lgd1}}' \
--form 'file1=@"/C:/temp/sampleDocument.txt"' \
--form 'jsonData='{
    \"comment\": \"Please review.\",
    \"description\": \"Review request\",
    \"requestType\": {
        \"id\": \"{{8aae3f174909012f50f2ff5e505f5a09}}\"
    },
    \"questionnaireResponses\": {
        \"questionnaireAnswers\": [
            {
                \"answerNumeric\": 10,
                \"questionItem\": {
                    \"id\": \"{{8aae3f174909011301757039505f4d09}}\"
                },
                \"questionnaireAttachments\": [
                    {
                        \"file\": \"cid:file1\"
                    }
                ]
            }
        ]
    }
}"
```

## Sample response

```
{  
    "id": "9c3e89353ef481002d261f298a220000",  
    "descriptor": "Request : Rest API Request Type : Logan McNeil (CHRO,  
HRExe, Mgr 4000, MatMgr, ProMgr,TalMgr,VPRept)",  
    "questionnaireResponses": {  
        "id": "9c3e89353ef481002d261f298a220002",  
        "descriptor": "Response for Request Rest API Questionnaire",  
        "questionnaireAnswers": [  
            {  
                "id": "9c3e89353ef481002d261f298a220003",  
                "descriptor": "10",  
                "answerNumeric": 10,  
                "questionItem": {  
                    "descriptor": "How old are you? for Request Rest API  
Questionnaire".  
                }  
            }  
        ]  
    }  
}
```

```

        "id": "8aae3f174909011301757039505f4d09"
    },
    "questionnaireAttachments": [
        {
            "id": "9c3e89353ef401002d261fc32d010000",
            "descriptor": "sampleDocument.txt",
            "fileLength": 4,
            "contentType": {
                "descriptor": "text/plain - mime_plain",
                "id": "d9ae6950446c11de98360015c5e6daf6"
            },
            "fileName": "sampleDocument.txt"
        }
    ]
},
"requestType": {
    "descriptor": "Rest API Request Type",
    "id": "8aae3f174909012f50f2ff5e505f5a09"

## Batch Protocol

### Concept: Batch Protocol for Workday REST APIs

Batch Protocol is a mechanism for grouping multiple REST API calls from any of the public Workday REST services within a single request. Batch Protocol enables you to specify multiple REST APIs in the request body of a single REST API call. You can use Batch Protocol when you need multiple REST API requests that:

- Need to process as a single transaction that can roll back in case one of the requests in the group fails.

Batch Protocol provides transactional support, which enables a batch of subrequests to either succeed as a single transaction or entirely roll back. A failure on any of the subrequests causes the entire batch of subrequests to roll back.

- Depend on data from other requests in the same transaction.

Batch Protocol supports referential dependencies, which enable you to pass data from 1 REST API call to another in the same batch.

- Require a specific sequence of REST API calls.

Batch Protocol sequentially executes the REST APIs in the order that you specify them in the batch request.

- Can tolerate some requests failing without aborting the entire transaction.

Batch Protocol enables you to opt out of transactional support for specific subrequests in a batch.

- Can significantly reduce network traffic when processed in a single transaction.

Batch Protocol consolidates multiple network connections to multiple Workday REST services into a single connection.

## Usage

- Submitting a Batch Request
- Security Considerations
- Referential Dependencies
- Default Variables
- Continuing Batch Processing on Failure
- JsonPath in Referential Dependencies
- Limits and Restrictions
- Error Handling

### Submitting a Batch Request

To submit a batch request using Batch Protocol, submit this REST API:

```
POST https://{{tenantHostname}}/batch/v1/{{tenantName}}
```

Example: POST https://yourTenantHostName.com/batch/v1/gms

Note: The Batch Protocol REST API version is different from the version of the Workday REST APIs in the subrequests. The current Batch Protocol REST API version is v1.

In the request body, specify the `batch[ ]` list of REST API subrequests, each containing a set of request fields:

```
{
  "batch": [
    {
      "name": "subrequestName",
      "method": "httpMethod",
      "relativeUri": "subrequestUri",
      "continueOnFailure": true,
      "defaultVars": {
        "variable1": "value1",
        "variableN": "valueN"
      },
      "body": {
        "requestField1": "value1",
        "requestFieldN": "valueN"
      }
    },
    ...
  ]
}
```

For details about the Batch Protocol REST API and the request fields, see [Reference: Batch Protocol REST API](#) on page 2055

### Security Considerations

- Ensure that you've configured security policies for each REST API call within the batch request. The REST API documentation lists the required security domains. The REST API documentation in the [Workday REST Services Directory](#) specifies the required security domains for each endpoint.
- All subrequests use the same authentication. You can't use different authorization per subrequest.

## Referential Dependencies

To pass data from one subrequest to another, use referential dependencies. A referential dependency uses this notation:

```
{subrequestName:$ .fieldJsonPath|defaultValue}
```

Enclose the referential dependency in curly braces { }, and specify:

**subrequestName:**

(Required) The name of a previous subrequest. Specify the exact name of the subrequest in the same batch.

Add a colon : after the *subrequestName* (without spaces).

**\$ .fieldJsonPath**

(Required) The JsonPath reference to a field value in the response body of a previous subrequest. Use [JsonPath](#) syntax to reference the field value.

Example: `$ .id` returns the `id` field value at the root (\$) of the JSON response data.

Batch Protocol processes a referential dependency based on the specified JsonPath, default value, and `continueOnFailure`. For details, see [JsonPath in Referential Dependencies](#) on page 2053.

**| defaultValue**

(Optional) The default value if `$ .fieldJsonPath` doesn't return a value.

Provide the default value after the vertical pipe | character.

To specify a default value, use either:

- A hard-coded value. You can't include these characters: { }, [ ]
- A default variable in the `defaultVars` of the same subrequest. See [Default Variables](#) on page 2051.

Use referential dependencies only in these subrequest fields:

- `relativeUri`

Example: Use a referential dependency in an ID path parameter. The ID can reference a newly created object from a preceding subrequest.

- `body` request fields

Specify the referential dependency within double quotes, regardless of the type of the referenced value. Batch Protocol resolves the proper type of the referenced value. Examples:

- "age": "{get-employee:\$ .age}" resolves to "age": 27.
- "anniversary": "Congrats on {get-employee:\$ .numberYears} years with the company!" resolves to "anniversary": "Congrats on 6 years with the company!".

Example: The sample second and third subrequests use referential dependency in the `relativeUri` field. It references the `id` response field from the first subrequest. The `title` field in the second subrequest also has a referential dependency that uses a default value.

```
{
  "batch": [
    {
      "name": "create-prospect",
      "method": "POST",
      "relativeUri": "recruiting/v3/prospects/",
      "body": {
        "candidate": {
          "name": {
            "firstName": "Jane",
            "lastName": "Prospect",
            "country": {
              "id": "bc33aa3152ec42d4995f4791a106ed09"
            }
          },
          "email": "JaneProspect@acme.com",
          "phone": {
            "countryPhoneCode": {
              "id": "db8d3ca6446c11de98360015c5e6daf6"
            },
            "phoneNumber": "1200361755",
            "deviceType": {
              "id": "f51701ef48570198880272fd9728ab03"
            }
          }
        }
      }
    },
    {
      "name": "create-prospect-experience",
      "method": "POST",
      "relativeUri": "recruiting/v3/prospects/{create-prospect:$ .id}/experiences",
      "body": {
        "companyName": "Acme Corporation",
        "title": "{create-prospect:$ .descriptor|Default Title}",
        "startYear": "2024-01-01"
      }
    },
    {
      "name": "create-prospect-skills",
      "method": "POST",
      "relativeUri": "recruiting/v3/prospects/{create-prospect:$ .id}/skills",
      "body": {
        "name": "Administration",
        "continueOnFailure": true
      }
    }
  ]
}
```

## Default Variables

A default value in a referential dependency can use a variable declared in the `defaultVars` field of the same subrequest. Declaring the variables and their default values within `defaultVars` helps with:

- Easier maintenance of default values.

- Reusability of default variables within a subrequest.
- Improves readability of JSON objects and arrays as default values.

The `defaultVars` field in a subrequest is a JSON map containing variable names and their default values. The default variable must match the expected type of default value within the referential dependency. Example: If the referential dependency value expects a list, the default variable must be a list.

To reference a default variable in a referential dependency in the same subrequest, prefix the default value with a dollar sign \$.

The `defaultVars` in this sample subrequest defines the `defaultCountry`, `defaultPhoneCode`, and `defaultConsent` variables with sample default values. The corresponding referential dependencies use the default variables as the default values.

```
{
  "name": "create-prospect",
  "method": "POST",
  "relativeUri": "recruiting/v3/prospects/",
  "defaultVars": {
    "defaultCountry": {
      "id": "bc33aa3152ec42d4995f4791a106ed09"
    },
    "defaultPhoneCode": {
      "id": "db8d3ca6446c11de98360015c5e6daf6"
    },
    "defaultConsent": true
  },
  "body": {
    "candidate": {
      "name": {
        "firstName": "Jane",
        "lastName": "Prospect",
        "country": "{get-prospect:$candidate.name.country|$defaultCountry}"
      },
      "email": "JaneProspect@acme.com",
      "phone": {
        "countryPhoneCode": "{get-prospect:
$.candidate.phone.countryPhoneCode|$defaultPhoneCode}",
        "phoneNumber": "1200361755",
        "deviceType": {
          "id": "f51701ef48570198880272fd9728ab03"
        }
      }
    },
    "contactConsent": "{get-prospect:$contactConsent|$defaultConsent}"
  }
}
```

## Continuing Batch Processing on Failure

Batch Protocol provides transactional support by default. That is, if any subrequest in the batch isn't successful, the batch request:

- Rolls back all updates in the transaction.
- Stops processing the subrequests.
- Returns an error.

If your business requirements can tolerate a subrequest failure and you prefer to continue the batch processing, you can opt out of transactional support by setting the `continueOnFailure` flag to `true` in the subrequest.

If a subrequest fails and its `continueOnFailure` is `true`, the batch request:

- Doesn't roll back previous subrequests.
- Continues processing the next subrequests.
- Reports the error in the response data of the subrequest that failed.

When using `continueOnFailure`, consider these guidelines:

- Be careful when combining `continueOnFailure` with referential dependencies.

A referential dependency can't reference a subrequest whose `continueOnFailure` is true. If so, the subrequest will return an error unless you specified a default value in the referential dependency. If that subrequest fails and the processing continues:

- Batch Protocol can't resolve referential dependency that depends on that data.
- A subsequent subrequest might fail if it assumes that the previous subrequest created or updated the data.
- A batch timeout ignores the `continueOnFailure` flag.

If a batch request runs longer than the transaction timeout (25 seconds), then Batch Protocol rolls back the entire request, regardless of the `continueOnFailure` flag.

- A parse error in the batch request ignores the `continueOnFailure` flag.

If a general parse error occurs on the required request body format, then Batch Protocol immediately returns an error regardless of the `continueOnFailure` flag. Examples: A subrequest field name is invalid; a required subrequest field is missing.

Note: Ensure that the service, version, and subresources in the `relativeUri` are valid. If these path parameters are invalid and `continueOnFailure` is true, Batch Protocol continues processing and reports the error in the response.

### JsonPath in Referential Dependencies

In a referential dependency, use the [JsonPath](#) syntax to fetch a value within the JSON response data of a subrequest. In general, the `$ .fieldPath` notation is sufficient to get a specific field value. Ensure that you specify a valid `fieldPath` and that you use correct JsonPath syntax for more complex notations.

Batch Protocol processes a referential dependency based on the JsonPath, default value, and `continueOnFailure`. This table summarizes how these specified request fields affect batch requests containing subrequests with referential dependency:

JsonPath syntax is valid	JsonPath returns a value	Default value provided	<code>continueOnFailure</code>	Result
x	N/A	N/A	true	The batch request reports an error for the subrequest and continues processing.
x	N/A	N/A	false	The batch request stops processing and rolls back its transaction.
✓	✓	N/A	N/A	The subrequest uses the value from the JsonPath and the batch request continues processing.

JsonPath syntax is valid	JsonPath returns a value	Default value provided	continueOnFailure	Result
✓	x	✓	N/A	The subrequest uses the default value and the batch request continues processing.
✓	x	x	true	The batch request reports an error for the subrequest and continues processing.
✓	x	x	false	The batch request stops processing and rolls back its transaction.

There might be cases when you need to use JsonPath syntax that returns indefinite paths, such as these notations:

- Deep scan operator: ...
- Expression: ?(<expression>)
- Multiple array indices: [<number>, <number> (, <number>)]

If you need to use indefinite paths, note that an indefinite path always returns a list data type, even if the data at that path doesn't exist. Be mindful when using indefinite paths, which might cause unexpected results if the referential dependency is within a string. Note these sample referential dependencies with indefinite paths and their results:

Example using referential dependency with indefinite path	Result
"names": "{get-employees:\$ .name[?(@.age > 21)]}"	"names": ["Alice", "Bob", "Carl"]
"ceo": "The CEO is {get-employees: \$.name[?(@.position == 'CEO')]}"  This example returns a single employee.	"ceo": "The CEO is [\"Montgomery Burns\"]"  The indefinite path returns a list containing the single employee.
"seniorExecs": "{get-employees: \$.name[?(@.role == 'Executive' && @.aage > 65)]}"  This example contains a typo in the field path aage.	"seniorExecs": []  The invalid path returns an empty list.

If the referenced subrequest returns a list of instances, specify a JsonPath that accounts for the list. Example:

```
{
  "batch": [
    {
      "name": "getWorkers",
      "method": "GET",
      "relativeUri": "staffing/v1/workers?search=logan"
    }
  ]
}
```

```

        } ,
        {
          "name": "getSingleWorker",
          "method": "GET",
          "relativeUri": "staffing/v1/workers/{getWorkers:$ .data[1].id}"
        }
      ]
    }
  }
}

```

For more information about indefinite paths, see [JsonPath > What is Returned When?](#).

## Limits and Restrictions

- Maximum number of subrequests per batch: 375.  
All batch requests have this limit, regardless of the HTTP methods used by the subrequests.
- Batch request timeout: 25 seconds.  
All batch requests have this limit, regardless of the HTTP methods used by the subrequests.
- All subrequests must share the same authentication.  
The REST APIs in all subrequests act on behalf of the same individual using the client. The security profile of the same user affects all REST API access to Workday resources.
- All subrequests must share the same HTTP headers.  
The specified HTTP headers with the Batch Protocol REST API apply to all subrequests in the batch.
- Batch Protocol supports uploading attachments, but not retrieving attachments. For uploading attachments, Batch Protocol doesn't impose additional limits on top of the REST framework limits. See [./.../.../manage-workday/tenant-configuration/it-administrator-resources/limitations-and-availability/dan1370796659943.dita](#)

## Error Handling

By default, if any subrequest in the batch isn't successful, the entire batch request rolls back and returns a non-200 status code and the error message.

Note: For debugging purposes, we highly recommend that you include the `name` in all the subrequests. The name helps you locate the subrequest in the response data.

However, if you enable the `continueOnFailure` flag on a subrequest and the subrequest fails, Batch Protocol proceeds with the batch request. Upon completion, the batch request returns a 200 status code and includes any encountered error in the response data. Each subrequest returns a status code and a response body containing either the requested data or error messages. Always check the response for errors.

See [Response Codes in Reference: Batch Protocol REST API](#) on page 2055.

Related Information

### Reference

[Reference: Sample Batch Protocol Requests](#) on page 2061

### Reference: Batch Protocol REST API

Batch Protocol provides a REST API endpoint that submits multiple REST API subrequests.

### Batch Protocol Endpoint

```
https://{{tenantHostname}}/batch/v1/{{tenantName}}
```

Example: <https://yourTenantHostName.com/batch/v1/gms>

Note: The Batch Protocol REST API version is different from the version of the Workday REST APIs in the subrequests. The current Batch Protocol REST API version is v1.

## HTTP Method

POST

## Request Body

A JSON map containing the `batch[]` array. Each item in `batch[]` is a subrequest containing these request fields:

`name`

Data type: string

Required: Yes for referential dependencies and debugging with `continueOnFailure`.

Description: Identifies the subrequest. Specify a unique double-quoted string, which can contain alphanumeric characters, underscores, and dashes.

Can contain referential dependencies: No

Examples:

```
"request_1"
"create-employee"
"allWorkers"
```

`method`

Data type: string

Required: Yes

Description: The HTTP method. Possible values:

- GET
- POST
- PUT
- PATCH
- DELETE

Can contain referential dependencies: No

`relativeUri`

Data type: string

Required: Yes

Description: The relative path of a Workday REST API endpoint. Begin the path with a valid REST service name and version, followed by the resource path. The base path assumes the tenant base path of the Batch Protocol endpoint.

Note that Batch Protocol:

- Doesn't support bulk updates in a subrequest. You can't specify the query parameter `bulk=true`.
- Requires URL encoding for special characters and spaces. Example: If a subrequest calls the WQL REST API, all

spaces in the `query` parameter must be encoded as %20.

```
"relativeUri": "wql/v1/data?  
query=SELECT%20workdayID%20FROM  
%20workersForHCMReporting  
%20(dataSourceFilter%20=%  
%20allActiveWorkers)"
```

- Uses the same tenant specified in the base URL of the Batch Protocol REST API. Don't include the tenant path parameter in `relativeUri`.

Can contain referential dependencies: Yes in these path parameters:

Path Parameter	Example
Resource ID	"recruiting/v3/prospects/{create-employee:\$id}"
Subresource ID	"recruiting/v3/prospects/4ab154d8cbc10180394c703/experiences/{employee-experience:\$id}"
Reference ID value	"recruiting/v3/prospects/COMPANY_ID=Company_{create-employee:\$companyId}" "recruiting/v3/prospects/{get-worker:\$id}"
Query parameter value	"staffing/v6/workers?search={create-employee:\$firstName}{create-employee:\$lastName}"

Note: The reference ID and query parameter values can mix regular text and multiple referential dependencies. However, the resource and subresource IDs can only accept a single referential dependency.

`continueOnFailure`

Data type: boolean

Required: No

Description: If true, Batch Protocol continues processing when this subrequest encounters an error. For more information, see *Continuing Batch Processing on Failure* in [Concept: Batch Protocol for Workday REST APIs](#) on page 2048.

Default: false

**defaultVars**

Can contain referential dependencies: No

Data type: JSON object

Required: No

Description: Defines variables for default values in referential dependencies. Define `defaultVars` for referential dependencies in the same subrequest. For more information, see *Default Variables* in [Concept: Batch Protocol for Workday REST APIs](#) on page 2048.

Can contain referential dependencies: No

Examples:

```
{
  "defaultId": 0,
  "noName": "blank"
}
```

**body**

Data type: JSON object

Required: Yes for requests that require a request body. If the REST API requires an empty request body, specify `"body" : {}`.

Description: Contains the data for POST, PUT, and PATCH subrequests.

Can contain referential dependencies: Yes in field values. Field names can't contain referential dependencies.

Examples:

```
{
  "name": "Joe Cool",
  "greeting": "Hello {get-employee:$preferredName}!",
  "age": "{get-employee:$age}"
}
```

**Response Codes****200**

Successful or partial response.

The response data contains these fields:

- `total` - The number of processed subrequests.
- `data[]` - An array containing the response data for each subrequest. Each item in `data[]` contains these fields:
  - `name` - The subrequest name, if given.
  - `body` - The response data from the subrequest if the subrequest succeeded.

Note: If the subrequest failed and the `continueOnFailure` flag is true, the `body` contains the error messages and

- error code. Always check for errors even if the status code is 200.
- status - The HTTP status code from the subrequest.

Example:

```
{
  "total": 3,
  "data": [
    {
      "name": "create-
prospect",
      "body": {
        "id": "6c742b78640290000b951cc4a6890000",
        "descriptor": "Jane
Prospect",
        "candidate": {
          "id": "6c742b78640290000b951d5e311c0000",
          "descriptor": "Jane Prospect",
          "countryPhoneCode": {
            "descriptor": "United States of
America (+1)",
            "id": "db8d3ca6446c11de98360015c5e6daf6"
          },
          "email": "JaneProspect@acme.com",
          "name": {
            "id": "6c742b78640210000b951d5e311c0002",
            "descriptor": "Jane Prospect",
            "country": {
              "descriptor": "United States of
America",
              "id": "bc33aa3152ec42d4995f4791a106ed09"
            },
            "firstName": "Jane",
            "primary": "Prospect"
          },
          "phoneNumber": "1200361755"
        },
        "contactConsent": false
      },
      "status": 201
    },
    {
      "name": "create-
prospect-experience",
      "body": {
        "id": "6c742b78640290000b951d5e311c0003",
        "descriptor": "Jane Prospect"
      }
    }
  ]
}
```

```

        "error": "invalid
request: validation errors",
"errors": [
{
    "error":
"Enter a start year.", "code":
"A258"
}
],
"status": 400
},
{
    "name": "create-
prospect-skills",
"body": {
    "id":
"6c742b78640290000b9588a2cff0000",
    "name":
"Administration"
},
"status": 201
}
]
}

```

400

Invalid request.

Possible causes:

- The HTTP method used with the Batch Protocol REST API is invalid. Ensure that the HTTP method is POST.
- Duplicate subrequest names in the batch request.
- A subrequest with "continueOnFailure": false encountered one of these possible errors:
  - Invalid relativeUri.
  - Invalid request field name.
  - Nested referential dependency.
  - Invalid fields inside body.
  - Application validation error.
- A referential dependency in a subrequest references a subrequest that has "continueOnFailure": true.

404

Not found.

A subrequest with "continueOnFailure": false encountered one of these possible errors:

- Incorrect method.
- Invalid resource or subresource in the relativeUri field.

Other standard HTTP codes

Batch Protocol can return other standard HTTP status codes, such as:

- 408 - Timeout error.
- 429 - Too many requests.
- 500 - Server error.

### Reference: Sample Batch Protocol Requests

#### Creating a Prospect

The process of creating a prospect is a series of calls that create the prospect and its subresources such as names, experiences, addresses, education, attachments. The REST API calls should be in a single transaction in which everything succeeds or rolls back when any of the calls might fail.

Sample request:

```
POST https://{{tenantHostname}}/batch/v1/{{tenant}}
```

```
{
  "batch": [
    {
      "name": "create-prospect",
      "method": "POST",
      "relativeUri": "recruiting/v3/prospects/",
      "body": {
        "candidate": {
          "name": {
            "firstName": "Jane",
            "lastName": "Prospect",
            "country": {
              "id": "bc33aa3152ec42d4995f4791a106ed09"
            }
          },
          "email": "JaneProspect@acme.com",
          "phone": {
            "countryPhoneCode": {
              "id": "db8d3ca6446c11de98360015c5e6daf6"
            },
            "phoneNumber": "1200361755",
            "deviceType": {
              "id": "f51701ef48570198880272fd9728ab03"
            }
          }
        }
      }
    },
    {
      "name": "create-prospect-experience",
      "method": "POST",
      "relativeUri": "recruiting/v3/prospects/{create-prospect:$ .id}/experiences",
      "body": {
        "body": {
          "companyName": "Acme Corporation",
          "title": "{create-prospect:$ .descriptor|Default Title}",
          "startYear": "2024-01-01"
        }
      }
    },
    {
      "name": "create-prospect-skills",
      "method": "POST",
      "relativeUri": "recruiting/v3/prospects/{create-prospect:$ .id}/skills"
    }
  ]
}
```

```

        "relativeUri": "recruiting/v3/prospects/{create-prospect:$ .id} /skills",
        "body": {
            "name": "Administration"
        },
        "continueOnFailure": true
    }
]
}

```

Sample response:

```
{
  "total": 3,
  "data": [
    {
      "name": "create-prospect",
      "body": {
        "id": "89c65f66c91190000b9b9b883ec70000",

## Changing a Location in a Change Job Event

The Change Job event requires this series of calls:

- Initiate the Change Job event.
- Update the appropriate subresources such as business title, job classification, job profile, location, position, and others.
- Submit the Change Job event.

The REST API calls should be in a single transaction in which everything succeeds or rolls back when any of the calls might fail.

Sample request:

```
POST https://{tenantHostname}/batch/v1/{tenant}
```

```
{
    "batch": [
        {
            "name": "startChangeJobEvent",
            "method": "POST",
            "relativeUri": "staffing/v6/workers/Employee_ID=25655/jobChanges",
            "body": {
                "date": "2024-01-31",
                "reason": {
                    "id": "9a7f47f0d2d14825a2016c76af30b939"
                }
            }
        },
        {
            "name": "startDetails",
            "method": "PATCH",
            "relativeUri": "staffing/v6/jobChanges/{startChangeJobEvent:$ .id}/startDetails/{startChangeJobEvent:$ .id}",
            "body": {
                "reason": {
                    "descriptor": "Data Change > Data Change > Change Location",
                    "id": "9a7f47f0d2d14825a2016c76af30b939"
                },
                "date": "2024-01-31"
            }
        },
        {
            "name": "changeLocation",
            "method": "PATCH",
            "relativeUri": "staffing/v6/jobChanges/{startChangeJobEvent:$ .id}/location/{startChangeJobEvent:$ .id}",
            "body": {
                "location": {
                    "descriptor": "New York",
                    "id": "d951e85593ad4daf88dc1bfabf069732"
                }
            }
        }
    ]
}
```

```

        },
        "workShift": {
            "descriptor": "Evening (United States of America)",

## REST API Headers

### Concept: Request Timeout REST API Header

The `wd-request-timeout` header enables clients to specify a custom timeout value for REST API requests. This header enables clients to inform the server about the maximum amount of time they will wait for a response. The primary purpose of this header is to specify the maximum time the client will wait for the server response.

**Note:** The `wd-request-timeout` header doesn't guarantee the server response within the specified timeframe.

The `wd-request-timeout` header provides clients with greater control over their interactions with the server, enabling them to define acceptable wait times for responses. This header can be useful for long-running operations where the default server-side timeout might not be sufficient, or for critical operations where a faster failure is desired.

### Request Timeout Header

To define a client request timeout, specify this HTTP header in your REST API request:

```
wd-request-timeout: <time in milliseconds>
```

The `wd-request-timeout` value must be an integer representing the time in milliseconds.

**Example:** This sample `wd-request-timeout` header specifies a 5-second timeout.

```
wd-request-timeout: 5000
```

### Timeout Response

The server responds with these HTTP status codes depending on the nature of the timeout:

**499: Client closed request**

Along with error code S26, the server returns the 499 status code when the client reaches the timeout before the server could respond.

```
499 Client Closed Request{
  "error": "Client request timeout
occurred before the server could
provide a response",
  "code": "S26"
}
```

**503: Server timeout**

Along with error code S27, the server returns the 503 status code when a timeout occurs on the server side, and the client request did not include the `wd-request-timeout` header.

```
503 Service Unavailable
{
  "error": "A timeout has occurred
before the server could provide a
response",
  "code": "S27"
}
```

}

## Guidelines and Considerations

- Unless Workday defines an explicit timeout for a specific REST API endpoint, the default client request timeout is 600000 milliseconds (10 minutes). The default timeout applies to both read and write requests.
- The maximum `wd-request-timeout` value is 1800000 milliseconds (30 minutes).
- Clients can avoid the "499 Client Closed Request" response by increasing the `wd-request-timeout` header value.

## Concept: REST Metadata API Header

The Workday REST APIs enable you to retrieve metadata information when you include the `wd-metadata-api-version` header in the request. To retrieve metadata information about the fields returned by a REST API, specify this HTTP header in your request:

```
wd-metadata-api-version: v1
```

The header value is the version of the REST Metadata API, which is currently `v1`. Note that the header value isn't the version of the requested REST web service.

## Security

The REST Metadata API uses the same security access model as the standard REST APIs. If the user has the appropriate security privileges to call an API without the header, the same privileges enable the user to call that API with the `wd-metadata-api-version` header.

## Metadata Response

When you specify the `wd-metadata-api-version` header, the request returns the metadata instead of the data from your tenant. The metadata uses the standard Javascript Object Notation (JSON) format.

The metadata enables you to discern the API response fields based on the configured conditions or the security permissions of the current user. The metadata contains information related to display options, textual data, and data types.

Display options include:

Field Attribute	Description
<code>required</code>	A standard request must specify the field.
<code>readOnly</code>	A POST, PUT, or PATCH method can't update the field.
<code>hidden</code>	<p>The field is contextual depending on what type of object you're calling, related object conditions, or security configuration.</p> <p>Example: A standard REST response can hide a field if the current user lacks permission to view the field. If the current user lacks security permission, the metadata returns the field with <code>"hidden": "true"</code>. If the current user can view the field, the metadata returns the field with <code>"hidden": "false"</code>.</p>

Textual data:

- Labels
- Help text
- Name

Field data types:

Data Type	Included Information
Array	Nonsingular instance.
Boolean	Indicates that the field is a boolean.
Integer	Multiple of, maximum, minimum.
Number	Multiple of, maximum, minimum.
Object	Single instance.
String	Maximum length.
String (date)	Date format and precision.

The metadata response is dynamic. If the required attribute of a field has changed, Workday reflects the change in the metadata response. Similarly, the Metadata API reflects changes based on the security configuration of the user.

## Guidelines and Limitations

Consider these guidelines and limitations:

- For an array data type, the metadata specifies `items` and a reference to the schema definition of an array item. This specification is standard JSON schema specification. Example:

```
"items": {
    "$ref": "#/definitions/jobPostingAnchorSummary"
}
```

The definition section of the metadata includes the referenced schema definition. Example:

```
"definitions": {
    "jobPostingAnchorSummary": {
        "additionalProperties": false,
        "properties": {
            "endDate": {
                "hidden": false,
                "label": "End Date",
                "readOnly": false,
                "format": "date",
                "precision": "YYYY-MM-DD",
                "type": "string"
            },
            "timeType": {
                "hidden": false,
                "label": "Full/Part-time",
                "readOnly": false,
                "$ref": "#/definitions/positionTimeTypeDetail"
            },
            ...
        }
    }
}
```

Note that the `timeType` field in the `jobPostingAnchorSummary` schema also references another schema, `positionTimeTypeDetail`. The definition section includes all referenced schemas in the metadata.

- When you use the `wd-metadata-api-version` header with a POST, PUT, or PATCH request, specify an empty request body. Example: `{}`
- You can't use the `wd-metadata-api-version` header with these requests:
  - DELETE operations.
  - Prompt endpoints. A prompt endpoint is a GET operation that returns Workday ID values for certain resources. Example: GET `/values/jobChangesGroup/jobs/` in the Staffing REST web service.
  - Bulk operations. A bulk operation is an endpoint that specifies the `bulk=true` parameter. Example: POST `/requisitions/{ID}/requisitionLines?bulk=true` in the Procurement REST web service.
  - Reports-as-a-Service requests.

## Example

This sample request retrieves information about job postings:

```
GET /jobPostings
```

To retrieve the metadata of the job postings, specify the `wd-metadata-api-version` header. Example:

```
"header": [
  {
    "key": "wd-metadata-api-version",
    "value": "v1",
  }
]
```

This snippet shows the sample metadata response:

```
{
  "type": "object",
  "properties": {
    "total": {
      "hidden": false,
      "readOnly": true,
      "multipleOf": 1.0,
      "exclusiveMax": 2147483647,
      "exclusiveMin": 0,
      "type": "integer"
    },
    "data": {
      "hidden": false,
      "readOnly": true,
      "type": "array",
      "items": {
        "$ref": "#/definitions/jobPostingAnchorSummary"
      }
    }
  },
  "definitions": {
    "jobPostingAnchorSummary": {
      "additionalProperties": false,
      "properties": {
```

```
"endDate": {
    "hidden": false,
    "label": "End Date",
    "readOnly": false,
    "format": "date",
    "precision": "YYYY-MM-DD",
    "type": "string"
},
"timeType": {
    "hidden": false,
    "label": "Full/Part-time",
    "readOnly": false,

### Concept: Validate Only Mode for REST APIs

The validate-only mode enables you to validate a REST API request without taking any action or persisting any data in the tenant. The validate-only mode applies to these methods:

- POST

- PUT
  - PATCH
  - DELETE

To enable the validate-only mode, specify this HTTP header in your REST API request:

x-validate-only: 1

The validate-only mode performs these validations:

- Operation security.
  - Display option violations.
  - Field-level security.
  - Instance set constraints.
  - Prompt resource constraints.
  - Currency constraints.
  - Optional field configuration constraints.
  - Processing options, representation content, and header validations.

When the request encounters validation errors, the request returns a non-successful HTTP response code (Example: 400) and the error messages. Correct the errors in the request and resend it.

When the request passes all validations, the request returns the 200 HTTP response code. To process the updates and persist the data in the tenant, resend the request without the `x-validate-only` header or set it to zero. Example:

x-validate-only: 0

## Example

This example submits a PUT request with the `x-validate-only` header set to 1. The response displays a sample validation error.

## Sample request:

```
PUT https://api.workday.com/expense/v1/entries/4d718d459cce01000c6fb285efa20000
```

Header:

Name	Value
x-validate-only	1

## Sample request body:

```
{  
  "amount": {  
    "currency": "USD",  
    "value": "1000"  
  }  
}
```

### Sample response:

```
{  
  "error": "invalid request: validation errors",  
  "errors": [  
    {}  
  ]  
}
```

```

        "code": "A6",
        "error": "Value required in field",
        "field": "date",
        "path": "date"
    }
]
}

```

## FAQ: REST Metadata API

- [What security access model does the Metadata API use? on page 2075](#)
- [In what format is the metadata response? on page 2075](#)
- [How do the metadata tags relate to the standard API call? What does it mean that a field is hidden or not? on page 2075](#)
- [Does "readOnly" mean that a standard REST "PUT" method can't write data to that field? on page 2076](#)
- [For "items" in an array, what does the \\$ref indicate when it has something like "#/definitions/candidateTag"? on page 2076](#)
- [Can I use Metadata API calls with RaaS? on page 2077](#)

What security access model does the Metadata API use?

The Workday REST Metadata API uses the same security access model as a standard Workday REST API to get a metadata response. If the user has the appropriate security privileges to call an API in the standard way, then they can also call that same API with the `wd-metadata-api-version` header and receive a metadata response.

In what format is the metadata response?

The metadata response is an extension of the JSON Schema Specification.

How do the metadata tags relate to the standard API call? What does it mean that a field is hidden or not?

The Metadata API allows the calling user to discern which fields the standard API response would return. The Metadata API response depends on the configured conditions or the current security permissions of the user.

If a field has a value for `hidden`, then the response depends on what type of object you're calling and the conditions or security configuration related to it. If the standard REST response would hide the field due to insufficient user permissions, then the metadata response for that user indicates the field as hidden. Example:

```
"hidden": "true"
```

The corresponding standard REST response (without the Metadata API header) doesn't return the value of that field from the calling user.

Conversely, assume that the calling user has the requisite security or meets the required conditions to view the value of that field. If the standard REST

response would return the field to the user, then the metadata response for that user indicates the field as not hidden. Example:

```
"hidden": "false"
```

The corresponding standard REST response (without the Metadata API header) returns the value of that field to the calling user.

Example: A REST API returns fields based on whether the calling user is a salaried worker or a temporary worker. Those fields would include the `hidden` property in the Metadata API response.

In this example, if the processing user is a salaried worker, the Metadata API would return `"hidden" : "false"` for those fields. However, if the processing user is a temporary worker, then the Metadata API would return `"hidden" : "true"` for the same fields. The Metadata API returns the field with the `hidden` property for the temporary worker, but the standard REST response doesn't return the field.

Does “`readOnly`” mean that a standard REST “PUT” method can't write data to that field?

For “`items`” in an array, what does the `$ref` indicate when it has something like “`#/definitions/candidateTag`”?

Yes. If a field is `readOnly`, data can't be written with a PUT, POST, or PATCH HTTP method.

The `$ref` in an `items` array means that there's an array of items and each item is of type `$ref`. The `$ref` points to a definition, which explains the fields and properties. A `$ref` definition is an embedded representation, based on the JSON Schema specification.

Refer to these links for more information about `$ref` and the JSON Schema specification:

[Referenced and Referencing Schemas](#) from the JSON Schema specification

Example:

```
"$ref": "#/definitions/prospectSummary"
```

Refers to this definition, which is further down in an example Metadata API response:

```
"definitions": {
    "prospectSummary": {
        "additionalProperties": false,
        "properties": {
            "candidateTags": {
                "hidden": false,
                "label": "Candidate Tags",
                "readOnly": false,
                "type": "array",
                "x-enum-member": [
                    "Candidate"
                ],
                "x-enum-name": "Candidate"
            }
        }
    }
}
```

```

        "items": {
          "$ref": "#/
definitions/candidateTag"
        }
      }
    }
  }
}

```

The "\$ref": "#/definitions/candidateTag" in the preceding example refers to this definition in the same Metadata response:

```

"candidateTag": {
  "additionalProperties": false,
  "properties": {
    "id": {
      "hidden": false,
      "readOnly": true,
      "type": "string"
    },
    "descriptor": {
      "hidden": false,
      "readOnly": true,
      "type": "string"
    },
    ...
  }
}

```

Can I use Metadata API calls with RaaS?

No. The Metadata API isn't supported with RaaS requests.

## REST API Security and Authentication

### Concept: Workday REST API Security

Workday REST APIs use OAuth and the Workday configurable security model to secure interactive transactions in end-user applications. REST APIs act on behalf of the individual using the client. The user's security profile affects the REST API access to Workday resources.

#### Security Policies

Workday secures each REST API endpoint to a domain or business process security policy. Each endpoint can access only the domains and business processes that the current user can access.

The domain security policies control who can view and modify Workday data through the REST APIs. For each Workday REST API invoked by your application, configure the appropriate domain security policies. When you edit the security policy permissions for the domain that secures the REST API, add a Report/Task permission for the security groups. Select the proper permission for each security group:

- View for the GET method.

- Modify for the POST, PUT, PATCH, DELETE methods.

Note: Workday REST APIs require the Report/Task Permissions in the security policy, whether the user is an ISU or an individual user. The Integration Permissions only apply to Workday SOAP web services.

The business process security policies control which security groups have permission to perform business process actions.

If the current user can't access the domain or business process, the REST API returns an error. Example: The `GET /supervisoryOrganizations` REST API returns only the organizations that the user has authorization to access.

The endpoint descriptions in the [Workday REST Services Directory](#) include the domains that secure the endpoints. The endpoint descriptions also include the scope, which is the corresponding Workday functional area.

See [Setup Considerations: Security Policies](#).

## **OAuth Authentication**

OAuth enables Workday users to authorize third-party clients to access their Workday data securely on their behalf. When you register your REST API client with Workday, you must specify the functional area that the client should have access to. If the client isn't secured to a scope functional area, then the client can't use the REST APIs secured to that functional area, regardless of the current user's security profile.

To authenticate a REST API request using OAuth, specify the Bearer access token in the Authorization header of the REST API request. The way that the access token is retrieved depends on the OAuth grant type.

Note: Workday recommends that your web service client not use the refresh token to retrieve access tokens frequently, such as with each web service call or at a frequent scheduled interval. Access tokens expire by default in 4 hours if you don't explicitly configure them to expire in 60 minutes. Access tokens for the Implicit grant type remain valid for 24 hours unless the session idles out or times out, at which time they invalidate.

Workday REST APIs also support SAML and JWT. For details, see [REST API Authentication Methods](#) in [API Authentication Methods](#) on Workday Community.

## **Concept: Cross Origin Resource Sharing (CORS)**

Cross Origin Resource Sharing (CORS) is a standard mechanism that enables browsers to make cross-domain requests. A cross origin request occurs when an application on a host domain initiates a request for resources located on another domain. The browser enables the request only if the target domain specifies that it accepts a cross origin request from the initiating domain.

When you develop a browser-based application that requires access to Workday REST APIs, register your application with Workday using the Register API Client task. Workday supports cross-origin requests for the OAuth Authorization Code flow with Proof Key for Code Exchange (PKCE). To configure CORS support, specify the domain or domains that will be requesting resources from your tenant. Add each CORS domain to the Allowed Origins table on the Register API Client task. The API Client will then accept cross origin requests from those domains for the Authorization Code with PKCE grant type.

Note: Workday supports CORS on Workday REST API requests only. Workday doesn't support CORS on other types of API requests, such as SOAP and Reports as a Service (RaaS).

[Related Information](#)

### Tasks

[Register API Clients](#)

### Reference

[Cross-Origin Resource Sharing \(CORS\)](#)

## Steps: Configuring OAuth 2.0 for Your REST API Client

### Context

The Workday REST API works with OAuth 2.0 to authorize access to resources in a Workday tenant. To use OAuth 2.0, enter information into Workday before your client uses the REST API. Use the information that you obtain from the tenant to create your client.

### Steps

1. [Register API Clients](#).

Supply information to Workday before your client uses the REST API. Use the results of this step for the next step.

2. Use the information from Workday to create your client:

Option	Description
Client ID	A unique identifier for your client.
Client Secret	Required for authorization code grant only. Use to obtain an access token.
Workday REST API Endpoint	Use to access resources in your tenant.
Token Endpoint	Required for authorization code grant only. Use to exchange an authorization code for a token.
Authorization Endpoint	For client authorization requests.

### Next Steps

[Create your client.](#)

[Related Information](#)

### Reference

[Community: OAuth 2.0 Using Authorization Tab in Postman](#)

## Steps: Authenticate REST API with SAML

### Prerequisites

Set up Security Assertion Markup Language (SAML) 2.0 Authentication in Workday and with your Identity Provider (IdP) before using it to authenticate Workday REST API requests.

### Context

Supply an OAuth 2.0 access token to send requests to the Workday REST API. You can use SAML to retrieve the required OAuth token.

## Steps

1. Register API Clients.

Register your API client with these options:

- Client Grant Type: SAML Bearer Grant
- x509 Certificate: select the certificate for your IdP.
- Access Token Type: Bearer
- Grant Administrative Consent: select the check box.
- Scope (Functional Areas): select all the areas that apply to the REST resources you use. If you use REST resources that Workday secures to core Workday domains that aren't in any functional areas, select the Include Workday Owned Scope check box.

Copy the Token Endpoint and Client ID values.

2. Retrieve the SAML Response using the API provided by your IdP.

Decode the SAML Response, extract the SAML Assertion from within the response, and then base64url-encode the SAML Assertion. The SAML Assertion must be signed by your IdP.

3. Send an HTTPS POST request to the token endpoint, with this request message body:

```
grant_type=urn:ietf:params:oauth:grant-type:saml2-
bearer&assertion={base64url-encoded SAML Assertion}&client_id={API
Client ID}
```

The request returns a response body similar to:

```
{
  "access_token": "myAccessToken",
  "token_type": "Bearer"
}
```

4. Set the HTTP Authorization header to Bearer {myAccessToken} for your request to the REST resource URL.

Example: Send the access token in the Authorization header to the resource REST URL:

```
curl -H "Authorization: Bearer {myAccessToken}" https://{{Workday REST
API Endpoint}}/{resource}
```

Note: Workday recommends that your web service client not use the refresh token to retrieve access tokens frequently, such as with each web service call or at a frequent scheduled interval. Access tokens expire by default in 4 hours if you don't explicitly configure them to expire in 60 minutes. Access tokens for the Implicit grant type remain valid for 24 hours unless the session idles out or times out, at which time they invalidate.

## Result

The response body contains the JSON data for the response from the resource.

## Next Steps

Continue to use the access token to send requests to the resource. Use the refresh token to retrieve a new access token only when the access token expires.

## Prism Analytics REST APIs

### Steps: Load Data into a Table Using Data Change with the REST API

#### Prerequisites

##### Security:

- *Prism: Manage File Containers* domain in the Prism Analytics functional area when uploading a file.
- Any of these security requirements:
  - *Prism: Tables Owner Manage* domain in the Prism Analytics functional area.
  - *Prism: Tables Manage* domain in the Prism Analytics functional area.
  - *Table Owner* permission on the table.
  - *Table Editor* permission on the table.
  - *Can Delete Table Data* permission on the table.
  - *Can Insert Table Data* permission on the table.
  - *Can Truncate Table Data* permission on the table.
  - *Can Update Table Data* permission on the table.

#### Context

The Prism Analytics REST API enables you to programmatically run data change activities created through the UI to change the data in a Prism Analytics table. You can change the data in a table once or on a regular basis. To change the table data, both the table and data change task must already exist in the Data Catalog.

When you create a data change task in the UI, you can run it as a data change activity using the REST API at any time. Use the POST /dataChanges/{id}/activities resource endpoint to run a data change task.

However, when the data change task specifies file upload as the source type, then you also need to create a file container and upload files to it before you run the data change task. These steps describe how to run a data change task that specifies file upload as the source type using the Prism Analytics REST API.

Use this URL when you use the REST API to access the REST resources using version 3:

```
https://{{hostname}}/api/prismAnalytics/v3/{{tenantname}}
```

#### Note:

Specify v3 as the version with the tables, fileContainers, and dataChanges resources.

Integration system users can't create a table.

See the Workday REST Services Directory on Workday Community for details on the version 3 REST resources.

#### Steps

1. Register your API client in your tenant using the Register API Client for Integrations task.  
Select Include Workday Owned Scope when you register. For more information, see [Register API Clients for Integrations](#).
2. Create a file container.  
Use the POST /fileContainers REST resource. Workday returns the ID of the file container.

- Upload 1 or more files to the file container. Specify the file container ID in the URL of the POST request.

Use the POST /fileContainers/{id}/files REST resource.

Consider these rules:

- You can upload 1 file in each POST request. To upload multiple files into the file container, create multiple POST requests either sequentially or concurrently.
- Files must be gzip compressed.
- Each filename in a file container must be unique.
- The maximum number of concurrent uploads is 10.

Note: You should retry the request if Workday returns HTTP response status code of 429 Too Many Requests.

- Get the ID of the data change task that you want to run.

Use the GET /dataChanges REST resource.

- Run the data change task while specifying the file container that you created.

Use the POST /dataChanges/{id}/activities REST resource. In the body of the POST request JSON, specify the file container ID:

```
{
  "fileContainerWid": "string"
}
```

## Result

Workday:

- Runs the data change task and starts a data change activity.
- Returns the ID of the data change activity.
- Changes the data in the target table based on the data in the file container source.

## Next Steps

You can view the data change activity progress and history on:

- The Activities tab of the View Table report.
- The Data Change Activities tab of the Data Catalog report.
- The Prism Management Console report.

[Workday REST Services Directory](#)

[Reference: Naming Guidelines](#)

## Steps: Load Data into a Table Using the REST API

### Prerequisites

Security:

- Prism: Tables Create* domain in the Prism Analytics functional area.
- Prism: Tables Manage* domain in the Prism Analytics functional area.

## Context

The Prism Analytics REST API enables you to programmatically create and push external data into a Prism Analytics table. You can load data into a table once or on a regular basis. You can load data into a table you just created, or an existing table.

Use this URL when you use the REST API version 2 to access the Datasets and wBuckets resources:

```
https://{{hostname}}/ccx/api/prismAnalytics/{{version}}/{{tenantname}}
```

Use this URL when you use the REST API version 3 to access the Tables and Buckets resources:

```
https://{{hostname}}/api/prismAnalytics/{{version}}/{{tenantname}}
```

Note:

To create and load data into a Prism Analytics table with the REST API, you must specify v2 or v3 as the version.

Integration system users can't create a table.

These instructions include links to the REST resources for version 2. You can find the resources for version 3 online in the Workday REST Services Directory.

## Steps

1. Register your API client in your tenant using the Register API Client for Integrations task.  
Select Include Workday Owned Scope when you register. For more information, see [Register API Clients for Integrations](#).
2. Get the ID of an existing or new table.
  - a) (Optional) Get a list of existing tables to retrieve the ID of the table you want to load data into.  
Use the Tables resource for v3, and the Datasets resource for v2. See [Reference: Datasets](#) on page 2129.
  - b) (Optional) Create a table while specifying the table name and fields in the body of the POST request. Note the table ID in the response.  
The table name you specify is the table API name. Optionally, you can also specify a display name. API names and display names must conform to name validation rules.  
Use the Tables resource for v3, and the Datasets resource for v2. See [Reference: Datasets](#) on page 2129.
3. Create a bucket for the table from the previous step.

In the body of the POST request JSON:

- Specify a unique name for the bucket. Bucket names must conform to name validation rules.
- Specify the table ID in the targetDataset parameter.
- Describe the schema of the data files you'll upload to the bucket. The schema must be the same or a subset of the table schema.

Use the Buckets resource for v3, and the wBuckets resource for v2. See:

- [Reference: wBuckets](#) on page 2167
- [Reference: Table and Dataset Field Attributes](#) on page 2094
- [Reference: File Parse Options](#) on page 2090

4. Upload 1 or more files into the bucket. Specify the bucket ID in the URL of the POST request.

Consider these rules:

- You can upload 1 file in each POST request. To upload multiple files into the bucket, create multiple POST requests either sequentially or concurrently.
- Files must be gzip compressed.
- Each filename in a bucket must be unique.
- The schema of the files you upload must match the schema defined in the bucket.
- The maximum number of concurrent uploads is 10.

Use the Buckets/Files resource for v3, and the wBuckets/Files resource for v2. See:

- [Reference: wBuckets/Files on page 2182](#)
- [Reference: Source File Format Requirements on page 2098](#)

Note: You should retry the request if Workday returns HTTP response status code of 429 Too Many Requests.

5. After you've successfully uploaded all files to the bucket, load the data into the table. You do this by running the complete call on the bucket.

This call starts a background process that moves the data from its temporary location into the table. This call either replaces or appends the table depending on the operation parameter in the body of the POST Buckets or wBuckets call. You can only call this resource on a bucket once and only when the state of the bucket is New. When this call succeeds, Workday changes the bucket state to Processing and immediately returns a success response. Then in the background, Workday starts the process to commit the data into the table.

Use the Buckets/Complete resource for v3, and the wBuckets/Complete resource for v2. See [Reference: wBuckets/Complete on page 2181](#).

6. Get the status of the bucket. You might want to get the bucket status to find out what state it's in, such as Processing, Success, or Failed.

Use the Buckets resource for v3, and the wBuckets resource for v2. See [Reference: wBuckets on page 2167](#).

You can view the status of the bucket loading data into the table on the Activities tab of the View Table report for the table associated with the bucket.

7. In the Workday UI, create a derived dataset using this table as the base.

#### Related Information

[Reference: Naming Guidelines](#)

## Steps: Load Data into a Dataset Using the REST API

### Prerequisites

#### Security:

- *Prism Datasets: Create* domain in the Prism Analytics functional area.
- *Prism Datasets: Manage* domain in the Prism Analytics functional area.

### Context

The Prism Analytics REST API enables you to programmatically create and push external data into a Prism Analytics dataset. When you use the REST API, you create and load into an API dataset. An API dataset is a specific type of base dataset.

API base datasets are similar to base datasets created in the UI, except you can't edit or publish an API dataset. Create a derived dataset using the API dataset as its base if you want to make any edits.

Note: If you're new to Workday, you don't have access to version 1 to create or edit base datasets.

You can load data into an API dataset once or on a regular basis. You can load data into an API dataset you just created, or an existing API dataset.

Use this URL when you use the REST API to access the Datasets and wBuckets resources:

```
https://{{hostname}}/ccx/api/prismAnalytics/{{version}}/{{tenantname}}
```

Note:

To create and load data into a dataset with the REST API, you must specify v1 as the version.

Integration system users can't create a dataset.

## Steps

1. Register your API client in your tenant using the Register API Client for Integrations task.  
Select Include Workday Owned Scope when you register. For more information, see [Register API Clients for Integrations](#).
2. Get the ID of an existing or new API dataset.
  - a) (Optional) Get a list of existing API datasets to retrieve the ID of the dataset you want to load data into.  
See [Reference: Datasets on page 2129](#).
  - b) (Optional) Create an empty dataset while specifying the dataset name in the body of the post request. Note the dataset ID in the response.  
The dataset name you specify is the dataset API name. Optionally, you can also specify a display name. API names and display names must conform to name validation rules.  
See [Reference: Datasets on page 2129](#).
3. Create a wBucket for the dataset from the previous step. In the body of the post request, enter JSON that specifies a unique name for the wBucket and describes the structure of the data files you'll upload to the wBucket. Use the dataset ID in the targetDataset parameter.  
wBucket names must conform to name validation rules.

See:

- [Reference: wBuckets on page 2167](#)
- [Reference: Table and Dataset Field Attributes on page 2094](#)
- [Reference: File Parse Options on page 2090](#)

4. Upload 1 or more files into the wBucket. Specify the wBucket ID in the URL of the post request.

Consider these rules:

- You can upload 1 file in each post request. To upload multiple files into the wBucket, create multiple post requests either sequentially or concurrently.
- Files must be gzip compressed.
- Each filename in a wBucket must be unique.
- The schema of the file you upload must match the schema defined in the wBucket.

See:

- [Reference: wBuckets/Files on page 2182](#)
- [Reference: Source File Format Requirements on page 2098](#)

5. After you've successfully uploaded all files to the wBucket, commit the data to the dataset. You do this by running the complete call on the wBucket.

This call starts a background process that moves the data from its temporary location to the dataset. This call either replaces or appends the dataset depending on the operation parameter in the body of the POST wBuckets call. You can only call this resource on a wBucket once and only when

the state of the wBucket is New. When this call succeeds, Workday changes the wBucket state to Processing and immediately returns a success response. Then in the background, Workday starts the process to commit the data into the dataset.

See Reference: [wBuckets/Complete](#) on page 2181.

- Get the status of the wBucket. You might want to get the wBucket status to find out what state it's in, such as Processing, Success, or Failed.

See Reference: [wBuckets](#) on page 2167.

You can use the WBucket Monitor task in the Workday UI to view the current information on all wBuckets, such as the associated dataset, state, and the user who modified it most recently.

- In the Workday UI, create a derived dataset using this dataset as the base.

## Concept: Prism Analytics REST API

Workday provides the Prism Analytics REST API web service that works with Prism Analytics tables, data change tasks, and datasets. You can develop a software program that uses the different resource endpoints to programmatically create Prism Analytics tables and datasets and modify data in them.

Workday provides these versions of the Prism Analytics REST APIs:

Version	Description	REST Resources
3	<p>You can use version 3 to:</p> <ul style="list-style-type: none"> <li>Create tables.</li> <li>Edit tables.</li> <li>Load data into datasets using buckets.</li> <li>Change the data in tables by running a data change task that you create in the web interface. Example: You can insert new data, or update or delete existing data in a table.</li> </ul> <p>Workday recommends using version 3.</p>	<ul style="list-style-type: none"> <li>/tables</li> <li>/buckets</li> <li>/fileContainers</li> <li>/dataChanges</li> </ul> <p>Version 3 includes multiple approaches for changing data in a table:</p> <ul style="list-style-type: none"> <li>Use the fileContainers and dataChanges resources together. We recommend using this approach.</li> <li>Use the buckets resource. We don't recommend using this approach.</li> </ul>
2	<p>Workday doesn't recommend using version 2.</p> <p>You can use version 2 to:</p> <ul style="list-style-type: none"> <li>Create tables.</li> <li>Edit tables.</li> <li>Load data into datasets using wBuckets.</li> </ul>	<ul style="list-style-type: none"> <li>/datasets</li> <li>/wBuckets</li> </ul> <p>When you use v2 with the datasets resource, Workday creates a table instead of a dataset.</p>
1	<p>Workday doesn't recommend using version 1.</p> <p>You can use version 1 to:</p> <ul style="list-style-type: none"> <li>Create API base datasets.</li> <li>Edit API base datasets.</li> </ul>	<ul style="list-style-type: none"> <li>/datasets</li> <li>/wBuckets</li> </ul>

Version	Description	REST Resources
	<ul style="list-style-type: none"> <li>Load data into API base datasets using wBuckets.</li> </ul>	

See the Workday REST Services Directory on Workday Community for details on the version 3 REST resources. This Administrator Guide includes the documentation for the version 1 and version 2 resources.

Note: If you're new to Workday, you don't have access to version 1 to create or edit base datasets.

Related Information

**Reference**

[Workday REST Services Directory](#)

## Concept: wBuckets, Buckets, and File Containers

You can use the Prism Analytics REST APIs to upload 1 or more files destined for a table or base dataset. To upload the files to Workday, you need to store them in a temporary container that Workday accesses when loading data to a table or base dataset. Workday provides different temporary containers, and each temporary container corresponds to a different API resource.

The type of temporary container you use depends on the API version:

- Version 3: Use either the buckets resource with a table or the fileContainers resource with a data change activity. We recommend using version 3 with the fileContainers resource.
- Version 2: Use the wBuckets resource with a table.
- Version 1: Use the wBuckets resource with an API base dataset.

Note: If you're new to Workday, you don't have access to version 1 to create or edit base datasets.

This table describes file containers and buckets, and explains how they're different:

File Containers	Buckets and wBuckets
A file container is a temporary container that stores delimited files that a data change activity can access as source data.	A bucket or wBucket is a temporary container that stores delimited files that you'll load into a table or an API base dataset.
Use the fileContainers resource with version 3.	Use the buckets resource with version 3. Use the wBuckets resource with versions 1 or 2.
Supports gzip compressed delimited files only.	Supports gzip compressed delimited files only.
You can use a file container only once.	You can use a bucket only once.
A file container doesn't describe the schema of the files it stores.	A bucket describes the schema of the files that it stores.
You create file containers independently of any data change task, data change activity, or table.	You create a bucket for a specific table or dataset. Specify an associated table or dataset when you create the bucket.
To use a file container with the REST API, you: <ol style="list-style-type: none"> <li>Create a file container.</li> <li>Load files into it.</li> <li>Run a data change activity for a data change task that uses file upload as the source type. Specify the file container in the body of the API call.</li> </ol> Workday creates the data change activity that loads data from the file container into the table.	To use a bucket with the REST API, you: <ol style="list-style-type: none"> <li>Create a bucket for a specific table or dataset.</li> <li>Load files into the bucket.</li> <li>Commit (complete) the bucket.</li> </ol> Workday starts a process in the background to load data from the bucket into the table or dataset.

File Containers	Buckets and wBuckets
Functions as storage only. You don't run any call on the file container itself.	Functions as both storage (when you upload files to it) and an activity (when you complete it).
Files in file containers have states that represent whether or not the files were successfully uploaded to the file container. File containers don't have states.	Bucket states represent the status of the data load activity into the table or dataset.
You can use the file container with any data change task that specifies file upload as the source type.	You can use the bucket with a table or dataset that has schema that matches the bucket schema.
File containers have no name, only an ID.	Each bucket name must be unique.
Unused file containers never expire. Workday deletes all file containers older than 8 days.	A bucket can only be in the New state for a maximum of 24 hours. If you don't run the complete call within 24 hours, Workday aborts the bucket and removes any files you uploaded.  Workday deletes all used buckets.
You can upload 1 or more files to a file container, but each file must conform to the same schema.	You can upload 1 or more files to a bucket, but each file must conform to the same schema.
Use a new file container for each data change activity that you run.	Use a new bucket for each attempt to load data into a table or dataset.
You can create multiple data change tasks per target table, but only 1 data change activity for a target table can be running at any given time.	You can create multiple buckets for the same table or dataset, but only 1 bucket per table or dataset can be in the Processing state at any given time.
Workday loads data from the file containers into the table in the order you run the data change activities, not the order you create the file containers.	Workday loads data from the buckets into the table or dataset in the order you run the complete calls, not the order you create the buckets.

## File States in File Containers

Files in file containers have these states:

State	Description
Success	When Workday successfully loads all files to the file container.
Failed	When Workday isn't able to load the files to the file container for any reason. This might happen if a file is corrupt.
Uploading	When Workday is in process of uploading the files to the file container.
Timed Out	When Workday fails to upload the file to the file container because it failed to connect to an internal server in less than 30 minutes.

## Bucket and wBucket States

Buckets and wBuckets have these states:

State	Description
New	(Versions 1, 2, and 3) When you first create a bucket or wBucket, the state is New. You can load files into a bucket or wBucket in the New state.
Queued	(Versions 2 and 3 only) Workday changes the state to Queued after you run the complete call on a bucket or wBucket, but Workday is busy processing other buckets or wBuckets. When a processing slot becomes available, Workday changes the state back to Processing.
Processing	(Versions 1, 2, and 3) Workday changes the state to Processing immediately after you run the complete call on a bucket or wBucket. If a processing slot is available, then the state remains as Processing, and Workday starts running the background processes to move the data into the table or dataset. When Workday finishes these background processes, it changes the state to either Success, Warning, or Failed, depending on the status.
Success	(Version 1) When Workday successfully moves the data to the dataset, the state is Success. (Versions 2 and 3) When Workday successfully loads all rows into the table, the state is Success.
Warning	(Versions 2 and 3 only) When Workday successfully loads rows into the table, but encounters some invalid rows, the state is Warning.
Failed	(Versions 1, 2, and 3) When Workday isn't able to move the data to the table or dataset for any reason, the state is Failed.
Cancelled	(Versions 1, 2, and 3) When a bucket or wBucket is in the Processing state for 1 or more hours, you can force Workday to stop trying to move data into the table or dataset. You stop this process using the Cleanup WBucket State task. After running this task on the bucket or wBucket, the state is Cancelled.

## Concept: Delimited File Example

This example shows how to create an API dataset from a delimited file using version 1 of the REST API.

Note: If you're new to Workday, you don't have access to version 1 to create or edit base datasets.

In this example, suppose that you have this CSV file:

```
Employee_Name, ID, Total_Sold, Date
"McNeil, Logan", 35, 5590.00, 2018-05-31 23:00:00
"Serrano, Teresa", 99, 11900.00, 2018-05-31 23:00:00
"Myers, Dawn", 144, 700.50, 2018-05-31 23:00:00
```

The first row in the file is a header row that lists the field names. Each subsequent row corresponds to a record.

For this CSV file, you could use this JSON in the body of the call to create the wBucket:

```
{
  "name": "MyBucketName",
  "operation": {
    "id": "Operation_Type=Replace"
  },
  "schema": {
    "fields": [
      {
        "ordinal": 1,
        "name": "Employee_Name",
```

```

        "description": "Name of employee",
        "type": {
          "id": "Schema_Field_Type=Text"
        },
      },
      {
        "ordinal": 2,
        "name": "ID",
        "description": "Unique identifier for the policy",
        "precision": 18,
        "scale": 0,
        "type": {
          "id": "Schema_Field_Type=Numeric"
        },
      },
      {
        "ordinal": 3,
        "name": "Total_Sold",
        "description": "Total value of policies sold",
        "precision": 38,
        "scale": 2,
        "type": {
          "id": "Schema_Field_Type=Numeric"
        },
      },
      {
        "ordinal": 4,
        "name": "Date",
        "description": "Date policy completed",
        "parseFormat": "yyyy-MM-dd HH:mm:ss",
        "type": {
          "id": "Schema_Field_Type=Date"
        }
      }
    ],
    "parseOptions": {
      "charset": {
        "id": "Encoding=UTF-8"
      },
      "fieldsDelimitedBy": ",",
      "fieldsEnclosedBy": "\"",
      "headerLinesToIgnore": 1,
      "type": {
        "id": "Schema_File_Type=Delimited"
      }
    },
    "schemaVersion": {
      "id": "Schema_Version=1.0"
    }
  },
  "targetDataset": {
    "id": "WID"
  }
}

```

## Reference: File Parse Options

This section describes the JSON `parseOptions` parameter when using the REST API for creating tables and base datasets. You define the parse options when creating a bucket or wBucket. Use version 2 or 3 with tables, and use version 1 with datasets.

Note: If you're new to Workday, you don't have access to version 1 to create or edit base datasets.

Parameter Name	Type	Required?	Description
charset	Object	Yes	<p>Applies to versions 1, 2 and 3.</p> <p>The character set of the file. Currently, the only character set supported is UTF-8 (case sensitive).</p> <p>Use this format:</p> <pre>"charset": {   "id": "Encoding=charset" }</pre>
type	Object	Yes	<p>Applies to versions 1, 2 and 3.</p> <p>The type of file that you'll upload to the wBucket. Currently, the only file type supported is Delimited (case sensitive).</p> <p>Use this format:</p> <pre>"type": {   "id": "Schema_File_Type=filetype" }</pre>
fieldsDelimitedBy	String	Yes	<p>Applies to versions 1, 2 and 3.</p> <p>The single character, such as a comma, that separates the fields of a record in the data files.</p>
fieldsEnclosedBy	String	No	<p>Applies to versions 1, 2 and 3.</p> <p>The character that encloses a single field value, if any. This is also known as the quote character.</p> <p>If you don't include this parameter, Workday automatically uses the double quote character.</p> <p>Some delimited files use the quote character to enclose individual data values. The quote character is typically the double quote character.</p> <p>If a field value contains a field delimiter or new line character as data, then the field value must be enclosed in the quote character. Otherwise, Workday assumes that the field delimiter denotes a new field, and that the new line character denotes a new record.</p> <p>If a field value contains the quote character as data, then the field value must be enclosed in the quote</p>

Parameter Name	Type	Required?	Description
			character and it must be escaped by another quote character.
fieldsEnclosingCharacterEscapedBy	String	No	<p>Applies to versions 2 and 3 only.</p> <p>The character used to escape the enclosing characters inside a field value.</p> <p>If you don't include this parameter, Workday uses a double quote character. Use this format:</p> <pre>"fieldsEnclosingCharacterEscapedBy": "\\"</pre>
recordsDelimitedBy	String	No	<p>Applies to versions 2 and 3 only.</p> <p>The character that separates records in your source data files.</p> <p>If you don't include this parameter, Workday recognizes any of these characters to separate records:</p> <ul style="list-style-type: none"> <li>• \r</li> <li>• \n</li> <li>• \r\n</li> </ul>
commentCharacter	String	No	<p>Applies to versions 2 and 3 only.</p> <p>The character that represents a comment at the beginning of a line of text. Workday ignores every line in the external file that starts with the comment character. Example: Select # as the commentCharacter to ignore lines that start with #.</p> <p>If you don't include this parameter, Workday reads all lines as rows of data.</p>
ignoreLeadingWhitespaces	Boolean	No	<p>Applies to versions 2 and 3 only.</p> <p>When set to true, Workday removes whitespace characters outside the quotes of Text fields before the quote character.</p> <p>If you don't include this parameter, Workday trims leading whitespace characters (sets to true).</p>
ignoreTrailingWhitespaces	Boolean	No	<p>Applies to versions 2 and 3 only.</p> <p>When set to true, Workday removes whitespace characters outside the quotes of Text fields after the quote character.</p>

Parameter Name	Type	Required?	Description
			If you don't include this parameter, Workday trims trailing whitespace characters (sets to true).
ignoreLeadingWhitespacesInQuotes	Boolean	No	<p>Applies to versions 2 and 3 only.</p> <p>When set to true, Workday removes whitespace characters inside the quotes of Text fields at the beginning of the field value.</p> <p>If you don't include this parameter, Workday doesn't trim leading whitespace characters (sets to false).</p>
ignoreTrailingWhitespacesInQuotes	Boolean	No	<p>Applies to versions 2 and 3 only.</p> <p>When set to true, Workday removes whitespace characters inside the quotes of Text fields at the end of the field value.</p> <p>If you don't include this parameter, Workday doesn't trim leading whitespace characters (sets to false).</p>
headerLinesToIgnore	Number	No	<p>Applies to versions 1, 2 and 3.</p> <p>The number of lines at the beginning of the data files to ignore when reading the source file. This enables the data files to include header information separate from the data.</p> <p>When the data files have no header, set to 0. When data files have a header, set to a value of 1 or greater as required.</p> <p>If you don't include this parameter, Workday automatically uses the value of 0.</p>
ignoreTrailingExtraFields	Boolean	No	<p>Applies to versions 2 and 3 only.</p> <p>When set to true, Workday ignores any extra fields at the end of the wBucket schema that don't exist in the target table.</p> <p>Set to true when the schema of the source file isn't an exact match of the table schema, and you want Workday to ignore any extra fields at the end of the wBucket schema.</p> <p>If you don't include this parameter, Workday sets it to False.</p>
ignoreTrailingMissingFields	Boolean	No	Applies to versions 2 and 3 only.

Parameter Name	Type	Required?	Description
			<p>When set to true, Workday ignores any missing fields at the end of the wBucket schema that exist in the target table.</p> <p>Set to true when the schema of the source file isn't an exact match of the table schema, and you want Workday to ignore any missing fields at the end of the wBucket schema.</p> <p>If you don't include this parameter, Workday sets it to False.</p>

## Reference: Table and Dataset Field Attributes

This section describes the JSON parameters used in the `fields` parameter when using the REST API for creating tables or base datasets. Use version 2 or 3 with tables, and use version 1 with base datasets.

Note: If you're new to Workday, you don't have access to version 1 to create or edit base datasets.

When you use version 2 or 3 of the REST API to create tables, you use or see the `fields` parameter:

- In the body of the request to create (POST) or edit (PUT) a table.
- In the body of the request to create a bucket.
- In the response to some REST API requests, such as a request to list all tables or list all buckets.

When you use version 1 of the REST API to create datasets, you use or see the `fields` parameter:

- In the body of the request to create a wBucket.
- In the response to some REST API requests, such as a request to list all datasets or list all wBuckets.

Parameter Name	Type	Required?	Description
ordinal	Number	Yes	<p>The order of the field in the file (index). The ordinal values:</p> <ul style="list-style-type: none"> <li>• Must start with 1.</li> <li>• Must be contiguous.</li> <li>• Can't skip any number.</li> <li>• Have a maximum of 1,000.</li> </ul>
name	String	Yes	<p>The name of the field. When you use version 2 or 3, this is the field API name.</p> <p>You can't change the API name after you save the table or dataset. Field API names must conform to name validation rules.</p>
displayName	String	No	<p>Applies to versions 2 and 3 only.</p> <p>The display name of the table field. If you don't include this parameter, Workday sets it to the same value in the name parameter.</p> <p>You can change this name at any time. Field display names must conform to name validation rules.</p>

Parameter Name	Type	Required?	Description
description	String	No	The description of the field. The description must contain less than 1,000 characters.
type	Object	Yes	<p>The field type of the field (case sensitive). Valid values are:</p> <ul style="list-style-type: none"> <li>• Boolean</li> <li>• Currency</li> <li>• Date</li> <li>• Double</li> <li>• Instance</li> <li>• Integer</li> <li>• Long</li> <li>• Multi-Instance</li> <li>• Numeric</li> <li>• Text</li> </ul> <p>(Version 1 only) When the schema includes Numeric fields, Workday uses the type parameter with the precision and scale parameters to convert the field type to the appropriate dataset field type. Example: if a Numeric field has a precision of 9 and a scale of 0, the field type in the dataset will be Integer.</p> <p>Use this format:</p> <pre>"type": {   "id": "Schema_Field_Type=type" }</pre>
parseFormat	String	Depends	<p>Required for Date fields.</p> <p>The Date format that the values in this field must match to be recognized as a Date field.</p>
precision	Number	Depends	<p>Required for Numeric fields.</p> <p>The maximum number of digits in a Numeric field. This value includes all digits to the left and right of the decimal point. The maximum value is 38.</p>
scale	Number	Depends	<p>Required for Numeric fields.</p> <p>The maximum number of digits to the right of the decimal point in a Numeric field. This value must be less than the precision value.</p>
businessObject	Object	Depends	Required for Instance and Multi-Instance fields.

Parameter Name	Type	Required?	Description
			<p>The Workday ID (WID) of the business object to associate with an Instance or Multi-Instance field.</p> <p>Use this format:</p> <pre>"businessObject": {   "id": "WID" }</pre>
contextObject	Object	Depends	<p>Optional for Instance and Multi-Instance fields.</p> <p>The Workday ID (WID) of the report field to associate with an Instance or Multi-Instance field.</p> <p>Use this format:</p> <pre>"contextObject": {   "id": "WID" }</pre>
externalId	Boolean	Depends	<p>Applies to versions 2 and 3 only. Required when the target operation is update, upsert, or delete.</p> <p>Specifies the field in a table to use as a key. Specify a field as the external ID when the values in the field uniquely identify each row from its source.</p> <p>Set a field as the external ID if you want to update or delete data in the table based on data in an external file. This parameter is similar to a primary key in a relational database.</p> <p>When using this parameter, consider:</p> <ul style="list-style-type: none"> <li>• You can only define 1 field in a table as the external ID field.</li> <li>• Ensure that each field value in the external ID field is unique. If the field values aren't unique, you'll get unexpected results. Workday doesn't enforce the uniqueness.</li> <li>• You can't define a default value for fields used as an external ID. The field value must come from the external source and can't be NULL.</li> <li>• You must set the external ID field as required.</li> </ul>
required	Boolean	Depends	Applies to versions 2 and 3 only. Required when field is set as the external ID (primary key).

Parameter Name	Type	Required?	Description
			Specifies that the field must contain data. Make a field required to ensure it doesn't contain a NULL value when you insert or update data in the table. When you insert or update data in a table and this field is NULL, Workday rejects the row, and instead includes it in the error file.
defaultValue	String	No	<p>Applies to versions 2 and 3 only.</p> <p>Specifies a value for a field if the uploaded source file schema doesn't include that field. When the source file schema doesn't include a field, Workday uses the default value for all rows in the source file.</p> <p>Note: The Default Value is only used when the source file schema is missing a field, not when a particular field value is NULL.</p>
useAsOperationKey	Boolean	Depends	<p>Applies to versions 2 and 3 only. Required when the target operation is update, upsert, or delete.</p> <p>Specifies the field to use as the operation key. You can specify 1 of these fields:</p> <ul style="list-style-type: none"> <li>The field that has externalID set to True</li> <li>WPA_LoadID</li> <li>WPA_RowID</li> </ul> <p>When the operation type is upsert, you can only specify the field that has externalID set to True.</p>

This table describes when you can use each field parameter:

Parameter Name	Creating a table (v2, v3)?	Creating a wBucket v1?	Creating a wBucket v2 or bucket v3?
ordinal	Yes	Yes	Yes
name	Yes	Yes	Yes
displayName	Yes	No	No
description	Yes	Yes	Yes
type	Yes	Yes	Yes
parseFormat	Yes	Yes	Yes
precision	Yes	Yes	Yes
scale	Yes	Yes	Yes
businessObject	Yes	Yes	Yes
contextObject	Yes	Yes	Yes

Parameter Name	Creating a table (v2, v3)?	Creating a wBucket v1?	Creating a wBucket v2 or bucket v3?
externalId	Yes	No	No
required	Yes	No	No
defaultValue	Yes	No	No
useAsOperationKey	No	No	Yes

## Reference

[Reference: Naming Guidelines](#)

## Reference: Source File Format Requirements

When you use the REST API to create tables or base datasets, you upload 1 or more data source files to Workday. Workday uses the data in these files to populate the table or base dataset. Workday supports delimited files that are RFC 4180-compliant. For more information, see [RFC 4180](#).

Consider these guidelines and requirements:

- The files must be delimited, such as a comma-delimited file.
- If the file contains any empty lines, Workday:
  - (Versions 2 and 3) Ignores the empty lines.
  - (Version 1) Inserts NULL values into the record.
- The files must be gzip compressed.
- Each record must be delimited by a newline character, and must be either CR (\r), LF (\n), or CRLF (\r\n).
- If a field value contains the field delimiter, new line character, or double quotes, then the field value must be enclosed in a quote character, such as double quotes.
- If the field value contains a quote character, then it must be escaped by:
  - (Versions 2 and 3) The escape character (`fieldsEnclosingCharacterEscapedBy` parameter).
  - (Version 1) Another quote character (`fieldsEnclosedBy` parameter).
- Workday doesn't trim leading or trailing spaces in field values. Any spaces before or after the field delimiter or inside the quote characters are part of the field value. Example: This text includes a leading space in the second field: Tom Smith, Marge Smith
- Numeric field values can only contain numerals and a period as the decimal point in order to be recognized as a numeric value.
- Date field values must match a supported date format in order to be recognized as a date value.
- The number of fields in the files must match the number of fields in the wBucket fields parameter.
- The maximum number of fields is 1,000.
- The maximum length of a field value is 32,000 characters.
- The maximum length of a row in the data source file is 500,000 characters.

Note: If you're new to Workday, you don't have access to version 1 to create or edit base datasets.

Related Information

## Concepts

[Concept: Delimited File Example](#) on page 2089

## Reference: External Data Limits

Workday enforces limits when you create a table or base dataset using the REST API or the UI. The limits apply when you:

- Create a table or base dataset in the UI by uploading a file. Workday creates and uses a bucket.
- Create a data change task in the UI by uploading a file. Workday creates and uses a file container.
- Run a data change task in the UI by uploading a file. Workday creates and uses a file container.
- Upload a file to a file container using the REST API.
- Create a bucket using the REST API.
- Upload a file to a bucket using the REST API.
- Publish a dataset.

Note: If you're new to Workday, you don't have access to create or edit base datasets.

Workday enforces these limits:

Limit	Value
Maximum size of a single file	256 MB compressed
Maximum number of buckets that can be created or edited in a 24-hour rolling period	24,000
Maximum number of data change activities and bucket completions that can be run in a 24-hour rolling period	24,000
Maximum number of concurrent uploads using any method	10
Maximum number of files in all file containers and buckets in a 24-hour rolling period	50,000
Maximum size of all files in all file containers and buckets in a 24-hour rolling period	125 GB compressed
Maximum number of fields in a table.	1,000
Maximum number of fields in a dataset, including Prism calculated fields, when you publish.	1,000

## Example: Create a Table Using the Prism Analytics REST API

This example illustrates how to create a Prism Analytics table using version 3 of the REST API.

### Context

Your company sells lemonade from lemonade stands at different locations. You track the sales data in an external system, but you want to bring that data into Workday so you can join it with Workday data. You want to create a program that uses the REST API to bring in the data to a Prism Analytics table.

Your lemonade sales data is in a delimited file, `lemonade_sales.csv`, with this data:

```
Sales Key,Stand Location,Hot Day?,Date,Total Sales,Cost Center
1000,123 Main St, FALSE, 06/26/2022, 41.5, 3b122818d7934d1c8c663ddbe1937819
1001,driveway, FALSE, 06/27/2022, 33, 3b122818d7934d1c8c663ddbe1937819
1002,friend's house, TRUE, 06/28/2022, 86.5, 3b122818d7934d1c8c663ddbe1937819
1003,123 Main St, FALSE, 06/26/2022, 41.5, 3b122818d7934d1c8c663ddbe1937819
1004,driveway, FALSE, 06/27/2022, 33, 3b122818d7934d1c8c663ddbe1937819
1005,friend's house, TRUE, 06/28/2022, 77.25, 3b122818d7934d1c8c663ddbe1937819
1006,123 Main St, FALSE, 07/02/2022, 45.5, 3b122818d7934d1c8c663ddbe1937819
1007,driveway, FALSE, 07/03/2022, 39, 3b122818d7934d1c8c663ddbe1937819
1008,friend's house, TRUE, 07/05/2022, 76.5, 3b122818d7934d1c8c663ddbe1937819
1009,123 Main St, FALSE, 07/06/2022, 21.5, 3b122818d7934d1c8c663ddbe1937819
1010,driveway, FALSE, 07/31/2022, 28, 3b122818d7934d1c8c663ddbe1937819
1011,friend's house, TRUE, 08/01/2022, 66.5, 3b122818d7934d1c8c663ddbe1937819
1012,123 Main St, FALSE, 08/02/2022, 44.5, 3b122818d7934d1c8c663ddbe1937819
1013,driveway, FALSE, 08/03/2022, 10, 3b122818d7934d1c8c663ddbe1937819
```

```
1014,friend's house,TRUE,08/04/2022,96.5,3b122818d7934d1c8c663ddbe1937819
```

The first row in the file is a header row that lists the field names. Each subsequent row corresponds to a record. The Sales Key field uniquely identifies each row in the file, so we'll use that as the key field.

This example includes:

- The URLs to use in the API calls.
- The request Body content to provide when applicable for a call.
- The response Body content to each call.

This example doesn't cover how to create a program or how to use any third-party program for running API calls, such as Postman.

The URLs in this example use this as the base URL:

```
https://myhost/api/prismAnalytics/v3/mytenant
```

## Prerequisites

Review the Prism Analytics version 3 REST resources in the Workday REST Services Directory on Workday Community.

Register your API client in your tenant using the Register API Client for Integrations task. When you register the API client:

- Select Include Workday Owned Scope.
- When you manage the refresh token, specify a user in Workday Account who has access to create and edit Prism tables. The API calls will use this user account.
- Save the bearer access token. Use it in the authentication header in every REST API call.

For more information, see [Register API Clients for Integrations](#).

Compress the source file using gzip compression so you have `lemonade_sales.csv.gz`.

Security:

- *Prism: Tables Create* domain in the Prism Analytics functional area.
- *Prism: Tables Manage* domain in the Prism Analytics functional area.
- *Prism: Manage File Containers* domain in the Prism Analytics functional area.

## Steps

1. Create a table called Lemonade Stand Sales.

When you create the table, you define each field and their attributes, such as field type and any field constraints. In this example, define the Sales Key field as the external ID. Because Sales Key is the external ID, you must also mark it as required.

Use this URL:

```
POST https://myhost/api/prismAnalytics/v3/mytenant/tables
```

Use this JSON in the Body of the POST request.

```
{
  "name": "lemonade_stand_sales",
  "displayName": "Lemonade Stand Sales",
  "description": "This table contains the lemonade stand sales in the neighborhood.",
  "tags": [
    { "name": "lemonade sales" },
    { "name": "citrus sales" }
```

```
],
"fields": [
  {
    "ordinal": 1,
    "name": "Sales_Key",
    "displayName": "Sales Key",
    "description": "The unique identifier for this sales transaction.",
    "externalId": true,
    "required": true,
    "precision": 19,
    "scale": 0,
    "type": {
      "id": "Schema_Field_Type=Numeric"
    }
  },
  {
    "ordinal": 2,
    "name": "Stand_Location",
    "displayName": "Stand Location",
    "description": "The location of the lemonade stand.",
    "externalId": false,
    "required": false,
    "type": {
      "id": "Schema_Field_Type=Text"
    }
  },
  {
    "ordinal": 3,
    "name": "Hot_Day",
    "displayName": "Hot Day?",
    "description": "This is True when the outside temp was over 85F.",
    "defaultValue": false,
    "externalId": false,
    "required": false,
    "type": {
      "id": "Schema_Field_Type=Boolean"
    }
  },
  {
    "ordinal": 4,
    "name": "Date",
    "displayName": "Date",
    "description": "The date the lemonade was sold.",
    "externalId": false,
    "required": true,
    "defaultValue": "2000-01-01T08:08:08Z",
    "parseFormat": "MM/dd/yyyy",
    "type": {
      "id": "Schema_Field_Type=Date"
    }
  },
  {
    "ordinal": 5,
    "name": "Total_Sales",
    "displayName": "Total Sales",
    "description": "The total sale price of this transaction.",
    "externalId": false,
    "required": true,
    "precision": 26,
    "scale": 6,
    "type": {
      "id": "Schema_Field_Type=Numeric"
    }
  }
]
```

```

        },
        {
            "ordinal": 6,
            "name": "Cost_Center",
            "displayName": "Cost Center",
            "description": "The cost center assigned to this transaction.",
            "externalId": false,
            "required": false,
            "defaultValue": " ",
            "businessObject": {
                "id": "89b94d1da24d4346997fdb640e465894"
            },
            "type": {
                "id": "Schema_Field_Type=Instance"
            }
        }
    ]
}

```

Workday creates the table, assigns it an ID, and provides the ID in the response Body. In this example, the table ID is 162399b4217110000feb4288d3680000. This is the response Body:

```

{
    "name": "lemonade_stand_sales",
    "displayName": "Lemonade Stand Sales",
    "description": "This table contains the lemonade stand sales in the neighborhood.",
    "tags": [
        {
            "id": "162399b4217190000feb47ef87fc0002",
            "name": "lemonade sales"
        },
        {
            "id": "162399b4217190000feb47ef87fc0001",
            "name": "citrus sales"
        }
    ],
    "enableForAnalysis": false,
    "createdBy": {
        "id": "64700e15a04847f6ac13343b007478e3",
        "fullName": "Workday Implementer"
    },
    "createdMoment": "2022-06-21T02:39:19.850Z",
    "id": "162399b4217110000feb4288d3680000",
    "fields": [
        {
            "ordinal": 1,
            "description": "The unique identifier for this sales transaction.",
            "type": {
                "id": "32e3fa0dd9ea1000072bac410415127a",
                "descriptor": "Numeric"
            },
            "precision": 19,
            "name": "Sales_Key",
            "displayName": "Sales Key",
            "fieldId": "NzAyMTI2MDctMzzkOS00ZTM4LThjMzUtOWI4OTUxYzFiOGI3",

        "required": false,
        "externalId": false,
        "id": "162399b4217190000feb44efb03a0004"
    }
]
}
}

```

2. Navigate to the Data Catalog report, and create a data change task using the Lemonade Stand Sales table as the target.

When you create the data change task:

- Use this as the name for the data change task: DCT Lemonade Stand Sales - insert from API
- Specify File Upload as the source type.
- Use the `lemonade_sales.csv` file to define the source schema.
- On the Source Options step, change the field type for the Cost Center field to Instance, and specify Cost Center as the business object.
- Verify all field types that Workday automatically assigned to each field are correct. Example: Verify that the Date field is assigned the Date field type. Example: Verify the digits before and after the decimal for each Numeric source field is compatible with the digits before and after the decimal for each target field.
- Specify Insert as the operation type.
- Save the data change task, but don't run it.

Workday creates the data change task and assigns an ID.

3. Get the ID of the data change task.

Use this URL:

```
GET https://myhost/api/prismAnalytics/v3/mytenant/dataChanges
```

Don't include anything in the Body of the request.

This is the response Body:

```
[  
  {  
    "name": "DCT_Lemonade_Stand_Sales_insert_from_API",  
    "displayName": "DCT Lemonade Stand Sales - insert from API",  
    "id": "162399b4217110001023687b7e9f0000"  
  },  
  ...  
]
```

In this example, the ID of the data change task is 162399b4217110001023687b7e9f0000.

4. Make sure that the data change task is valid.

Use this URL:

```
GET https://myhost/api/prismAnalytics/v3/mytenant/  
dataChanges/162399b4217110001023687b7e9f0000/validate
```

Don't include anything in the Body of the request.

When the data change task is valid, Workday returns a 200 HTTP response. This is the response Body of a valid data change task:

```
{  
  "descriptor": "DCT Lemonade Stand Sales - insert from API",  
  "id": "162399b4217110001023687b7e9f0000"  
}
```

5. Create a file container.

A file container is a temporary container that stores delimited files that a data change activity can access as source data.

Use this URL:

```
POST https://myhost/api/prismAnalytics/v3/mytenant/fileContainers
```

Don't include anything in the Body of the request.

This is the response Body:

```
{  
  "id": "a6bd2bdcc9b8100007694c634f530000"  
}
```

Workday creates the file container, assigns it an ID, and provides the ID in the response Body. In this example, the file container ID is a6bd2bdcc9b8100007694c634f530000.

## 6. Upload the source file to the file container.

When you make this call, you must attach the gzip compressed delimited file. How you do this depends on your program. Example: If you use curl to make your API calls, you would include the -F parameter:

```
-F file=@/Users/kathy.smith/Downloads/lemonade_sales.csv.gz
```

Use this URL:

```
POST https://myhost/api/prismAnalytics/v3/mytenant/fileContainers/a6bd2bdcc9b8100007694c634f530000/files
```

Don't include any text in the Body of the request.

Workday adds the `lemonade_sales.csv.gz` file to the file container and provides a checksum in the body response. This is the response Body:

```
{
  "id": "a6bd2bdcc9b810000a1590b5b5b70000",
  "descriptor": "lemonade_sales.csv.gz",
  "name": "lemonade_sales.csv.gz",
  "checksum": "549EC0B1660A9BDE84CD84B98270DE4B",
  "length": 311,
  "state": {
    "id": "8b9a8d64149c100012d99f7ff7c4006e",
    "descriptor": "Success"
  },
  "allowedFileSize": 268435456
}
```

If you have lemonade sales data in multiple CSV files, you can make this call multiple times, once for each attached file.

## 7. Run the data change task.

Use `162399b4217110001023687b7e9f0000` as the ID of the data change task.

Use this URL:

```
POST https://myhost/api/prismAnalytics/v3/mytenant/
dataChanges/162399b4217110001023687b7e9f0000/activities
```

Include the ID of the file container in the Body request. Use this JSON in the Body of the POST request.

```
{
  "fileContainerWid": "a6bd2bdcc9b8100007694c634f530000"
}
```

Workday starts a data change activity and uses the data in the specified file container to change the data in the table. Workday includes the ID of the data change activity in the response Body:

```
{
  "id": "a6bd2bdcc9b890000a7b72291d930000"
}
```

- Check the status of the data change activity to find out if it finished successfully.

Use this URL:

```
GET https://myhost/api/prismAnalytics/v3/mytenant/
dataChanges/162399b4217110001023687b7e9f0000/activities/
a6bd2bdcc9b890000a7b72291d930000
```

Don't include anything in the Body of the request.

Workday retrieves the state of the data change activity and describes what happened in the message parameter of the response Body.

This is the Body of the response when the data change activity was successful, and all rows were loaded into the table:

```
{
  "id": "a6bd2bdcc9b890000a7b72291d930000",
  "name": "lemonade_stand_sales_Insert_2022 06 21 11 42 11 751 -0700",
  "displayName": "Lemonade Stand Sales Insert 2022 06 21 11 42 11 751 -0700",
  "dataChangeWid": "162399b4217110001023687b7e9f0000",
  "dataChangeName": "DCT_Lemonade_Stand_Sales_insert_from_API",
  "dataChangeDisplayName": "DCT Lemonade Stand Sales - insert from API",
  "dataChange": {
    "id": "162399b4217110001023687b7e9f0000",
    "name": "DCT_Lemonade_Stand_Sales_insert_from_API",
    "displayName": "DCT Lemonade Stand Sales - insert from API"
  },
  "message": "Load completed successfully to Table lemonade_stand_sales (162399b4217110000feb4288d3680000). Total rows processed: 15",
  "state": {
    "id": "5afbc3cacb9810001c3bb3815a4600c1",
    "descriptor": "Success"
  },
  "operation": {
    "id": "c6db770e22ab100006326e7a31370002",
    "descriptor": "Insert"
  },
  "startTime": 1655836931751,
  "endTime": 1655836954681,
  "target": {
    "descriptor": "Lemonade Stand Sales",
    "id": "162399b4217110000feb4288d3680000"
  },
  "stats": {
    "processedFiles": 1,
    "wBucketSize": 311,
    "totalRowCount": 15
  },
  "createdBy": {
    "id": "64700e15a04847f6ac13343b007478e3",
    "descriptor": "wd-implementer / Workday Implementer",
    "fullName": "wd-implementer / Workday Implementer"
  },
  "fileContainer": {
    "descriptor": "33077$41",
    "id": "a6bd2bdcc9b8100007694c634f530000"
  },
  "activityType": "DataChange"
}
```

## Next Steps

- Access the View Table Details report to view the table that you created. Click the Activities tab to view the data change activity progress and history.
- You can cancel a running data change activity. You need the data change task ID and data change activity ID. Use this URL:

```
POST https://myhost/api/prismAnalytics/v3/mytenant/
dataChanges/162399b4217110001023687b7e9f0000/cancel/
a6bd2bdcc9b89000a7b72291d930000
```

## REST API Resources

### Reference: Budget Check

#### URL Base Path

Tenant Base Path

```
https://{{hostname}}/api/budgets/v1/{{tenant}}
```

Example:

```
https://yourTenantHostName.com/api/budgets/v1/gms
```

Workday Extend API Gateway Base Path

For Workday Extend apps, use the regional API Gateway base URL for your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Developer Site. Note that the API Gateway base URL doesn't include the tenant name.

#### Description

Performs a budget check against input details for a transaction before or after the transaction happens. Returns the budget check status.

#### POST Budget Check

```
POST /runBudgetCheck
```

Secured by: *Budgets REST APIs* security domain.

Use this method to submit transaction input details, perform a budget check, and retrieve the budget check status.

This method doesn't persist data into Workday. It's a read-only POST.

You supply a JSON format body with your request. In the request body, supply values for these fields:

Field	Type	Description
<i>company</i>	ID	Workday ID or Reference ID that represents the company for the budget check.
<i>date</i>	Date	Date that Workday initiates the budget check.
<i>currency</i>	ID	Workday ID or Reference ID that represents the currency for the transaction amount of the budget check.
<i>transactionLines</i>	<i>checkBudgetLines</i>	Container element for budget lines.
<i>ledgerAccount</i>	ID	Workday ID that represents the ledger account for the budget check.
<i>accountingWorktags</i>	ID	Workday IDs that represent a set of transaction accounting worktags.
<i>transactionAmount</i>	Number	Transaction amount for the budget check.

The response body is in JSON format.

Field	Type	Description
<i>company</i>	ID	Workday ID or Reference ID that represents the company for the budget check.
<i>date</i>	Date	Date that Workday initiates the budget check.
<i>currency</i>	ID	Workday ID or Reference ID that represents the currency for the transaction amount of the budget check.
<i>overallStatus</i>	ID	Workday ID and descriptor of overall budget check status.
<i>transactionLines</i>	<i>checkBudgetLines</i>	Container element for budget lines.
<i>ledgerAccount</i>	ID	Workday ID that represents the ledger account for the budget check.
<i>accountingWorktags</i>	ID	Workday IDs that represent a set of transaction accounting worktags.
<i>transactionAmount</i>	Number	Transaction amount for the budget check.

Field	Type	Description
<i>currency</i>	ID	Currency for amounts that the budget check returns.
<i>planLedgerAccountOrSummary</i>	ID	Workday ID of the plan ledger Account or ledger account summary that is subject to budget check.
<i>planAccountingWorktags</i>	ID	Workday IDs for a set of plan accounting worktags that are subject to budget check.
<i>planAmount</i>	Number	Plan amount that Workday checks the transaction against for budget check.
<i>spendAmount</i>	Number	Total amount of spend that already exists against this budget.
<i>availableAmount</i>	Number	Available budget amount after existing spend and the current transaction amount.
<i>plan</i>	ID	Workday ID and descriptor for plan that is subject to budget check.
<i>lineStatus</i>	ID	Workday ID and descriptor for status of the line-level budget check.

## Reference: Currencies

### URL Base Path

Tenant Base Path

```
https://{{hostname}}/api/common/v1/{{tenant}}
```

Example:

```
https://yourTenantHostName.com/api/common/v1/gms
```

Workday Extend API Gateway Base Path

For Workday Extend apps, use the regional API Gateway base URL for your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Developer Site. Note that the API Gateway base URL doesn't include the tenant name.

### URI

Note: We plan to retire the Currencies APIs in the Common v1 REST service in March 2023. Workday recommends that you use the Currencies APIs in the new Core Accounting v1 REST service instead.

A collection of currencies:

```
/currencies
```

An individual currency:

```
/currencies/{id}
```

URI Parameter	Description
id	Reference to a currency. Example: Currency WID.

## Description

Currencies resource represents currencies in Workday. You can only view the currencies and currency information allowed by the security profile of the current user.

Currencies support these methods:

- [GET Currencies](#) on page 2112

## GET Currencies

Secured by:

Core Navigation

No request body required or available for this method. When retrieving a collection, use these optional query parameters to page the results:

Query Parameter	Description	Default	Max
limit	Limit of object data entries included in a single response.	20	100
offset	Offset to the first object in a collection.	0	

Response body is in JSON format.

## GET Currencies Examples

This GET request retrieves all the currencies available to the current user:

```
GET /currencies
```

The response is a collection of currencies, in JSON format (Workday displays only 1 currency in the response):

```
"total": 210,
"data": [
    {
        "descriptor": "ADF",
        "id": "0e63f0db520c4d99b2f734fdb257dad5",
        "href": "https://[Workday REST API Endpoint]/currencies/0e63f0db520c4d99b2f734fdb257dad5",
        "code": "ADF",
        "precision": 2
    },
    ...
]
```

This request retrieves information about the Euro (id=eae312fc5152410cb4c8b452c26320a6).

```
GET /currencies/eae312fc5152410cb4c8b452c26320a6
```

The response body:

```
{
  "descriptor": "EUR",
  "id": "eae312fc5152410cb4c8b452c26320a6",
  "href": "https://{{Workday REST API Endpoint}}/currencies/eae312fc5152410cb4c8b452c26320a6",
  "code": "EUR",
  "precision": 2
}
```

## Reference: Custom Object Definitions

### URL Base Path

Tenant Base Path

```
https://{{hostname}}/api/common/v1/{{tenant}}
```

Example:

```
https://yourTenantHostName.com/api/common/v1/gms
```

Workday Extend API Gateway Base Path

For Workday Extend apps, use the regional API Gateway base URL for your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Developer Site. Note that the API Gateway base URL doesn't include the tenant name.

### URI

Note: Workday recommends that you don't use the Custom Object Definition APIs in the Common v1 REST service. We no longer support them, and plan to retire them. Use the Custom Object Definition v1 REST service instead. See [Concept: Custom Object Definition REST APIs](#) on page 2249 for more information.

Collection of custom object definitions:

```
/customObjectDefinitions
```

Single custom object definition:

```
/customObjectDefinitions/{id}
```

URI Parameter	Description
id	Reference to a custom object definition. Example: Definition WID.

### Description

The Custom Object Definitions resource represents information about the custom objects defined in your particular implementation of Workday. You can only view the custom object definition information permitted by the security profile of the current user.

Custom Objects are extensions of Workday *business objects*.

Example: A Worker object can be extended to have a custom object named Parking Space that has information about a worker parking space. If a worker can only have 1 assigned parking space, it is a single-instance custom object.

Example: A custom object named Apparel extends Worker objects to contain information about articles of clothing. If a single worker can have more than 1 assigned item of clothing, it is a multi-instance custom object.

Custom Object Definitions supports these methods:

- [GET Custom Object Definitions](#) on page 2114

## GET Custom Object Definitions

Secured by:

Custom Object Management

No request body required or available for this method. When retrieving a collection, use these optional query parameters to page the results:

Query Parameter	Description	Default	Max
limit	Limit of object data entries included in a single response.	20	100
offset	Offset to the first object in a collection to include in the response.	0	

The response body is in JSON format.

Use this method to obtain:

- `customObjectAlias` - constructs a resource URL to represent the custom object.
- `multiInstance` - true for multi-instance and false for single-instance custom objects.
- `businessObject` - business object that the custom object extends.

## GET Custom Object Definitions Examples

This GET request retrieves all the custom object definitions available to the current user:

`GET /customObjectDefinitions`

The response is a collection of custom object definitions, in JSON format.

In this example response, there are 2 multi-instance custom object definitions, Apparel and Shoes, and 1 single-instance, Worker Shoes. An individual worker can have more than 1 item of Apparel, more than 1 item of Shoes, and only 1 item of Worker Shoes:

```
{
  "total": 3,
  "data": [
    {
      "descriptor": "Apparel",
      "id": "8da46c229b0842ec89f0860cba174da0",
      "customObjectName": "Apparel",
      "multiInstance": true,
      "customObjectAlias": "apparel",
      "businessObject": {
        "descriptor": "Worker",
        "id": "766f3df40606431e8229445f1fe283c3"
      }
    },
    {
      "descriptor": "Shoes",
      "id": "e2b6ebfab5da412ea518f1a684cf730f",
      "customObjectName": "Shoes",
      "multiInstance": true,
      "customObjectAlias": "shoes",
    }
  ]
}
```

```

        "businessObject": {
            "descriptor": "Worker",
            "id": "766f3df40606431e8229445f1fe283c3"
        }
    },
    {
        "descriptor": "Worker Shoes",
        "id": "bae237b94ae9421daaa3799df6f6e3c5",
        "customObjectName": "Worker Shoes",
        "multiInstance": false,
        "customObjectAlias": "workerShoes",
        "businessObject": {
            "descriptor": "Worker",
            "id": "766f3df40606431e8229445f1fe283c3"
        }
    }
]
}

```

This GET request retrieves the specified custom object definition from the previous example:

```
GET /customObjectDefinitions/e2b6ebfab5da412ea518f1a684cf730f
```

The response is a single custom object definition, in JSON format:

```
{
    "descriptor": "Shoes",
    "id": "e2b6ebfab5da412ea518f1a684cf730f",
    "customObjectName": "Shoes",
    "multiInstance": true,
    "customObjectAlias": "shoes",
    "businessObject": {
        "descriptor": "Worker",
        "id": "766f3df40606431e8229445f1fe283c3"
    }
}
```

### [Reference: Custom Objects \(Single-Instance\)](#)

#### **URL Base Path**

Tenant Base Path

```
https://{{hostname}}/api/common/v1/{{tenant}}
```

Example:

```
https://yourTenantHostName.com/api/common/v1/gms
```

Workday Extend API Gateway Base Path

For Workday Extend apps, use the regional API Gateway base URL for your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Developer Site. Note that the API Gateway base URL doesn't include the tenant name.

## URI

Note: Workday recommends that you don't use the Custom Objects (Single-Instance) APIs in the Common v1 REST service. We no longer support them, and plan to retire them. Use the Custom Objects (Single-Instance) v2 REST service instead. See [Concept: Custom Object \(Single-Instance\) REST APIs](#) on page 2239 for more information.

Single-instance Custom Object in Workday:

`/customObjects/{customObjectAlias}/{customObjectID}`

URI Parameter	Description
customObjectAlias	Web service alias for the custom object. Object creator supplies the alias when you create the custom object.
customObjectID	Reference to the custom object.

## Security

You can only view the Custom Objects and Custom Objects information permitted by the security profile of the current user.

## Description

Custom objects accessible through the Workday REST API are extensions of existing Workday objects.

Example: Worker object can extend to include a custom object named Parking Space. If a worker can only have 1 assigned parking space, it's an example of a single-instance custom object. This topic describes single-instance custom objects.

To view information about custom objects, use the Custom Object Definitions resource. To examine how the custom object is defined, use the View Custom Object task.

To add or change existing data, don't specify an inactive custom list value when using the Workday REST API. If you do, then an error returns stating that your request is invalid and the web service alias for the inactive custom list value. If you retrieve data containing an inactive custom list value, then the returned data includes the inactive custom list value. You can deactivate and reactivate a custom list value in the custom list definition using the Workday user interface.

To retrieve the WID and the formatting of other fields in the payload for a particular object, use the GET operation.

## Custom Objects IDs (Single-Instance)

For single-instance custom objects, the custom object ID is any valid ID for the custom object, or any valid ID for the extended Workday object. You can use the custom object ID or the extended Workday object ID because there's a single instance of that custom object.

Example: You can use the ID of the Parking Space or the ID of that Worker interchangeably for that Parking Space.

Secured by:

Use View Custom Object in your tenant to obtain this information.

No request body required or available for this method.

The response body is in JSON format.

To retrieve the custom object, you can use the custom object ID or the extended Workday object ID.

### Custom Object (Single-Instance) Used in Examples

The examples are based on the single-instance custom object Parking Spaces, an extension of the Worker object. Parking Spaces has a web service alias of *parkingSpaces*, and has these fields:

- Space Number (*spaceNumber*), an integer.
- Space Size (*spaceSize*), a value from a custom list.
- Maintenance Cost (*maintenanceCost*), a currency and an integer.

This GET request retrieves the Parking Space object using the Parking Space ID (id=26e7475e009d30000fa0d7926d60000b):

```
GET /customObjects/parkingSpaces/26e7475e009d30000fa0d7926d60000b
```

The response body is:

```
{
  "id": "26e7475e009d30000fa0d7926d60000b",
  "worker": {"id": "3aa5550b7fe348b98d7b5741afc65534"} ,
  "spaceNumber": 76,
  "spaceSize": {"id": "compact"} ,
  "maintenanceCost": {"currency": "USD", "value": "45.36"}
}
```

This GET request retrieves the Parking Space object using the Worker ID (id=3aa5550b7fe348b98d7b5741afc65534):

```
GET /customObjects/parkingSpaces/3aa5550b7fe348b98d7b5741afc65534
```

The response body is:

```
{
  "id": "26e7475e009d30000fa0d7926d60000b",
  "worker": {"id": "3aa5550b7fe348b98d7b5741afc65534"} ,
  "spaceNumber": 76,
  "spaceSize": {"id": "compact"} ,
  "maintenanceCost": {"currency": "USD", "value": "45.36"}
}
```

## Reference: PUT Custom Objects (Single-Instance)

Note: Workday recommends that you don't use the Custom Objects (Single-Instance) APIs in the Common v1 REST service. We no longer support them, and plan to retire them. Use the Custom Objects (Single-Instance) v2 REST service instead. See [Concept: Custom Object \(Single-Instance\) REST APIs](#) on page 2239 for more information.

Secured by:

Use View Custom Object in your tenant to obtain this information.

This method requires a request body. This method updates only the fields you include in the request body. To determine which fields you can specify in the request body, access the View Custom Object task. Use the field names in the Custom Field Web Service Alias column on the Field Definitions table.

The response body is in JSON format.

PUT updates existing instances of custom objects. For single-instance custom objects, you can use either the custom object ID or the extended Workday object ID.

If the object doesn't exist, you receive an error message.

## Custom Object (Single-Instance) Used in Examples

The examples are based on the single-instance custom object Parking Spaces, an extension of the Worker object. Parking Spaces has a web service alias of *parkingSpaces*, and has these fields:

- Space Number (*spaceNumber*), an integer.
- Space Size (*spaceSize*), a value from a custom list.
- Maintenance Cost (*maintenanceCost*), a currency and an integer.

This PUT request updates the Parking Space object using the Parking Space ID (id=26e7475e009d30000fa0d7926d60000b):

```
PUT /customObjects/parkingSpaces/26e7475e009d30000fa0d7926d60000b
```

Use this request body:

```
{
  "spaceSize": { "id" : "fullSize" },
  "spaceNumber": 27,
  "maintenanceCost": { "currency": "USD", "value": "56.56" }
}
```

The response body is:

```
{ "ok": "OK" }
```

## Reference: POST Custom Objects (Single-Instance)

Note: Workday recommends that you don't use the Custom Objects (Single-Instance) APIs in the Common v1 REST service. We no longer support them, and plan to retire them. Use the Custom Objects (Single-Instance) v2 REST service instead. See [Concept: Custom Object \(Single-Instance\) REST APIs](#) on page 2239 for more information.

Secured by:

Use View Custom Object in your tenant to obtain this information.

This method requires a request body. To determine which fields you can specify in the request body, access the View Custom Object task. Use the field names in the Custom Field Web Service Alias column on the Field Definitions table.

Use this query parameter:

Query Parameter	Description
updateIfExists	When true, updates the object if it exists. When false, return an error if the object exists. Default is false. If the object doesn't exist, this method creates regardless of this setting.

In each of these POST examples, we specify a particular worker, because the example custom object extends the Worker object. If your custom object extends a different Workday object, you specify that Workday object in place of the Worker object.

To create custom objects, supply an extended Workday object and a value for the reference ID, if defined, in the request body. The example specifies the worker ID.

A successful POST request that creates an object returns the HTTP status code: 201 Created.

### Custom Object (Single-Instance) Used in Examples

The examples are based on the single-instance custom object Parking Spaces, an extension of the Worker object. Parking Spaces has a web service alias of *parkingSpaces*, and has these fields:

- Space Number (*spaceNumber*), an integer.
- Space Size (*spaceSize*), a value from a custom list.
- Maintenance Cost (*maintenanceCost*), a currency and an integer.

If the worker doesn't have a Parking Space object, this POST request creates a Parking Space object for the specified worker (id=3aa5550b7fe348b98d7b5741afc6553):

```
POST /customObjects/parkingSpaces
```

Use this request body:

```
{
  "worker": {"id": "3aa5550b7fe348b98d7b5741afc65534"} ,
  "spaceSize": {"id": "fullSize"} ,
  "spaceNumber": 76 ,
  "maintenanceCost": {"currency": "USD", "value": "37.25"}
}
```

The response body returned:

```
{ "ok": "Created" }
```

If the worker already has a Parking Space object, you receive an error message. However, you can update an existing Parking Space object with this POST request:

```
POST /customObjects/parkingSpaces?updateIfExists=true
```

Use this request body:

```
{
  "worker": {"id": "3aa5550b7fe348b98d7b5741afc65534"} ,
  "spaceSize": {"id": "compact"} ,
  "spaceNumber": 76 ,
  "maintenanceCost": {"currency": "USD", "value": "45.36"}
}
```

The response body returned is the same, even though the POST updated the object:

```
{ "ok": "Created" }
```

### Reference: DELETE Custom Objects (Single-Instance)

Note: Workday recommends that you don't use the Custom Objects (Single-Instance) APIs in the Common v1 REST service. We no longer support them, and plan to retire them. Use the Custom Objects (Single-Instance) v2 REST service instead. See [Concept: Custom Object \(Single-Instance\) REST APIs](#) on page 2239 for more information.

Secured by:

Use View Custom Object in your tenant to obtain this information.

There is no request body required or available for this method.

The response body is in JSON format.

The DELETE operation removes a single custom object.

This DELETE request deletes a Parking Space object using the Parking Space ID (id=26e7475e009d30000fa0d7926d60000b):

```
DELETE /customObjects/parkingSpaces/26e7475e009d30000fa0d7926d60000b
```

The response body is:

```
{ "ok": "OK" }
```

## Reference: Custom Objects (Multi-Instance)

### Reference: Custom Objects (Multi-Instance)

#### URL Base Path

Tenant Base Path

```
https://{{hostname}}/api/common/v1/{{tenant}}
```

Example:

```
https://yourTenantHostName.com/api/common/v1/gms
```

Workday Extend API Gateway Base Path

For Workday Extend apps, use the regional API Gateway base URL for your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Developer Site. Note that the API Gateway base URL doesn't include the tenant name.

#### URI

Note: Workday recommends that you don't use the Custom Objects (Multi-Instance) APIs in the Common v1 REST service. We no longer support them, and plan to retire them. Use the Custom Objects (Multi-Instance) v2 REST service instead. See [Concept: Custom Object \(Multi-Instance\) REST APIs](#) on page 2225 for more information.

Multi-instance Custom Object in Workday:

```
/customObjects/{customObjectAlias}/{customObjectID}
```

Collection of multi-instance custom objects of a specific Workday object:

```
/{extendedWorkdayObjectResource}/{extendedWorkdayObjectID}/customObjects/{customObjectAlias}
```

URI Parameter	Description
customObjectAlias	Web service alias for the custom object. The object creator supplies the alias when you create the custom object. Example: A custom object named Stock Grants might use the web service alias stockGrants.

URI Parameter	Description
customObjectId	A reference to the custom object. Example: Custom object WID.
extendedWorkdayObjectResource	The resource for the Workday object extended to create the custom object. See the table later. Example: Resource for the Workday object Bank Account is bankAccounts. This URI parameter is only used when retrieving a collection of custom objects.
extendedWorkdayObjectID	Reference to the extended Workday object. Example: Bank Account WID.

## Security

You can only view the Custom Objects and Custom Objects information permitted by the security profile of the current user.

## Description

Custom objects accessible through the Workday REST API are extensions of existing Workday objects.

Example: Worker object can extend to include a custom object named Stock Grants. If a single worker can have more than 1 stock grant, it's an example of a multi-instance custom object.

To view information about custom objects, use the Custom Object Definitions resource. To examine how the custom object is defined, use the View Custom Object task.

To add or change existing data, don't specify an inactive custom list value when using the Workday REST API. If you do, an error returns stating that your request is invalid and the web service alias for the inactive custom list value. If you retrieve data containing an inactive custom list value, then the returned data includes the inactive custom list value. You can deactivate and reactivate a custom list value in the custom list definition using the Workday user interface.

Workday objects that can extend into custom objects listed below.

To retrieve the WID and the formatting of other fields in the payload for a particular object, use the GET operation.

## Custom Objects IDs (Multi-Instance)

For multi-instance custom objects, the custom object ID is any valid ID for that custom object. There might be more than 1 multi-instance custom object associated with the Workday object. You specify the custom object ID, or the custom object compound ID, but not the Workday object ID alone.

The Workday object ID and the custom object reference ID, separated by a semicolon (;) comprises the compound ID.

Example: If the object has these IDs:

- Extended Workday object WID (a worker object): 3aa5550b7fe348b98d7b5741afc6553
- Reference ID (the reference ID field of the custom object is grantName): New\_Hire

Then a compound ID for the custom object is:

- 3aa5550b7fe348b98d7b5741afc6553;grantName=New\_Hire

## Reference: GET Single Custom Object (Multi-Instance)

Note: Workday recommends that you don't use the Custom Objects (Multi-Instance) APIs in the Common v1 REST service. We no longer support them, and plan to retire them. Use the Custom Objects (Multi-Instance) v2 REST service instead. See [Concept: Custom Object \(Multi-Instance\) REST APIs on page 2225](#) for more information.

Secured by:

Use View Custom Object in your tenant to obtain this information.

No request body required or available for this method.

The response body is in JSON format.

For a custom object that is multi-instance, you can retrieve a single instance associated with a particular extended Workday object. To get the instance, use the custom object ID.

## Custom Object (Multi-Instance) Used in Examples

The examples are based on the multi-instance custom object Stock Grants, an extension of the Worker object. Stock Grants has a web services alias of *stockGrants*, and has these fields:

- Grant Date (*grantDate*), a Date.
- Type of Shares (*typeOfShares*), a custom list that can take on the values ISO, NQO, and RSU (iso, nqo, rsu).
- Number of Shares (*numberOfShares*), an integer.
- Grant Name (*grantName*), a text string.
- Strike Price (*strikePrice*), a currency value.

For this example, the reference ID for the custom object is the Grant Name.

This GET request retrieves a specific custom object, using the custom object ID (id=0314e3d563f5300023ac063a90880002):

```
GET /customObjects/stockGrants/0314e3d563f5300023ac063a90880002
```

The response is a single custom object, in JSON format:

```
{
  "id": "0314e3d563f5300023ac063a90880002",
  "worker": {"id": "66faa65677834f0a9b586dd5645e9004"},
  "grantDate": "2011-03-15",
  "typeOfShares": {"id": "iso"},
  "numberOfShares": 5000,
  "grantName": "Merit_1Q2011",
  "strikePrice": {"currency": "USD", "value": "375.25"}
}
```

This GET request retrieves a specific custom object, using the compound ID. The Worker ID (id=66faa65677834f0a9b586dd5645e900) links with the reference ID (grantName=Merit\_4Q2011), separated by a semicolon (:):

```
GET /customObjects/
stockGrants/66faa65677834f0a9b586dd5645e9004;grantName=Merit_4Q2011
```

The response is a single custom object, in JSON format:

```
{
  "id": "0314e3d563f530001f5df84013cb0001",
  "worker": {"id": "66faa65677834f0a9b586dd5645e9004"} ,
  "grantDate": "2012-01-15",
  "typeOfShares": {"id": "iso"} ,
  "numberOfShares": 500,
  "grantName": "Merit_4Q2011",
  "strikePrice": {"currency": "USD", "value": "355.17"}
}
```

### **Reference: GET Collection of Custom Objects (Multi-Instance)**

Note: Workday recommends that you don't use the Custom Objects (Multi-Instance) APIs in the Common v1 REST service. We no longer support them, and plan to retire them. Use the Custom Objects (Multi-Instance) v2 REST service instead. See [Concept: Custom Object \(Multi-Instance\) REST APIs](#) on page 2225 for more information.

Secured by:

Use View Custom Object in your tenant to obtain this information.

No request body required or available for this method.

The response body is in JSON format.

For a custom object that is multi-instance, you can retrieve a collection of all the instances associated with a particular extended Workday object, or a single specific instance. To get the collection, select the resource alias associated with Workday object.

### **REST API Resource Names for Workday Objects**

This table lists the:

- Workday objects that you can extend with custom objects.
- Resource name (plural form) of the Workday object. Use the appropriate resource name in the request URL of the GET endpoint that retrieves a collection of multi-instance custom objects.

Extended Workday Object	Resource Name in the Request URL

### Custom Object (Multi-Instance) Used in Examples

The examples are based on the multi-instance custom object Stock Grants, an extension of the Worker object. Stock Grants has a web services alias of *stockGrants*, and has these fields:

- Grant Date (*grantDate*), a Date.
- Type of Shares (*typeOfShares*), a custom list that can take on the values ISO, NQO, and RSU (iso, nqo, rsu).
- Number of Shares (*numberOfShares*), an integer.
- Grant Name (*grantName*), a text string.
- Strike Price (*strikePrice*), a currency value.

For this example, the reference ID for the custom object is the Grant Name.

This GET request retrieves all the Stock Grants of the specified worker (id=66faa65677834f0a9b586dd5645e9004):

```
GET /workers/66faa65677834f0a9b586dd5645e900/customObjects/stockGrants
```

The response is a collection of Stock Grants, in JSON format:

```
{
  "total": 3,
  "data": [
    {
      "id": "0314e3d563f5300023ac063d40080003",
      "worker": {"id": "66faa65677834f0a9b586dd5645e9004"},
      "grantDate": "2011-10-15",
      "typeOfShares": {"id": "iso"},
      "numberOfShares": 500,
      "grantName": "Merit_3Q2011",
      "strikePrice": {"currency": "USD", "value": "385.78"}
    },
    {
      "id": "0314e3d563f5300023ac063a90880002",
      "worker": {"id": "66faa65677834f0a9b586dd5645e9004"},
      "grantDate": "2011-03-15",
      "typeOfShares": {"id": "iso"},
      "numberOfShares": 500,
      "grantName": "Merit_1Q2011",
      "strikePrice": {"currency": "USD", "value": "375.25"}
    },
    {
      "id": "0314e3d563f530001f5df84013cb0001",
      "worker": {"id": "66faa65677834f0a9b586dd5645e9004"},
      "grantDate": "2012-01-15",
      "typeOfShares": {"id": "iso"},
      "numberOfShares": 500,
      "grantName": "Merit_4Q2011",
      "strikePrice": {"currency": "USD", "value": "355.17"}
    }
  ]
}
```

```

        }
    ]
}
}
```

### Reference: PUT Custom Objects (Multi-Instance)

Note: Workday recommends that you don't use the Custom Objects (Multi-Instance) APIs in the Common v1 REST service. We no longer support them, and plan to retire them. Use the Custom Objects (Multi-Instance) v2 REST service instead. See [Concept: Custom Object \(Multi-Instance\) REST APIs](#) on page 2225 for more information.

Secured by:

Use View Custom Object in your tenant to obtain this information.

PUT updates existing instances of custom objects.

This method requires a request body. This method updates only the fields you include in the request body. To determine which fields you can specify in the request body, access the View Custom Object task. Use the field names in the Custom Field Web Service Alias column on the Field Definitions table.

The response body is in JSON format.

### Custom Object (Multi-Instance) Used in Examples

The examples are based on the multi-instance custom object Stock Grants, an extension of the Worker object. Stock Grants has a web services alias of *stockGrants*, and has these fields:

- Grant Date (*grantDate*), a Date.
- Type of Shares (*typeOfShares*), a custom list that can take on the values ISO, NQO, and RSU (iso, nqo, rsu).
- Number of Shares (*numberOfShares*), an integer.
- Grant Name (*grantName*), a text string.
- Strike Price (*strikePrice*), a currency value.

For this example, the reference ID for the custom object is the Grant Name.

This PUT request updates a Stock Grants object, using the custom object ID (id=0314e3d563f5300023ac063a90880002):

```
PUT /customObjects/stockGrants/0314e3d563f5300023ac063a90880002
```

Use this request body:

```
{
  "grantDate": "2011-07-15",
  "typeOfShares": { "id": "iso" },
  "numberOfShares": 510,
  "grantName": "Merit_2Q2011",
  "strikePrice": { "currency": "USD", "value": "325.68" }
}
```

The response body is:

```
{ "ok": "OK" }
```

This PUT request updates a Stock Grants object, using the compound ID: Worker ID (id=66faa65677834f0a9b586dd5645e900) concatenated with the reference ID (grantName=Merit\_2Q2011), separated by a semicolon (;):

```
PUT /customObjects/
stockGrants/66faa65677834f0a9b586dd5645e9004;grantName=Merit_2Q2011
```

Use this request body:

```
{
```

```

    "grantDate": "2011-07-15",
    "typeOfShares": { "id": "iso" },
    "numberOfShares": 510,
    "grantName": "Merit_2Q2011",
    "strikePrice": { "currency": "USD", "value": "335.48" }
}

```

The response body is:

```
{ "ok": "OK" }
```

### Reference: POST Custom Objects (Multi-Instance)

Note: Workday recommends that you don't use the Custom Objects (Multi-Instance) APIs in the Common v1 REST service. We no longer support them, and plan to retire them. Use the Custom Objects (Multi-Instance) v2 REST service instead. See [Concept: Custom Object \(Multi-Instance\) REST APIs](#) on page 2225 for more information.

Secured by:

Use View Custom Object in your tenant to obtain this information.

This method requires a request body. To determine which fields you can specify in the request body, access the View Custom Object task. Use the field names in the Custom Field Web Service Alias column on the Field Definitions table.

Use these query parameters to indicate how to treat existing objects, and whether you're creating a single object or a collection:

Query Parameter	Description
updateIfExists	When set to true, update the object if it exists. When set to false, return an error if the object exists. The default is false. If the object doesn't exist, 1 is created regardless of this setting. Multi-instance custom objects without a reference ID don't support this parameter. Each POST request creates an object.
bulk	When set to true, your JSON request body contains a collection of custom objects to create (or update if updateIfExists is true). The default is false. A POST request has a limit of 100 items.

The response body is in JSON format.

To create custom objects, specify an extended Workday object and a value for the reference ID, if defined, in the request body. These examples specify the Worker ID and the Grant Name.

POST creates new instances of custom objects.

A successful POST request that creates an object returns the HTTP status code: 201 Created.

### Custom Object (Multi-Instance) Used in Examples

The examples are based on the multi-instance custom object Stock Grants, an extension of the Worker object. Stock Grants has a web services alias of *stockGrants*, and has these fields:

- Grant Date (*grantDate*), a Date.
- Type of Shares (*typeOfShares*), a custom list that can take on the values ISO, NQO, and RSU (iso, nqo, rsu).
- Number of Shares (*numberOfShares*), an integer.
- Grant Name (*grantName*), a text string.
- Strike Price (*strikePrice*), a currency value.

For this example, the reference ID for the custom object is the Grant Name.

This POST request creates an instance of Stock Grants for the specified worker (ID=66faa65677834f0a9b586dd5645e9004):

`POST /customObjects/stockGrants`

Use this request body:

```
{
  "worker": {"id": "66faa65677834f0a9b586dd5645e9004"} ,
  "grantDate": "2012-01-15",
  "typeOfShares": {"id": "iso"} ,
  "numberOfShares": 500,
  "grantName": "Merit_4Q2011",
  "strikePrice": {"currency": "USD", "value": "360.12"}
}
```

The response body is:

```
{ "ok": "Created" }
```

This POST request creates instances of Stock Grants for the specified worker:

`POST /customObjects/stockGrants?bulk=true`

Use this request body:

```
[
{
  "worker": {"id": "66faa65677834f0a9b586dd5645e9004"} ,
  "grantDate": "2011-03-15",
  "typeOfShares": {"id": "iso"} ,
  "numberOfShares": 500,
  "grantName": "Merit_1Q2011",
  "strikePrice": {"currency": "USD", "value": "375.25"}
},
{
  "worker": {"id": "66faa65677834f0a9b586dd5645e9004"} ,
  "grantDate": "2011-10-15",
  "typeOfShares": {"id": "iso"} ,
  "numberOfShares": 500,
  "grantName": "Merit_3Q2011",
  "strikePrice": {"currency": "USD", "value": "385.78"}
}]
```

The response body is:

```
{ "ok": "OK" }
```

In this example, if you attempt to POST to an object that exists, you receive an error message. However, you can update an existing object using this POST request:

`POST /customObjects/stockGrants?updateIfExists=true`

using this request body:

```
{
  "worker": {"id": "66faa65677834f0a9b586dd5645e9004"} ,
  "grantDate": "2012-01-15",
  "typeOfShares": {"id": "iso"} ,
  "numberOfShares": 500,
  "grantName": "Merit_4Q2011",
  "strikePrice": {"currency": "USD", "value": "355.17"}
}
```

The response body returned is:

```
{ "ok": "Created" }
```

## Reference: DELETE Custom Objects (Multi-Instance)

Note: Workday recommends that you don't use the Custom Objects (Multi-Instance) APIs in the Common v1 REST service. We no longer support them, and plan to retire them. Use the Custom Objects (Multi-Instance) v2 REST service instead. See [Concept: Custom Object \(Multi-Instance\) REST APIs](#) on page 2225 for more information.

Secured by:

Use View Custom Object in your tenant to obtain this information.

No request body required or available for this method.

The response body is in JSON format.

The DELETE operation removes a single custom object.

This DELETE request removes a single Stock Grants object using the object ID (id=805aee624fb5300017ed3d099b6e000f):

```
DELETE /customObjects/stockGrants/805aee624fb5300017ed3d099b6e000f
```

The response body is:

```
{ "ok" : "OK" }
```

This DELETE request removes a single Stock Grants object, using the compound ID. The Worker ID (id=66faa65677834f0a9b586dd5645e900) is concatenated with the reference ID (grantName=Merit\_2Q2011), separated by a semicolon (;):

```
DELETE /customObjects/
stockGrants/66faa65677834f0a9b586dd5645e900;grantName=Merit_2Q2011
```

The response body is:

```
{ "ok" : "OK" }
```

## Reference: Datasets

### URI

A collection of tables (version 2) or datasets (version 1):

```
/datasets
```

An individual table (version 2) or dataset (version 1):

```
/datasets/{id}
```

URI Parameter	Description
id	A reference to a Prism Analytics table (version 2) or dataset (version 1). Example: The WID of the table.

### Description

The Datasets resource represents a collection of tables or datasets created by the Workday REST API. Version 2 of the REST API works with tables, and version 1 works with datasets. You can only view the tables or datasets permitted by the security profile of the current user.

Datasets supports these methods:

- [GET Datasets](#) on page 2130

- [POST Datasets](#) on page 2133
- [PUT Datasets](#) on page 2138 (Version 2 only)

## GET Datasets

(Version 2) Secured by any of these security requirements:

- *Prism: Tables Manage* domain in the Prism Analytics functional area.
- *Table Viewer* permission on the table.
- *Table Editor* permission on the table.
- *Table Owner* permission on the table.
- *Prism Datasets: Manage* domain in the Prism Analytics functional area.
- *Dataset Viewer* permission on the dataset.
- *Dataset Editor* permission on the dataset.
- *Dataset Owner* permission on the dataset.

(Version 1) Secured by any of these security requirements:

This resource exposes the tables or datasets that the current user has permission on.

There's no request body required or available for this method. When retrieving a collection, use these optional query parameters to page the results:

Query Parameter	Description	Default	Max
limit	The limit of object data entries included in a single response.	20	100
offset	The offset to the first object in a collection to include in the response.	0	
name	The API name of the table to retrieve a single table. You can only use the query parameter with version 2.		

The response body is in JSON format.

The response body is a JSON collection of tables or datasets including their ID values.

## GET Datasets Examples (version 1)

Using version 1, this GET request retrieves all datasets available to the current user, Betty Liu:

```
GET /datasets
```

The response is a collection of datasets, in JSON format (we display only one dataset in the response):

```
{
  "total": 5,
  "data": [
    {
      "id": "942fb35ce25301483a2af59303000e00",
      "updatedMoment": "2018-07-06T20:37:11.540Z",
      "isEmpty": true,
      "createdMoment": "2018-07-06T20:37:11.540Z",
      "updatedBy": {
        "id": "274555853a4446cf8809325243534f34",
        "fullName": "Betty Liu (manager 4300, CostCtrMgr 30.3, 41200, PayIntPartner; PayPartner, PayAdmin)"
      }
    }
  ]
}
```

```

        "isPublished": false,
        "createdBy": {
            "id": "274555853a4446cf8809325243534f34",
            "fullName": "Betty Liu (manager 4300, CostCtrMgr 30.3, 41200, PayIntPartner; PayPartner, PayAdmin)"
        },
        "name": "External_Policies",
        "sourceType": {
            "descriptor": "API",
            "id": "ebb9f67077f510001a2d1c2985031293"
        }
    },
    ...
]
}

```

This request retrieves information about the dataset named External\_Policies (ID = 942fb35ce25301483a2af59303000e00):

```
GET /datasets/942fb35ce25301483a2af59303000e00
```

The response body:

```
{
    "id": "942fb35ce25301483a2af59303000e00",
    "updatedBy": {
        "id": "274555853a4446cf8809325243534f34",
        "fullName": "Betty Liu (manager 4300, CostCtrMgr 30.3, 41200, PayIntPartner; PayPartner, PayAdmin)"
    },
    "createdBy": {
        "id": "274555853a4446cf8809325243534f34",
        "fullName": "Betty Liu (manager 4300, CostCtrMgr 30.3, 41200, PayIntPartner; PayPartner, PayAdmin)"
    },
    "isEmpty": true,
    "name": "External_Policies",
    "createdMoment": "2018-07-06T20:37:11.540Z",
    "isPublished": false,
    "sourceType": {
        "descriptor": "API",
        "id": "ebb9f67077f510001a2d1c2985031293"
    },
    "updatedMoment": "2018-07-06T20:37:11.540Z"
}
```

## GET Datasets Examples (version 2)

Using version 2, this GET request retrieves all tables available to the current user, Betty Liu:

```
GET /datasets
```

The response is a collection of tables, in JSON format (we display only 1 table in the response):

```
{
    "total": 71,
    "data": [
        {
            "id": "1eb80593fedb0142b468133e015f9603",
            "updatedMoment": "2019-08-29T01:00:11.102Z",
            "displayName": "Written_Premiums",
            ...
        }
    ]
}
```

```

        "empty": false,
        "permissions": {
            "canTruncateTableData": true,
            "canDeleteTableData": true,
            "canEditDataSourceSecurity": true,
            "canEdit": true,
            "canPublish": false,
            "canAppendTableData": true,
            "canReplaceTableData": true,
            "canView": true,
            "canSelectTableData": true,
            "canDelete": false,
            "canShare": true
        },
        "createdBy": {
            "id": "8503e6ffc9e71087bfef081063b30280",
            "fullName": "Workday Implementer"
        },
        "name": "Written_Premiums",
        "createdMoment": "2019-08-28T20:54:08.241Z",
        "published": false,
        "stats": {
            "rows": "117",
            "size": "22985"
        },
        "updatedBy": {
            "id": "a002a0bc7e5b10000dbb7051e4b011fa"
        },
        "description": "Table of Written_Premiums"
    },
    ...
}
]
}

```

This request retrieves information about the dataset named lemonade\_stand\_sales (ID = c90ca356894d01882ffcb6d40900d300):

```
GET /datasets/c90ca356894d01882ffcb6d40900d300
```

The response body:

```
{
    "id": "c90ca356894d01882ffcb6d40900d300",
    "updatedMoment": "2020-11-04T04:42:39.641Z",
    "permissions": {
        "canTruncateTableData": true,
        "canShare": true,
        "canReplaceTableData": true,
        "canDeleteTableData": true,
        "canEdit": true,
        "canAppendTableData": true,
        "canPublish": false,
        "canDelete": true,
        "canEditDataSourceSecurity": true,
        "canSelectTableData": true,
        "canView": true
    },
    "updatedBy": {
        "id": "a002a0bc7e5b10000dbb7051e4b011fa"
    },
    "description": "This table contains the lemonade stand sales in the neighborhood.",
    "displayName": "Lemonade Stand Sales",
}
```

```

    "createdBy": {
      "id": "34cd5fca15dd41d698b0667011e4c9bd",
      "fullName": "Developer Generic User"
    },

      "size": "5046",
      "rows": "17"
    },
    "createdMoment": "2020-11-04T04:31:52.991Z",
    "name": "lemonade_stand_sales",
    "published": false,
    "empty": false
  }
}

```

## POST Datasets

(Version 2) Secured by:

*Prism: Tables Create* domain in the Prism Analytics functional area.

(Version 1) Secured by:

*Prism Datasets: Create* domain in the Prism Analytics functional area.

Use this method to create a new table or dataset with the specified name. Version 2 of the REST API creates a table, and version 1 creates a dataset.

When you create a dataset using version 1, this method creates an empty API dataset. You must supply a JSON format body with your request.

In the request body, supply a value for these parameters:

Body Parameter	Type	Description
name	String	(Version 1) Dataset name. You can't change this name after you create the dataset.  (Version 2) Table name. This is the table API name. You can't change this name after you create the table.  API names must conform to name validation rules.
displayName	String	(Version 2 only) The display name for the table. You can change this name at any time.  Display names must conform to name validation rules.
description	String	(Version 2 only) The description of the table. The description must contain less than 1,000 characters.
documentation	String	(Version 2 only) A long string field you can use to include more detailed information about this table for internal documentation purposes. The documentation must contain less than 32,000 characters.
fields	Object	(Version 2 only) The fields to create in the table.  See: <a href="#">Reference: Table and Dataset Field Attributes</a> on page 2094.

The response body is in JSON format and has the ID of the table or dataset.

## POST Datasets Examples (version 1)

Using version 1, this POST request creates a new dataset named External\_Policies:

```
POST /datasets
```

Using this request body:

```
{
  "name": "External_Policies"
}
```

The response body is a listing of the dataset in JSON format:

```
{
  "id": "942fb35ce25301483a2af59303000e00",
  "createdMoment": "2018-07-06T20:37:11.540Z",
  "createdBy": {
    "id": "274555853a4446cf8809325243534f34",
    "fullName": "Betty Liu (manager 4300, CostCtrMgr 30.3, 41200, PayIntPartner; PayPartner, PayAdmin)"
  },
  "name": "External_Policies"
}
```

## POST Datasets Examples (version 2)

Using version 2, this POST request creates a new table named lemonade\_stand\_sales:

```
POST /datasets
```

Using this request body. The table schema defines these fields:

- Sales Key
- Stand Location
- Hot Day?
- Date
- Total Sales
- Cost Center

```
{
  "name": "lemonade_stand_sales",
  "displayName": "Lemonade Stand Sales",
  "description": "This table contains the lemonade stand sales in the neighborhood.",
  "fields": [
    {
      "ordinal": 1,
      "name": "Sales_Key",
      "displayName": "Sales Key",
      "externalId": true,
      "required": true,
      "precision": 18,
      "scale": 0,
      "type": {
        "id": "Schema_Field_Type=Numeric"
      }
    },
    {
      "ordinal": 2,
      "name": "Stand_Location",
      "displayName": "Stand Location"
    },
    {
      "ordinal": 3,
      "name": "Hot_Day?",
      "displayName": "Hot Day?"
    },
    {
      "ordinal": 4,
      "name": "Date",
      "displayName": "Date"
    },
    {
      "ordinal": 5,
      "name": "Total_Sales",
      "displayName": "Total Sales"
    },
    {
      "ordinal": 6,
      "name": "Cost_Center",
      "displayName": "Cost Center"
    }
  ]
}
```

```

    "name": "Stand_Location",
    "displayName": "Stand Location",
    "description": "The location of the lemonade stand.",
    "externalId": false,
    "required": false,
    "type": {
        "id": "Schema_Field_Type=Text"
    }
},
{
    "ordinal": 3,
    "name": "Hot_Day",
    "displayName": "Hot Day?",
    "description": "This is True when the outside temp was over 85F.",
    "externalId": false,
    "required": false,
    "type": {
        "id": "Schema_Field_Type=Boolean"
    }
},
{
    "ordinal": 4,
    "name": "Date",
    "displayName": "Date",
    "description": "The date the lemonade was sold.",
    "externalId": false,
    "required": true,
    "parseFormat": "MM/dd/YYYY",
    "type": {
        "id": "Schema_Field_Type=Date"
    }
},
{
    "ordinal": 5,
    "name": "Total_Sales",
    "displayName": "Total Sales",
    "externalId": false,
    "required": true,
    "precision": 18,
    "scale": 2,
    "type": {
        "id": "Schema_Field_Type=Numeric"
    }
},
{
    "ordinal": 6,
    "name": "Cost_Center",
    "displayName": "Cost Center",
    "externalId": false,
    "required": false,
    "businessObject": {
        "id": "89b94d1da24d4346997fdb640e465894"
    },
    "type": {
        "id": "Schema_Field_Type=Instance"
    }
}
]
}

```

The response body is a listing of the table in JSON format:

```
{

```

```

"id": "c90ca356894d01882ffcb6d40900d300",
"fields": [
  {
    "id": "c90ca356894d8177ef27b7d40900d600",

## PUT Datasets

Secured by any of these security requirements:

- *Prism: Tables Manage* domain in the Prism Analytics functional area.
- *Prism: Tables Owner Manage* domain in the Prism Analytics functional area.
- *Prism: Tables Manage Schema* domain in the Prism Analytics functional area.

You can only use the PUT method with version 2. Use this method to edit an existing table with the specified name. You must supply a JSON format body with your request.

In the request body, supply values for these parameters:

Body Parameter	Type	Description
name	String	Table name. This is the table API name. You can't change this name after you create the table. API names must conform to name validation rules.
displayName	String	The display name for the table. You can change this name at any time. Display names must conform to name validation rules.
description	String	The description of the table. The description must contain less than 1,000 characters.
fields	Object	The fields to modify in the table.

The response body is in JSON format and has the ID of the table.

## Reference: Datasets/Describe

### URI

The description of an individual table (version 2) or dataset (version 1):

```
/datasets/{id}/describe
```

URI Parameter	Description
id	A reference to a Prism Analytics table (version 2) or dataset (version 1). Example: The WID of the table.

### Description

The Datasets/Describe resource represents the description of a table or dataset. Version 2 of the REST API works with tables, and version 1 works with datasets. You can only describe a table or dataset permitted by the security profile of the current user.

Datasets/Describe supports this method:

- [GET Datasets/Describe](#) on page 2139

## GET Datasets/Describe

(Version 2) Secured by any of these security requirements:

- *Prism: Tables Manage* domain in the Prism Analytics functional area.
- *Prism: Tables Owner Manage* domain in the Prism Analytics functional area.
- *Prism: Tables Manage Schema* domain in the Prism Analytics functional area.
- *Table Viewer* permission on the table.

(Version 1) Secured by any of these security requirements:

- *Table Editor* permission on the table.
- *Table Owner* permission on the table.
- *Prism Datasets: Manage* domain in the Prism Analytics functional area.
- *Dataset Viewer* permission on the dataset.
- *Dataset Editor* permission on the dataset.
- *Dataset Owner* permission on the dataset.

This resource exposes the description of a table or dataset that the current user has permission on.

There's no request body required or available for this method. When retrieving a collection, use these optional query parameters to page the results:

Query Parameter	Description	Default	Max
limit	The limit of object data entries included in a single response.	20	100
offset	The offset to the first object in a collection to include in the response.	0	

The response body is in JSON format.

The response body is a JSON representation of a table or dataset including its ID value and field information.

### GET Datasets/Describe Example (version 1)

Using version 1, this request retrieves the description about the dataset named External\_Policies (ID = e2db164babc70190cdcca27e6d0011cc):

```
GET /datasets/e2db164babc70190cdcca27e6d0011cc/describe
```

The response body:

```
{
  "total": 1,
  "data": [
    {
      "id": "e2db164babc70190cdcca27e6d0011cc",

```

## Reference: Inbox Tasks

### URL Base Path

Tenant Base Path

```
https://{{hostname}}/api/common/v1/{{tenant}}
```

Example:

```
https://yourTenantHostName.com/api/common/v1/gms
```

Workday Extend API Gateway Base Path

For Workday Extend apps, use the regional API Gateway base URL for your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Developer Site. Note that the API Gateway base URL doesn't include the tenant name.

### URI

Single task in My Tasks of the current user:

```
/inboxTasks/{{id}}
```

URI Parameter	Description
id	Reference to the task in My Tasks. Example: task Workday ID.

### Description

The Inbox Tasks resource represents a task in My Tasks that the specified user can approve or deny. To see all tasks in My Tasks for a specific worker, use the Workers/Inbox Task resource.

The Inbox Tasks resource supports this method:

- [PUT My Inbox Task](#) on page 2146

To use the Inbox Task REST APIs:

1. Get the tasks in My Tasks for a specific worker.
  - a. Call the `GET /workers/{id}/inboxTasks` method, where `{id}` is the Workday ID of a worker.
  - b. From the response data, save the Workday ID of the task for approval or denial.
2. Approve or deny the task in My Tasks.
  - a. Call the `PUT /inboxTasks/{id}?type={type}` method, where:
    - `{ID}` is the Workday ID of the task that you saved from the `GET /workers/{id}/inboxTasks` method response.
    - `{type}` is either approval or denial.
  - b. Specify the request body when you call the `PUT /inboxTasks/{id}` method. Specify either:
    - An empty request body. Example: `{}`
    - A comment. Example: `{ "comment": "Requirements are satisfied." }`

## PUT My Inbox Task

Secured by:

Core Navigation

The PUT My Inbox Task method approves or denies an approval-type task in My Tasks. An approval-type task has a `stepType` descriptor of Approval. Specify the `type` query parameter.

Query Parameter	Value	Description
<code>type</code>	<code>approval</code>	Approves the approval task.
	<code>denial</code>	Denies the approval task.

The response body is in JSON format.

## PUT Inbox Task Examples

This `GET /workers/{id}/inboxTasks` example returns the tasks in My Tasks for the manager of Betty Liu:

```
GET /workers/3aa5550b7fe348b98d7b5741afc65534/inboxTasks
```

The `GET /workers/{id}/inboxTasks` method returns this task, which is a time off request from Betty Liu:

```
{
  "total": 1,
  "data": [
    {
      "descriptor": "Approval by Manager",
      "id": "90ef2b58c8e3cf15b879a848aed69219",
      "href": "https://[Workday REST API Endpoint]/inboxTasks/90ef2b58c8e3cf15b879a848aed69219",
      "subject": {
        "descriptor": "Betty Liu",
        "id": "3bcc416214054db6911612ef25d51e9f",
        "href": "https://[Workday REST API Endpoint]/workers/3bcc416214054db6911612ef25d51e9f"
      },
      "overallProcess": {
        "id": "3bcc416214054db6911612ef25d51e9f"
      }
    }
  ]
}
```

```

    "descriptor": "Time Off Request: Betty Liu",
    "id": "dc930ab57b114b6694edf9eb92621281",
    "href": "https://{{Workday REST API Endpoint}}/businessProcesses/dc930ab57b114b6694edf9eb92621281",
  },
  "status": {
    "descriptor": "Awaiting Action",
    "id": "d9e4108c446c11de98360015c5e6daf6"
  },
  "stepType": {
    "descriptor": "Approval",
    "id": "d8c8920e446c11de98360015c5e6daf6"
  },
  "assigned": "2013-02-26T19:06:57.493Z",
  "due": "2013-02-28"
}
]
}

```

Using the task `id` value from the preceding response, this PUT request approves the time off request:

```
PUT /inboxTasks/90ef2b58c8e3cf15b879a848aed69219?type=approval
```

The sample PUT method submits this empty request body:

```
{}
```

The response body is the task in JSON format. The descriptor indicates that the task you modified is an Approval by Manager task:

```
{
  "descriptor": "Approval by Manager",
  "id": "90ef2b58c8e3cf15b879a848aed69219",
  "href": "https://{{Workday REST API Endpoint}}/inboxTasks/90ef2b58c8e3cf15b879a848aed69219"
}
```

This PUT request approves the time off request with a comment:

```
PUT /inboxTasks/90ef2b58c8e3cf15b879a848aed69219?type=approval
```

The sample PUT method submits the comment in this request body:

```
{
  "comment": "Requirements are satisfied."
}
```

#### Tenant Base Path

```
https://{{hostname}}/api/common/v1/{tenant}
```

#### Example:

```
https://yourTenantHostName.com/api/common/v1/gms
```

## Workday Extend API Gateway Base Path

For Workday Extend apps, use the regional API Gateway base URL for your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Developer Site. Note that the API Gateway base URL doesn't include the tenant name.

### URI

Collection of Job Change Reasons:

`/jobChangeReasons`

Individual Job Change Reasons:

`/jobChangeReasons/{id}`

URI Parameter	Description
<code>id</code>	Reference to a job change reason. Example: Job change reason WID.

### Description

The Job Change Reasons resource represents job change reasons in Workday. You can only view the Job Change Reasons and information allowed by the security profile of the current user.

Job Change Reasons supports this method:

- [GET Job Change Reasons](#) on page 2148

### GET Job Change Reasons

Secured by:

Staffing Actions: Change Job Date and Reason

No request body required or available for this method. When retrieving a collection, use these optional query parameters to page the results:

Query Parameter	Description	Default	Max
<code>limit</code>	Limit of object data entries included in a single response.	20	100
<code>offset</code>	Offset to the first object in a collection to include in the response.	0	

The response body is in JSON format.

GET Job Change Reasons returns the job change reasons in Workday. You typically use this in conjunction with the Workers/Job Change resource to initiate job changes. Because the job change business process requires a reason, use this resource to return the job change reasons defined in your tenant.

### GET Job Change Reasons Examples

This GET request retrieves all the job change reasons available to the current user:

`GET /jobChangeReasons`

The response is a collection of job change reasons, in JSON format (only 1 job change reason in the response is shown):

```
{
  "total": 7,
  "data": [
    {
      "descriptor": "Transfer > Transfer > Move to another Manager",
      "id": "b7187dceedb34c8db3a8e15adf02a620",
      "href": "https://[Workday REST API Endpoint]/jobChangeReasons/b7187dceedb34c8db3a8e15adf02a620",
      "managerReason": true,
      "isForEmployee": true,
      "isForContingentWorker": true
    },
    ...
  ]
}
```

This request retrieves information about the Transfer job change reason (id=b7187dceedb34c8db3a8e15adf02a620):

GET /jobChangeReason/b7187dceedb34c8db3a8e15adf02a620

The response body:

```
{
  "descriptor": "Transfer > Transfer > Move to another Manager",
  "id": "b7187dceedb34c8db3a8e15adf02a620",
  "href": "https://[Workday REST API Endpoint]/jobChangeReasons/b7187dceedb34c8db3a8e15adf02a620",
  "managerReason": true,
  "isForEmployee": true,
  "isForContingentWorker": true
}
```

### URL Base Path

Tenant Base Path

```
https://[hostname]/api/common/v1/{tenant}
```

Example:

```
https://yourTenantHostName.com/api/common/v1/gms
```

### Workday Extend API Gateway Base Path

For Workday Extend apps, use the regional API Gateway base URL for your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Developer Site. Note that the API Gateway base URL doesn't include the tenant name.

### URI

A collection of Organizations:

```
/organizations?organizationType={organizationTypeId}
```

An individual Organization:

/organizations/{organizationId}?organizationType={organizationTypeID}

URI Parameter	Description
organizationTypeID	Reference to an Organization Type. Example: Organization Type WID. Requests must provide an Organization Type.
organizationId	Reference to an Organization. Example: Organization WID.

## Description

The Organizations resource represents the organizations in Workday. You can only view the Organization information permitted by the security profile of the current user.

Organizations supports this method:

- [GET Organizations](#) on page 2150

## GET Organizations

Secured by:

Reports: Organization

No request body required or available for this method. When retrieving a collection, use these optional query parameters to page the results:

Query Parameter	Description	Default	Max
limit	Limit of object data entries included in a single response.	20	100
offset	Offset to the first object in a collection to include in the response.	0	

The response body is in JSON format.

## GET Organizations Examples

This GET request retrieves all the Organizations available to the current user where the Organization Type ID is bf2d8218d2c34cc5aca1148580a88374:

```
GET /organizations?organizationType=bf2d8218d2c34cc5aca1148580a88374
```

The response is a collection of Organizations, in JSON format (only 1 Organization in the response is shown):

```
{
  "total": 756,
  "data": [
    {
      "descriptor": "Trans SWE Complex",
      "id": "46cd406ea858103b094a61f864b500b0"
    }
  ],
  ...
]
```

This request retrieves information about the Organization whose Organization ID is ee8a05ace22e4a39a9ba6a2f168b713b and Organization Type ID is bf2d8218d2c34cc5aca1148580a88374.

```
GET /organizations/ee8a05ace22e4a39a9ba6a2f168b713b?
organizationType=bf2d8218d2c34cc5acac148580a88374
```

The response body:

```
{
  "descriptor": "FUND-16 HREG Fund for Named Professorship",
  "id": "ee8a05ace22e4a39a9ba6a2f168b713b"
}
```

This request retrieves information about the Supervisory Organization whose Organization ID is ab7a15abd31e4a21a9de6a3f168c215d and Organization Type ID is df3b25adc33e5a26a7db6a6f178a327b.

```
GET /organizations/ab7a15abd31e4a21a9de6a3f168c215d?
organizationType=df3b25adc33e5a26a7db6a6f178a327b
```

Because a Supervisory Organization is returned, the response body contains the href for that Supervisory Organization:

```
{
  "descriptor": "Payroll Commitments Fund 3",
  "id": "ab7a15abd31e4a21a9de6a3f168c215d",
  "href": "https://{{Workday REST API Endpoint}}/supervisoryOrganizations/
ab7a15abd31e4a21a9de6a3f168c215d"
}
```

A Supervisory Organization is a subtype of Organization, and contains an href.

}

```

## Reference: System Health Dashboard

### URL Base Path

Tenant Base Path

```
https://{{hostname}}/api/systemMetrics/v1/{{tenant}}
```

Example:

```
https://yourTenantHostName.com/api/systemMetrics/v1/gms
```

Workday Extend API Gateway Base Path

For Workday Extend apps, use the regional API Gateway base URL for your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Developer Site. Note that the API Gateway base URL doesn't include the tenant name.

### Description

The System Health Dashboard API enables you to extract basic information about the current state of your tenant. This API includes these resources:

- `activeTasks` - The running and queued tasks, including all background and UI tasks.
- `activeUserSessions` - The active Workday sessions in your tenant.
- `systemMetricsOverview` - The number of active tasks (both running and queued) and the number of active Workday sessions.

### GET /activeTasks

Retrieves a list of running and queued tasks, including all background and UI tasks.

Secured by: *Resource Scheduling Administrator* and *System Monitor Administrator* domains in the System Health Dashboard functional area.

There are no input parameters. GET /activeTasks returns these values:

Field	Description
<code>total</code>	Integer representing the total number of running and queued tasks in your tenant.

Field	Description
<i>data</i>	Container for subelements. Workday returns 1 <i>data</i> element for each task.
<i>queueName</i>	Text value for name of the queue where the task resides.
<i>bytesAllocated</i>	Integer representing the amount of memory, in bytes, that Workday allocated to the task.
<i>status</i>	Current status of the task ( <i>Running</i> or <i>Queued</i> ).
<i>account</i>	Container with Workday ID ( <i>id</i> ) and description text ( <i>descriptor</i> ) of the Workday account that owns the task.
<i>startTime</i>	Timestamp of when Workday started the task.
<i>task</i>	Container with Workday ID ( <i>id</i> ) and description text ( <i>descriptor</i> ) of the task in Workday.
<i>taskDurationMillis</i>	Integer representing the amount of total time, in milliseconds, for the task.
<i>cpuTimeMillis</i>	Integer representing the amount of CPU time, in milliseconds, for the task.
<i>origin</i>	Text field representing the entity that requested the task.
<i>instancesAccessed</i>	Integer representing number of objects in Workday that the task accessed.
<i>queuedSubtaskCount</i>	Integer representing the number of subtasks currently in the queue for this task.

Sample GET /activeTasks response:

```
{
  "total": 2,
  "data": [
    {
      "task": {
        "descriptor": "systemMetrics/activeTasks/view (GET) (v1 - )",

      "instancesAccessed": 11
    },
    {
      "task": {
        "descriptor": "TrickleDocTask"
      }
    }
  ]
}
```

```

        },
        "status": "Queued",
        "account": {
            "descriptor": "oms",
            "id": "1c07ac59faa10000931d3d397ea0080"
        },
        "origin": "System",
        "queueMillis": 47578,
        "queuedSubtaskCount": 1,
        "taskDurationMillis": 47578,
        "queueName": "Single Background"
    }
]
}

```

## GET /activeUserSessions

Retrieves a list of all active Workday sessions in your tenant.

**Secured by:** *Resource Scheduling Administrator* and *System Monitor Administrator* domains in the System Health Dashboard functional area.

There are no input parameters. GET /activeUserSessions returns these values:

Field	Description
<i>total</i>	Integer representing the total number of active Workday sessions in your tenant.
<i>data</i>	Container for subelements. Workday returns 1 <i>data</i> element for each active Workday session.
<i>id</i>	Workday ID (WID) for the Workday session.
<i>descriptor</i>	Text description of the Workday session.
<i>role</i>	Workday ID ( <i>id</i> ) and description ( <i>descriptor</i> ) of the Workday role of the account that started the Workday session.
<i>signonTime</i>	Timestamp of when the Workday session started.
<i>authenticationType</i>	Workday ID ( <i>id</i> ) and description ( <i>descriptor</i> ) of the authentication method used for the Workday session.
<i>deviceType</i>	Workday ID ( <i>id</i> ) and description ( <i>descriptor</i> ) of the device type (Example: Desktop) used for the Workday session.
<i>systemAccount</i>	Workday ID ( <i>id</i> ) and description ( <i>descriptor</i> ) of the Workday account that started the Workday session.
<i>elapsedMinutes</i>	Integer representing number of elapsed minutes for the Workday session.

Sample GET /activeUserSessions response:

```
{
    "total": 2,
    "data": [
        {
            "id": "",
            "descriptor": "oms",
            "role": {
                "id": "1c07ac59faa10000931d3d397ea0080",
                "descriptor": "oms"
            },
            "signonTime": "2023-01-12T14:30:00Z",
            "authenticationType": {

00 16 621 -0700",
        "role": {
            "descriptor": "Super User",
            "id": "989eafee6aa449679fe58caeed36b31"
        },
        "signonTime": "2019-04-23T22:00:16.000Z",
        "authenticationType": {
            "descriptor": "User Name Password",
            "id": "88bff566a25b45b0b633159af1a2f916"
        },
        "systemAccount": {
            "descriptor": "SuperUser / Developer Generic User",
            "id": "34cd5fc15dd41d698b0667011e4c9bd"
        }
    }
]
}

```

## GET /systemMetricsOverview

Retrieves the number of active tasks (both running and queued) and the number of active Workday sessions.

Secured by: *Resource Scheduling Administrator* and *System Monitor Administrator* domains in the System Health Dashboard functional area.

There are no input parameters. GET /systemMetricsOverview returns these values:

Field	Description
<i>total</i>	Always returns 1.
<i>data</i>	Always returns 1 array containing <i>queuedTasks</i> , <i>activeUserSessions</i> , and <i>runningTasks</i> .
<i>queuedTasks</i>	Integer representing the number of queued tasks in your tenant.
<i>activeUserSessions</i>	Integer representing the number of current Workday sessions in your tenant.

Field	Description
<i>runningTasks</i>	Integer representing the number of running tasks in your tenant.

Sample GET /systemMetricsOverview response:

```
{
  "total": 1,
  "data": [
    {
      "queuedTasks": 1,
      "activeUserSessions": 1,
      "runningTasks": 1
    }
  ]
}
```

## Reference: Validate Worktags

### URL Base Path

Tenant Base Path

```
https://{{hostname}}/api/common/v1/{{tenant}}
```

Example:

```
https://yourTenantHostName.com/api/common/v1/gms
```

Workday Extend API Gateway Base Path

For Workday Extend apps, use the regional API Gateway base URL for your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Developer Site. Note that the API Gateway base URL doesn't include the tenant name.

### URI

Note: Workday recommends that you don't use the Validate Worktags API in the Common v1 REST service. We no longer support them, and plan to retire them. Use the Worktag v1 REST service instead. See [Concept: Validate Worktags REST API](#) on page 2217 for more information.

Validate allowed and required worktag types and worktag combinations for a transaction.

```
/validateWorktags
```

#### URI Parameter

The resource supports no URI parameters.

### Description

Validate the allowed and required worktag types and worktag combinations so that you can correct errors before you submit transactions by web service. Validate Worktags supports the POST Validate Worktags method.

## POST Validate Worktags

Secured by:

- *Manage: Related Worktags* domain with View and Modify access.
- *Worktag REST API* domain with View and Modify access.

Use this method to validate a set of worktags for a transaction based on:

- Transaction type worktag settings on the Maintain Worktag Usage report.
- Web service default worktag types on the Maintain Worktag Type Precedences task.
- Related worktags set up on the Maintain Related Worktag Usage report.
- Company restrictions.

This method doesn't persist data into Workday. It's a read-only POST.

You supply a JSON format body with your request. In the request body, supply values for these parameters:

Body Parameter	Type	Description
taggableConfiguration	ID	<p>Required. The worktag configuration used on the Maintain Worktag Usage report. Usually it's a worktag type ID. Example: <i>Expense_report</i>.</p> <p>Some worktag types support more granular configuration. Example: You can use the <i>budget_structure_id</i> of a plan structure as the budget worktag type.</p>
restrictions	ID	Restrictions entered on the request. Example: Use the transaction company as a restriction to validate that the cost center is valid for use with the company.
worktags	ID	<p>Set of worktags for the transaction used to determine validation issues. The response validates all worktags on the transaction for:</p> <ul style="list-style-type: none"> <li>• Missing required worktag types.</li> <li>• Invalid worktag combinations.</li> </ul> <p>The parameter doesn't support aggregation worktag values. Example: Job family or cost center hierarchy.</p>
allowBuiltInWorktags	Boolean	Worktag types that can't be configured as allowed worktag types on the Maintain Worktag Usage report for the taggableConfiguration. Set to <code>True</code> to include built-in worktag types in the request. Example: Spend category worktag for a supplier invoice.
validationTypes	ID	Set of validation types you want returned in the response. Leave the request parameter empty to return all validation types. Use the Worktags REST Validation Types report to view the reference IDs of the supported validation types.

### Response

The response body indicates worktag validation issues for the transaction upon submission. Here's a list of the JSON name/value pairs returned in the response body for validateWorktags.

Validation Type - Key Name	Description
invalidRestrictionsForWorktags <ul style="list-style-type: none"> <li>• invalidRestrictedToValues</li> <li>• worktagWithRestrictedToValues</li> </ul>	The worktag value combination is invalid because of restrictions. Example: The <i>Cost Center</i> in <code>worktagWithRestrictedToValues</code> isn't restricted to the <i>Company</i> in <code>invalidRestrictedToValues</code> .
invalidWorktagCombinations <ul style="list-style-type: none"> <li>• worktagWithAllowedValues</li> <li>• invalidWorktagValues</li> </ul>	The worktag value combination has invalid allowed worktags.  Example: The <i>Cost Center</i> in <code>worktagWithAllowedValues</code> has allowed values for <i>Region</i> , but the <i>Region</i> in <code>invalidWorktagValues</code> isn't an allowed value.
missingRequiredWorktagTypesForTaggableConfig	Required worktag types aren't sent in the request for taggableConfiguration, excluding defaults set up on the Maintain Worktag Usage report.
missingRequiredWorktagTypesForWorktags <ul style="list-style-type: none"> <li>• worktagWithRequiredWorktags</li> <li>• missingWorktagTypes</li> </ul>	Required worktag types for a worktag are missing.  Applies to requested worktags that have related worktag types set up as required.  Example: The <i>Cost Center</i> in <code>worktagWithRequiredWorktags</code> requires <i>Region</i> , and <i>Region</i> is in <code>missingWorktagTypes</code> because it isn't in the request.
missingRequiredWorktagTypesAfterDefaulting	Required worktag types aren't sent in the request for taggableConfiguration after applying defaults set up on the Maintain Worktag Type Precedences task.
nonAllowedInactiveWorktagValues	The request includes inactive worktag values, but the worktag type set up doesn't allow inactive worktag values.
nonAllowedWorktagTypesForTaggableConfig	Worktag types sent in the request aren't allowed for the taggableConfiguration.
onlyOneProjectOrPhaseOrTaskAllowed	The set of worktags can't contain more than 1 of these worktag types on the request: <ul style="list-style-type: none"> <li>• <i>~Project~</i></li> <li>• <i>~Project Phase~</i></li> <li>• <i>~Project Task~</i></li> </ul>
status	<ul style="list-style-type: none"> <li>• <i>Success</i> indicates that the set of worktags is valid for the request.</li> <li>• <i>Error</i> indicates the set of worktags for the request is invalid.</li> </ul>

Validating worktags has restrictions and requirements. You might receive an error message when you attempt to validate worktags:

HTTP Response Code	Error Message	Description/Solution
400	Taggable Configuration is required.	Supply a value for taggableConfiguration.
400	Duplicate worktag types aren't allowed.	Sending more than 1 value for the same worktag type isn't allowed.

## POST Validate Worktags Examples

On expense report, this POST request validates:

- Cost Center *10000 Office of CEO*.
- Region *Trans AA - Central Africa (inactive)*.

The configuration for expense report:

- Doesn't allow inactive *Region*.
- Has required *Business Unit*.
- Doesn't allow worktag types *Cost Center* and *Fund*.

Worktag type precedence isn't enabled.

POST /validateWorktags

Using this request body:

```
{
  "taggableConfiguration": { "id": "Taggable_Type_ID=EXPENSE_REPORT" },
  "worktags": [
    { "id": "Cost_Center_Reference_ID=10000" },
    { "id": "Organization_Reference_ID=REGION-4-132" }
  ]
}
```

The response body is the worktag validation in JSON format:

```
{
  "missingRequiredWorktagTypesAfterDefaulting": [
    {
      "descriptor": "Business Unit",
      "id": "babec3e40ccf4a27b5b771d138289bbb"
    }
  ],
  "missingRequiredWorktagTypesForTaggableConfig": [
    {
      "descriptor": "Business Unit",
      "id": "babec3e40ccf4a27b5b771d138289bbb"
    }
  ],
  "nonAllowedWorktagTypesForTaggableConfig": [
    {
      "descriptor": "Cost Center",
      "id": "dc123302446c11de98360015c5e6daf6"
    }
  ],
  "nonAllowedInactiveWorktagValues": [
    {
      "descriptor": "Trans AA - Central Africa (inactive)",
      "id": "5b8348a2df5448b0bafea0563dc42eb5"
    }
  ]
}
```

```

        }
    ],
    "status": "error"
}

```

On expense report, this POST request validates:

- Cost Center *10000 Office of CEO*.
- Fund *AMU Cost Share*.
- Project *Transform Reinventing Mobility*.
- Division *CPG*.
- Company *Global Modern Services, Inc (Indonesia)*.

The configuration for expense report allows the worktag types of the worktags sent in the request.

Cost Center *10000 Office of CEO*:

- Is restricted to company *200.1 Global Modern Services K.K. (Japan)*.
- Has Required on Transactions *Gift* and *Campaign*.
- Allows only Fund *FH01 AMU Funds* and Project: *ACME Projects*.

Division *CPG*:

- Allows only Fund *F03.1 AMU General Plant Fund*.
- Has Required on Transactions *Grant*.

Worktag type precedence isn't enabled.

POST /validateWorktags

Using this request body:

```
{
  "taggableConfiguration": { "id": "Taggable_Type_ID=EXPENSE_REPORT" },
  "restrictions": [
    { "id": "Company_Reference_ID=COMPANY-10-209" }
  ],
  "worktags": [
    { "id": "Cost_Center_Reference_ID=10000" },
    { "id": "Fund_ID=AMU Cost Share Fund" },
    { "id": "Project_ID=TRANSFORM_Reinventing_Mobility" },
    { "id": "Organization_Reference_ID=CPG" }
  ]
}
```

The response body is the worktag validation in JSON format:

```
{
  "invalidRestrictionsForWorktags": [
    {
      "invalidRestrictedToValues": [
        {
          "descriptor": "200.10 PT Global Modern Services, Inc (Indonesia)",
          "id": "cfdefbbb550e4b37ae88ef0f6518041b"
        }
      ],
      "worktagWithRestrictedToValues": {
        "descriptor": "10000 Office of CEO",
        "id": "3b122818d7934d1c8c663ddbe1937819"
      }
    }
  ],
  "missingRequiredWorktagTypesForWorktags": [

```

```
{
  "missingWorktagTypes": [
    {
      "descriptor": "Campaign",
      "id": "dc1234e2446c11de98360015c5e6daf6"
    },
    {
      "descriptor": "Gift",
      "id": "d2e0bdb657da45edadd7cd371d24a13e"
    }
  ],
  "worktagWithRequiredWorktags": {
    "descriptor": "10000 Office of CEO",
    "id": "3b122818d7934d1c8c663ddbe1937819"
  }
},
{
  "missingWorktagTypes": [
    {
      "descriptor": "Grant",
      "id": "ea50fe2ba95b453086f8c9616473a1e5"
    }
  ],
  "worktagWithRequiredWorktags": {
    "descriptor": "CPG",
    "id": "1fcf0b79747a43d1a4de334e0c214b1b"
  }
}
],
"status": "error",
"invalidWorktagCombinations": [
  {
    "worktagWithAllowedValues": {
      "descriptor": "10000 Office of CEO",
      "id": "3b122818d7934d1c8c663ddbe1937819"
    },
    "invalidWorktagValues": [
      {
        "descriptor": "AMU Cost Share Fund",
        "id": "32b25c2287a6101bebcla79b7c8a034d"
      },
      {
        "descriptor": "Mobilizing the Enterprise",
        "id": "4fba36e75dce4cf9bf0c386f15dc18b2"
      }
    ]
  },
  {
    "worktagWithAllowedValues": {
      "descriptor": "CPG",
      "id": "1fcf0b79747a43d1a4de334e0c214b1b"
    },
    "invalidWorktagValues": [
      {
        "descriptor": "AMU Cost Share Fund",
        "id": "32b25c2287a6101bebcla79b7c8a034d"
      }
    ]
  }
]
}
```

On expense report, this POST request validates:

- Project *Mobilizing*.
- Project Plan Phase 2 *Define Structure the Enterprise*.

```
POST /validateWorktags
```

Using this request body:

```
{
  "taggableConfiguration": {"id": "Taggable_Type_ID=EXPENSE_REPORT"} ,
  "worktags": [
    {"id": "Project_ID=TRANSFORM_Reinventing_Mobility"} ,
    {"id": "Project_Plan_ID=PROJECT_PLAN_PHASE-4-8"}
  ]
}
```

The response body is the worktag validation in JSON format:

```
{
  "onlyOneProjectOrPhaseOrTaskAllowed": "Only one of ~Project~, ~Project Phase~ or ~Project Task~ worktag value can be specified." ,
  "status": "error"
}
```

Indicate a specific returned validation type.

On expense report, this POST request validates:

- Cost Center *10000 Office of CEO*.
- Region *Trans AA - Central Africa (inactive)*.

The expense report configuration doesn't allow:

- Inactive Region.
- Cost Center and Fund worktag types.

```
POST /validateWorktags
```

Using this request body:

```
{
  "validationTypes": [
    {"id": "Worktags_REST_Validation_Type_ID=INACTIVE_WORKTAG_TYPES"} ,
  ],
  "taggableConfiguration": {"id": "Taggable_Type_ID=EXPENSE_REPORT"} ,
  "worktags": [
    {"id": "Cost_Center_Reference_ID=10000"} ,
    {"id": "Organization_Reference_ID=REGION-4-132"}
  ]
}
```

Even though the worktags in the request have other validation errors (Example: *Cost Center* isn't allowed on expense reports), the response only contains the requested worktag validation of nonAllowedInactiveWorktagValues.

```
{
  "nonAllowedInactiveWorktagValues": [
    {
      "descriptor": "Trans AA - Central Africa (inactive)" ,
      "id": "5b8348a2df5448b0bafea0563dc42eb5"
    }
  ],
}
```

```

        "status": "error"
    }
}
```

On supplier invoice, this POST request validates:

#### *Plant Research Grant 1*

The configuration for supplier invoice requires:

- *Grant*.
- *Cost Center*.

The *Plant Research Grant 1* has default Cost Center *10000 Office of the CEO*.

Worktag type precedence is enabled, and *Grant* is one of the worktag types.

POST /validateWorktags

Using this request body:

```
{
    "validationTypes": [
        {
            "id": "Worktags_REST_Validation_Type_ID=REQUIRED_WORKTAG_TYPES_AFTER_DEFAULTING",
            "taggableConfiguration": {
                "id": "Taggable_Type_ID=SUPPLIER_INVOICE"
            },
            "worktags": [
                {
                    "id": "Grant_ID=AGRT-0021"
                }
            ]
        }
    ]
}
```

The response body is the worktag validation in JSON format:

```
{
    "status": "success"
}
```

*Cost Center* isn't sent in the request, but it defaults from the grant. Per the supplier invoice configuration, the worktags are valid.

[Configure Worktag Defaulting](#)

[Configure Related Worktags](#)

## Reference: wBuckets

### URI

A collection of wBuckets:

```
/wBuckets
```

An individual wBucket:

```
/wBuckets/{id}
```

URI Parameter	Description
id	A reference to a wBucket. Example, the WID of the wBucket.

## Description

The wBuckets resource represents a collection of wBuckets created by the Workday REST API. Use version 2 of the REST API to associate the wBucket with a table, and use version 1 of the REST API to associate the wBucket with a dataset. You can only view the wBuckets permitted by the security profile of the current user.

(Version 2) The current user must have either *Table Editor* or *Table Owner* permission on the table associated with a wBucket.

(Version 1) The current user must have either *Dataset Editor* or *Dataset Owner* permission on the dataset associated with a wBucket.

wBuckets supports these methods:

- [GET wBuckets](#) on page 2168
- [POST wBuckets](#) on page 2171
- [PUT wBuckets](#) on page 2180 (Version 2 only)

## GET wBuckets

(Version 2) Secured by any of these security requirements:

- *Prism: Tables Manage* domain in the Prism Analytics functional area.
  - *Prism: Tables Owner Manage* domain in the Prism Analytics functional area.
  - *Table Editor* permission on the table.
  - *Table Owner* permission on the table.
  - *Can Insert Table Data* permission on the table.
  - *Can Update Table Data* permission on the table.
- 
- *Prism Datasets: Manage* domain in the Prism Analytics functional area.
  - *Dataset Editor* permission on the dataset.
  - *Dataset Owner* permission on the dataset.

(Version 1) Secured by any of these security requirements:

There's no request body required or available for this method. When retrieving a collection, use these optional query parameters to page the results:

Query Parameter	Description	Default	Max
limit	The limit of object data entries included in a single response.	20	100
offset	The offset to the first object in a collection to include in the response.	0	
name	The name of the wBucket to retrieve a single wBucket. You can only use the query parameter with version 2.		

The response body is in JSON format.

The response body is a JSON collection of wBuckets including their ID values and the IDs of their associated tables or datasets.

### GET wBuckets Examples (version 1)

Using version 1, this GET request retrieves all wBuckets available to the current user, Beth Liu:

```
GET /wBuckets
```

The response is a collection of wBuckets, in JSON format (we display only 1 wBucket in the response):

```
{
  "total": 7,
  "data": [
    {

}

```

## GET wBuckets Examples (version 2)

Using version 2, this GET request retrieves all wBuckets available to the current user, Beth Liu:

```
GET /wBuckets
```

The response is a collection of wBuckets, in JSON format (we display only 1 wBucket in the response):

```
{
    "total": 142,
    "data": [
        {
            "id": "6dfd766416b3014e02c70fa2e8311112",
            "name": "Written_Premiums_2019_04_03_15_56_48_242_0700",
            "operation": {
                "descriptor": "TruncateAndInsert",
                "id": "7454ac79855d10000d7a155e1b4c0063"
            },
            "createdBy": {
                "id": "8503e6ffc9e71087bfef081063b30280",
                "fullName": "Workday Implementer"
            },
            "updatedMoment": "2019-04-03T22:56:57.755Z",
            "createdMoment": "2019-04-03T22:56:55.888Z",
            "targetDataset": {
                "descriptor": "Written_Premiums",
                "id": "6dfd766416b301e8a2ebcf5ae831cd10"
            },
            "state": {
                "descriptor": "Success",
                "id": "5afbc3cacb9810001c3bb3815a4600c1"
            },
            "stats": {
                "wBucketSize": "2533",
                "processedFiles": 1
            },
            "updatedBy": {
                "id": "8503e6ffc9e71087bfef081063b30280",

  }
}
```

## POST wBuckets

(Version 2) Secured by:

- *Prism: Tables Manage* domain in the Prism Analytics functional area.
- *Prism: Tables Owner Manage* domain in the Prism Analytics functional area.
- *Table Editor* permission on the table.
- *Table Owner* permission on the table.
- *Can Delete Table Data* permission on the table.
- *Can Truncate Table Data* permission on the table.
- *Can Insert Table Data* permission on the table.
- *Can Update Table Data* permission on the table.

(Version 1) Secured by:

- *Prism Datasets: Manage* domain in the Prism Analytics functional area.
- *Dataset Owner* permission on the dataset.

- *Dataset Editor* permission on the dataset.

Use this method to create a new wBucket for a particular table or dataset. Use version 2 of the REST API to associate the wBucket with a table, and use version 1 of the REST API to associate the wBucket with a dataset. You must supply a JSON format body with your request.

When you create a wBucket for a particular table or dataset, you must describe the structure of the data files you'll upload to the wBucket. The file structure:

- Specifies a particular table (version 2) or dataset (version 1) to associate with the wBucket.
- Describes the file schema in the form of parsing options and field information.

The schema you specify must match the schema of the files you upload to the wBucket.

In the request body, supply a value for these required parameters:

Body Parameter	Type	Description
name	String	The name of the wBucket. wBucket names must conform to name validation rules.
displayName	String	(Version 2 only) The display name for the wBucket. You can change this name at any time.
operation	Object	<p>The operation to perform on the dataset or table with the files in the wBucket.</p> <p>Workday supports these operations for version 2:</p> <ul style="list-style-type: none"> <li>• Insert</li> <li>• TruncateAndInsert</li> <li>• Update</li> <li>• Upsert</li> <li>• Delete</li> </ul> <p>Workday supports these operations for version 1:</p> <ul style="list-style-type: none"> <li>• Append</li> <li>• Replace</li> </ul> <p>Use this format:</p> <pre>"operation": {   "id": "Operation_Type=mode" }</pre>
schema	Object	<p>The schema of the associated files. The schema described here must match the schema of the files you upload to the wBucket.</p> <p>Use this format:</p> <pre>"schema": {   "fields": [ {field1}, {fieldn} ] ,   "parseOptions": [     {parse_option_parameters},     "schemaVersion": { "id": "Schema_Version=1.0" }   ] }</pre> <p>See:</p>

Body Parameter	Type	Description
		<ul style="list-style-type: none"> <li>• <a href="#">Reference: Table and Dataset Field Attributes on page 2094</a></li> <li>• <a href="#">Reference: File Parse Options on page 2090</a></li> </ul>
targetDataset	Object	<p>The table (version 2) or dataset (version 1) to associate with this wBucket. When using version 1, the dataset must be created using this REST API.</p> <p>Use this format:</p> <pre>"targetDataset": {   "id": "Workday_ID_string" }</pre>

The response body is in JSON format.

### POST wBuckets Examples (version 1)

Using version 1, this POST request creates a new wBucket named Policies\_bucket\_2 for the External\_Policies dataset (ID = 942fb35ce25301483a2af59303000e00).

```
POST /wBuckets
```

Using this request body. The schema describes these fields:

- Employee\_Name
- ID
- Total\_Sold
- Date

```
{
  "name": "Policies_bucket_2",
  "operation": {
    "id": "Operation_Type=Replace"
  },
  "schema": {
    "fields": [
      {
        "ordinal": 1,
        "name": "Employee_Name",
        "description": "Name of employee",
        "type": {
          "id": "Schema_Field_Type=Text"
        }
      },
      {
        "ordinal": 2,
        "name": "ID",
        "description": "Unique identifier for the policy",
        "precision": 8,
        "scale": 0,
        "type": {
          "id": "Schema_Field_Type=Numeric"
        }
      },
      {
        "ordinal": 3,
        "name": "Total_Sold",
        "description": "Total value of policies sold",
        "type": {
          "id": "Schema_Field_Type=Text"
        }
      }
    ]
  }
}
```

```

        "precision": 38,
        "scale": 2,
        "type": {
          "id": "Schema_Field_Type=Numeric"
        },
      },
      {
        "ordinal": 4,
        "name": "Date",
        "description": "Date policy completed",
        "parseFormat": "yyyy-MM-dd HH:mm:ss",
        "type": {
          "id": "Schema_Field_Type=Date"
        },
      },
      {
        "ordinal": 5,
        "name": "Description",
        "description": "This describes each record",
        "type": {
          "id": "Schema_Field_Type=Text"
        }
      }
    ],
    "parseOptions": {
      "charset": {
        "id": "Encoding=UTF-8"
      },
      "fieldsDelimitedBy": ",",
      "fieldsEnclosedBy": "\"",
      "headerLinesToIgnore": 1,
      "type": {
        "id": "Schema_File_Type=Delimited"
      }
    },
    "schemaVersion": {
      "id": "Schema_Version=1.0"
    }
  },
  "targetDataset": {
    "id": "942fb35ce25301483a2af59303000e00"
  }
}

## POST wBuckets Examples (version 2)

Using version 2, this POST request creates a new wBucket named insert\_lemonade\_stand\_02 for the lemonade\_stand\_sales table (ID = c90ca356894d01882ffcb6d40900d300).

```
POST /wBuckets
```

Using this request body. The schema describes these fields:

- Sales Key
- Stand Location
- Hot Day?
- Date
- Total Sales
- Cost Center

```
{
    "name": "insert_lemonade_stand_02",
    "displayName": "Insert Lemonade Stand",
    "operation": {
        "id": "Operation_Type=Insert"
    },
    "targetDataset": {
        "id": "c90ca356894d01882ffcb6d40900d300"
    },
    "schema": {
        "fields": [
            {
                "ordinal": 1,
                "name": "Sales_Key",
                "precision": 18,
                "scale": 0,
                "type": {
                    "id": "Schema_Field_Type=Numeric"
                }
            },
            {
                "ordinal": 2,
                "name": "Stand_Location",
                "description": "The location of the lemonade stand.",
                "type": {
                    "id": "Schema_Field_Type=Text"
                }
            }
        ]
    }
}
```

```

        },
        },
        {
          "ordinal": 3,
          "name": "Hot_Day",
          "description": "This is True when the outside temp was over 85F.",
          "type": {
            "id": "Schema_Field_Type=Boolean"
          }
        },
        {
          "ordinal": 4,
          "name": "Date",
          "description": "The date the lemonade was sold.",
          "parseFormat": "MM/dd/yyyy",
          "type": {
            "id": "Schema_Field_Type=Date"
          }
        },
        {

## PUT wBuckets

(Version 2) Secured by:

- *Prism: Tables Manage* domain in the Prism Analytics functional area.
- *Prism: Tables Owner Manage* domain in the Prism Analytics functional area.
- *Table Editor* permission on the table.
- *Table Owner* permission on the table.
- *Can Delete Table Data* permission on the table.
- *Can Truncate Table Data* permission on the table.
- *Can Insert Table Data* permission on the table.
- *Can Update Table Data* permission on the table.

You can only use the PUT method with version 2. Use this method to edit an existing wBucket with the specified name. You must supply a JSON format body with your request. The wBucket state must be New.

In the request body, supply values for these parameters:

Body Parameter	Type	Description
name	String	The name of the wBucket. wBucket names must conform to name validation rules.
displayName	String	The display name for the wBucket. You can change this name at any time.
operation	Object	<p>The operation to perform on the table with the files in the wBucket.</p> <p>Workday supports these operations for version 2:</p> <ul style="list-style-type: none"> <li>• Insert</li> <li>• TruncateAndInsert</li> <li>• Update</li> <li>• Upsert</li> <li>• Delete</li> </ul> <p>Use this format:</p> <pre>"operation": {     "id": "Operation_Type=mode" }</pre>
schema	Object	<p>The schema of the associated files. The schema described here must match the schema of the files you upload to the wBucket.</p> <p>Use this format:</p> <pre>"schema": {     "fields": [ {field1}, {fieldn} ],     "parseOptions": {         "parse_option_parameters",         "schemaVersion": { "id": "Schema_Version=1.0" }     } }</pre> <p>See:</p>

Body Parameter	Type	Description
		<ul style="list-style-type: none"> <li>• <a href="#">Reference: Table and Dataset Field Attributes on page 2094</a></li> <li>• <a href="#">Reference: File Parse Options on page 2090</a></li> </ul>
targetDataset	Object	<p>The table to associate with this wBucket.</p> <p>Use this format:</p> <pre>"targetDataset": {   "id": "Workday_ID_string" }</pre>

The response body is in JSON format.

#### Related Information

##### **Reference**

[Reference: Datasets on page 2129](#)

[Reference: wBuckets/Files on page 2182](#)

[Reference: Naming Guidelines](#)

## Reference: wBuckets/Complete

### URI

To commit the wBucket data to the associated table (version 2) or dataset (version 1):

```
/wBuckets/{id}/complete
```

URI Parameter	Description
id	A reference to a wBucket. Example: The WID of the wBucket.

### Description

The wBuckets/Complete resource represents your intention to commit the data contained in the wBucket into the associated table or dataset. Use version 2 of the REST API to associate the wBucket with a table, and use version 1 of the REST API to associate the wBucket with a dataset. You can only commit data to a table or dataset permitted by the security profile of the current user.

wBuckets/Complete supports this method:

- [POST wBuckets/Complete on page 2181](#)

## POST wBuckets/Complete

(Version 2) Secured by:

- *Prism: Tables Manage* domain in the Prism Analytics functional area.
- *Table Owner* permission on the table.
- *Table Owner* permission on the table.
- *Table Editor* permission on the table.

(Version 1) Secured by:

- *Prism Datasets: Manage* domain in the Prism Analytics functional area.
- *Dataset Owner* permission on the dataset.

- *Dataset Editor* permission on the dataset.

Use this method after you upload all files to a wBucket in order to commit the data in those files into the table or dataset. The wBucket state must be New.

You must include an empty JSON string { } in the request body for this method.

The response body is in JSON format.

### **POST wBuckets/Complete Examples (version 1)**

Using version 1, this POST request commits the data in the wBucket with an ID = 942fb35ce253019d713a3acc03001c00:

```
POST /wBuckets/942fb35ce253019d713a3acc03001c00/complete
```

The response contains the wBucket including its current state (Processing in this example) in JSON format:

```
{
  "id": "942fb35ce253019d713a3acc03001c00",
  "state": {
    "descriptor": "Processing",
    "id": "5afbc3cacb9810001c3673d03ea200bf"
  }
}
```

### **POST wBuckets/Complete Examples (version 2)**

Using version 2, this POST request commits the data in the wBucket with an ID = c90ca356894d011c0a6cda050a00ef00:

```
POST /wBuckets/c90ca356894d011c0a6cda050a00ef00/complete
```

The response contains the wBucket including its current state (Processing in this example) in JSON format:

```
{
  "id": "c90ca356894d0164ef54d35b0a000901",
  "state": {
    "descriptor": "Processing",
    "id": "5afbc3cacb9810001c3673d03ea200bf"
  }
}
```

## **Reference: wBuckets/Files**

### **URI**

An individual file to upload to a wBucket:

```
wBuckets/{ID}/files
```

URI Parameter	Description
id	A reference to a wBucket. Example: The WID of the wBucket.

## Description

The wBuckets/Files resource represents a single file you can upload to the wBucket. Use version 2 of the REST API to associate the wBucket with a table, and use version 1 of the REST API to associate the wBucket with a dataset. You can only upload files to a wBucket permitted by the security profile of the current user.

wBuckets/Files supports this method:

- [POST wBuckets/Files on page 2183](#)

## POST wBuckets/Files

(Version 2) Secured by:

- *Prism: Tables Manage* domain in the Prism Analytics functional area.
- *Table Owner* permission on the table.
- *Table Editor* permission on the table.

(Version 1) Secured by:

- *Prism Datasets: Manage* domain in the Prism Analytics functional area.
- *Dataset Editor* or *Dataset Owner* permission on the dataset associated with the wBucket.

Use this method to upload a single file to a wBucket for a particular table or dataset. The wBucket state must be New. You must supply a file in the body with your request. The file must be delimited and gzip compressed.

See [Reference: Source File Format Requirements on page 2098](#).

The schema of the file you upload must match schema you specified in the wBucket.

There's no request body required or available for this method.

The response body is in JSON format.

### POST wBuckets/Files Examples (version 1)

Using version 1, this POST request uploads a file to the Policies\_bucket\_2 wBucket (ID = 942fb35ce253019d713a3acc03001c00):

```
POST wBuckets/942fb35ce253019d713a3acc03001c00/files
```

The request body uses a file called policies\_data\_July.csv.gz.

The response body is in JSON format:

```
{
  "fileLength": 11309,
  "fileName": "policies_data_July.csv.gz",
  "md5Checksum": ""
}
```

### POST wBuckets/Files Examples (version 2)

Using version 2, this POST request uploads a file to the insert\_lemonade\_stand\_02 wBucket (ID = c90ca356894d011c0a6cda050a00ef00):

```
POST wBuckets/c90ca356894d011c0a6cda050a00ef00/files
```

The request body uses a file called lemonade\_sales\_upsert.csv.gz.

The response body is in JSON format:

```
{
  "fileLength": 219,
  "fileName": "lemonade_sales_upsert.csv.gz",
  "md5Checksum": "7BE73812E4F7637B8ED0339572F6BD89"
}
```

Related Information

## Reference

[Reference: Datasets](#) on page 2129

[Reference: wBuckets](#) on page 2167

## Reference: Workers

### URL Base Path

Tenant Base Path

```
https://{{hostname}}/api/common/v1/{{tenant}}
```

Example:

```
https://yourTenantHostName.com/api/common/v1/gms
```

Workday Extend API Gateway Base Path

For Workday Extend apps, use the regional API Gateway base URL for your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Developer Site. Note that the API Gateway base URL doesn't include the tenant name.

### URI

Collection of workers:

/workers

Individual worker:

/workers/{id}

URI Parameter	Description
id	Reference to the worker. Example: Worker WID. In place of an ID, you can use the word me for the current user.

### Description

Workers resource represents workers. You can only view the workers and worker information permitted by the security profile of the current user.

Workers supports this method:

- [GET Workers](#) on page 2185

## GET Workers

Secured by:

*Worker Data: Public Worker Reports* in the Staffing functional area.

No request body required or available for this method. When retrieving a collection, use these optional query parameters:

Query Parameter	Description
limit	Limit of object data entries included in a single response. The default is 20, and the maximum is 100.
offset	Offset to the first object in a collection to include in the response. The default is zero.
search	Search for workers by name only. Use at least 3 consecutive characters in the search text. The search is case-insensitive, and the search text only matches names that start with the search text.
view	View for the response body.

The response body is in JSON format.

## Views

Views for the GET Workers resource:

- workerSummary - default view for GET /workers.
- workerProfile - default view for GET /workers/{id}.
- timeOffSummary - displays total time-off balances for a worker. Displays the total hourly balance for hourly plans, and/or the total daily balance for daily plans.

The table lists the JSON name/value pairs returned in the response body for the workerSummary and workerProfile views. Unless specified, the values are strings. The body doesn't include empty value pairs, pair orders can change, and Workday might introduce new pairs in patches between releases. Your application must respond to these changes.

Name	workerSummary	workerProfile	Notes
descriptor	X	X	Display name of the object.  Depending on the General Name Display Type on Edit Tenant Setup - System, the descriptor returns either the legal name, preferred name, or a concatenation of the legal and preferred names of the worker.
id	X	X	Workday object ID.
href	X	X	URL that represents the object.
businessTitle	X	X	
dateOfBirth		X	
isManager	X	X	Boolean.
location		X	Location object.
primarySupervisorOrganization	X	X	Supervisory organization object.
primaryWorkAddressText		X	

Name	workerSummary	workerProfile	Notes
primaryWorkEmail	X		
primaryWorkPhone	X		
supervisoryOrganizationsManaged	X		Supervisory organizations managed by the worker.
yearsOfService		X	

## Search

The search query parameter searches the worker names for matches. The search is case-insensitive and only matches names that start with that text. Example: These searches return Logan McNeil:

```
/workers?search=log
/workers?search=mcneil
/workers?search=Mcne
```

But this search doesn't:

```
/workers?search=ogan
```

A hyphen represents a space for name searches. This search returns Juan-Carlos Salazar Jimenez:

```
/workers?search=carlos
```

You can also include multiple search texts. The results are ORed together. This search result includes Betty Liu and Logan McNeil:

```
/workers?search=logan liu
```

## GET Workers Examples

This GET request retrieves all the workers available to the current user:

```
GET /workers
```

The response is a collection of workers, in JSON format (only 2 workers in the response):

```
{
  "total": 303,
  "data": [
    {
      "descriptor": "Abby Brennan [C]",
      "id": "6dcb8106e8b74b5aabb1fc3ab8ef2b92",
      "href": "https://[Workday REST API Endpoint]/

        "id": "dd2061e4fd644a95b4fe2df815462b6b",
        "href": "https://[Workday REST API Endpoint]/
supervisoryOrganizations/dd2061e4fd644a95b4fe2df815462b6b"
      },
      "businessTitle": "Senior Customer Services Representative",
      "primaryWorkEmail": "abrennan@gmail.com",
      "isManager": false,
      "primaryWorkPhone": "+1 (773) 721-9821"
    },
    {
      "descriptor": "Adam Carlton",
      "id": "1da8b422311b4929bfa4520f7f0b4e83",
      "primaryWorkEmail": "acarlton@workday.com",
      "primaryWorkPhone": "+1 (773) 721-9821"
    }
  ]
}
```

```

    "href": "https://Workday REST API Endpoint}/
workers/1da8b422311b4929bfa4520f7f0b4e83",
    "primarySupervisoryOrganization": {
        "descriptor": "Payroll Department",
        "id": "31fd8a267e4b4375aa8ff594033193cf",
        "href": "https://Workday REST API Endpoint}/
supervisoryOrganizations/31fd8a267e4b4375aa8ff594033193cf"
    },
    "businessTitle": "Staff Payroll Specialist",
    "primaryWorkEmail": "acarlton@workday.net",
    "isManager": false,
},
...
]
}

```

This request retrieves 5 workers, starting with the 100th worker, available to the current user:

```
GET /workers?limit=5&offset=99
```

The response is a collection of workers, in JSON format (only 1 worker in the response):

```

{
    "total": 303,
    "data": [
        {
            "descriptor": "Emma Hobson",
            "id": "19f7dabb79994d29931cd139df6272ed",
            "href": "https://Workday REST API Endpoint}/
workers/19f7dabb79994d29931cd139df6272ed",
            "primarySupervisoryOrganization": {
                "descriptor": "Global Support - UK & Ireland Group",
                "id": "7159687c81c24f91b0769772c4a6ac90",
                "href": "https://Workday REST API Endpoint}/
supervisoryOrganizations/7159687c81c24f91b0769772c4a6ac90"
            },
            "businessTitle": "Customer Service Representative",
            "primaryWorkEmail": "ehobson@workday.net",
            "isManager": false,
        },
        ...
    ]
}

```

This request retrieves the workers whose names (first, last, or middle) start with carl, available to the current user:

```
GET /workers?search=carl
```

The response is a collection of 4 workers, in JSON format:

```
{
    "total": 4,
    "data": [
        {

```

```

    "descriptor": "Adam Carlton",

```

```

    ]
}
```

This request retrieves information about Logan McNeil (`id=66faa65677834f0a9b586dd5645e9004`).

```
GET /workers/66faa65677834f0a9b586dd5645e9004
```

The worker in the response body contains additional information, compared with the previous body that contains a collection of workers:

```
{
  "descriptor": "Logan McNeil",
  "id": "66faa65677834f0a9b586dd5645e9004",
  "href": "https://{{Workday REST API Endpoint}}/
workers/66faa65677834f0a9b586dd5645e9004",
  "dateOfBirth": "1972-05-25",
  "businessTitle": "Chief Human Resources Officer",
  "supervisoryOrganizationsManaged": "https://{{Workday REST API Endpoint}}/
workers/66faa65677834f0a9b586dd5645e9004/supervisoryOrganizationsManaged",
  "isManager": true,
  "location": {
    "descriptor": "San Francisco",

  },
  "primaryWorkAddressText": "3939 The Embarcadero, San Francisco, CA 94111",
  "yearsOfService": "13"
}
```

This request retrieves information about Adam Carlton (`id=1da8b422311b4929bfa4520f7f0b4e83`), but instead of the default view, it uses the `workerSummary` view:

```
GET /workers/1da8b422311b4929bfa4520f7f0b4e83?view=workerSummary
```

The worker in this response body contains the same information returned by default for collections of workers:

```
{
  "descriptor": "Adam Carlton",
  "id": "1da8b422311b4929bfa4520f7f0b4e83",
  "href": "https://{{Workday REST API Endpoint}}/
workers/1da8b422311b4929bfa4520f7f0b4e83",
  "primarySupervisoryOrganization": {
    "descriptor": "Payroll Department",
    "id": "31fd8a267e4b4375aa8ff594033193cf",
    "href": "https://{{Workday REST API Endpoint}}/
supervisoryOrganizations/31fd8a267e4b4375aa8ff594033193cf"
  },
  "businessTitle": "Staff Payroll Specialist",
  "primaryWorkEmail": "acarlton@workday.net",
  "isManager": false
}
```

This request retrieves information about Logan McNeil's time-off balance (`id=66faa65677834f0a9b586dd5645e9004`), using the `timeOffSummary` view:

```
GET /workers/66faa65677834f0a9b586dd5645e9004?view=timeOffSummary
```

The result displays Logan McNeil and their time-off balance:

```
{
  "descriptor": "Logan McNeil",
  "id": "66faa65677834f0a9b586dd5645e9004",
  "href": "https://[Workday REST API Endpoint]/workers/66faa65677834f0a9b586dd5645e9004",
  "totalHourlyBalance": "184"
}
```

This request retrieves all the workers available to the current user and their time-off balances, using the timeOffSummary view:

```
GET /workers/?view=timeOffSummary
```

The result is a collection of workers with their time-off balances (only 2 workers in the response):

```
{
  "total": 130,
  "data": [
    {
      "descriptor": "Abby Brennan [C]",
      "id": "6dcb8106e8b74b5aabb1fc3ab8ef2b92",
      "href": "https://[Workday REST API Endpoint]/workers/6dcb8106e8b74b5aabb1fc3ab8ef2b92",
      "totalHourlyBalance": "144"
    },
    {
      "descriptor": "Adam Carlton",
      "id": "1da8b422311b4929bfa4520f7f0b4e831",
      "href": "https://[Workday REST API Endpoint]/workers/1da8b422311b4929bfa4520f7f0b4e831",
      "totalHourlyBalance": "184"
    },
    ...
  ]
}
```

## Reference: Workers/Business Title Changes

### URL Base Path

Tenant Base Path

```
https://[hostname]/api/common/v1/{tenant}
```

Example:

```
https://yourTenantHostName.com/api/common/v1/gms
```

Workday Extend API Gateway Base Path

For Workday Extend apps, use the regional API Gateway base URL for your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Developer Site. Note that the API Gateway base URL doesn't include the tenant name.

### URI

Collection of Business Title Changes for a Worker:

/workers/{id}/businessTitleChanges

URI Parameter	Description
id	Reference to a worker. Example: Worker WID. In place of an ID, you can use the word me to represent the current user.

## Description

Workers/Business Title Changes resource represents business title changes for a specific worker. You can only view the worker and business title changes information permitted by the security profile of the current user.

Workers/Business Title Changes resource supports these methods:

- [GET Workers/Business Title Changes](#) on page 2191
- [POST Workers/Business Title Changes](#) on page 2191

## GET Workers/Business Title Changes

Secured by Security Domain:

Staffing Actions: Business Title

No request body required or available for this method. When retrieving a collection, use these optional query parameters to page the results:

Query Parameter	Description	Default	Maximum
limit	Limit of object data entries included in a single response.	20	100
offset	Offset to the first object in a collection to include in the response.	0	

The response body is in JSON format.

## GET Workers/Business Title Changes Examples

This GET request retrieves all the business title changes for Betty Liu (id=3bcc416214054db6911612ef25d51e9f), available to the current user:

```
GET /workers/3bcc416214054db6911612ef25d51e9f/businessTitleChanges
```

The response is a collection of business title changes, in JSON format (there is only 1 business title change in the collection)

```
{
  "total": 1,
  "data": [
    {
      "descriptor": "Title Change: Betty Liu",
      "id": "a445947495a84539987368b6841e71ae",
      "href": "https://{{Workday REST API Endpoint}}/businessProcesses/a445947495a84539987368b6841e71ae",
      "proposedBusinessTitle": "Sr. Director, Global Payroll Operations",
      "currentBusinessTitle": "Director, Payroll Operations"
    }
  ]
}
```

## POST Workers/Business Title Changes

Secured by Business Process Security Policy:

Change Business Title

## Change My Business Title (used instead of Change Business Title only if you use me as the ID)

Use this method to create a new business title change for the specified worker. You must supply a JSON format body with your request.

In the request body, supply a value for this parameter:

Body Parameter	Type	Description
proposedBusinessTitle	string	New proposed business title.

The response body has the current and the proposed business title.

The business title change business process has restrictions and requirements. You might receive an error message when you attempt to complete a business title change:

HTTP Response Code	Error Message	Description/Solution
400	Proposed Business Title is required.	Supply a value for proposedBusinessTitle.
400	Worker is terminated and does not have a future hire.	
400	Worker submitted is the processing user.	You cannot propose your own business title changes.
400	Worker has additional jobs. This task is not supported for workers with multiple jobs.	
400	There are other staffing or business title business processes that affect this business title that are effective after this date.	
400	The last filled date for the position is after the current date.	
400	The position vacated by this worker.	

### POST Workers/Business Title Changes Examples

This POST request proposes a new business title for Betty Liu (id=3bcc416214054db6911612ef25d51e9f).

POST /workers/3bcc416214054db6911612ef25d51e9f/businessTitleChanges

using this request body:

```
{
  "proposedBusinessTitle": "Sr. Director, Payroll Operations"
}
```

The response body in JSON format:

```
{
  "descriptor": "Title Change: Betty Liu",
  "id": "b1f2b39dac1a4f5ba591f04bd53e3e3a",
  "href": "https://[Workday REST API Endpoint]/businessTitleChanges/b1f2b39dac1a4f5ba591f04bd53e3e3a"
}
```

## Reference: Workers/Direct Reports

### URL Base Path

Tenant Base Path

```
https://{{hostname}}/api/common/v1/{{tenant}}
```

Example:

```
https://yourTenantHostName.com/api/common/v1/gms
```

Workday Extend API Gateway Base Path

For Workday Extend apps, use the regional API Gateway base URL for your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Developer Site. Note that the API Gateway base URL doesn't include the tenant name.

### URI

Collection of workers that directly report to the specified worker:

```
/workers/{{id}}/directReports
```

URI Parameter	Description
id	Reference to the worker. Example: Current user WID. In place of an ID, you can use the word me to represent the current user.

### Description

Workers/Direct Reports resource represents workers that directly report to the specified worker. You can only view the information permitted by the security profile of the current user.

Workers/Direct Reports supports this method:

- [GET Workers/Direct Reports](#) on page 2193

### GET Workers/Direct Reports

Secured by:

Reports: Manager

Reports: Matrix Manager

Self-Service: My Team

No request body required or available for this method. Use these optional query parameters:

Query Parameter	Description
limit	Limit of object data entries included in a single response. The default is 20, and the maximum is 100.
offset	Offset to the first object in a collection to include in the response. The default is zero.
view	View for the response body.

The response body is in JSON format.

Use this method to retrieve information about the workers that directly report to the current user.

## Views

Views for the GET Workers/Direct Reports subresource:

- workerSummary - default view for GET Workers/Direct Reports
- workerProfile - alternate view for GET Workers/Direct Report
- timeOffSummary - view to display total time-off balances for a worker; displays the total hourly balance for hourly plans, and/or the total daily balance for daily plans

The table lists the JSON name/value pairs returned in the response body for the workerSummary and workerProfile views. Unless specified, the values are strings. Empty value pairs are not included in the body, the pair orders can change, and new pairs might be introduced in patches between releases. Your application must respond to the changes.

Name	workerSummary	workerProfile	Notes
descriptor	X	X	Description of the object
id	X	X	Workday object ID
href	X	X	URL that represents the object
businessTitle	X	X	
dateOfBirth		X	
isManager	X	X	Boolean
location		X	Location object
primarySupervisoryOrganization	X	X	Supervisory organization object
primaryWorkAddressText	X		
primaryWorkEmail	X		
primaryWorkPhone	X		
supervisoryOrganizationsManaged	X		Supervisory organizations managed by the worker
yearsOfService		X	

## GET Workers/Direct Reports Examples

This GET request retrieves all the workers that directly report to the specified worker (me represents the current user):

```
GET /workers/me/directReports
```

The response is a collection of workers, in JSON format (only 1 worker in the response):

```
{
  "total": 6,
  "data": [
    {
      "descriptor": "Betty Liu",
      "id": "3bcc416214054db6911612ef25d51e9f",
      "href": "https://[Workday REST API Endpoint]/workers/3bcc416214054db6911612ef25d51e9f",
      "primarySupervisoryOrganization": {
        "descriptor": "Human Resources",
        "id": "e02485f863ec48d39a082bb95cc4abe4",
        "href": "https://[Workday REST API Endpoint]/supervisoryOrganizations/e02485f863ec48d39a082bb95cc4abe4"
      }
    }
  ]
}
```

```

        },
        "businessTitle": "Director, Payroll Operations",
        "primaryWorkEmail": "bliu@workday.net",
        "isManager": true,
    },
    ...
]

}

```

This GET request retrieves all the workers that directly report to the specified worker (the current user) and displays the time-off summaries of the workers:

```
GET /workers/me/directReports?view=timeOffSummary
```

The response is a collection of workers, in JSON format (only 3 workers in the response):

```
{
    "total": 14,
    "data": [
        {
            "descriptor": "Amos Tutuola",
            "id": "0319bd914a344d4d9c8af30151a02b46",
            "href": "https://{{Workday REST API Endpoint}}/workers/0319bd914a344d4d9c8af30151a02b46",
            "totalHourlyBalance": "144"
        },
        {
            "descriptor": "Betty Liu",
            "id": "3bcc416214054db6911612ef25d51e9f",
            "href": "https://{{Workday REST API Endpoint}}/workers/3bcc416214054db6911612ef25d51e9f",
            "totalHourlyBalance": "184"
        },
        {
            "descriptor": "Billy Clark",
            "id": "59f88aaaec84462faf7b1fcc9837580e",
            "href": "https://{{Workday REST API Endpoint}}/workers/59f88aaaec84462faf7b1fcc9837580e",
            "totalHourlyBalance": "144"
        },
        ...
    ]
}
```

## Reference: Workers/History

```

Workday Extend API Gateway Base Path

For Workday Extend apps, use the regional API Gateway base URL for your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Developer Site. Note that the API Gateway base URL doesn't include the tenant name.

## Resource URI

Collection of the History items for a specified worker:

`/workers/{id}/history`

URI Parameter	Description
<code>id</code>	Reference to the worker. Example: Worker task WID. In place of an ID, you can use the word <code>me</code> to represent the current user.

## Description

The Workers/History resource references a collection of history items for a specific worker. You can only view the items permitted by the security profile of the current user.

Workers/History supports this method:

- [GET Workers/History](#) on page 2196

## GET Workers/History

Secured by:

Worker Data: Historical Staffing Information

No request body required or available for this method. Use these optional query parameters to page the results:

Query Parameter	Description	Default	Maximum
<code>limit</code>	Limit of object data entries included in a single response	20	100
<code>offset</code>	Offset to the first object in a collection to include in the response	0	

The response body is in JSON format.

## GET Workers/History Examples

This GET request retrieves the worker history items for the specified user, Betty Liu (`id=3bcc416214054db6911612ef25d51e9f`):

```
GET /workers/3bcc416214054db6911612ef25d51e9f/history
```

The response is a collection of history items for the specified worker, in JSON format (1 history item in the response is shown):

```
{
  "total": 16,
  "data": [
    {
      "descriptor": "Hire: Betty Liu",
      "id": "d32900f8d0f649f9aac3cf82c0e26852",

```

Example:

```
https://yourTenantHostName.com/api/common/v1/gms
```

Workday Extend API Gateway Base Path

For Workday Extend apps, use the regional API Gateway base URL for your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Developer Site. Note that the API Gateway base URL doesn't include the tenant name.

### URI

Collection of tasks in My Tasks for the current user:

```
/workers/{{id}}/inboxTasks
```

URI Parameter	Description
id	Reference to the current user. Example: Worker WID. In place of the ID, you can use the word me to represent the current user.

### Description

The Workers/Inbox Tasks resource represents tasks in My Tasks for the current user. You cannot access tasks in My Tasks for another user. The current user is the user who was granted the authorization token.

For tasks in My Tasks that are of stepType Approval, the current user can approve or deny the tasks using the Inbox Tasks resource.

The Workers/Inbox Tasks resource supports this method:

- [GET Worker/Inbox Tasks](#) on page 2198

## GET Worker/Inbox Tasks

Secured by:

Core Navigation

No request body required or available for this method. When retrieving a collection, use these optional query parameters to page the results:

Query Parameter	Description	Default	Maximum
limit	Limit of object data entries included in a single response.	20	100
offset	Offset to the first object in a collection to include in the response.	0	

The response body is in JSON format.

## GET Workers/Inbox Tasks Examples

This GET request retrieves a collection of the tasks in My Tasks of the current user:

```
GET /workers/me/inboxTasks
```

The response is a collection of tasks in My Tasks, in JSON format (there is 1 task in the response):

```
{
  "total": 1,
  "data": [
    {
      "descriptor": "Approval by Manager",

## Reference: Workers/Job Changes

### URL Base Path

Tenant Base Path

```
https://{{hostname}}/api/common/v1/{{tenant}}
```

Example:

```
https://yourTenantHostName.com/api/common/v1/gms
```

Workday Extend API Gateway Base Path

For Workday Extend apps, use the regional API Gateway base URL for your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Developer Site. Note that the API Gateway base URL doesn't include the tenant name.

### URI

Collection of Job Changes for a Worker:

```
/workers/{{id}}/jobChanges
```

URI Parameter	Description
id	A reference to a worker. Example: Worker WID.

### Description

Workers/Job Changes resource represents job changes for a specific worker. You can only view the worker and job changes information permitted by the security profile of the current user.

Workers/Job Changes resource supports this method:

- [POST Workers/Job Changes](#) on page 2199

### POST Workers/Job Changes

Secured by:

Change Job

Use this method to initiate a job change for the specified worker.

You supply a JSON format body with your request. In the request body, supply values for these parameters:

Body Parameter	Type	Description
jobChangeReason	id	Reason for the job change. Use the Job Change Reasons resource to get the IDs for job change reasons.
supervisoryOrganization	id	Target organization for the job change. The worker is in this organization after the job change is complete. Use the Supervisory Organizations resource to get the IDs for supervisory organizations.
effective	date	(Optional) Effective date of the job change. If left blank, is set to current date.

Body Parameter	Type	Description
moveManagersTeam	boolean	(Optional) If the manager team is transferred to the new organization.
proposedOrganizations	organizations	(Optional) Set of proposed organizations, which are the organizations to which the worker is assigned.

To find valid values for jobChangeReason, and supervisoryOrganization, use the Job Change and the Supervisory Organizations resources.

The proposed organizations are the organizations to which the worker is assigned. To change the proposed organizations, you supply:

- All proposed organizations that you want to set for the worker in the request body, including the unchanged organizations. Even if you only want to change one proposed organization, you supply all organizations that are to be set for the worker. If you do not include a proposed organization, then that organization will not be set for the worker.
- Worker proposed organizations, which are the organizations to which the worker is assigned. The organization WIDs exist in Workday.
- Worker supervisory organization. A supervisory organization groups workers into a management hierarchy. The organization WID exists in Workday.

Note: To change the proposed organizations, you enable the *Change Organization Assignments* step in the *Change Job* business process. When a request contains proposed organizations, an *Assign Organizations* event is created after Workday validates the request. The *Assign Organizations* event is processed in addition to the *Change Job* event.

The *Change Job* business process has restrictions. You might receive an error message when you attempt to complete a job change:

HTTP Response Code	Error Message	Description/Solution
400	Worker has additional jobs. This task is not supported for workers with multiple jobs.	
400	Reason is required.	Supply a value for jobChangeReason.
400	Proposed Supervisory Organization is required.	Supply a value for supervisoryOrganization.
400	You cannot initiate this action because there are other pending actions for the worker that conflict with this one. Close any pending Staffing, Matrix Organization, Pay Group or Organization events before initiating this action.	
400	Reason is not valid for the Job Change Event or the processing user is a Manager and the Reason is not valid for managers.	
400	Reason is not valid for the worker type (Employee or Contingent Worker).	
400	The proposed supervisory organization is in a Hiring Freeze. It cannot be selected.	
400	Supervisory Organization must be active.	

HTTP Response Code	Error Message	Description/Solution
400	The hiring restrictions for the proposed supervisory organization do not allow this type of worker.	
400	The Proposed Supervisory Organization must be different from the Position's current organization when the reason has a category of Transfer.	
400	Organization is not accessible by the user.	
400	Proposed supervisory organization is not valid. It will be made inactive after the event effective date. This will result in this position not having a supervisory organization.	
400	Worker is terminated and does not have a future hire.	
400	Worker submitted is the processing user.	
400	This position is in a pending Merit Event. The effective date must be after the pending Merit Event's effective date.	
400	The current position has a pending organization change or a completed Supervisory Organization change effective after this date. Therefore, this position cannot have changes as of the effective date.	
400	The effective date must be after the date of the last completed Change Organization assignment.	
400	The effective date must be equal to or greater than the date the position was last updated.	
400	The effective date must be after the date of the last completed Assign Pay Group change.	
400	The effective date must be after the date of the last completed Matrix Organization change.	
400	Hiring restrictions are missing for the organization selected.	
400	The date entered cannot be earlier than the earliest hire date.	
400	Proposed Organizations have Organization Types that cannot be part of Change Organization Assignments.	Supply valid organizations in the proposed organizations list. Organizations with these Organization Types are required: Company, Cost Center, Region.

### POST Workers/Job Changes Examples

This POST request transfers Dana Marek (id=fac08217aec474fad96d5f3771e76bc) to a new supervisory organization.

```
POST /workers/fac08217aec474fad96d5f3771e76bc/jobChanges
```

using this request body:

```
{
  "jobChangeReason" : {"id":"b7187dceedb34c8db3a8e15adf02a620"},  

  "supervisoryOrganization" : {"id":"fd935c1ac1a047f8a11c74add2991e04"}
}
```

The response body is the job change process in JSON format:

```
{
  "descriptor": "Transfer: Dana Marek",
  "id": "3e6318cff9fd495bae0b44d40525509b",
  "href": "https://{{Workday REST API Endpoint}}/  
businessProcesses/3e6318cff9fd495bae0b44d40525509b"
}
```

This POST request for John Smith (`id=e6dc3990e66242d2b9308d165d7c0e21`) sets their proposed organizations, which are the organizations to which John is assigned:

`POST /workers/e6dc3990e66242d2b9308d165d7c0e21/jobChanges`

Request body:

```
{
  "jobChangeReason": {"id": "3e420aeee42f04791a07cf18cf6f154f"},  

  "supervisoryOrganization": {"id": "8a30f8b5b65e4a48b01d4e17ec8f8778"},  

  "proposedOrganizations":  

  [  

    {"id": "6f806d33769347b69088d4bb3b538d77"},  

    {"id": "211359ad55e641adbb806f5392414c15"},  

    {"id": "d93bd712c6a44ac297c4ed37ac6b83c1"}  

  ]  

}
```

The response body is the job change process in JSON format:

```
{
  "descriptor": "Data Change: John Smith",
  "id": "ff3c57e0cb6710001d55e45fc76bf1d6",
  "href": "https://{{Workday REST API Endpoint}}/businessProcesses/  
ff3c57e0cb6710001d55e45fc76bf1d6",
  "jobChangeReason": {
    "descriptor": "Data Change > Data Change > Change Details of Job",

```

Example:

```
https://yourTenantHostName.com/api/common/v1/gms
```

Workday Extend API Gateway Base Path

For Workday Extend apps, use the regional API Gateway base URL for your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Developer Site. Note that the API Gateway base URL doesn't include the tenant name.

### URI

Collection of Organization assignments for a worker primary position:

`/workers/{id}/Organizations`

URI Parameter	Description
<code>id</code>	Worker reference. Example: Current user WID. In place of an ID, you can use the word me to represent the current user.

### Description

Workers/Organizations resource represents the Organization assignments for a worker primary position. You can only view the Organization assignments permitted by the security profile of the current user.

Workers/Organizations supports this method:

- [GET Workers/Organizations on page 2203](#)

### GET Workers/Organizations

Secured by:

Reports: Organization

No request body required or available for this method. When retrieving a collection, use these optional query parameters to page the results:

Query Parameter	Description	Default	Max
limit	Limit of object data entries included in a single response.	20	100
offset	Offset to the first object in a collection to include in the response.	0	

The response body is in JSON format.

### GET Workers/Organizations Example

This GET request retrieves the Organization assignments for the worker whose WID is f07f269bf85445bf807ee12d0acc80c9:

```
GET /workers/f07f269bf85445bf807ee12d0acc80c9/organizations
```

The response is a collection of Organizations, in JSON format (only 1 Organization is shown):

```
{
  "total": 8,
  "data": [
    {
      "descriptor": "United States",
      "id": "3ebf81b54c0a43da9cfeld0a3432bbb7",
      "organizationType": {
        "descriptor": "Region Hierarchy",
        "id": "04067490dbfd458caf7d0d4d5e2f11df"
      }
    },
    ...
  ]
}
```

## Reference: Workers/Pay Slips

```

Example:

```
https://yourTenantHostName.com/api/common/v1/gms
```

Workday Extend API Gateway Base Path

For Workday Extend apps, use the regional API Gateway base URL for your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Developer Site. Note that the API Gateway base URL doesn't include the tenant name.

### Resource URI

Collection of pay slips for a specified worker:

```
/workers/{{id}}/paySlips
```

URI Parameter	Description
id	Worker reference. In place of an ID, you can use the word me to represent the current user.

## Description

Workers/Pay Slips is a collection of pay slips for a specified worker. You can only view the items permitted by the security profile of the current user.

Workers/Pay Slips supports this method:

- [GET Workers/Pay Slips](#) on page 2205

## GET Workers/Pay Slips

Secured by either:

*Self-Service: Payroll (My Payslips) domain in the Core Payroll functional area or,*

*Reports: Pay Calculation Results for Worker (Results) and Worker Data: Payroll (Payslips) domains in the Core Payroll functional area.*

The GET method returns pay slips for the specified worker.

No request body required or available for this method. Use these optional query parameters to page the results:

Query Parameter	Description	Default	Max
limit	Limit of object data entries included in a single response	20	100
offset	Offset to the first object in a collection to include in the response	0	

The response body is in JSON format.

## GET Workers/Pay Slips Examples

The following GET request retrieves the pay slips for the worker Logan McNeil (id=66faa65677834f0a9b586dd5645e9004):

```
GET /workers/66faa65677834f0a9b586dd5645e9004/paySlips
```

The response is a collection of pay slips for the worker, in JSON format (only 1 pay slip is shown):

```
{
  "total": 3,
  "data": [
    {
      "descriptor": "Logan McNeil: 01/31/2008 (Salary) - Complete",
      "id": "8550ea5378314d43b1cacbad633cb027",
      "gross": "20858.34",
      "status": {
        "descriptor": "Complete",
        "id": "b4a78dee73634adaa417b7976a17e921"
      },
      "net": "11403.99",
      "date": "2008-02-02"
    },
    ...
  ]
}
```

```

Example:

```
https://yourTenantHostName.com/api/common/v1/gms
```

Workday Extend API Gateway Base Path

For Workday Extend apps, use the regional API Gateway base URL for your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Developer Site. Note that the API Gateway base URL doesn't include the tenant name.

### URI

Collection of Supervisory Organizations managed by a worker:

```
/workers/{{id}}/supervisoryOrganizationsManaged
```

URI Parameter	Description
id	Worker reference. Example: WID of the current user. In place of an ID, you can use the word me to represent the current user.

### Description

Workers/Supervisory Organizations Managed resource represents the Supervisory Organizations managed by the specified worker. You can only view the Supervisory Organizations permitted by the security profile of the current user.

Workers/Supervisory Organizations Managed supports this method:

- [GET Workers/Supervisory Organizations Managed on page 2206](#)

### GET Workers/Supervisory Organizations Managed

Secured by:

Reports: Organization security domain

No request body required or available for this method. When retrieving a collection, use these optional query parameters to page the results:

Query Parameter	Description	Default	Maximum
limit	Limit of object data entries included in a single response.	20	100
offset	Offset to the first object in a collection to include in the response.	0	

The response body is in JSON format.

## GET Workers/Supervisory Organizations Managed Examples

This GET request retrieves the Supervisory Organizations managed by the specified worker:

```
GET /workers/f07f269bf85445bf807ee12d0acc80c9/supervisoryOrganizationsManaged
```

The response is a collection of Supervisory Organizations, in JSON format (in this response there is only 1 Supervisory Organization):

```
{
  "total": 1,
  "data": [
    {
      "descriptor": "IT Services",
      "id": "e22d6f43777e4ef29f4f4c5a3afdae77",
      "href": "https://{{Workday REST API Endpoint}}/supervisoryOrganizations/e22d6f43777e4ef29f4f4c5a3afdae77",
      "workers": "https://{{Workday REST API Endpoint}}/supervisoryOrganizations/e22d6f43777e4ef29f4f4c5a3afdae77/workers",
      "manager": {
        "descriptor": "Anthony Rizzo",
        "id": "f07f269bf85445bf807ee12d0acc80c9",
        "href": "https://{{Workday REST API Endpoint}}/workers/f07f269bf85445bf807ee12d0acc80c9"
      },
      "name": "IT Services"
    }
  ]
}
```

## Reference: Workers/Time off Entries

### URL Base Path

#### Tenant Base Path

```
https://{{hostname}}/api/common/v1/{{tenant}}
```

#### Example:

```
https://yourTenantHostName.com/api/common/v1/gms
```

#### Workday Extend API Gateway Base Path

For Workday Extend apps, use the regional API Gateway base URL for your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Developer Site. Note that the API Gateway base URL doesn't include the tenant name.

### Resource URI

Collection of time off entries for a specified worker:

```
/workers/{{id}}/timeOffEntries
```

URI Parameter	Description
<i>id</i>	Worker reference. In place of an ID, you can use the word me to represent the current user.

### Description

*Workers/Time Off Entries* is a collection of time off entries for a specified worker. You can only view the items permitted by the security profile of the current user.

To view the time off balances by plan for a worker, use the *Workers/Time Off Plans* resource.

To examine a summary of the time off balances for direct reports of a worker, use the *timeOffSummary* view of the Workers/Direct Reports subresource.

To see a summary of the time off balance for a worker, use the *timeOffSummary* view of the Workers resource.

*Workers/Time Off Entries* supports this method:

- [GET Workers/Time off Entries](#) on page 2208

## GET Workers/Time off Entries

Secured by:

*Self-Service: Time Off*

*Worker Data: Time Off (Time Off)*

*Worker Data: Time Off (Time Off Balances Manager View)*

The GET method returns time off entries for the specified worker. Workday doesn't return time off entries in the past.

No request body required or available for this method. Use these optional query parameters to page the results:

Query Parameter	Description	Default	Maximum
<i>limit</i>	Limit of object data entries included in a single response	20	100
<i>offset</i>	Offset to the first object in a collection to include in the response	0	

The response body is in JSON format.

## GET Workers/Time off Entries Examples

This GET request retrieves the time off entries for the worker Logan McNeil (*id=66faa65677834f0a9b586dd5645e9004*):

```
GET /workers/66faa65677834f0a9b586dd5645e9004/timeOffEntries
```

The response is a collection of time off entries for the worker, in JSON format (this example displays only one-time off entry):

```
{
  "total": 3,
  "data": [
    {
      "descriptor": "09/26/2013 - 8 Hours (Logan McNeil)",
      "id": "f9f3208f2fd5103833bb37d5e438025f",
      "timeOff": {
        "descriptor": "PTO - Vacation",
        "id": "15fbcb5a5df7429bba082f6fdc42fb85",

### URL Base Path

Tenant Base Path

```
https://{{hostname}}/api/common/v1/{{tenant}}
```

Example:

```
https://yourTenantHostName.com/api/common/v1/gms
```

Workday Extend API Gateway Base Path

For Workday Extend apps, use the regional API Gateway base URL for your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Developer Site. Note that the API Gateway base URL doesn't include the tenant name.

### Resource URI

Collection of time-off balances by plan for a specified worker:

```
/workers/{{id}}/timeOffPlans
```

URI Parameter	Description
id	Worker reference. In place of an ID, you can use the word me to represent the current user.

### Description

Workers/Time Off Plans is a collection of time-off balances by plan for a specified worker. You can only view the items permitted by the security profile of the current user.

To view the time-off entries for a worker, use the Workers/Time Off Entries resource.

To examine a summary of the time-off balance for a worker, use the timeOffSummary view of the Workers resource.

To see a summary of the time-off balances for direct reports of a worker, use the timeOffSummary view of the Workers/Direct Reports subresource.

Workers/Time Off Plans supports this method:

- [GET Workers/Time Off Plans](#) on page 2210

## GET Workers/Time Off Plans

Secured by:

Self-Service: Time Off Balances

Worker Data: Time Off (Time Off Balances)

Worker Data: Time Off (Time Off Balances Manager View)

The GET method returns time off balances by plan for the specified worker.

No request body required or available for this method. Use these optional query parameters to page the results:

Query Parameter	Description	Default	Maximum
limit	Limit of object data entries included in a single response	20	100
offset	Offset to the first object in a collection to include in the response	0	

The response body is in JSON format.

## GET Workers/Time Off Plans Examples

This GET request retrieves the time-off balances by plan for the worker Logan McNeil (id=66faa65677834f0a9b586dd5645e9004):

```
GET /workers/66faa65677834f0a9b586dd5645e9004/timeOffPlans
```

The response is a collection of time-off balances by plan for the worker, in JSON format (only 1 time-off plan and its balance is shown):

```
{
  "total": 3,
  "data": [
    {
      "descriptor": "Floating Holiday PLAN",
      "id": "eab51dc897884a9bbb96168242f968ca",
      "timeOffBalance": "24",
      "unitOfTime": {
        "descriptor": "Hours",
        "id": "c4dacbd56bca4a9a8950e8d3ed21bbdb"
      }
    },
    ...
  ]
}
```

## REST API Guides

### Concept: Change Jobs REST APIs

The Change Job REST APIs provide the ability to invoke the Change Job functionality from your integration or custom app.

For reference documentation about the Change Jobs REST APIs, see these resources in the *Staffing* service on the [Workday REST Services Directory](#):

- [jobChanges](#)
- [workers](#)
- [Prompt Values](#)

#### URL Base Path

The Change Job REST API endpoints use this base path:

```
https://<tenantHostname>/api/staffing/<version>/<tenantName>
```

Example:

```
https://company.tenant.com/api/staffing/v1/gms
```

#### Usage

- [Security Considerations on page 2211](#)
- [Initiating a Change Job Event on page 2211](#)
- [Editing the Change Job Data on page 2212](#)
- [Editing the Change Job Data on page 2212](#)
- [Submitting a Change Job Event on page 2215](#)
- [Saving a Change Job Event for Later on page 2215](#)
- [Retrieving Change Job Prompt Values on page 2216](#)
- [Checking Validations on page 2217](#)
- [Limitations on page 2217](#)

#### Security Considerations

You can control the roles that initiate a *Change Job* business process through the Change Job REST APIs. To enable the roles, configure the Change Job (REST Service) initiating action on the *Change Job* business process security policy.

Workday secures all Change Job REST API endpoints to specific security domains. See the endpoint descriptions in the *Staffing* REST web service documentation to determine the applicable security domains.

#### Initiating a Change Job Event

To initiate a Change Job event for a worker, call the `POST /workers/{ID}/jobChanges` endpoint. This endpoint is equivalent to clicking Start on the Change Job task.

To construct the request, you need:

- The Workday ID of the worker.

You can call the `GET /values/jobChangesGroup/workers` prompt values endpoint to get the worker ID for the Change Job event. The `workers` prompt endpoint:

- Returns values by category for the authenticated user.
- Returns worker IDs who are available for a change job on the current date or a given effective date.
- Doesn't return workers who have in-progress Change Job events.
- A request body containing at least the effective date and the reason for the Change Job event. If the worker has multiple job positions, also specify the job.

To get valid Workday IDs for the request fields, you can call their related prompt values endpoints.

Sample request:

Initialize a Change Job event for a worker. The reason `id` is for Change Job Details, and the effective date is `2020-07-30`.

```
POST /workers/7594bcb88bd410e98b8e171963e103f1/jobChanges
```

Request body:

```
{
  "date" : "2020-07-30",
  "reason" : {"id": "32e3a48dc5f24cd2acb4c5c0e852c08a"}
}
```

Sample response:

```
{
  "id": "86528185055201e76db707493200cb51",
  "descriptor": "Data Change: Dillon Ryan",
  "reason": {
    "descriptor": "Data Change > Data Change > Change Job Details",
    "id": "32e3a48dc5f24cd2acb4c5c0e852c08a"
  },
  "supervisoryOrganization": {
    "descriptor": "Global Modern Services",
    "id": "1cb55e73c1531035e9e83f6c8e9d01d3"
  },
  "job": {
    "descriptor": "P-06566 Accountant - Dillon Ryan",
    "id": "7594bcb88bd410e98b8e17b4eace03f6"
  },
  "location": {
    "descriptor": "San Francisco",
    "id": "d13a7c46a06443c4a33c09afbd72c73"
  },
  "date": "2020-07-30"
}
```

Save the `id` from the response. You'll use this Change Job `id` in the subsequent Change Job REST API calls.

## Editing the Change Job Data

After you initiate a Change Job event, call any of the `PATCH /jobChanges/{id}/{subResource}/{{subResourceID}}` endpoints to edit the data for the Change Job event. The subresource of a `PATCH` endpoint corresponds to a section in the Change Job request. Example subresources: `startDetails`,

jobProfile, location, businessTitle, and others. You can call multiple PATCH endpoints on the initiated Change Job event.

To construct the request, you need:

- The Change Job event ID.

For the `ID` and `subresourceID` path parameters, specify the returned `id` from the `POST /workers/{ID}/jobChanges` endpoint.

- A request body containing the data to update.

The Change Job REST APIs provide corresponding PATCH and GET endpoints. You can call a `GET /jobChanges/{id}/{subResource}/{subResourceID}` endpoint to retrieve existing data about the Change Job section. You can use its response data to populate the request body for the PATCH endpoint. Update and remove fields in the request body as needed. Note that the PATCH endpoints perform partial updates. They only update the fields included in the request body.

To get valid Workday IDs for the request fields, you can call their related prompt endpoints.

Sample request:

Retrieve existing information about the Start Details section of the Change Job event:

```
GET /jobChanges/86528185055201e76db707493200cb51/
startDetails/86528185055201e76db707493200cb51
```

Sample response:

```
{
  "id": "86528185055201e76db707493200cb51",
  "descriptor": "Data Change: Dillon Ryan",
  "date": "2020-07-30",
  "reason": {
    "descriptor": "Data Change > Data Change > Change Job Details",
    "id": "32e3a48dc5f24cd2acb4c5c0e852c08a"
  },
  "supervisoryOrganization": {
    "descriptor": "Global Modern Services",
    "id": "1cb55e73c1531035e9e83f6c8e9d01d3"
  },
  "job": {
    "descriptor": "P-06566 Accountant - Dillon Ryan",
    "id": "7594bcb88bd410e98b8e17b4eace03f6"
  },
  "location": {
    "descriptor": "San Francisco",
    "id": "d13a7c46a06443c4a33c09afbd72c73"
  }
}
```

Sample request:

Change the reason in the Start Details section to Change Location.

```
PATCH /jobChanges/86528185055201e76db707493200cb51/
startDetails/86528185055201e76db707493200cb51
```

Request body:

```
{
  "reason": {
    "descriptor": "Data Change > Data Change > Change Location",
    "id": "9a7f47f0d2d14825a2016c76af30b939"
```

```

    }
}
```

Sample response:

```
{
  "id": "86528185055201e76db707493200cb51",
  "descriptor": "Data Change: Dillon Ryan",
  "date": "2020-07-30",
  "reason": {
    "descriptor": "Data Change > Data Change > Change Location",
    "id": "9a7f47f0d2d14825a2016c76af30b939"
  },
  "supervisoryOrganization": {
    "descriptor": "Global Modern Services",
    "id": "1cb55e73c1531035e9e83f6c8e9d01d3"
  },
  "job": {
    "descriptor": "P-06566 Accountant - Dillon Ryan",
    "id": "7594bcb88bd410e98b8e17b4eace03f6"
  },
  "location": {
    "descriptor": "San Francisco",
    "id": "d13a7c46a06443c4a33c09afbd72c73"
  }
}
```

Sample request:

Change the location to New York.

```
PATCH /jobChanges/86528185055201e76db707493200cb51/
location/86528185055201e76db707493200cb51
```

Request body:

```
{
  "location": {
    "descriptor": "New York",
    "id": "2a49aa1ae0dc4dccb9d3c46cd71ee635"
  }
}
```

Sample response:

```
{
  "scheduledHours": "40",
  "location": {
    "descriptor": "New York",
    "id": "2a49aa1ae0dc4dccb9d3c46cd71ee635"
  }
}
```

Note that the `descriptor` fields in the sample request bodies are only for demonstration purposes. The PATCH methods ignore the descriptor fields when you specify the object id. The edits don't persist until you submit the Change Job event.

## Submitting a Change Job Event

After editing the Change Job data using the PATCH endpoints, submit the Change Job event. To submit the Change Job event with the edited data, call the `POST /jobChanges/{ID}/submit` endpoint, where `ID` is the Change Job event ID. Specify an empty request body.

The `POST /jobChanges/{ID}/submit` endpoint is equivalent to clicking Submit on the Change Job task. This endpoint initiates the *Change Job* business process and sets the status to In Progress. After you submit the Change Job event, you can no longer submit any of the Change Job REST APIs with the same event ID. Users with the correct permissions can continue the *Change Job* business process in the Workday UI.

Sample request:

Submit the Change Job event for the location update for Dillon Ryan:

```
POST /jobChanges/86528185055201e76db707493200cb51/submit
```

Request body:

```
{ }
```

Sample response:

```
{
  "id": "86528185055201e76db707493200cb51",
  "descriptor": "Data Change: Dillon Ryan",
  "status": {
    "descriptor": "In Progress",
    "id": "e2d08afc53614c37b32b31270bb8bee3"
  },
  "businessProcessParameters": {
    "for": {
      "descriptor": "Global Modern Services",
      "id": "1cb55e73c1531035e9e83f6c8e9d01d3"
    },
    "overallBusinessProcess": {
      "descriptor": "Data Change: Dillon Ryan",
      "id": "86528185055201e76db707493200cb51"
    },
    "overallStatus": "In Progress"
  }
}
```

## Saving a Change Job Event for Later

After editing the Change Job data using the PATCH endpoints, you have the option to save the *Change Job* event for a later submission. To save the Change Job event for later, call the `POST /jobChanges/{ID}/submit` endpoint, where `ID` is the Change Job event ID. Specify this exact request body, which contains the Save for Later action id:

```
{
  "businessProcessParameters": {
    "action": {
      "id": "d9e41a8c446c11de98360015c5e6daf6"
    }
  }
}
```

The `POST /jobChanges/{ID}/submit` endpoint is equivalent to clicking Save for Later on the Change Job task. This endpoint initiates the *Change Job* business process and sets the status to In Progress. After

you submit the Change Job event, you can no longer submit any of the Change Job REST APIs with the same event ID. Users with the correct permissions can revise the Change Job event and submit it in the Workday UI.

Sample request:

Save the Change Job event for later.

```
POST /jobChanges/86528185055201e76db707493200cb51/submit
```

Request body:

```
{
  "businessProcessParameters": {
    "action": {
      "id": "d9e41a8c446c11de98360015c5e6daf6"
    }
  }
}
```

Sample response:

```
{
  "id": "86528185055201e76db707493200cb51",
  "descriptor": "Data Change: Dillon Ryan",
  "status": {
    "descriptor": "In Progress",
    "id": "e2d08afc53614c37b32b31270bb8bee3"
  },
  "businessProcessParameters": {
    "for": {
      "descriptor": "Global Modern Services",
      "id": "1cb55e73c1531035e9e83f6c8e9d01d3"
    },
    "overallStatus": "In Progress",
    "overallBusinessProcess": {
      "descriptor": "Data Change: Dillon Ryan",
      "id": "6e8564cba12b015ec341b5351a00f050"
    }
  }
}
```

## Retrieving Change Job Prompt Values

The Change Job prompt value endpoints return Workday ID values for objects that you need to include in your Change Job API requests. The Change Job prompt value endpoints are the `GET /value/jobChangesGroup/<object>` endpoints. The *Staffing* REST web service documentation lists them under the `Prompt Values` section. The Change Job prompt value endpoints:

- Enable you to get valid Workday IDs for required `id` fields in a Change Job REST API request.
- Accept the `staffingEvent` query parameter. If you specify the `staffingEvent` query parameter, the prompt value endpoint returns categories that are similar to the prompt categories in the Workday UI. A prompt category includes an `HREF` link that drills down subcategories that return the Workday ID values of the object. Ensure that each call to an `HREF` link includes the `Authorization` header.
- Provide query parameters that filter the results. See the `PATCH` method descriptions for details about which prompt value endpoints and query parameters apply to the request fields.

## Checking Validations

The Change Job PATCH endpoints perform the same Workday UI validations. When submitting the Change Job event, the `POST /jobChanges/{ID}/submit` endpoint performs any custom validations defined for the initiating step of the business process.

This sample response displays the errors returned with a 400 HTTP status code. Each error identifies the request field and path that caused the error.

```
{
  "error": "invalid request: errors have occurred",
  "errors": [
    {
      "error": "Invalid id for field",
      "code": "S5",
      "field": "timeType",
      "path": "timeType",
      "internalMessage": "The id '511619b6fc0c1079dd8c75378d9a04b8' was able to be resolved, but it resolves to a type that is not expected here. Make sure the instance given is of the correct type.",
      "location": "Line: 10, column: 34"
    },
    {
      "error": "Invalid id for field",
      "code": "S5",
      "field": "payRateType",
      "path": "payRateType",
      "internalMessage": "The id '511619b6fc0c1079dd8c75378d9a04b8' was able to be resolved, but it resolves to a type that is not expected here. Make sure the instance given is of the correct type.",
      "location": "Line: 17, column: 33"
    }
  ]
}
```

## Limitations

- The Change Job REST APIs don't support the configurations in Maintain Localization Settings.
- If a *Change Job* event triggers compensation changes, ensure that you add a *Propose Compensation* business process as a step in the *Change Job* business process definition.
- The Change Job REST APIs don't support a completed future-dated position change. However, users can perform this change in the Workday UI.

## Concept: Validate Worktags REST API

This topic provides an overview and usage guidance on the Validate Worktags REST API.

### Overview

The Validate Worktags service performs validations of the allowed and required worktag types and worktag combinations, enabling you to correct errors before you submit REST API transactions.

Use the Validate Worktags REST API to validate a set of worktags for a transaction based on:

- Settings for transaction type worktags on the Maintain Worktag Usage report.
- Default worktag types for the web service on the Maintain Worktag Type Precedences task.
- Setup for the related worktags on the Maintain Related Worktag Usage report.
- Company restrictions.

For reference documentation about the Validate Worktags REST API, see the *Worktag* service on the [Workday REST Services Directory](#).

## Usage

- Security Considerations
- URL Base Path
- Constructing the Request Body
- Checking Validations
- Examples:
  - Validating a Cost Center and Region for Expense Report
  - Validating a Cost Center, Fund, Project, and Division for Expense Report
  - Validating a Project and Project Plan for Expense Report
  - Validating Cost Center and Region for Invalid Worktags in Expense Report
  - Validating Grant in Supplier Invoice

## Security Considerations

The *Manage: Related Worktags* security domain secures the Validate Worktags REST API.

## URL Base Path

Tenant Base Path

```
https://{{tenantHostname}}/api/worktag/{{version}}/{{tenantName}}
```

Example:

```
https://yourTenantHostName.com/api/worktag/v1/gms
```

Workday Extend API Gateway Base Path

Workday Extend is a separately licensed Workday product that provides developer tools and more flexible model components for storing custom data. If your business needs require that you use the legacy Custom Object REST APIs with Workday Extend, note the difference in the URL base path.

For Workday Extend apps, use the API Gateway URL for the Extend region of your company. See *Reference: Workday Extend API Gateways and Authorization Base URLs* on the Workday Developer Site.

## Constructing the Request Body

The Validate Worktags REST API provides a read-only POST endpoint, which validates the given worktag configuration. In the request body, specify these fields:

taggableConfiguration	(Required) The taggable type to validate. Specify the reference ID of the taggable type that's configured for the transaction on the Maintain Worktag Usage report. Use the reference ID format <code>Taggable_Type_ID={{referenceID}}</code> . You can get the reference ID of the taggable type from the View Taggable Types task. Example:
	<pre><code>"taggableConfiguration":   { "id": "Taggable_Type_ID=EXPENSE_REPORT" }</code></pre>

Some worktag types support more granular configuration. Example: You can use the `budget_structure_id` of a plan structure as the budget worktag type.

**validationTypes**

A list of the validation types to return with validation results. Specify the reference ID of the validation type using the format `Worktags_REST_Validation_Type_ID={referenceID}`. You can get the reference ID of the supported validation types in the Worktags REST Validation Types report. Example:

```
"validationTypes": [
    {"id": "Worktags_REST_Validation_Type_ID=INACTIVE"}]
```

If you don't specify `validationTypes`, the endpoint returns all validation types.

**worktags**

A list of worktags for the transaction used to determine validation issues. Specify the reference ID of the worktags. Example:

```
"worktags": [
    {"id": "Cost_Center_Reference_ID=100000"},  

    {"id": "Organization_Reference_ID=REGION-4-132"}]
```

The endpoint validates all worktags on the transaction for:

- Missing required worktag types.
- Invalid worktag combinations.

The parameter doesn't support aggregation of worktag values. Example: Job family or cost center hierarchy.

**restrictions**

A list of worktag types configured with "Restricted to" values. Specify the reference ID of the restricted value. Example: Use the transaction company as a restriction to validate that the cost center is valid for use with the company:

```
"restrictions": [
    {"id": "Company_Reference_ID=COMPANY-10-209"}]
```

**allowBuiltInWorktags**

If `true`, the request includes built-in worktag types that can't be configured as allowed worktag types on the Maintain Worktag Usage report for the taggableConfiguration. The built-in worktags aren't configurable worktag types, but are valid for validation purposes. Example: Supplier in supplier invoice.

## Checking Validations

The response body returns worktag validation issues for the transaction. The `status` field returns:

- **success** - Indicates valid worktags in the request.
- **error** - Indicates invalid worktags in the request. The response also includes validation issues or error messages.

These validation types return a list of the `id` and `descriptor` fields of the object instances that failed the validation.

Validation Type - Key Name	Description
invalidRestrictionsForWorktags <ul style="list-style-type: none"> <li>• <code>invalidRestrictedToValues</code></li> <li>• <code>worktagWithRestrictedToValues</code></li> </ul>	The worktag value combination is invalid because of restrictions. Example: The <i>Cost Center</i> in <code>worktagWithRestrictedToValues</code> isn't restricted to the <i>Company</i> in <code>invalidRestrictedToValues</code> .
invalidWorktagCombinations <ul style="list-style-type: none"> <li>• <code>worktagWithAllowedValues</code></li> <li>• <code>invalidWorktagValues</code></li> </ul>	The worktag value combination has invalid allowed worktags.  Example: The <i>Cost Center</i> in <code>worktagWithAllowedValues</code> has allowed values for region, but the <i>Region</i> in <code>invalidWorktagValues</code> isn't an allowed value.
missingRequiredWorktagTypesForTaggableConfig	Required worktag types aren't sent in the request for taggableConfiguration, excluding defaults set up on the Maintain Worktag Usage report.
missingRequiredWorktagTypesForWorktags <ul style="list-style-type: none"> <li>• <code>worktagWithRequiredWorktags</code></li> <li>• <code>missingWorktagTypes</code></li> </ul>	Required worktag types for a worktag are missing.  Applies to requested worktags that have related worktag types set up as required.  Example: The <i>Cost Center</i> in <code>worktagWithRequiredWorktags</code> requires <i>Region</i> , and <i>Region</i> is in <code>missingWorktagTypes</code> because it isn't in the request.
missingRequiredWorktagTypesAfterDefaulting	Required worktag types aren't sent in the request for taggableConfiguration after applying defaults set up on the Maintain Worktag Type Precedences task.
nonAllowedInactiveWorktagValues	The request includes inactive worktag values, but the worktag type set up doesn't allow inactive worktag values.
nonAllowedWorktagTypesForTaggableConfig	Worktag types sent in the request aren't allowed for the taggableConfiguration.
onlyOneProjectOrPhaseOrTaskAllowed	The set of worktags can't contain more than 1 of these worktag types on the request: <ul style="list-style-type: none"> <li>• <code>~Project~</code></li> <li>• <code>~Project Phase~</code></li> <li>• <code>~Project Task~</code></li> </ul>

## Examples

### Validating a Cost Center and Region for Expense Report

This sample request validates:

- Cost Center *10000 Office of CEO*.

- Region *Trans AA - Central Africa (inactive)*.

This sample assumes:

- The configuration for expense report:
  - Doesn't allow inactive *Region*.
  - Has required *Business Unit*.
  - Doesn't allow worktag types *Cost Center* and *Fund*.
- Worktag type precedence isn't enabled.

Sample request:

```
POST /validateWorktags
```

Sample request body:

```
{
  "taggableConfiguration": { "id": "Taggable_Type_ID=EXPENSE_REPORT" },
  "worktags": [
    { "id": "Cost_Center_Reference_ID=10000" },
    { "id": "Organization_Reference_ID=REGION-4-132" }
  ]
}
```

Sample response:

```
{
  "missingRequiredWorktagTypesAfterDefaulting": [
    {
      "descriptor": "Business Unit",
      "id": "babec3e40ccf4a27b5b771d138289bbb"
    }
  ],
  "missingRequiredWorktagTypesForTaggableConfig": [
    {
      "descriptor": "Business Unit",
      "id": "babec3e40ccf4a27b5b771d138289bbb"
    }
  ],
  "nonAllowedWorktagTypesForTaggableConfig": [
    {
      "descriptor": "Cost Center",
      "id": "dc123302446c11de98360015c5e6daf6"
    }
  ],
  "nonAllowedInactiveWorktagValues": [
    {
      "descriptor": "Trans AA - Central Africa (inactive)",
      "id": "5b8348a2df5448b0bafea0563dc42eb5"
    }
  ],
  "status": "error"
}
```

## Validating a Cost Center, Fund, Project, and Division for Expense Report

This sample request validates:

- Cost Center *10000 Office of CEO*.
- Fund *AMU Cost Share*.
- Project *Transform Reinventing Mobility*.

- Division *CPG*.
- Company *Global Modern Services, Inc (Indonesia)*.

This sample assumes:

- The configuration for expense report allows the worktag types of the worktags sent in the request:

*Cost Center 10000 Office of CEO:*

- Is restricted to company *200.1 Global Modern Services K.K. (Japan)*.
- Has Required on Transactions *Gift* and *Campaign*.
- Allows only Fund *FH01 AMU Funds* and Project: *ACME Projects*.

Division *CPG*:

- Allows only Fund *F03.1 AMU General Plant Fund*.
- Has Required on Transactions *Grant*.
- Worktag type precedence isn't enabled.

Sample request:

```
POST /validateWorktags
```

Sample request body:

```
{
  "taggableConfiguration": { "id": "Taggable_Type_ID=EXPENSE_REPORT" },
  "restrictions": [
    { "id": "Company_Reference_ID=COMPANY-10-209" }
  ],
  "worktags": [
    { "id": "Cost_Center_Reference_ID=10000" },
    { "id": "Fund_ID=AMU Cost Share Fund" },
    { "id": "Project_ID=TRANSFORM_Reinventing_Mobility" },
    { "id": "Organization_Reference_ID=CPG" }
  ]
}
```

Sample response:

```
{
  "invalidRestrictionsForWorktags": [
    {
      "invalidRestrictedToValues": [
        {
          "descriptor": "200.10 PT Global Modern Services, Inc (Indonesia)",
          "id": "cfdefbbb550e4b37ae88ef0f6518041b"
        }
      ],
      "worktagWithRestrictedToValues": {
        "descriptor": "10000 Office of CEO",
        "id": "3b122818d7934d1c8c663ddbe1937819"
      }
    }
  ],
  "missingRequiredWorktagTypesForWorktags": [
    {
      "missingWorktagTypes": [
        {
          "descriptor": "Campaign",
          "id": "dc1234e2446c11de98360015c5e6daf6"
        }
      ]
    }
  ]
}
```

```

        "descriptor": "Gift",
        "id": "d2e0bdb657da45edadd7cd371d24a13e"
    },
],
"worktagWithRequiredWorktags": {
    "descriptor": "10000 Office of CEO",
    "id": "3b122818d7934d1c8c663ddbe1937819"
}
},
{
    "missingWorktagTypes": [
        {
            "descriptor": "Grant",
            "id": "ea50fe2ba95b453086f8c9616473a1e5"
        }
    ],
    "worktagWithRequiredWorktags": {
        "descriptor": "CPG",
        "id": "1fcf0b79747a43d1a4de334e0c214b1b"
    }
}
],
"status": "error",
"invalidWorktagCombinations": [
    {
        "worktagWithAllowedValues": {
            "descriptor": "10000 Office of CEO",
            "id": "3b122818d7934d1c8c663ddbe1937819"
        },
        "invalidWorktagValues": [
            {
                "descriptor": "AMU Cost Share Fund",
                "id": "32b25c2287a6101bebcla79b7c8a034d"
            },
            {
                "descriptor": "Mobilizing the Enterprise",
                "id": "4fba36e75dce4cf9bf0c386f15dc18b2"
            }
        ]
    },
    {
        "worktagWithAllowedValues": {
            "descriptor": "CPG",
            "id": "1fcf0b79747a43d1a4de334e0c214b1b"
        },
        "invalidWorktagValues": [
            {
                "descriptor": "AMU Cost Share Fund",
                "id": "32b25c2287a6101bebcla79b7c8a034d"
            }
        ]
    }
]
}
}

```

## Validating a Project and Project Plan for Expense Report

This sample request validates:

- Project *Mobilizing*.
- Project Plan Phase 2 *Define Structure the Enterprise*.

Sample request:

```
POST /validateWorktags
```

Sample request body:

```
{
  "taggableConfiguration": { "id": "Taggable_Type_ID=EXPENSE_REPORT" },
  "worktags": [
    { "id": "Project_ID=TRANSFORM_Reinventing_Mobility" },
    { "id": "Project_Plan_ID=PROJECT_PLAN_PHASE-4-8" }
  ]
}
```

Sample response:

```
{
  "onlyOneProjectOrPhaseOrTaskAllowed": "Only one of ~Project~, ~Project Phase~ or ~Project Task~ worktag value can be specified.",
  "status": "error"
}
```

## Validating Cost Center and Region for Invalid Worktags in Expense Report

This sample indicates a specific returned validation type. On an expense report, this request validates:

- Cost Center *10000 Office of CEO*.
- Region *Trans AA - Central Africa (inactive)*.

This sample assumes:

- The expense report configuration doesn't allow:
  - Inactive Region.
  - Cost Center and Fund worktag types.

Sample request:

```
POST /validateWorktags
```

Sample request body:

```
{
  "validationTypes": [
    { "id": "Worktags_REST_Validation_Type_ID=INACTIVE_WORKTAG_TYPES" }
  ],
  "taggableConfiguration": { "id": "Taggable_Type_ID=EXPENSE_REPORT" },
  "worktags": [
    { "id": "Cost_Center_Reference_ID=10000" },
    { "id": "Organization_Reference_ID=REGION-4-132" }
  ]
}
```

Even though the worktags in the request have other validation errors (Example: Cost Center isn't allowed on expense reports), the response only contains the requested worktag validation of nonAllowedInactiveWorktagValues.

```
{
  "nonAllowedInactiveWorktagValues": [
    {
      "descriptor": "Trans AA - Central Africa (inactive)" ,

```

```

        "id": "5b8348a2df5448b0bafea0563dc42eb5"
    },
    "status": "error"
}

```

## Validating Grant in Supplier Invoice

On a supplier invoice, this sample request validates:

- Grant *Plant Research Grant 1*.

This sample assumes:

- The configuration for supplier invoice requires:
  - *Grant*.
  - *Cost Center*.
- The *Plant Research Grant 1* has default Cost Center *10000 Office of the CEO*.
- Worktag type precedence is enabled, and *Grant* is one of the worktag types.

Sample request:

```
POST /validateWorktags
```

Sample request body:

```
{
  "validationTypes": [
    {
      "id": "Worktags_REST_Validation_Type_ID=REQUIRED_WORKTAG_TYPES_AFTER_DEFAULTING",
      "taggableConfiguration": {
        "id": "Taggable_Type_ID=SUPPLIER_INVOICE"
      },
      "worktags": [
        {
          "id": "Grant_ID=AGRT-0021"
        }
      ]
    }
}
```

Cost Center isn't sent in the request, but it defaults from the grant. Per the supplier invoice configuration, the worktags are valid:

```
{
  "status": "success"
}
```

## Custom Objects REST APIs

### Concept: Custom Object (Multi-Instance) REST APIs

This topic provides an overview and usage guidance on the Custom Object (Multi-Instance) REST APIs.

#### Overview

Custom objects are extensions of existing Workday business objects, and enable your enterprise to store custom data related to the business objects. Your integrations or apps can call the Custom Object REST APIs to get, create, update, and delete custom object data.

A multi-instance custom object is a collection of custom object instances attached to a Workday business object. In Workday, users can view or edit a custom object table on the Additional Data tab of the business object. Example: The Worker object can associate a custom object named Stock Grants. Because a worker can have more than 1 stock grant, the Stock Grants custom object is a multi-instance custom object.

When you or administrators create a custom object definition in Workday, certain configuration settings affect how you must specify the Custom Object REST API requests. This table summarizes how custom object settings affect the REST APIs:

Custom Object Setting	Custom Object REST API Implication
Web Service Alias	Determines the root resource name of the REST API endpoints that access the custom object data.
Allow Multiple Instances per Object	If true, the custom object is multi-instance. For GET, PUT, and DELETE endpoints, the ID path parameter is a compound ID consisting of the business object ID and custom object Reference ID.
Reference ID	Enables an easy way to identify custom objects in a GET, PUT, or DELETE request.  Note: Workday strongly recommends the use of Reference IDs with multi-instance custom objects. If you don't use Reference IDs, the custom object WIDs aren't easily available, which makes it difficult to identify a custom object instance.

Note: The Custom Object REST APIs don't support effective-dated custom objects. To update an effective-dated custom object, use the equivalent SOAP web service operation on the business object additional data.

For reference documentation about the Custom Object (Multi-Instance) REST APIs, see the *Custom Object Data (Multi-Instance)* service on the [Workday REST Services Directory](#).

## Usage

- [Security Considerations](#) on page 2226
- [URL Base Path](#) on page 2227
- [Constructing the Request URL](#) on page 2227
- [Constructing the Request Body](#) on page 2230
- [Creating a Custom Object Instance](#) on page 2231
- [Creating Custom Object Instances in Bulk](#) on page 2232
- [Retrieving a Custom Object Instance](#) on page 2233
- [Retrieving a Custom Object Collection for a Business Object](#) on page 2234
- [Updating a Custom Object Instance](#) on page 2235
- [Deleting a Custom Object Instance](#) on page 2236
- [Checking Validations](#)
- [Limitations](#) on page 2238

## Security Considerations

When creating a custom object definition, you can assign Workday-defined and custom domains to the custom object. The configured security policies on the custom object determine the required REST API permissions on the custom object data. To view the security domains for a custom object, access the View Custom Object report.

For integrations that call the Custom Object (Single-Instance) REST APIs, ensure that you have the correct scopes when you [././././authentication-and-security/authentication/oauth/dan1370797831458.dita](#).

For more information, see [Concept: Security for Custom Objects](#).

## URL Base Path

### Tenant Base Path

```
https://{{tenantHostname}}/api/customObject/{{version}}/{{tenantName}}
```

Example:

```
https://yourTenantHostName.com/api/customObject/v2/gms
```

Note: The legacy v1 version uses the base path format `https://yourTenantHostName.com/api/v1/yourTenant`. Starting with v2, the Custom Object REST service uses the base path format `https://yourTenantHostName.com/api/customObject/version/yourTenant` (where version is the current version.)

### Workday Extend API Gateway Base Path

Workday Extend is a separately licensed Workday product that provides developer tools and more flexible model components for storing custom data. If your business needs require that you use the legacy Custom Object REST APIs with Workday Extend, note the difference in the URL base path.

For Workday Extend apps, use the API Gateway URL for the Extend region of your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Workday Developer Site.

Sample Workday Extend request URL (US region) for the GET `/customObjects/{{customObjectAlias}}/{{customObjectID}}` endpoint:

```
https://api.workday.com/customObjects/v2/stockGrants/
EmployeeID=21001;grantName>New_Hire
```

Sample Workday Extend request URL (US region) for the GET `/{{businessObjectResource}}/{{businessObjectID}}/customObjects/{{customObjectAlias}}` endpoint:

```
https://api.workday.com/customObjects/v2/workers/Employee=21001/
customObjects/stockGrants
```

## Constructing the Request URL

For the GET, PUT, and DELETE endpoints that operate on a specific instance of a multi-instance custom object, the request URL follows this format:

```
{basePath}/customObjects/{{customObjectAlias}}/{{customObjectID}}
```

Where:

`{basePath}`

The tenant host, service version, and tenant name.

```
https://yourTenantHostName.com/api/
customObject/{{version}}/yourTenant
```

Note: The legacy v1 version uses the base path format `https://yourTenantHostName.com/api/v1/yourTenant`.

customObjects	The Custom Objects service name, which is <code>customObjects</code> .
{customObjectAlias}	The web service alias of the custom object. Example: <code>stockGrants</code> is the web service alias of the sample Stock Grants, which is a multi-instance custom object.  To determine the web service alias of the custom object, access the View Custom Object task.
{customObjectID}	A compound ID containing the business object ID and custom object Reference ID, separated by a semicolon (;). The business object ID can be the Workday ID or the Reference ID of the extended business object.  A compound ID uses this format:
	<pre>{businessObjectID} ; {referenceId}={referenceIdValue}</pre>

This sample compound ID uses the `EmployeeID` Reference ID of the business object and the `grantName` Reference ID of the custom object:

`EmployeeID=21001;grantName=New_Hire`

Note: The Reference ID of the multi-instance custom object is a setting in the custom object definition. If the custom object doesn't have a Reference ID, you can use the Workday ID of the custom object instance. The GET endpoint that returns the collection of custom object instances for the business object includes the Workday ID of the custom objects. See [Retrieving a Custom Object Collection for a Business Object](#) on 2234.

These sample request URLs are for a GET endpoint that retrieves a specific Stock Grant for a specific worker. The web service alias of the Stock Grants custom object is `stockGrants`. Each example is a variation of the compound ID, which uses:

- The Reference ID of the business object and custom object.

v2 example:

```
https://company.tenant.com/api/customObject/v2/gms/customObjects/
stockGrants/EmployeeID=21001;grantName=New_Hire
```

v1 example:

```
https://company.tenant.com/api/v1/gms/customObjects/stockGrants/
EmployeeID=21001;grantName=New_Hire
```

- The Workday ID of the business object and the Reference ID of the custom object.

v2 example:

```
https://company.tenant.com/api/customObject/v2/gms/customObjects/
stockGrants/3aa5550b7fe348b98d7b5741afc65534;grantName=New_Hire
```

v1 example:

```
https://company.tenant.com/api/v1/gms/customObjects/
stockGrants/3aa5550b7fe348b98d7b5741afc65534;grantName=New_Hire
```

- The Workday IDs of the business object and the custom object.

v2 example:

```
https://company.tenant.com/api/customObject/v2/gms/customObjects/
stockGrants/3aa5550b7fe348b98d7b5741afc65534;da117f20c8d7300026b797fd5f7b2541
```

v1 example:

```
https://company.tenant.com/api/v1/gms/customObjects/
stockGrants/3aa5550b7fe348b98d7b5741afc65534;da117f20c8d7300026b797fd5f7b2541
```

The Custom Object (Multi-Instance) REST APIs include an additional GET endpoint whose root resource is the business object. This additional GET endpoint retrieves a collection of custom object instances for a specific business object, and the request URL follows this format:

```
{basePath}/{businessObjectResource}/{businessObjectId}/customObjects/
{customObjectAlias}
```

Where:

{basePath}

The tenant host, service version, and tenant name.

```
https://yourTenantHostName.com/api/
customObject/version/yourTenant
```

Note: The legacy v1 version uses the base path format `https://yourTenantHostName.com/api/v1/yourTenant`.

{businessObjectResource}

The resource name of the extended Workday business object associated with the multi-instance custom object. Example: `workers`

See the resource names in [Reference: Workday Object Resource Names and Object Keys](#) on page 2251.

{businessObjectId}

The Workday ID or Reference ID of the extended business object. Example: `Employee=21001`

customObjects

The Custom Objects service name, which is `customObjects`.

{customObjectAlias}

The web service alias of the custom object. Example: `stockGrants`

To determine the web service alias of the custom object, access the View Custom Object task.

This sample request URL is for a GET collection endpoint that retrieves all Stock Grant instances for a specific worker.

v2 example:

```
https://company.tenant.com/api/customObject/v2/gms/workers/Employee=21001/
customObjects/stockGrants
```

v1 example:

```
https://company.tenant.com/api/v1/gms/workers/Employee=21001/customObjects/
stockGrants
```

## Constructing the Request Body

When you create or update custom object data with a POST or PUT endpoint, specify the required or optional custom fields in the request body. To determine the custom fields, you can use the response data model from the `GET /customObjects/{customObjectAlias}/{customObjectID}` endpoint on an existing custom object instance. You can also see the custom object definition in the View Custom Object task. Ensure that you specify the correct data type of the custom field:

Text

Specify a quoted string.

Integer

Specify an unquoted numeric value.

Boolean

Specify an unquoted `true` or `false`.

Date

Specify the `yyyy-mm-dd` date format. Example:

```
"grantDate": "2021-05-19"
```

Currency

Specify the currency as an object map containing the `currency` and `value` fields. Example:

```
"strikePrice": {
  "currency": "USD",
  "value": "170.50"
}
```

Single-instance custom list

Specify the single-instance custom list as an object map. The `id` field in the object map specifies the list value. Use the web service alias of the list value, as defined in the custom list definition. Example:

```
"typeOfShares": {
  "id": "iso"
}
```

Multi-instance custom list

Specify the multi-instance custom list as an array of object maps. The `id` field in each object map specifies the list value. Use the web service alias of the list value, as defined in the custom list definition. Example:

```
"stockAllocations": [
  {
    "id": "psu"
  },
  {
    "id": "iso"
  }
]
```

```
        "id": "rsu"
    }
]
```

Note: Ensure that the request body doesn't contain inactive custom list values. A request body that contains an inactive custom list value causes an error. To deactivate and reactivate a custom list value, access the Edit Custom List task.

When you create custom object data with a POST endpoint, the request body *must* also contain the business object attached to the custom object. Specify an object map containing the Workday ID or Reference ID of the existing business object. The object key is the name that corresponds to the Workday object. For a list of valid object keys corresponding to the supported Workday objects, see the object keys in [Reference: Workday Object Resource Names and Object Keys](#) on page 2251.

This sample object map in the request body identifies a Worker business object. To attach the new custom object instance to the Worker, specify `worker` as the key of the object map.

```
"worker": {
    "id": "Employee_ID=21035"
}
```

This next example identifies a Company business object. To attach the new custom object instance to the Company, you must use `company` as the key of the object map.

```
"company": {
    "id": "Company_Reference_ID=GMS_USA_company"
}
```

#### Validate-only requests

When you set the HTTP header `x-validate-only` to 1, the Custom Object REST API only validates the request and doesn't persist data in the tenant. The `x-validate-only` header applies to the POST, PUT, DELETE endpoints.

### Creating a Custom Object Instance

Creating a multi-instance custom object adds a row to the custom object table in Workday. To create a multi-instance custom object, use this endpoint:

```
POST /customObjects/{customObjectAlias}
```

To submit the endpoint, specify:

- The `{customObjectAlias}` path parameter using the web service alias of the custom object.
- Optionally, the `updateIfExists=true` query parameter to update the existing instance. The POST endpoint updates only the fields that you specify in the request body. Note that if you specify the `updateIfExists=true` query parameter, the business object in the request body must be the existing business object attached to the existing custom object.
- In the request body:
  - The required object map containing the business object.
  - The required and optional custom field data.

See [Constructing the Request URL](#) on page 2227 and [Constructing the Request Body](#) on page 2230.

Sample request:

Create a stock grant for the worker whose ID is Employee\_ID=21035.

```
POST /customObjects/stockGrants
```

Request body:

```
{
  "worker": {
    "id": "Employee_ID=21035"
  },
  "strikePrice": {
    "currency": "USD",
    "value": "170"
  },
  "grantName": "Merit_Q22021",
  "numberOfShares": 1000,
  "typeOfShares": {
    "id": "iso"
  },
  "grantDate": "2021-05-19"
}
```

Sample response:

```
{
  "ok": "Created"
}
```

### Creating Custom Object Instances in Bulk

Creating multi-instance custom objects in bulk adds multiple rows to the custom object table in a single request. You can create custom object instances for different business objects in the same request. To create a multi-instance custom object in bulk, use this endpoint:

```
POST /customObjects/{customObjectAlias}?bulk=true
```

To submit the endpoint, specify:

- The {customObjectAlias} path parameter using the web service alias of the custom object.
- The bulk=true query parameter.
- Optionally, the updateIfExists=true query parameter to update the existing instance. The POST endpoint updates only the fields that you specify in the request body. Note that if you specify the updateIfExists=true query parameter, the business object in the request body must be the existing business object attached to the existing custom object.
- In the request body, an array of custom object instances to create. The bulk request has a limit of 200 items.

Example: [ {customObjectInstance1}, {customObjectInstance2} ]

For each {customObjectInstance} in the array, specify:

- The required object map containing the business object.
- The required and optional custom field data.

See [Constructing the Request URL](#) on page 2227 and [Constructing the Request Body](#) on page 2230.

Sample request:

Create a stock grant for 2 workers whose IDs are Employee\_ID=21035 and a Workday ID, respectively.

```
POST /customObjects/stockGrants?bulk=true&updateIfExists=true
```

Request body:

```
[
```

```
{
    "typeOfShares": {
        "id": "rsu"
    },
    "strikePrice": {
        "currency": "USD",
        "value": "24500"
    },
    "grantName": "Merit_Q32020",
    "grantDate": "2021-09-15",
    "numberOfShares": 300,
    "worker": {
        "id": "Employee_ID=21035"
    }
},
{
    "typeOfShares": {
        "id": "nqo"
    },
    "strikePrice": {
        "currency": "USD",
        "value": "265"
    },
    "grantName": "Merit_Q32020",
    "grantDate": "2021-09-15",
    "numberOfShares": 220,
    "worker": {
        "id": "989eafee6aa449679fe58caeed36b31"
    }
}
]
```

Sample response:

```
{
    "ok": "OK"
}
```

## Retrieving a Custom Object Instance

To retrieve an instance of a multi-instance custom object, use this endpoint:

```
GET /customObjects/{customObjectAlias}/{customObjectID}
```

To submit the endpoint, specify:

- The {customObjectAlias} path parameter using the web service alias of the custom object.
- The {customObjectID} path parameter using a compound ID that follows this format:

```
{businessObjectID};  
{customObjectReferenceId}={customObjectReferenceIdValue}
```

See [Constructing the Request URL](#) on page 2227.

Sample request:

Retrieve a specific stock grant for a specific worker.

```
GET /customObjects/stockGrants/Employee_ID=21035;grantName=Merit_Q12021
```

Sample response:

```
{
  "id": "e960ff12fbf430002def34b5e6232ef2",
  "strikePrice": {
    "currency": "USD",
    "value": "167"
  },
  "grantName": "Merit_Q12021",
  "numberOfShares": 100,
  "typeOfShares": {
    "id": "iso"
  },
  "grantDate": "2021-03-19",
  "worker": {
    "id": "989eafee6aa449679fe58caeed36b31"
  }
}
```

## Retrieving a Custom Object Collection for a Business Object

To retrieve all instances of a multi-instance custom object for a specific business object, use this endpoint:

```
GET /{businessObjectResource}/{businessObjectID}/customObjects/
{customObjectAlias}
```

To submit the endpoint, specify:

- The `{businessObjectResource}` path parameter using the resource name of the business object.
- The `{businessObjectID}` path parameter using the Workday ID or Reference ID of the business object.
- The `{customObjectAlias}` path parameter using the web service alias of the custom object.

See [Constructing the Request URL](#) on page 2227.

Sample request:

Retrieve all stock grants for a specific worker:

```
GET /workers/Employee_ID=21035/customObjects/stockGrants
```

Sample response:

```
{
  "total": 3,
  "data": [
    {
      "id": "e960ff12fbf430002e95089d1d722f90",
      "strikePrice": {
        "currency": "USD",
        "value": "170"
      },
      "grantName": "Merit_Q32021",
      "numberOfShares": 1000,
      "typeOfShares": {
        "id": "iso"
      },
      "grantDate": "2021-05-19",
      "worker": {
        "id": "989eafee6aa449679fe58caeed36b31"
      }
    }
  ]
}
```

```

        },
        {
            "id": "e960ff12fbf430002e829e6eb8cc2f8f",
            "strikePrice": {
                "currency": "USD",
                "value": "170"
            },
            "grantName": "Merit_Q22021",
            "numberOfShares": 150,
            "typeOfShares": {
                "id": "iso"
            },
            "grantDate": "2021-05-19",
            "worker": {
                "id": "989eafee6aa449679fe58caeed36b31"
            }
        },
        {
            "id": "e960ff12fbf430002f2498d12ff02f92",
            "strikePrice": {
                "currency": "USD",
                "value": "24500"
            },
            "grantName": "Merit_Q32020",
            "numberOfShares": 300,
            "typeOfShares": {
                "id": "rsu"
            },
            "grantDate": "2021-09-15",
            "worker": {
                "id": "989eafee6aa449679fe58caeed36b31"
            }
        }
    ]
}

```

## Updating a Custom Object Instance

To update an instance of a multi-instance custom object, use this endpoint:

```
PUT /customObjects/{customObjectAlias}/{customObjectID}
```

To submit the endpoint, specify:

- The {customObjectAlias} path parameter using the web service alias of the custom object.
- The {customObjectID} path parameter using a compound ID that follows this format:

```
{businessObjectID};  
{customObjectReferenceId}={customObjectReferenceIdValue}
```

- In the request body, specify the custom field data to update. Consider these guidelines:
  - Ensure that you specify the correct data type of the custom field data.
  - The PUT endpoint updates only the fields that you specify in the request body. If you don't include fields in the request body, the PUT endpoint doesn't replace those fields with null values. If you need to update a field to a null value, delete the custom object instance and recreate it without specifying the field in the request body.
  - You can't update the values of the business object ID and the custom object Reference ID in the request body.

See [Constructing the Request URL](#) on page 2227 and [Constructing the Request Body](#) on page 2230.

**Sample request:**

Update the strike price of a stock grant for a specific worker.

```
PUT /customObjects/stockGrants/Employee_ID=21035;grantName=Merit_Q12021
```

**Request body:**

```
{
  "strikePrice": {
    "currency": "USD",
    "value": "270"
  }
}
```

**Sample response:**

```
{
  "ok": "OK"
}
```

**Deleting a Custom Object Instance**

To delete an instance of a multi-instance custom object, use this endpoint:

```
DELETE /customObjects/{customObjectAlias}/{customObjectID}
```

To submit the endpoint, specify:

- The {customObjectAlias} path parameter using the web service alias of the custom object.
- The {customObjectID} path parameter using a compound ID that follows this format:

```
{businessObjectID};
{customObjectReferenceId}={customObjectReferenceIdValue}
```

[See Constructing the Request URL](#) on page 2227.

**Sample request:**

Delete a specific stock grant for a specific worker.

```
DELETE /customObjects/stockGrants/Employee_ID=21035;grantName=Merit_Q12021
```

**Sample response:**

```
{
  "ok": "OK"
}
```

**Checking Validations**

The Custom Object REST APIs return these HTTP status codes. This list also includes common mistakes and error messages:

404

If you specified an invalid custom object alias or business object ID as a path parameter, the endpoint returns a similar error message:

```
{
```

```

        "error": "not found:
parkingSpacex",
        "code": "S21"
}

```

If you specified a valid business object ID as a path parameter, the endpoint returns an error message with a valid object ID. In this case, the custom object instance doesn't exist.

```

{
    "error": "not found:
Employee_ID=21035",
    "code": "S21"
}

```

400

If you specified an invalid field value in the request body, the endpoint returns an error with a similar error message:

```

{
    "error": "invalid request:
errors have occurred",
    "errors": [
        {
            "error": "not found:
norma",
            "code": "S5",
            "location": "Line: 25,
column: 6"
        }
    ]
}

```

If you incorrectly specified a data type in the request body, the endpoint returns an error with a similar error message:

```

{
    "error": "invalid request:
errors have occurred",
    "errors": [
        {
            "error": "Current token
(VALUE_STRING) not of boolean
type",
            "code": "S5",
            "location": "Line: 6,
column: 19"
        }
    ]
}

```

If you incorrectly formatted a custom field in the request body, the endpoint returns an error with a similar error message:

```

{
    "error": "invalid request:
errors have occurred",
}

```

```

    "errors": [
        {
            "error": "Can not
instantiate value of type
[map type;
class java.util.LinkedHashMap,
[simple type,
class java.lang.String] ->
[simple type,
class java.lang.String]] from JSON
String;
no single-
String constructor/factory method",
            "code": "S5",
            "location": "Line: 23,
column: 33"
        }
    ]
}

```

500

Possible errors:

- Missing business object in the request body.
- Missing required field.
- Invalid currency.
- Misformatted date. The date must use the yyyy-mm-dd format.

Sample error:

```
{
    "error": "internal error",
    "code": "S24",
    "caseId": "ad0fc780-
a4fd-43bb-80cf-524c5772b8a0"
}
```

## Limitations

Custom objects and custom fields have limits. For details, see [Reference: Custom Object Limits and Field Limits](#).

## Concept: Custom Object (Single-Instance) REST APIs

This topic provides an overview and usage guidance on the Custom Object (Single-Instance) REST APIs.

### Overview

Custom objects are extensions of existing Workday business objects, and enable your enterprise to store custom data related to the business objects. Your integrations or apps can call the Custom Object REST APIs to get, create, update, and delete custom object data.

A single-instance custom object is a set of custom fields attached to a Workday business object. In Workday, users can view or edit a custom object form on the Additional Data tab of the business object. Example: The Worker object can associate a custom object named Parking Space. Because a worker can only have 1 assigned parking space, the parking space is a single-instance custom object.

When you or administrators create a custom object definition in Workday, certain configuration settings affect how you must specify the Custom Object REST API requests. This table summarizes how custom object settings affect the REST APIs:

Custom Object Setting	Custom Object REST API Implication
Web Service Alias	Determines the root resource name of the REST API endpoints that access the custom object data.
Allow Multiple Instances per Object	If false, the custom object is single-instance. For GET, PUT, and DELETE endpoints, the ID path parameter is the extended Workday object ID.

Note: The Custom Object REST APIs don't support effective-dated custom objects. To update an effective-dated custom object, use the equivalent SOAP web service operation on the business object additional data.

For reference documentation about the Custom Object (Single-Instance) REST APIs, see the *Custom Object Data (Single-Instance)* service on the [Workday REST Services Directory](#).

### Usage

- [Security Considerations](#) on page 2239
- [URL Base Path](#) on page 2240
- [Constructing the Request URL](#) on page 2240
- [Constructing the Request Body](#) on page 2241
- [Creating a Custom Object Instance](#) on page 2242
- [Creating Custom Object Instances in Bulk](#) on page 2243
- [Retrieving a Custom Object Instance](#) on page 2245
- [Updating a Custom Object Instance](#) on page 2245
- [Deleting a Custom Object Instance](#) on page 2246
- [Checking Validations](#)
- [Limitations](#) on page 2248

### Security Considerations

When creating a custom object definition, you can assign Workday-defined and custom domains to the custom object. The configured security policies on the custom object determine the required REST API permissions on the custom object data. To view the security domains for a custom object, access the View Custom Object report.

For integrations that call the Custom Object (Single-Instance) REST APIs, ensure that you have the correct scopes when you [.../authentication-and-security/authentication/oauth/dan1370797831458.dita](#).

For more information, see [Concept: Security for Custom Objects](#).

## URL Base Path

### Tenant Base Path

```
https://{{tenantHostname}}/api/customObject/{{version}}/{{tenantName}}
```

Example:

```
https://yourTenantHostName.com/api/customObject/v2/gms
```

Note: The legacy v1 version uses the base path format `https://yourTenantHostName.com/api/v1/yourTenant`. Starting with v2, the Custom Object REST service uses the base path format `https://yourTenantHostName.com/api/customObject/version/yourTenant` (where version is the current version.)

### Workday Extend API Gateway Base Path

Workday Extend is a separately licensed Workday product that provides developer tools and more flexible model components for storing custom data. If your business needs require that you use the legacy Custom Object REST APIs with Workday Extend, note the difference in the URL base path.

For Workday Extend apps, use the API Gateway URL for the Extend region of your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Workday Developer Site.

Sample Workday Extend request URL (US region) for the GET `/customObjects/{{customObjectAlias}}/{{customObjectID}}` endpoint:

```
https://api.workday.com/customObjects/v2/parkingSpaces/EmployeeID=21001
```

## Constructing the Request URL

For the GET, PUT, and DELETE endpoints that operate on a specific custom object instance, the request URL follows this format:

```
{basePath}/customObjects/{{customObjectAlias}}/{{customObjectID}}
```

Where:

`{basePath}`

The tenant host, service version, and tenant name.

```
https://yourTenantHostName.com/api/customObject/{{version}}/yourTenant
```

Note: The legacy v1 version uses the base path format `https://yourTenantHostName.com/api/v1/yourTenant`.

`customObjects`

The Custom Objects service name, which is `customObjects`.

`{customObjectAlias}`

The web service alias of the custom object. Example: `parkingSpaces` is the web service alias of the sample Parking Spaces, which is a single-instance custom object.

To determine the web service alias of the custom object, access the View Custom Object task.

{customObjectID}

The Workday ID or Reference ID of the extended business object. Example: Employee=21001

These sample request URLs are for a GET endpoint that retrieves a specific parking space for a specific worker. The web service alias of the Parking Spaces custom object is *parkingSpaces*. Each example is a variation of the custom object ID, which uses:

- The Reference ID of the business object.

v2 example:

```
https://company.tenant.com/api/customObject/v2/gms/customObjects/
parkingSpaces/EmployeeID=21001
```

v1 example:

```
https://company.tenant.com/api/v1/gms/customObjects/parkingSpaces/
EmployeeID=21001
```

- The Workday ID of the business object.

v2 example:

```
https://company.tenant.com/api/customObject/v2/gms/customObjects/
parkingSpaces/3aa5550b7fe348b98d7b5741afc65534
```

v1 example:

```
https://company.tenant.com/api/v1/gms/customObjects/
parkingSpaces/3aa5550b7fe348b98d7b5741afc65534
```

## Constructing the Request Body

When you create or update custom object data with a POST or PUT endpoint, specify the required or optional custom fields in the request body. To determine the custom fields, you can use the response data model from the `GET /customObjects/{customObjectAlias}/{customObjectID}` endpoint on an existing custom object instance. You can also see the custom object definition in the View Custom Object task. Ensure that you specify the correct data type of the custom field:

Text

Specify a quoted string.

Integer

Specify an unquoted numeric value.

Boolean

Specify an unquoted `true` or `false`.

Date

Specify the `yyyy-mm-dd` date format. Example:

```
"paidUntilDate": "2021-05-19"
```

Currency

Specify the currency as an object map containing the `currency` and `value` fields. Example:

```
"suggestedFee": {
  "currency": "USD",
  "value": "10"
}
```

Single-instance custom list

Specify the single-instance custom list as an object map. The `id` field in the object map specifies the list

value. Use the web service alias of the list value, as defined in the custom list definition. Example:

```
"parkingSpaceType": {
    "id": "normal"
}
```

#### Multi-instance custom list

Specify the multi-instance custom list as an array of object maps. The `id` field in each object map specifies the list value. Use the web service alias of the list value, as defined in the custom list definition. Example:

```
"accommodatesParkingSpaceType": [
    {
        "id": "normal"
    },
    {
        "id": "employeeOfTheMonth"
    }
]
```

**Note:** Ensure that the request body doesn't contain inactive custom list values. A request body that contains an inactive custom list value causes an error. To deactivate and reactivate a custom list value, access the [Edit Custom List task](#).

When you create custom object data with a POST endpoint, the request body *must* also contain the business object attached to the custom object. Specify an object map containing the Workday ID or Reference ID of the existing business object. The object key is the name that corresponds to the Workday object. For a list of valid object keys corresponding to the supported Workday objects, see the object keys in [Reference: Workday Object Resource Names and Object Keys](#) on page 2251.

This sample object map in the request body identifies a Worker business object. To attach the new custom object instance to an existing worker, specify `worker` as the key of the object map.

```
"worker": {
    "id": "Employee_ID=21035"
}
```

This next example identifies a Company business object. To attach the new custom object instance to an existing company, you must use `company` as the key of the object map.

```
"company": {
    "id": "Company_Reference_ID=GMS_USA_company"
}
```

#### Validate-only requests

When you set the HTTP header `x-validate-only` to 1, the Custom Object REST API only validates the request and doesn't persist data in the tenant. The `x-validate-only` header applies to the POST, PUT, DELETE endpoints.

### Creating a Custom Object Instance

Creating a single-instance custom object adds custom object data to a business object. To create a single-instance custom object, use this endpoint:

```
POST /customObjects/{customObjectAlias}
```

To submit the endpoint, specify:

- The {customObjectAlias} path parameter using the web service alias of the custom object.
- Optionally, the updateIfExists=true query parameter to update the existing instance. The POST endpoint updates only the fields you specify in the request body. Note that if you specify the updateIfExists=true query parameter, the business object in the request body must be the existing business object attached to the existing custom object.
- In the request body:
  - The required object map containing the business object.
  - The required and optional custom field data.

See [Constructing the Request URL](#) on page 2240 and [Constructing the Request Body](#) on page 2241.

Sample request:

Create a parking space for the worker whose ID is Employee\_ID=21035.

```
POST /customObjects/parkingSpaces
```

Request body:

```
{
  "worker": {
    "id": "Employee_ID=21035"
  },
  "suggestedFee": {
    "currency": "USD",
    "value": "10"
  },
  "description": "A12345",
  "fieldWithValidation": "10",
  "customList": {
    "id": "myvalueone"
  },
  "accomodatesParkingSpaceType": [
    {
      "id": "normal"
    },
    {
      "id": "employeeOfTheMonth"
    }
  ],
  "paidUntilDate": "2021-05-28",
  "parkingSpaceType": {
    "id": "normal"
  }
}
```

Response:

```
{
  "ok": "Created"
}
```

## Creating Custom Object Instances in Bulk

Creating a single-instance custom object in bulk enables you to add custom object data to multiple business objects in the same request. To create a single-instance custom object in bulk, use this endpoint:

```
POST /customObjects/{customObjectAlias}?bulk=true
```

To submit the endpoint, specify:

- The `{customObjectAlias}` path parameter using the web service alias of the custom object.
- The `bulk=true` query parameter.
- Optionally, the `updateIfExists=true` query parameter to update the existing instance. The POST endpoint updates only the fields you specify in the request body. Note that if you specify the `updateIfExists=true` query parameter, the business object in the request body must be the existing business object attached to the existing custom object.
- In the request body, an array of custom object instances to create. Example: `[ {customObjectInstance1}, {customObjectInstance2} ]`.

For each `{customObjectInstance}` in the array, specify:

- The required object map containing the business object.
- The required and optional custom field data.

See [Constructing the Request URL](#) on page 2240 and [Constructing the Request Body](#) on page 2241.

Sample request:

Create a parking space for 2 workers whose IDs are `Employee_ID=21035` and a Workday ID, respectively.

```
POST /customObjects/parkingSpaces?bulk=true&updateIfExists=true
```

Request body

```
[
  {
    "suggestedFee": {
      "currency": "USD",
      "value": "5"
    },
    "available": true,
    "parkingSpaceNumber": 100,
    "description": "parking garage first floor",
    "worker": {
      "id": "Employee_ID=21035"
    }
  },
  {
    "suggestedFee": {
      "currency": "USD",
      "value": "5"
    },
    "available": true,
    "parkingSpaceNumber": 200,
    "description": "parking garage second floor",
    "worker": {
      "id": "3aa5550b7fe348b98d7b5741afc65534"
    }
  }
]
```

Sample response:

```
{
  "ok": "OK"
}
```

## Retrieving a Custom Object Instance

To retrieve a single-instance custom object, use this endpoint:

```
GET /customObjects/{customObjectAlias}/{customObjectID}
```

To submit the endpoint, specify:

- The {customObjectAlias} path parameter using the web service alias of the custom object.
- The {customObjectID} path parameter using the Workday ID or Reference ID of the business object that the custom object is attached to.

See [Constructing the Request URL](#) on page 2240.

Sample request:

Retrieve the parking space for a specific worker:

```
GET /customObjects/parkingSpaces/Employee_ID=21035
```

Sample response:

```
{
  "id": "e960ff12fbf430002851430d67162a92",
  "suggestedFee": {
    "currency": "USD",
    "value": "10"
  },
  "currentFee": "10",
  "parkingSpaceNumber": 10,
  "description": "A123",
  "customList": [
    {
      "id": "myvalueone"
    }
  ],
  "accomodatesParkingSpaceType": [
    {
      "id": "guest"
    }
  ],
  "parkingSpaceType": {
    "id": "normal"
  },
  "worker": {
    "id": "989eafee6aa449679fe58caeed36b31"
  }
}
```

## Updating a Custom Object Instance

To update a single-instance custom object, use this endpoint:

```
PUT /customObjects/{customObjectAlias}/{customObjectID}
```

To submit the endpoint, specify:

- The {customObjectAlias} path parameter using the web service alias of the custom object.
- The {customObjectID} path parameter using the Workday ID or Reference ID of the business object that the custom object is attached to.

- In the request body, specify the custom field data to update. Consider these guidelines:
  - Ensure that you specify the correct data type of the custom field data.
  - The PUT endpoint updates only the fields you specify in the request body. If you don't include fields in the request body, the PUT endpoint doesn't replace those fields with null values. If you need to update a field to a null value, delete the custom object instance and recreate it without specifying the field in the request body.
  - You can't update the values of the business object ID and the custom object Reference ID in the request body.

See [Constructing the Request URL](#) on page 2240 and [Constructing the Request Body](#) on page 2241.

This sample request updates the suggested fee and description of a parking space for a specific worker.

```
PUT /customObjects/parkingSpaces/Employee_ID=21035
```

```
{
  "suggestedFee": {
    "currency": "USD",
    "value": "8.50"
  },
  "description": "AA12345"
}
```

Response:

```
{
  "ok": "OK"
}
```

## Deleting a Custom Object Instance

To delete a single-instance custom object, use this endpoint:

```
DELETE /customObjects/{customObjectAlias}/{customObjectID}
```

To submit the endpoint, specify:

- The {customObjectAlias} path parameter using the web service alias of the custom object.
- The {customObjectID} path parameter using the Workday ID or Reference ID of the business object that the custom object is attached to.

See [Constructing the Request URL](#) on page 2240.

This sample request deletes the parking space for a specific worker.

```
DELETE /customObjects/parkingSpaces/Employee_ID=21035
```

Response:

```
{
  "ok": "OK"
}
```

## Checking Validations

The Custom Object REST APIs return these HTTP status codes. This list also includes common mistakes and error messages:

404

If you specified an invalid custom object alias or business object ID as a path parameter, the endpoint returns a similar error message:

```
{
  "error": "not found:
parkingSpaceX",
  "code": "S21"
}
```

If you specified a valid business object ID as a path parameter, the endpoint returns an error message with a valid object ID. In this case, the custom object instance doesn't exist.

```
{
  "error": "not found:
Employee_ID=21035",
  "code": "S21"
}
```

400

If you specified an invalid field value in the request body, the endpoint returns an error with a similar error message:

```
{
  "error": "invalid request:
errors have occurred",
  "errors": [
    {
      "error": "not found:
norma",
      "code": "S5",
      "location": "Line: 25,
column: 6"
    }
  ]
}
```

If you incorrectly specified a data type in the request body, the endpoint returns an error with a similar error message:

```
{
  "error": "invalid request:
errors have occurred",
  "errors": [
    {
      "error": "Current token
(VALUE_STRING) not of boolean
type",
      "code": "S5",
      "location": "Line: 6,
column: 19"
    }
  ]
}
```

If you incorrectly formatted a custom field in the request body, the endpoint returns an error with a similar error message:

```
{
  "error": "invalid request: errors have occurred",
  "errors": [
    {
      "error": "Can not instantiate value of type [map type; class java.util.LinkedHashMap, [simple type, class java.lang.String] -> [simple type, class java.lang.String]] from JSON String; no single-String constructor/factory method",
      "code": "S5",
      "location": "Line: 23, column: 33"
    }
  ]
}
```

500

Possible errors:

- Missing business object in the request body.
- Missing required field.
- Invalid currency.
- Misformatted date. The date must use the yyyy-mm-dd format.

Sample error:

```
{
  "error": "internal error",
  "code": "S24",
  "caseId": "ad0fc780-a4fd-43bb-80cf-524c5772b8a0"
}
```

## Limitations

Custom objects and custom fields have limits. For details, see [Reference: Custom Object Limits and Field Limits](#).

### Related Information

[Workday REST Services Directory](#)

[Workday Extend API Explorer \(requires access to the Workday Extend Developer Site\)](#)

## Concept: Custom Object Definition REST APIs

This topic provides an overview and usage guidance on the Custom Object Definition REST APIs.

### Overview

The Custom Object Definition service provides access to information about the custom objects defined in your Workday tenant. Use the Custom Object Definition REST APIs primarily for getting custom object definitions. To create, update, or delete custom object definitions, we recommend that you use the Workday UI for convenience.

Custom object definitions specify the properties and types of data stored as custom objects, which are extensions of Workday business objects. Examples of custom objects:

- Parking space - A Parking Space custom object can be an extension of the Worker object that has information about a worker parking space. If a worker can only have 1 assigned parking space, it is a single-instance custom object.
- Apparel - An Apparel custom object can be an extension of the Worker object that contains information about articles of clothing. If a single worker can have more than 1 assigned item of clothing, it is a multi-instance custom object.

For reference documentation about the Custom Object Definition REST APIs, see the *Custom Object Definition* service on the [Workday REST Services Directory](#).

### Usage

- Security Considerations
- URL Base Path
- Equivalent Workday Tasks
- Retrieving Custom Object Definitions
- Limitations

### Security Considerations

The *Custom Object Management* security domain secures the Custom Object Definition REST APIs.

When creating a custom object definition, you can assign Workday-defined and custom domains to the custom object. The configured security policies on the custom object determine the required REST API permissions on the custom object data. To view the security domains for a custom object, access the View Custom Object report.

For more information, see [Concept: Security for Custom Objects](#).

### URL Base Path

Tenant Base Path

```
https://{{tenantHostname}}/api/customObjectDefinition/{{version}}/{{tenantName}}
```

Example:

```
https://yourTenantHostName.com/api/customObjectDefinition/v1/gms
```

Workday Extend API Gateway Base Path

Workday Extend is a separately licensed Workday product that provides developer tools and more flexible model components for storing custom data. If your business needs require that you use the legacy Custom Object REST APIs with Workday Extend, note the difference in the URL base path.

For Workday Extend apps, use the API Gateway URL for the Extend region of your company. See *Reference: Workday Extend API Gateways and Authorization Base URLs* on the Workday Developer Site.

Sample Workday Extend request URL (US region) for the GET /definitions endpoint:

```
https://api.workday.com/customObjectDefinition/v1/definitions
```

## Equivalent Workday Tasks

- Create Custom Field Type.
- Create Custom Object.
- Create Custom Object Validations.
- Edit Custom Object.

See [Steps: Set Up Custom Objects](#).

## Retrieving Custom Object Definitions

To retrieve all custom object definitions available to the current user, use this endpoint:

```
GET /customObjectDefinitions
```

In addition to the `id` and `descriptor` of the custom object definitions, this method returns this information:

- `customObjectAlias` - The resource name of the custom object. Use the `customObjectAlias` in the URL path when you call a Custom Object API. Example: GET /customObjects/{customObjectAlias}/{customObjectID}.
- `multiInstance` - If true, the definition is for a multi-instance custom object. If false, the custom object is single-instance.
- `businessObject` - The business object that the custom object extends.

Sample request:

```
GET /customObjectDefinitions
```

Sample response with 2 multi-instance and 1 single-instance custom object definitions. These custom object definitions specify that an individual worker can have more than 1 item of Apparel, more than 1 item of Shoes, and only 1 item of Worker Shoes.

```
{
  "total": 3,
  "data": [
    {
      "descriptor": "Apparel",
      "id": "8da46c229b0842ec89f0860cba174da0",
      "customObjectName": "Apparel",
      "multiInstance": true,
      "customObjectAlias": "apparel",
      "businessObject": {
        "descriptor": "Worker",
        "id": "766f3df40606431e8229445f1fe283c3"
      }
    },
    {
      "descriptor": "Shoes"
    }
  ]
}
```

```

    "descriptor": "Shoes",
    "id": "e2b6ebfab5da412ea518f1a684cf730f",
    "customObjectName": "Shoes",
    "multiInstance": true,
    "customObjectAlias": "shoes",
    "businessObject": [
        {
            "descriptor": "Worker",
            "id": "766f3df40606431e8229445f1fe283c3"
        }
    ],
    {
        "descriptor": "Worker Shoes",
        "id": "bae237b94ae9421daaa3799df6f6e3c5",
        "customObjectName": "Worker Shoes",
        "multiInstance": false,
        "customObjectAlias": "workerShoes",
        "businessObject": [
            {
                "descriptor": "Worker",
                "id": "766f3df40606431e8229445f1fe283c3"
            }
        ]
    }
}

```

This next sample request retrieves the custom object definition for Shoes.

```
GET /customObjectDefinitions/e2b6ebfab5da412ea518f1a684cf730f
```

Sample response:

```
{
    "descriptor": "Shoes",
    "id": "e2b6ebfab5da412ea518f1a684cf730f",
    "customObjectName": "Shoes",
    "multiInstance": true,
    "customObjectAlias": "shoes",
    "businessObject": [
        {
            "descriptor": "Worker",
            "id": "766f3df40606431e8229445f1fe283c3"
        }
    ]
}
```

## Limitations

Custom objects and custom fields have limits. For details, see [Reference: Custom Object Limits and Field Limits](#).

## Reference: Workday Object Resource Names and Object Keys

### REST API Resource Names and Object Keys for Workday Objects

Use these resource names and object keys with the Custom Object REST APIs.

This table lists the:

- Workday objects that you can extend with custom objects.
- Resource name (plural form) of the Workday object. Use the appropriate resource name in the request URL of the GET endpoint that retrieves a collection of multi-instance custom objects.
- Object key (singular form) of the Workday object. Use the object key in the request body of the POST endpoint that creates a custom object. The object key identifies the associated business object.

Extended Workday Object	Resource Name in the Request URL	Object Key in the Request Body
Academic Affiliate	academicAffiliates	academicAffiliate
Academic Unit	academicUnits	academicUnit
Academic Unit Hierarchy	academicUnitHierarchies	academicUnitHierarchy
Allocation Pools	allocationPools	allocationPool
Applicant (Pre-Hire)	applicants	applicant
Bank Account	bankAccounts	bankAccount
Business Asset	businessAssets	businessAsset
Company	companies	company
Cost Center	costCenters	costCenter
Customer	customers	customer

## User Activity Logging REST API

### Concept: User Activity Logging REST API

The User Activity Logging REST API enables developers and administrators to retrieve log entries that contain information about Workday user activities. This REST API provides access to the User Activity report data source.

Before submitting User Activity Logging REST API requests, begin logging the user activity in the tenant:

1. Access the Edit Tenant Setup - System task.
2. Select the Enable User Activity Logging option.

For reference information about the User Activity Logging REST API, see the `activityLogging` resource in the *Privacy* REST web service documentation.

### URL Base Path

The User Activity Logging REST API uses this base path:

```
https://<tenantHostname>/api/privacy/<version>/<tenantName>
```

Example:

```
https://company.tenant.com/api/privacy/v1/gms
```

### Usage

- [Security Considerations](#) on page 2254
- [Getting the Count of User Activity Instances](#) on page 2254
- [Retrieving User Activity Instances](#) on page 2255
- [Filtering the User Activity Instances](#) on page 2256
- [Best Practices](#) on page 2258

### Security Considerations

Workday secures the User Activity Logging REST API to the *System Auditing* domain in the System functional area.

When you submit the User Activity Logging REST API, you can view the activity logs for all users. However, if your security profile doesn't permit you to access the reported tasks in the activity logs, you don't have access to the tasks in Workday.

Review your internal security and privacy (GDPR) procedures to determine how you want to use the User Activity Logging REST API.

### Getting the Count of User Activity Instances

To estimate the size of the user activity records efficiently without actually fetching the data, you can get the count of the records using the `returnUserActivityEntryCount` parameter.

To get the count of user activity instances in a given time frame, use this endpoint and parameters:

```
GET /activityLogging?  
from={fromDateTime}&to={toDateDateTime}&returnUserActivityEntryCount=true
```

Where:

`{fromDateTime}`

The required date and time of the earliest log entry.  
Use the UTC time zone.

{toDateTime}

The required date and time of the latest log entry.  
Use the UTC time zone.

returnUserActivityEntryCount=true

If true, the endpoint returns only the count of user activity instances in the specified time frame.

The response data contains a userActivityEntryCount value.

Sample request:

Get the count of the user activity instances from May 15, 2022 to June 3, 2022.

```
GET /activityLogging?  
from=2022-05-15T00:00:00Z&to=2022-06-02T23:59:59Z&returnUserActivityEntryCount=true
```

Sample response:

```
{
  "total": 1,
  "data": [
    {
      "userActivityEntryCount": 10219
    }
  ]
}
```

## Retrieving User Activity Instances

To retrieve user activity instances within a given time frame, use this endpoint:

```
GET /activityLogging?  
from={fromDateTime}&to={toDateTime}&instancesReturned={instancesReturned}
```

Where:

{fromDateTime}

The required date and time of the earliest log entry.  
Use the UTC time zone.

{toDateTime}

The required date and time of the latest log entry.  
Use the UTC time zone.

{instancesReturned}

A number between 1 and 25 for fine-tuning the retrieval mechanism. Workday recommends a value of 1, which gives the best performance.

instancesReturned=1 retrieves 10,000 instances. If there are more than 10,000 instances, iteratively call the endpoint using the datetime of the last record as the {fromDateTime} parameter. For details about the iterative calls, see [Retrieve All User Activities in a Time Period](#) on page 2258.

The GET /activityLogging endpoint also provides the limit and offset pagination parameters. The default limit is 20 (maximum is 1000), and the default offset is 0.

Note: To ensure that you retrieve the complete set of data, iteratively call the GET /activityLogging endpoint with the limit and offset parameters. Set limit=1000. Initially set offset=0, then increment it by 1000 in subsequent calls. For details about the iterative calls, see [Retrieve All User Activities in a Time Period](#) on page 2258.

Sample request:

Get the user activity instances from May 15, 2022 to June 3, 2022.

```
GET /activityLogging?from=2022-05-15T00:00:00Z&to=2022-06-02T23:59:59Z
```

Note: This example uses the minimum required parameters. For best practice, see the [Best Practices on page 2258](#) section.

Sample response:

```
{
  "total": 10219,
  "data": [
    {
      "sessionId": "f3f7eb",
      "target": {
        "descriptor": "wd-environments / Workday Production Automation",
        "id": "2e89495897384ea9b2eab4341dc24dca"
      },
      "taskDisplayName": "Start New Session (Web Service)",
      "requestTime": "2022-05-16T11:55:38.338Z",
      "taskId": "03f043df676e40cfad46bc576f89b07f",
      "ipAddress": "64.124.173.190",
      "deviceType": "Desktop",
      "userAgent": "Mozilla/5.0 (Macintosh; Intel Mac OS X 10_15_7) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/101.0.4951.64 Safari/537.36",
      "activityAction": "READ",
      "systemAccount": "wd-environments"
    },
    ...
    ...
    {
      "sessionId": "f3f7eb",
      "target": {
        "descriptor": "Test",
        "id": "921606317e300154c4558ae0995d0000"
      },
      "taskDisplayName": "View Workbook",
      "requestTime": "2022-05-16T14:17:13.649Z",
      "taskId": "fb47dca0a89210001e2115c2bb6c0257",
      "ipAddress": "64.124.173.190",
      "deviceType": "Desktop",
      "userAgent": "Mozilla/5.0 (Macintosh; Intel Mac OS X 10_15_7) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/101.0.4951.64 Safari/537.36",
      "activityAction": "READ",
      "systemAccount": "wd-environments"
    }
  ]
}
```

The sample `data[]` array contains only 20 records because the default `limit` is 20. To retrieve all 10,219 records, iteratively call the `GET /activityLogging` endpoint with the `limit` and `offset` parameters. For details about how to call the `GET /activityLogging` endpoint iteratively, see [Retrieve All User Activities in a Time Period](#) on page 2258.

## Filtering the User Activity Instances

You can filter the log entries by users and tasks. To get the log entries for specific users and tasks, specify 1 or more `systemAccount` or `taskId` query parameters, respectively.

### Sample request:

Return all user activity instances from May 15, 2022 to June 3, 2022, where Logan McNeil or Teresa Serrano accessed the My Reports or Request Time Off reports.

1. Send the GET /activityLogging endpoint with the specified timeframe:

```
GET /activityLogging?
from=2022-05-15T00:00:00Z&to=2022-06-02T23:59:59Z&limit=1000
```

2. Search the response to find an entry where Logan McNeil or Teresa Serrano accessed the My Reports and Request Time Off reports. Then, copy the taskIds associated with those reports:

```
{
  "total": 10219,
  "data": [
    ...
    ...
    {
      "deviceType": "Desktop",
      "taskId": "a2b801281b5f100013d6f884ceb50047",
      "requestTime": "2022-06-02T20:48:57.693Z",
      "taskDisplayName": "My Reports",
      "systemAccount": "lmcneil",
      "ipAddress": "173.226.103.218",
      "sessionId": "56dc20",
      "userAgent": "Mozilla/5.0 (Windows NT 10.0; Win64; x64)
AppleWebKit/537.36 (KHTML, like Gecko) Chrome/102.0.5005.63
Safari/537.36",
      "activityAction": "READ"
    },
    ...
    ...
    {
      "deviceType": "Desktop",
      "taskId": "eb0bf32f15b1498c9d7d213523811770",
      "requestTime": "2022-06-02T21:28:21.341Z",
      "taskDisplayName": "Request Time Off",
      "systemAccount": "lmcneil",
      "ipAddress": "173.226.103.218",
      "target": {
        "descriptor": "Logan McNeil (CHRO, HRExe, Mgr 4000,
MatMgr, ProMgr, TalMgr, VPRept)",
        "id": "3aa5550b7fe348b98d7b5741afc65534"
      },
      "sessionId": "57b83f",
      "userAgent": "Mozilla/5.0 (Windows NT 10.0; Win64; x64)
AppleWebKit/537.36 (KHTML, like Gecko) Chrome/102.0.5005.63
Safari/537.36",
      "activityAction": "READ"
    },
    ...
    ...
  ],
}
```

3. Send the GET /activityLogging endpoint again with these additional query parameters:

- systemAccount: lmcneil
- systemAccount: tserrano
- taskId: a2b801281b5f100013d6f884ceb50047
- taskId: eb0bf32f15b1498c9d7d213523811770

```
GET /activityLogging?
from=2022-05-15T00:00:00Z&to=2022-06-02T23:59:59Z&systemAccount=tserrano&systemAcco
```

## Best Practices

To tune the performance and to ensure that you retrieve the complete set of records in a time period, iteratively call the GET /activityLogging endpoint with these recommended parameter values:

Parameter	Recommended Value
limit	1000
offset	Initially set to 0, then increment by 1000 in subsequent calls.
instancesReturned	1

Examples of iterative calls:

```
GET /activityLogging?
from=2022-05-15T00:00:00Z&to=2022-06-02T23:59:59Z&limit=1000&instancesReturned=1&offset=0
```

```
GET /activityLogging?
from=2022-05-15T00:00:00Z&to=2022-06-02T23:59:59Z&limit=1000&instancesReturned=1&offset=1000
```

```
GET /activityLogging?
from=2022-05-15T00:00:00Z&to=2022-06-02T23:59:59Z&limit=1000&instancesReturned=1&offset=2000
```

## Retrieve All User Activities in a Time Period

### Prerequisites

- Select the Enable User Activity Logging option in the Edit Tenant Setup - System task.
- Security: *System Auditing* in the System functional area.

### Context

This procedure describes how to call the GET /activityLogging endpoint iteratively with the instancesReturned, limit, and offset parameters. This iterative approach enables you to retrieve the complete set of user activity records within a time period efficiently.

The examples in this procedure assume that the endpoint URL in <base\_url> is:

```
http://<tenantHostname>/api/privacy/v1/<tenant>/activityLogging
```

## Steps

- Set these query and pagination parameters for the GET /activityLogging endpoint.

Option	Description
from	The date and time of the earliest log entry. Use the format {yyyy}-{mm}-{dd}T{hh}:{MM}:{ss}Z. Ensure that the time precision is second (not millisecond). The time is in Zulu time/UTC.  Example: {2022}-{04}-{17}T{08}:{15}:{00}Z
to	The date and time of the latest log entry. Use the format {yyyy}-{mm}-{dd}T{hh}:{MM}:{ss}Z. Ensure that the time precision is second (not millisecond). The time is in Zulu time/UTC.  Example: {2022}-{04}-{17}T{09}:{00}:{00}Z
limit	Specify 1000, which is the maximum. The API is more performant for complete processing if the limit is higher. We recommend 1000.
instancesReturned	Specify 1. For improved performance, set instancesReturned to 1, which fetches 10,000 records per request.
offset	Initially set to 0. To retrieve the first set of records, set offset to 0. You'll increment offset by 1000 in subsequent calls.

- Initialize a data collection for accumulating the endpoint response.

3. Repeat these steps *until* the size of the endpoint response is less than the `limit`, which is 1000.

a) Call `GET /activityLogging` with the query and pagination parameters.

The endpoint returns the requested user activity records within the `from` and `to` times, starting with the record at the `offset` position, sorted by time.

b) Add the endpoint response to the data collection.

c) Save the timestamp of the 1,000th record.

You'll use the saved timestamp as the `from` parameter for fetching the next set of 10,000 records. To ensure that the time precision of the `from` parameter is second, remove the millisecond portion of the saved timestamp.

d) Increment the `offset` parameter by 1000.

This example illustrates the iterative calls with the incremented `offset` parameter:

First call:

```
GET <base_url>?
from=2022-04-17T08:15:00Z&to=2022-04-17T09:15:00Z&limit=1000&instancesReturned=1&of
```

Second call:

```
GET <base_url>?
from=2022-04-17T08:15:00Z&to=2022-04-17T09:15:00Z&limit=1000&instancesReturned=1&of
```

Third call:

```
GET <base_url>?
from=2022-04-17T08:15:00Z&to=2022-04-17T09:15:00Z&limit=1000&instancesReturned=1&of
```

4. If the 10th call (with `offset=9000`) still returns 1000 rows, you've reached the 10,000th record. To retrieve the next set of 10,000 records:

a) Change the `from` parameter to the saved timestamp (with second precision) of the last record.

b) Reset the `offset` pagination parameter to 0.

c) Repeat the iterative `GET /activityLogging` calls *until* the number of records in the endpoint response is less than the `limit`.

This example illustrates the 10th call and the subsequent iteration of calls starting with the new `from` value and `limit=0`.

Tenth call:

```
GET <base_url>?
from=2022-04-17T08:15:00Z&to=2022-04-17T09:15:00Z&limit=1000&instancesReturned=1&of
```

If the size of the 10th endpoint response is 1000, and the timestamp of the last record is 2022-04-17T08:35:17Z, then these queries are the subsequent calls:

```
GET <base_url>?
from=2022-04-17T08:35:17Z&to=2022-04-17T09:15:00Z&limit=1000&instancesReturned=1&of
```

```
GET <base_url>?
from=2022-04-17T08:35:17Z&to=2022-04-17T09:15:00Z&limit=1000&instancesReturned=1&of
```

```
GET <base_url>?
from=2022-04-17T08:35:17Z&to=2022-04-17T09:15:00Z&limit=1000&instancesReturned=1&of
```

Continue the iterative calls until the number of records in the endpoint response is less than 1000.

## Example

This pseudocode illustrates the iterative calls that retrieve all user activity records within the `from` and `to` datetimes.

```
limit = 1000
instancesReturned = 1
data = []
repeat
    offset = 0
    repeat
        results = callAPI(from, to, limit, offset, instancesReturned)
        Add results to data
        offset += limit
    until length(results) < limit
    from = timestamp_of_the_last_entry
until 0 entries
return data
```

## Example: Call the User Activity Logging REST API Using Python

This example illustrates how a Python client can call the User Activity Logging REST API using the iterative approach described in [Retrieve All User Activities in a Time Period](#) on page 2258. This iterative approach ensures that the User Activity Logging REST API efficiently retrieves the complete set of user activity records in a given time period.

### Context

Your company uses Splunk to monitor user activities in Workday. A Splunk plugin can get the complete set of user activity records for a given time period using a Python client. The Python code iteratively calls the User Activity Logging REST API with query and pagination parameters.

Note: Attempting to get all user activity records for a time period in a single call is inefficient and might not return complete data. Instead, write a client that calls the User Activity Logging REST API with query and pagination parameters. You can then iteratively call the client to return paginated responses.

### Steps

1. In Python, create a `UserActivityClient` class.
2. Define the attributes and function for client authentication.

You can use a bearer token to authenticate calls to the User Activity Logging REST API. The token depends on various connection parameters such as the user, server, password, and others.

Specify these authentication attributes:

Option	Description
<code>token_endpoint</code>	The URL for authenticating the service.
<code>_client_id</code>	The client ID.
<code>_client_secret</code>	The client password.
<code>access_token</code>	The last refresh token. Initialize as <code>None</code> . For subsequent calls, pass the last refresh token.

This sample function, `refresh_access_token()`, posts the credentials to the authentication URL and returns an access token for subsequent API calls. Alternatively, you can obtain the token in another way and assign it to `self.access_token`. Note that the functions in this topic use the

`refresh_access_token()` function for client authentication and for refreshing the token when needed.

```
class UserActivityClient:
    ...
    def refresh_access_token(self):
        resp = requests.Session().post(
            self.token_endpoint,
            auth=(self._client_id, self._client_secret),
            data={"refresh_token": self.access_token,
                  "grant_type": "refresh_token"},
            timeout=(self.CONNECT_TIMEOUT, self.READ_TIMEOUT)
        )
        resp.raise_for_status()
        data = resp.json()
        if "access_token" in data:
            self._access_token = data["access_token"]
            return self._access_token
        else:
            raise ValueError("<appropriate error message>")
```

### 3. Define the attributes for the User Activity Logging REST API calls.

Consider the recommended values:

Option	Description
CONNECT_TIMEOUT	The timeout (in seconds) for connecting to the API server. Recommended value: 5
READ_TIMEOUT	The timeout (in seconds) for reading data from the API server, after the server connection. Recommended value: 60
MAX_RETRIES	The maximum number of times to retry if a call fails. Recommended value: 2
limit	The number of user activity records in a response. The maximum is 1000. A higher value makes the overall process more efficient. Recommended value: 1000
instances_returned	The value multiplied by 10,000 determines the number of records to fetch. The value of 1 gives the best performance. The instancesReturned parameter of the GET /activityLogging endpoint uses this value. Recommended value: 1
rest_url	The full URL of the User Activity Logging REST API endpoint.  <code>http://&lt;tenantHostname&gt;/api/privacy/v1/&lt;tenant&gt;/activityLogging</code>

Option	Description
access_token	The bearer token for authentication. In this example, the <code>refresh_access_token</code> function returns the token.

4. Define the function that submits the REST API request and gets the JSON response.

Import the `requests` package for the REST API request and response methods.

This `get()` function returns a forward-iterable cursor, `resp`, which contains a paginated set of user activity records. This code assumes that when the token is invalid, it automatically calls the `self.refresh_access_token()` function to obtain a new token. If you use an alternate method for authentication, modify the code appropriately.

```
import requests
import random
class UserActivityClient:
    ...
    def get(self, *args, **kwargs):
        if "timeout" not in kwargs:
            kwargs["timeout"] = (self.CONNECT_TIMEOUT,
self.READ_TIMEOUT)
        headers = kwargs["headers"]
        headers["Authorization"] = "Bearer {}".format(self.access_token)

        retry_count = 0
        url = self.rest_url
        while True:
            try:
                resp = requests.Session().get(url, **kwargs)
                resp.raise_for_status()
            except requests.exceptions.Timeout as e:
                if retry_count < self.MAX_RETRIES:
                    retry_count += 1
                    time.sleep(random.randint(1, 5))
                    continue
                else:
                    raise
            except requests.exceptions.HTTPError as e:
                if retry_count < self.MAX_RETRIES:
                    retry_count += 1
                    time.sleep(random.randint(1, 5))
                    if e.response.status_code == 401:
                        self.refresh_access_token()
                    continue
                else:
                    raise
            else:
                return resp
```

5. Define the function that calls the User Activity Logging REST API.

This `make_one_call()` function calls the `get()` function, which returns an iterable cursor, `resp`.

The `make_one_call()` function accepts the `from_time` and `to_time` datetime parameters that use the format `{yyyy}-{mm}-{dd}T{hh}:{MM}:{ss}Z`.

The `self.instances_returned` value is 1, which indicates that the endpoint will attempt to fetch 10,000 records within the given time period.

The `offset` parameter specifies from which offset position in the 10,000 records to return as the first record in the cursor. The `self.limit` specifies the number of records in the cursor. To retrieve

the complete data, you'll call the `make_one_call` function multiple times with incremental offset values.

```
class UserActivityClient:
    ...
    def make_one_call(self, from_time, to_time, offset):
        resp = self.get(headers = { "Content-Type": "application/json" },
                         params = { "from": from_time,
                                     "to": to_time,
                                     "type": "userActivity",
                                     "instancesReturned": self.instances_returned,
                                     "limit": self.limit,
                                     "offset" : offset,
                                     }
                         )
        return resp
```

Optionally, you can use these query parameters to filter the data by user or task. Example:

```
"systemAccount": "lmcneil",
"taskId" : "dc38ed1c446c11de98360015c5e6daf6"
```

#### 6. Define a function that iteratively gets all 10,000 records in a time period.

This `process_batch()` function iteratively calls the `make_one_call()` function. The `process_batch()` function processes up to 10,000 records at a time (or less in the last batch). In each batch, the `process_batch()` function calls the API multiple times with the incremented offset, and fills the `data` list with the response data. The `process_batch()` function returns the timestamp of the last record or 0 if the cursor is empty.

```
class UserActivityClient:
    ...
    def process_batch(self, st, et, data):
        offset = 0
        while True:
            resp = make_one_call(st, et, offset)
            if (len(resp)) == 0:
                # If there is no records, set last_timestamp to 0
                # to indicate the end of data.
                last_timestamp = 0
                break
            for r in response:
                # Extract data from each record to data.
                data.append(r.json())
                last_timestamp = r['requestTime']
            offset += self.limit
        return last_timestamp
```

#### 7. Define a function that iteratively gets a batch of 10,000 records.

This `process_duration()` function iteratively calls the `process_batch()` function. Given a start time `st` and an end time `et`, `process_duration()` gets all user activity records in the time frame by processing 10,000 records at a time. For each new batch of 10,000 records, use a new start time that is equal to the timestamp of the last record retrieved.

```
class UserActivityClient:
    ...
    def process_duration(self, st, et):
        t = st
        data = []
        while t < et:
```

```

last_timestamp = process_batch(self, t, et, data)
if last_timestamp == 0:
    break
t = truncate_to_second(last_timestamp)

```

#### 8. From the Splunk monitoring tool, call the Python client.

These steps describe how to monitor user activity in Splunk using the Python client. You can adjust these steps according to your requirements.

- Call `UserActivityClient.process_duration()`.
- For the initial run, set these parameters:

Parameter	Value
<code>end_time</code>	<code>current_time - 5 minutes</code> Example: If the current time is 2:20, <code>end_time</code> is 2:15.
<code>start_time</code>	<code>end_time - 1 hour</code> Example: If the current time is 2:20, <code>start_time</code> is 1:15.

- For subsequent runs, set these parameters:

Parameter	Value
<code>end_time</code>	<code>current_time - 5 minutes</code>
<code>start_time</code>	The time (with second precision) in the last record of the previous run.

#### Result

The Python client returns a JSON data collection containing the complete set of all user activity records within the requested time period.

## Global Payroll REST APIs

### Global Payroll REST APIs

#### Authorizations

You can use the `authorizations` REST API to enable third-party payroll vendors to validate JWTs (JSON Web Token) and authorize requests based on their claims. This API supports features such as Additional Payroll Data and Global Payroll Hub, enhancing security, usability, and scalability while helping meet security and compliance standards.

For reference documentation about the Authorizations REST API, see the `globalPayroll` service on the [Workday REST Services Directory](#).

#### Effective Changes

You can use the `effectiveChanges` REST API to make flexible requests for external pay groups from Workday to your third-party payroll systems. It is a full-stack REST API that provides field level change detection and returns the current snapshot for each worker in a JSON format. When you run the

REST API, Workday dynamically launches an integration event that uses the Data Changes On Demand integration template.

For more information, see:

- [Concept: Global Payroll Effective Changes REST API on page 2266](#)
- [Reference: Data Changes on Demand Request Criteria Parameters on page 1475](#)

## **Event Driven Integration Vendor Response**

You can use the `eventDrivenIntegrationVendorResponse` REST API to enable your third-party payroll vendor to send Workday a request with the status of hires and terminations in response to a *Payroll Effective Change Interface* integration EDI (Event Driven Integration) event.

For more information, see [Steps: Set Up API Client for Event-Driven Integration Payroll Vendor Response on page 1649](#).

## **Notifications**

You can use the `inboundNotifications` REST API to notify specific workers or role groups in Workday with custom messages that include links that users can copy, such as errors that they need to fix in the third-party payroll system.

For more information, see:

- [Concept: Notifications REST API on page 2271](#)
- [Reference: Inbound Notifications Request Samples on page 1494](#)

## **Pay Groups**

You can use the `payGroups` REST API to retrieve information pertaining to a particular external pay group, such as country, periods, ref ids, and so on.

For reference documentation about the Pay Groups REST API, see the `globalPayroll` service on the [Workday REST Services Directory](#).

## **Concept: Global Payroll Effective Changes REST API**

This topic provides an overview and usage guidance on the Global Payroll REST API.

### **Overview**

The Effective Changes REST API in the Global Payroll REST service enables you to make flexible requests for external pay groups from Workday to your third-party payroll systems. It is a full-stack REST API that provides field level change detection and returns the current snapshot for each worker in a JSON format.

1. Work with a payroll vendor to configure Data Changes on Demand in Workday. See [Steps: Set Up Data Changes on Demand on page 1427](#).
2. The third-party payroll vendor calls the `effectiveChanges` REST API.
3. The third-party payroll vendor retrieves the output file from the REST API. See [Concept: Data Changes on Demand Change Detection on page 1435](#).

For reference documentation about the `effectiveChanges` REST APIs, see `globalPayroll/effectiveChanges` in the [Workday REST Services Directory](#).

## URL Base Path

### Tenant Base Path

```
https://{{hostname}}/api/globalPayroll/{{version}}/{{tenant}}/effectiveChanges
```

### Example:

```
https://yourTenantHostName.com/api/globalPayroll/v1/gms/effectiveChanges
```

### Workday Extend API Gateway Base Path

For Workday Extend apps, use the regional API Gateway base URL for your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Developer Site. Note that the API Gateway base URL doesn't include the tenant name.

## Workday Tasks

You can utilize the View Data Changes on Demand task to see:

- Who made the request, such as vendor name and ISU.
- What were the request parameters, such as entry ranges, effective ranges, and response filters.
- What fields were included.
- If there were any worker overrides.
- An Integration Event link to the View Background Process task.

To access this task, copy the top-level event ID in the REST response and search it in Workday with the WID prefix. Example: `WID: 0c80b6074ebd01001944f2fdc45a0000`.

Example of the top-level event ID:

```
{
  "id": "0c80b6074ebd01001944f2fdc45a0000",
  "responseData": {
    "status": {
      "descriptor": "Processing",
      "id": "d8b0c17e446c11de98360015c5e6daf6"
    }
  }
}
```

## Security Considerations

You must have *View* access to the *Manage: Data Changes On Demand* domain in the Global Payroll Connect functional area to access the View Data Changes on Demand task. For more information on security considerations, see: [Setup Considerations: Data Changes on Demand](#) on page 1423.

## Prerequisites

See the prerequisites and steps in [Steps: Set Up Data Changes on Demand](#) on page 1427

## Generating Effective Change Data

Generate effective change data for organizations or workers based on request parameters by creating an integration event and reporting the changes in a JSON output file.

Example for requesting data for 1 worker to detect changes with these criteria parameters and response filters:

- `entryMomentFrom` and `entryMomentTo` date range set to 2025-03-27T00:00:00.000 through 2025-03-28T00:00:00.000.

- effectiveFrom date and effectiveTo date range set to 2025-03-01 through 2025-03-31.
- allEffective set as false.
- includeRequestCriteriaInResponse set as false.
- onlyInclude these fields:
  - Employee ID.
  - Personal communication addresses.
- Third Party Australia organization.
- Worker to include employee ID: 21286
- countryNameFormat as COUNTRY\_NAME.
- countryRegionNameFormat as COUNTRY\_REGION\_ID.

**Sample Request**

```
POST /effectiveChanges
```

```
{
  "requestCriteria": {
    "entryMomentFrom": "2025-03-27T00:00:00.000",
    "entryMomentTo": "2025-03-28T00:00:00.000",
    "effectiveFrom": "2025-03-01",
    "effectiveTo": "2025-03-31",
    "allEffective": false,
    "includeRequestCriteriaInResponse": false,
    "fields": {
      "fieldSetVersion": "v1",
      "onlyInclude": [
        {"id": "Field_Path_ID=$.workers.employeeId"},
        {"id": "Field_Path_ID=$.workers.personalCommunication.addresses.*"}
      ]
    },
    "organizations": [
      {"id": "Organization_Reference_ID=TP-Australia", "descriptor": "Third Party Australia"}
    ],
    "excludeWorkers": false,
    "workers": [
      {"id": "Employee_ID=21286"} //Not Required
    ],
    "responseFilter": {
      "countryNameFormat": "COUNTRY_NAME",
      "countryRegionNameFormat": "COUNTRY_REGION_ID"
    },
    "forceRerun": false,
    "schemaOnly": false
  }
}
```

**Sample Processing Response**

```
{
  "id": "0c80b6074ebd01001944f2fdc45a0000",
```

```

    "responseData": {
      "status": {
        "descriptor": "Processing",
        "id": "d8b0c17e446c11de98360015c5e6daf6"
      }
    }
  }
}

```

### Sample Completed Response

```

{
  "id": "0c80b6074ebd01001944f2fdc45a0000",
  "responseData": {
    "status": {
      "descriptor": "Completed",
      "id": "d8b0bcd8446c11de98360015c5e6daf6"
    },
    "documents": [
      {
        "documentId": "0c80b6074ebd01001944f397691b0000/787343f2-a7ff-4306-b396-121c8539f3fa",
        "documentTags": [
          {
            "id": "9391e623a658100015cdbfa4c7600045",
            "descriptor": "Document Schema"
          },
          {
            "id": "9bdbef7931771000070097cb97bd0000",
            "descriptor": "Data Changes On Demand - DIS"
          }
        ],
        "fileName": "Data Changes On Demand - DIS Schema.json"
      },
      {
        "organization": {
          "id": "3cb7ef394b564f72afedf26f2ede1b31",
          "descriptor": "Third Party - Australia",
          "Organization_Reference_ID": "TP-Australia"
        },
        "documentTags": [
          {
            "id": "9bdbef7931771000070097cb97bd0000",
            "descriptor": "Data Changes On Demand - DIS"
          },
          {
            "id": "7ca3e1bd04e4100003d394c3e53d0001",
            "descriptor": "Data - Full"
          }
        ]
      }
    ]
  }
}

```

```
        "id":  
        "0c80b6074ebd01001941f7979dd30000" ,  
        "descriptor":  
        "3cb7ef394b564f72afedf26f2ede1b31"  
    } ,  
    {  
        "id":  
        "df3520a3ef69432bbd9f48ed808dbd18" ,  
        "descriptor": "Deliverable"  
    }  
],  
"fileName":  
"EffectiveWorkerInstances.json" ,  
"documentId":  
"0c80b6074ebd01001944f397691b0000/  
e55a97b8-cac4-408b-bd57-  
b22759b48246"  
}  
]  
}
```

## GET REST API Example

Retrieve processing response details of a specific Data Changes on Demand event, such as the status and documentId to retrieve the output file.

```
GET /effectiveChanges/{ID}
```

## Retrieve Output File

After you make a POST request from your third-party payroll system, you'll get a notification in the third-party system when the request completes. In the notification, you can retrieve the document ID and run the myReports API to retrieve the JSON output file:

<https://{{hostname}}/cc-blobitory/{{tenant}}/{{documentId}}>

To view the output file, the integration system user must have security access to the *Reports: Data Changes On Demand Results* domain in the Payroll Interface functional area. The default document retention policy for the JSON file is 60 days. For more information, see [Concept: My Reports API](#) on page 1986.

## Sample Output JSON file

```
GET https://{{hostname}}/cc-blobitory/{{tenant}}/{{documentId}}
```

```
{  
  "dataChangesOnDemand": {  
    "workers": [  
      {  
        "iid": {"val": "fd30c20b3d4a4801a5c4a272327e77fd"},  
        "employeeId": {"val": "21286"},  
        "personalCommunication": {  
          "addresses": [  
            {  
              "iid": {"val":  
"d6d752e891f440cfac5c7df26454fb9-836cf00ef5974ac08b786079866c946f-  
ADDRESS_REFERENCE-4-861"},  
              "usageType": {"val": "HOME"},  
              "addressId": {"val": "ADDRESS_REFERENCE-4-861"},  
              "primary": {"val": "true"},  
              "addressLine1": {  
                "val": "123 Main Street",  
                "city": "Anytown",  
                "state": "CA",  
                "zip": "90210",  
                "country": "USA"  
              }  
            }  
          ]  
        }  
      }  
    ]  
  }  
}
```

```

        "val": "789 Test Street",
        "ecs": [
            {
                "eff": "2025-03-27T00:00:00.000-07:00",
                "ent": "2025-03-27T14:14:35.777-07:00",
                "p": "123 Test Road",
                "c": "789 Test Street"
            }
        ],
        "city": {
            "val": "Test City"
        },
        "postalCode": { "val": "12345" },
        "country": { "val": "Australia" },
        "stateProvince": {
            "val": "Test State"
        }
    }
]
}

```

## Limitations

See the Limitations section of [Setup Considerations: Data Changes on Demand](#) on page 1423.

## Performance Considerations

Running multiple integration jobs simultaneously depending on job sizes can impact performance because grid jobs share the resources. Example: You launch 2 integration jobs simultaneously that utilize the expected amount of resources for those jobs, and it took 30 minutes for each job to complete. The next day, you launch 5 integration jobs that can't utilize the expected amount of resources for those jobs because of the tenant grid capacity, and it took 60 minutes for each job to complete.

## Common Errors

To see the list of all the error codes, see the 400 Response section in the POST /effectiveChanges endpoint for the Global Payroll service in the [Workday REST Services Directory](#).

Related Information

### Concepts

[2024R2 Feature Release Note: Data Changes on Demand](#)

### Concept: Notifications REST API

## Overview

To use the Global Payroll Notifications synchronous REST API:

1. Work with a payroll vendor to configure Inbound Notifications in Workday. See [Steps: Set Up Inbound Notifications](#) on page 1493.
2. The third-party payroll vendor calls the Notifications REST API.
3. The Workday user recipients receive the Workday notification.

For reference documentation about the globalPayroll REST APIs, see [globalPayroll/notifications](#) in the [Workday REST Services Directory](#).

## URL Base Path

```
https://{{tenantHostname}}/api/globalPayroll/{{version}}/{{tenantName}}/
notifications
```

### Example:

```
https://yourTenantHostName.com/api/globalPayroll/v1/gms/notifications
```

## Workday Extend API Gateway Base Path

For Workday Extend apps, use the regional API Gateway base URL for your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Developer Site. Note that the API Gateway base URL doesn't include the tenant name.

## Workday Tasks

If you send Additional Payroll Data in the `featureConfiguration` request parameters, depending on the recipients' role, they will receive either an:

- Employee self-service (ESS) task My Additional Payroll Data
- Administrator task Additional Payroll Data.

## Security Considerations

The integration system user must have Modify access to the *Manage: Global Payroll Inbound Notifications* domain in the Global Payroll Connect functional area to make the REST API request.

## Prerequisites

See [Steps: Set Up Inbound Notifications](#) on page 1493.

## Generating Inbound Notifications

POST /notifications

Generate custom notifications to specific workers or organization recipients within Workday from third-party payroll systems, such as notifying individual workers or organization worker recipients that external payroll documents have been uploaded in Workday.

The recipient section requires either of these 2 options:

- `workerRecipients`
- `organizationRecipients`

If you want to send a notification to both, send 2 POST notifications for workers and organization.

The message body of the notification (`message.body`) is expected in English. If you want to provide a translation for the body message, use the `translations` section and provide the `user_language_ID`. Use the *Get References* web service to get references for the different supported language IDs. For more information:

- Go to Integrations > Get\_References in the Workday Web Services (WWS) Directory: <https://community.workday.com/sites/default/files/file-hosting/productionapi/index.html>
- See Concept: *Get Reference SOAP Web Service Guidelines and Troubleshooting* on page 2333.

Sample POST Text Notification to Direct Worker Recipients

```
{
  "recipient": {
    "workerRecipients": [ {"id": "Employee_ID=21008"} ]
```

```

},
"message": {
  "title": "Welcome to the External Payroll Vendor!",
  "body": "We look forward to processing your Payroll",
  "link": "https://testvendor.com/welcome",
  "translations": [
    {
      "title": "¡Bienvenido al Proveedor Externo de Nómina!",
      "body": "Esperamos poder procesar su nómina",
      "languages": [{"id": "User_Language_ID=fr_fr"}]
    }
  ]
}
}

```

#### Sample POST Text Notification to Org Recipients

```

{
  "recipient": {
    "organizationRecipients": [
      {"organization": {
        "id": "Organization_Reference_ID=PAY_GROUP-4-15",
        "roles": [
          {"id": "Organization_Role_ID=Payroll_Interface_Partner"
        ]
      }
    ],
    "message": {
      "title": "Welcome to the External Payroll Vendor!",
      "body": "We look forward to processing your Payroll",
      "link": "https://testvendor.com/welcome",
      "translations": [
        {
          "title": "¡Bienvenido al Proveedor Externo de Nómina!",
          "body": "Esperamos poder procesar su nómina",
          "languages": [{"id": "User_Language_ID=fr_fr"}]
        }
      ]
    }
  }
}

```

#### Sample POST Notification with Additional Payroll Data Task for ESS (Employee Self-Service)

```

{
  "featureConfiguration": {
    "feature": {
      "id": "Feature_ID=Additional_Payroll_Data",
      "properties": [
        {"id": "ActedOnUser", "value": "Employee_ID=27559"},
        {"id": "payGroup", "value": "Organization_Reference_ID=PAY_GROUP-16-194"}
      ]
    },
    "recipient": {
      "workerRecipients": [{"id": "Employee_ID=27559"}]
    },
    "message": {
      "title": "Your Country specific forms are ready!",
      "body": "Please complete Additional Payroll Data for the United States.",
      "translations": [
        {
          "title": "Notification de test",
          "body": "C'est juste un test!",
          "languages": [{"id": "User_Language_ID=fr_FR"}, {"id": "User_Language_ID=fr_CA"}]
        },
        {
          "title": "Notificación de prueba",
          "body": "¡Esto es solo una prueba!",
          "languages": [{"id": "User_Language_ID=es_ES"}]
        }
      ]
    }
  }
}

```

```

"languages": [{"id": "User_Language_ID=es"}]
}
}
}

```

### Sample POST Notification with Additional Payroll Data Task for Administrator

```

{
  "featureConfiguration": {
    "feature": {
      "id": "Feature_ID=Additional_Payroll_Data",
      "properties": [
        {"id": "ActedOnUser", "value": "Employee_ID=27559"},
        {"id": "payGroup", "value": "Organization_Reference_ID=PAY_GROUP-16-194"}
      ]
    },
    "recipient": {
      "workerRecipients": [{"id": "Employee_ID=21008"}]
    },
    "message": {
      "title": "Country specific forms are ready for Employee 27559!",
      "body": "Please complete Additional Payroll Data for the United States on behalf of the worker.",
      "translations": [
        {
          "title": "Notification de test",
          "body": "C'est juste un test!",
          "languages": [{"id": "User_Language_ID=fr_FR"}, {"id": "User_Language_ID=fr_CA"}]
        },
        {
          "title": "Notificación de prueba",
          "body": ";Esto es solo una prueba!",
          "languages": [{"id": "User_Language_ID=es"}]
        }
      ]
    }
  }
}

```

### Limitations

You can't directly delete notifications or mark them as complete. However, you can mark notifications on the notifications page as read and use the filter to exclude them from view. Example: If you send a notification to multiple admins and 1 admin completes the task, the notification still displays for all the admins.

## Learning REST APIs

### Learning REST APIs

The Learning REST service provides REST APIs that enable:

- The import of digital courses from an external partner platform into Workday Learning.

[See Manage Digital Course REST API.](#)

- The export of content from Workday Learning, including digital courses, blended courses, programs, stand-alone lessons, course offerings, and external content. The exported content enables partner platforms to synchronize their learning content with Workday.

See [Content REST API](#).

## Manage Digital Course REST API

### Overview

The Manage Digital Courses API in the Learning REST service supports the creation and the update of digital courses with an external link lesson from an external partner platform into Workday Learning.

Key features:

- Import and batch import digital course events with external links from partner platforms into Workday.  
See [Importing Learning Content](#).
- Update and modify learning content from partner platforms to Workday.  
See [Updating Digital Courses](#).
- The API recognizes calls for skipping approval steps in a Business Process and distinguishes between a new course posting and a course update.
  - It's important to note that due to Business Process approvals, the API will initially create events that go through a BP for approval, rather than directly creating courses.
  - The API response will reflect the event creation, not the course creation, until approved.

Note: Skills are not included in the current version.

For reference documentation about the Manage Digital Courses REST APIs, see [learning/manageDigitalCourses](#) in the [Workday REST Services Directory](#) or [Workday REST API Explorer](#) on the Developer Site.

### URL Base Path

Tenant Base Path

```
https://{{tenantHostname}}/api/ learning /{{version}}/{{tenantName}}/
manageDigitalCourses
```

Example to create or update single course:

```
https://{{yourTenantHostName}}.com/api/learning/v1/<TENANT_NAME>/
manageDigitalCourse
```

Example to create or update multiple courses:

```
https://{{yourTenantHostName}}.com/api/learning/v1/<TENANT_NAME>/
manageDigitalCourses?bulk=true
```

Workday Extend API Gateway Base Path

For Workday Extend apps, use the regional API Gateway base URL for your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Developer Site. Note that the API Gateway base URL doesn't include the tenant name.

## Workday Tasks

Workday Task	Endpoint
Create Course	POST /manageDigitalCourses
Edit Course	POST /manageDigitalCourses

You can use these related tasks to get IDs required by this API:

- View Learning Topic - Provides the ID and status of topics.
- View Learning Security Category - Provides the ID of learning security categories.

## Business Processes

Business Process	Endpoint
<i>Manage Course initiated by Manage Learning Course (REST Service)</i>	POST /manageDigitalCourses

## Security Considerations

The content that you import using the *Learning v1* REST service is secured to these domains in the Learning functional area:

- *Learning Access*
- *Manage: Learning Content*
- *Manage: Learning Course Enrollments*
- *Set Up: Learning Catalog*

## Importing Learning Content

The POST /manageDigitalCourses endpoint facilitates the import of learning content.

To import multiple learning courses, specify the `bulk=true` query parameter. The `bulk=true` query parameter requires the `data[]` array containing the multiple instances in the request body. If you don't specify the `bulk=true` query parameter, you must specify the request body with a single instance JSON object.

In the request body, a course instance must contain at least these required fields:

- `course{}` - Required for an update, where `course{id}` identifies the existing course to update.
- `title` - The unique title of the course.
- `description`
- `status` - Valid values:
  - `Learning_Registerable_Status_ID=Open`
  - `Learning_Registerable_Status_ID=Closed`
- `topics[]` - A list of topics that are taught by the learning course. Each specified topic must be active.

To get the ID and status of a topic, use the View Learning Topic task.

- `lessons[ ]` - A list of the lessons in this course, which must contain at least 1 lesson.

For each lesson, these fields are required:

- `title` - The unique lesson title in this course.
- `url` - The link to the learning content for this lesson. For learning content in a partner platform, provide the link to the external content. The URL must begin with either `http://` or `https://`.
- `type` - Valid value:
  - `b2e74b2398a210000479dab46bb20066` (External Content)
- `order` - A string containing the numeric order of this lesson in the learning course.

Optional fields in the request body include:

- `course{courseId}` - For creating a new course, optionally specify the course reference ID. If you don't specify `course{courseId}` with a new course, the API generates the reference ID.
- `securityCategories[ ]` - To get the ID of a security category, use the View Learning Security Category task. See [Concept: Security in Learning](#).
- `languages[ ]` - Specify the language reference ID using the `User_Language_ID=<languageCode>_<countryCode>` format.

For a list of supported languages and their language reference IDs, run the Integration IDs report on the User Language business object. Don't use the language reference IDs with the "`_x`" suffix. Note that this API supports Language translation levels 1, 2 and 3 in Learning. See also [Community: Languages](#).

- `duration` - Valid Values:
  - `Learning_Time_Unit_ID=Minutes`
  - `Learning_Time_Unit_ID=Days`
  - `Learning_Time_Unit_ID=Hours`
  - `Learning_Time_Unit_ID=Weeks`
  - `Learning_Time_Unit_ID=Years`
  - `Learning_Time_Unit_ID=Months`
- `enforceLessonOrder` - If you set this to true, you must provide at least 2 lessons for this course.
- `imageRepresentation` - Contains the URL of a thumbnail image for this course. You can alternatively specify the Workday ID of an image uploaded in Workday Drive.

## Examples

This sample request creates a single course. The `course{courseId}` object sets the course reference ID as `DIGITAL_COURSE-15-112`.

```
POST /manageDigitalCourses
```

Request body:

```
{
  "course": {
    "courseId": "DIGITAL_COURSE-15-112"
  },
  "title": "Digital Course",
  "description": "Testing Import of Digital Course with External Link Lesson",
  "topics": [
    {
      "id": "Learning_Topic=Business Skills"
    },
    {
      "id": "Learning_Topic=Culture"
    }
  ]
}
```

```

        }
    ],
    "status": {
        "id": "Learning_Registerable_Status_ID=Open"
    },
    "contactPersons": [
        {
            "id": "d66d21e0b1c949b2b1a3decd2fad1375"
        }
    ],
    "securityCategories": [
        {
            "id": "234567890876543"
        }
    ],
    "courseNumber": "1234",
    "languages": [
        {
            "id": "User_Language_ID=en_US"
        },
        {
            "id": "User_Language_ID=fr_FR"
        }
    ],
    "duration": {
        "durationUnit": {
            "id": "Learning_Time_Unit_ID=Hours"
        },
        "durationValue": "15"
    },
    "excludeFromRecommendations": false,
    "excludeFromSearchAndBrowse": false,
    "enforceLessonOrder": false,
    "imageRepresentation": {
        "thumbnailURL": "https://www.chemistryviews.org/wp-content/uploads/2023/06/2023_ColorOfSun.png"
    },
    "lessons": [
        {
            "title": "Lesson Title 1 - Batch Import Courses",
            "description": "Lesson Description 1",
            "url": "https://www.chemistryviews.org/wp-content/lesson1",
            "order": "1",
            "type": {
                "id": "b2e74b2398a210000479dab46bb20066"
            },
            "required": true
        }
    ]
}

```

This sample request creates two courses, as specified by the `bulk=true` query parameter and the `data[]` array in the request body.

Note the difference between the 2 instances:

- The first instance doesn't include the `course{}` object, so the API creates a new course with an auto-generated reference ID.
- The second instance includes the `course{courseId}` object, so the API creates a new course with the specified reference ID.

```
POST /manageDigitalCourses?bulk=true
```

Request body:

```
{
  "data": [
    {
      "title": "Test Course 1a",
      "description": "Testing Import of Digital Course with External Link Lesson",
      "topics": [
        {
          "id": "Learning_Topic=Business Skills"
        },
        {
          "id": "Learning_Topic=Culture"
        }
      ],
      "status": {
        "id": "Learning_Registerable_Status_ID=Open"
      },
      "contactPersons": [
        {
          "id": "d66d21e0b1c949b2b1a3decd2fad1375"
        }
      ],
      "securityCategories": [
        {
          "id": "Learning_Security_Category=234567890876543"
        }
      ],
      "courseNumber": "1234",
      "languages": [
        {
          "id": "User_Language_ID=en_US"
        },
        {
          "id": "User_Language_ID=fr_FR"
        }
      ],
      "duration": {
        "durationUnit": {
          "id": "Learning_Time_Unit_ID=Hours"
        },
        "durationValue": "15"
      },
      "excludeFromRecommendations": false,
      "excludeFromSearchAndBrowse": false,
      "enforceLessonOrder": false,
      "imageRepresentation": {
        "thumbnailURL": "https://www.chemistryviews.org/wp-content/uploads/2023/06/2023_ColorOfSun.png"
      },
      "lessons": [
        {
          "title": "Lesson Title 1 - Batch Import Courses",
          "description": "Lesson Description 1",
          "url": "https://www.google.com/",
          "order": "1",
          "type": {
            "id": "b2e74b2398a210000479dab46bb20066"
          },
          "required": true
        }
      ]
    }
  ]
}
```

```
},
{
  "course": {
    "courseId": "Accounting_101_2025_c"
  },
  "title": "Test Course 2 a",
  "description": "Testing a second course",
  "topics": [
    {
      "id": "Learning_Topic=Business Skills"
    },
    {
      "id": "Learning_Topic=Culture"
    }
  ],
  "status": {
    "id": "Learning_Registerable_Status_ID=Open"
  },
  "contactPersons": [
    {

    }
  ],
  "securityCategories": [
    {
      "id": "Learning_Security_Category=234567890876543"
    }
  ],
  "courseNumber": "1234",
  "languages": [
    {
      "id": "User_Language_ID=en_CA"
    },
    {
      "id": "User_Language_ID=fr_FR"
    }
  ],
  "duration": {
    "durationUnit": {
      "id": "Learning_Time_Unit_ID=Hours"
    },
    "durationValue": "4"
  },
  "excludeFromRecommendations": false,
  "excludeFromSearchAndBrowse": false,
  "enforceLessonOrder": false,
  "lessons": [
    {
      "title": "google",
      "description": "google",
      "url": "https://www.google.com/",
      "order": "1",
      "type": {
        "id": "b2e74b2398a210000479dab46bb20066"
      },
      "required": true
    },
    {
      "description": "workday",
      "title": "workday",
      "url": "https://www.workday.com/",
      "order": "2",
      "type": {
        "id": "b2e74b2398a210000479dab46bb20066"
      }
    }
  ]
}
```

```
        },
        "required": true
    }
}
]
}
}
```

## Updating Digital Courses

## To update an existing course:

- In the request body, specify the course{`id`} object where `id` is one of:
    - The title of the existing course. You can use this if the exact course title is available. Prefix the title with Learning\_Course. Example: To update the course entitled “Course 1”, specify:

"id": "Learning\_Course=Course 1"

- The reference ID or auto-generated ID of the existing course. You can use this if the human-readable reference ID is available. Prefix the course reference ID with `Learning_Course`. Example: To update the course that has an auto-generated ID “`DIGITAL.Course-15-112`”, specify:

"id": "Learning\_Course=DIGITAL\_COURSE-15-112"

- The Workday ID of the existing course. The system-generated WID is the most reliable way to identify the course. To update the course using its Workday ID “bd2793317d3c01001713d39479ff0000”, specify:

"id": "bd2793317d3c01001713d39479ff0000"

If you specify an existing title with the `course{id}` object, the API performs a full replacement of the existing course.

If you specify an existing title without specifying the course{`id`} object, the API attempts to create the course but will return an error indicating the course already exists.

- Include ALL fields in your request. Any omitted fields will be removed from the course. For example: If your course has 2 lessons and you only include 1 in the update, the omitted lesson will be removed. For the list of fields, see the OpenAPI spec for `POST /manageDigitalCourses`.

Changes made to digital courses through the Manage Digital Courses API will persist. However, any subsequent updates via the Manage Digital Courses API will overwrite changes that are manually entered in Workday Learning. Example: Assume you manually altered a Digital Course's title in Workday Learning, but the title remains unchanged on the partner platform. When you import learning content from the partner platform through the API, it will revert the title to what's on the partner platform.

Note: The Manage Digital Courses API doesn't override fields that are only available in Workday Learning UI. For subsequent updates after the POST /manageDigitalCourses request, we retain the updated fields in the UI that are unsupported in the API.

### Example:

This sample request updates a course. The course{**id**} object identifies the existing course whose reference ID is *Learning\_Course=DIGITAL COURSE-15-112* .

**POST /manageDigitalCourses**

## Request body:

{

```

"course": {
  "id": "Learning_Course=DIGITAL COURSE-15-112"
},
"title": "Test Course",
"description": "Testing Import of Digital Course with External Link Lesson",
"topics": [
  {
    "id": "Learning_Topic=Business Skills"
  },
  {
    "id": "Learning_Topic=Culture"
  }
],
"status": {
  "id": "Learning_Registerable_Status_ID=Open"
},
"contactPersons": [
  {
    "id": "d66d21e0b1c949b2b1a3decd2fad1375"
  }
],
"securityCategories": [
  {
    "id": "234567890876543"
  }
],
"courseNumber": "1234",
"languages": [
  {
    "id": "User_Language_ID=en_US"
  },
  {
    "id": "User_Language_ID=fr_FR"
  }
],
"duration": {
  "durationUnit": {
    "id": "Learning_Time_Unit_ID=Hours"
  },
  "durationValue": "15"
},
"excludeFromRecommendations": false,
"excludeFromSearchAndBrowse": false,
"enforceLessonOrder": false,
"imageRepresentation": {
  "thumbnailURL": "https://www.chemistryviews.org/wp-content/uploads/2023/06/2023_ColorOfSun.png"
},
"lessons": [
  {
    "title": "Lesson Title 1 - Batch Import Courses",
    "description": "Lesson Description 1",
    "url": "https://www.google.com/",
    "order": "1",
    "type": {
      "id": "b2e74b2398a210000479dab46bb20066"
    },
    "required": true
  }
]
}

```

## Limitations

Not all fields are available through the Manage Digital Courses API. You can use the Edit Course task to edit the fields that are not available in the API.

## Performance Considerations

Bulk import of content is supported up to 1000 courses in a single request.

## Common Errors

Error	Error Code	Cause and Solution
<i>Missing Required Field, Malformed Syntax, Invalid Data Value, Duplicate Resource</i>	400 Bad Request	Check the syntax of the request body, identify required fields, see if any ID or title already exists.
<i>Authentication Failed</i>	401 Unauthorized	Ensure your request headers contain a valid and unexpired API key or bearer token.

### Examples

[Learning REST Web Service](#)

## Content REST API

### Overview

The Content API in the Learning REST service provides the ability to export and sync learning content, including digital courses, blended courses, programs, stand-alone lessons, course offerings, and external content, from Workday to partner platforms.

Key features:

- Content Export : Exporting the entire content catalog or specific content using various filters. The exportable content catalog includes these:
  - Blended Courses
  - Course Offerings
  - Digital Courses
  - External Content
  - Programs
- Deep Links: Adding deep links to course descriptions for content consumption.
- Thumbnail Export: Exporting thumbnail images as part of catalog metadata.
- Content Synchronization: Ensuring the content catalog on partner platforms remains synchronized with Workday Learning.

For reference documentation about the Content REST APIs, see [learning/content](#) in the [Workday REST Services Directory](#) or [Workday REST API Explorer](#) on the Developer Site.

## URL Base Path

Tenant Base Path

```
https://{{tenantHostname}}/api/ learning /{{version}}/{{tenantName}}/ content
```

## Example

```
https://yourTenantHostName.com/api/learning/v1/<TENANT_NAME>/content
```

## Workday Extend API Gateway Base Path

For Workday Extend apps, use the regional API Gateway base URL for your company. See [Reference: Workday Extend API Gateways and Authorization Base URLs](#) on the Developer Site. Note that the API Gateway base URL doesn't include the tenant name.

## Security Considerations

The content that you export using the *Learning v1* REST service is secured to these domains in the Learning functional area:

- *Learning Access*
- *Manage: Learning Content*
- *Manage: Learning Course Enrollments*
- *Set Up: Learning Catalog*
- *Self-Service: Learning Instructor*
- *Self-Service: On the Job Training*

## Exporting Learning Content

The GET `/content` endpoint facilitates the full export of learning content.

This endpoint returns a collection of all learning content in Workday Learning. Each result includes a content type field, such as "Blended Course" or "Course Offering," which describes the type of content.

You can filter the content by content type, skills, or topics. To filter the content by last updated date, see [Getting the Latest Content](#).

To get the lessons for each course, see [Getting the Lessons](#).

Sample request:

```
GET /content
```

## Getting Specific Content

The GET `/content/{ID}` endpoint facilitates the retrieval of a specific instance of learning content.

Sample request:

```
GET /content/488e285c181a01d1bfa763943025a109
```

## Getting the Latest Content

You can use the `lastUpdated` query parameter with the GET `/content` endpoint to get the updated changes since the specified date.

The `lastUpdated` query parameter:

- Must be in `yyyy-mm-dd hh:mm` datetime format.
- Returns instances that are updated on or after the specified date.

Sample request:

```
GET /content?lastUpdated=2025-08-14-07:00
```

## Getting the Lessons

The GET `/content/{ID}/lessons` endpoint provides the ability to export detailed lesson information for each Course within Workday Learning to external partner platforms. The API returns lesson details for these lesson types:

- External Content
- In Person Led Training
- Instructor Led Virtual Classroom
- Media, Survey, Training

All lessons returned by the API maintain the same order as they appear in Workday.

Sample request:

```
GET /content/488e285c181a01d1bfa763943025a109/lessons
```

## Limitations

- For the v1 version, contextual security evaluation is unavailable. When content is exported, learners can view it on the partner platform. However, if a learner attempts to access content from the partner platform without the necessary viewing permissions, they will be unable to access the content within Workday.
- Lessons are not returned for Programs or Standalone lessons. Programs are a collection of content, not lessons, therefore Lessons are not returned for a program.

## Performance Considerations

For the GET endpoints that return a collection, the default is 20, and the maximum is 100 for result collection per page. LIMIT can be used to set the value required.

[Learning REST Web Service](#)

# Workday Web Services and Integration IDs

## Concept: Workday Web Services

Workday Web Services (WWS) provide a programmatic public API for our On-Demand Workday Business Management Services. Web services are one of the central components of the Workday architecture and provide the core enablement tool to integrate with Workday.

WWS use industry-standards. These standards encompass WSDL, SOAP, REST, and the WS-\* standards. In addition, we version WWS to ensure stability and backwards compatibility. Workday protects your investment in a specific version of our WWS as the business services of Workday evolve.

### Web Service Versioning

Workday provides a new version of the WWS API with each release and regular updates between releases. Example: Workday provided a v15 WWS API with Workday 15. Each update of the WWS API adds support for the new features introduced with the corresponding update of Workday.

You don't have to adopt the latest version of the WWS API. The WWS API is backward compatible. Example: A client application written to work with v14 of the WWS API will continue to work when v15 of the WWS API is available.

Note: Workday doesn't guarantee that an application written against 1 API version will always work after updates. Certain object model changes and data representations require enhancements to the API.

Workday recommends using the most recent version of the WWS APIs for optimum performance and stability. Workday updates prior versions of the WWS APIs to maintain backward compatibility for all noncurrent versions of the WWS APIs that haven't reached an end-of-life status. Workday doesn't generally enhance prior versions of WWS APIs.

We announce new WWS versions on Workday Developer Network. For supported WWS versions, see Workday Web Services (WWS) API Support Policy.

Workday can make backward compatible changes to an existing WWS version. Workday will make changes that aren't backward compatible in a new WWS version (Workday can change a Preview version).

Preview tenants provide one or more preview versions of the WWS API. The behavior of an operation or the WSDL for a service can change while a WWS version is in preview. Example: WWS versions v23.2 and v24.0 are available in Preview tenants while version v23.1 is the current version available in Production, Implementation, and Sandbox tenants.

## Unversioned Web Service Requests

Workday strongly discourages the use of unversioned web service requests, and their use is only for backward compatibility.

Workday interprets a versionless request as version 15 of the WWS API. Version 15 will continue to be the web service version applied to unversioned requests until version 15 reaches its End Of Life. However, the v15 WWS API might not support features introduced in subsequent Workday updates.

After version 15 reaches End of Life, Workday uses the earliest available version.

## Deprecation and Retirement of Web Services

Workday provides communication through the WWS API Documentation when we no longer update an operation. Deprecated operations will continue to work until the operation reaches End-of-Life status.

Workday gives End of Life notice at least 18 months before an API version or operation ends. We provide notice through the Workday Developer Network. Workday will also directly notify customers using API versions or operations planned for removal.

## Using a Single WSDL File for Multiple Web Services

You can combine Workday Web Services into a single WSDL or XML Schema (XSD) file. To combine the services, use the + character in between the services in your endpoint.

Example:

```
https://{{endpoint}}/ccx/service/{{tenant}}/Staffing+Human_Resources+Recruiting?
wsdl
```

Alternatively, you can use the

```
?xsd
```

suffix to retrieve the XML Schema for multiple services.

Workday always returns the latest version of our WWS when combining services and schema. Workday interprets a versionless request for the WSDL of a single service or XML Schema as v15. If v15 of the WWS API isn't available, Workday uses the first version after v15.

## Concept: Workday Web Services Best Practices

To optimize performance for Workday Web Services, always use these best practices:

Recommendation	Description
Specify a Workday Web Services version in a request.	Always specify the version at the message level.
Specify an <i>As_Of_Entry_DateTime</i> value when retrieving paged Workday data.	When you use a paged operation to retrieve Workday data, specify an <i>As_Of_Entry_DateTime</i> value in your <i>Response_Filter</i> element to ensure that the returned data set remains unchanged.
Never use a standard report with an Integration.	You can copy the standard report into a custom report. Use the Copy option in the related actions menu of a standard report and base your integration off of the copy. Select the Web Service Enable check box for the custom report.
Always web services enable your Custom Reports.	If you're using a custom report for your integration, always check the Web Service Enable check box. The check box enforces additional validations in the report and stabilizes the XML Schema structure.
Only use the descriptor attribute for readability.	<p>Use the <i>Descriptor</i> attribute to make XML documents more readable. Only use the <i>Descriptor</i> attribute as an informational description. Descriptors can change in both format and value. Don't use descriptors as an index, identifier, or other data.</p> <p>Example: The <i>Descriptor</i> attribute is set to the name of the worker (Logan McNeil):</p> <pre data-bbox="878 1459 1628 1712">&lt;wd:Worker_Reference   wd:Descriptor="Logan McNeil"&gt;     &lt;wd:ID       wd:type="WID"&gt;3aa55550b7fe348b98d7b555555741af&lt;/wd:ID&gt;     &lt;wd:ID       wd:type="Employee_ID"&gt;21001&lt;/wd:ID&gt;   &lt;/wd:Worker_Reference&gt;</pre>
Use the latest Workday Web Services version.	Specify the latest version of WWS in your requests.
Consider when to use Put web services vs. Import web services vs. Bulk Import web services.	<p>Consider using:</p> <ul style="list-style-type: none"> <li>• Put web services for small requests and to load individual documents.</li> </ul>

Recommendation	Description
	<ul style="list-style-type: none"> <li>Import web services for large requests and to load large documents.</li> <li>Bulk Import web services for large batch requests and to load many individual documents asynchronously.</li> </ul>

[Reference: Integrations and Web Service Limits](#)

## Concept: Workday Web Services Versioning

Web service versioning enables your integrations to remain unchanged and fully functional as Workday changes.

Web service versions determine the format for the WSDLs and:

- Requests sent into Workday.
- Responses returned by Workday.

You can specify the web service version in 1 of these ways:

- Endpoint versioning, where the version invoked becomes part of the URL endpoint.
- Message versioning, where a version number included in the request determines how Workday processes the request and the response of Workday.

When you include the web service version in both the endpoint and the message, Workday uses the version specified in the message.

Note: Workday uses whole numbers for web service versions before v21.0.

Version	Description
Endpoint	<p>When you specify the web service version on the endpoint, you use this format:</p> <pre data-bbox="878 1453 1339 1537">https://{{Workday domain}}/ccx/ service/{{tenant}}/{{service}}/ {{version}}</pre> <p>Example:</p> <pre data-bbox="878 1622 1428 1685">https://services1.workday.com/ccx/ service/acme/Human_Resources/v33.1</pre> <p>You can retrieve the WSDL for the specified version of a service using this template:</p> <pre data-bbox="878 1812 1339 1896">https://{{Workday domain}}/ccx/ service/{{tenant}}/{{service}}/ {{version}}?wsdl</pre>

Version	Description
	<p>Example:</p> <pre data-bbox="878 270 1442 354"><a href="https://services1.workday.com/ccx/service/acme/Human_Resources/v33.1?wsdl">https://services1.workday.com/ccx/service/acme/Human_Resources/v33.1?wsdl</a></pre>
Message	<p>You can specify the version in the SOAP-based message:</p> <pre data-bbox="878 481 1393 874">&lt;env:Envelope xmlns:env="http://schemas.xmlsoap.org/soap/envelope/"&gt; &lt;env:Body&gt; &lt;wd:Get_Locations_Request   xmlns:wd="urn:com.workday/bsvc"   wd:version="v33.1"&gt; &lt;wd:Request_Criteria&gt; &lt;wd:Location_Name&gt;This is an example&lt;/wd:Location_Name&gt; &lt;/wd:Request_Criteria&gt; &lt;/wd:Get_Locations_Request&gt; &lt;/env:Body&gt; &lt;/env:Envelope&gt;</pre> <p>The SOAP-based XML root element schema example with version information:</p> <pre data-bbox="878 1009 1556 1790">&lt;xsd:complexType   name="Get_Locations_RequestType"&gt; &lt;xsd:annotation&gt; &lt;xsd:documentation&gt;Request element used to find and get Locations and their associated data.&lt;/xsd:documentation&gt; &lt;/xsd:annotation&gt; &lt;xsd:sequence&gt; &lt;xsd:element   name="Request_References"   type="wd:Location_Request_ReferencesType"   minOccurs="0"&gt;...&lt;/xsd:element&gt; &lt;xsd:element   name="Request_Criteria"   type="wd:Location_Request_CriteriaType"   minOccurs="0"&gt;...&lt;/xsd:element&gt; &lt;xsd:element   name="Response_Filter"   type="wd:Response_FilterType"   minOccurs="0"/&gt; &lt;xsd:element   name="Response_Group"   type="wd:Location_Response_GroupType"   minOccurs="0"&gt;...&lt;/xsd:element&gt; &lt;/xsd:sequence&gt; &lt;xsd:attribute ref="wd:version" /&gt; &lt;/xsd:complexType&gt;</pre>

## Concept: Workday SOAP API Headers

### External Integration Headers

Workday SOAP APIs support these specialized HTTP headers:

- External integration headers
- Validate-only mode header
- Request timeout header

The external integration headers for SOAP web services provide insight about web service transactions for analysis and troubleshooting. You can set these HTTP headers to values that identify the originating company, system, and transaction type of the web service request. Workday accepts these request headers and adds them to the Workday logs. The request headers help with filtering the logs to expedite troubleshooting with Customer Support.

HTTP Header	Description	Header Value
wd-external-request-id	Tracks web service requests.	A universally unique identifier (UUID). You can optionally use an alphanumeric string that clearly and uniquely identifies the request.
wd-external-application-id	Tracks external systems or applications that send the web service requests.	The name of the external integration, third-party tool, or software component that sends the web service request. Use a name that clearly identifies the initiating application.
wd-external-originator-id	Tracks originators that initiate the web service requests.	The user account or system account that initiated the web service request.

Consider these guidelines when you set the HTTP header values:

- Although Workday doesn't validate the header values, we strongly recommend that you use unique values to track the requests clearly. For API calls made by Workday partners, we recommend using the wd-external-application-id header. Workday might reject requests without this header.
- Limit the length to 50 characters to enable efficient searching, debugging, and tracking in the logs. We truncate header values greater than 50 characters.
- Don't include sensitive information.

We log all external integration headers you send with each web service request. If you don't send any of the external integration headers with a web service request, we don't log the request headers.

### Validate Only Mode Header

Validate only mode enables you to validate a SOAP request without taking any action or persisting any data in the tenant.

To enable validate only mode, set these HTTP headers to 1 in your HTTP request:

```
X-Validate-Only: 1
```

Note: Workday recommends that you use the newest version of the SOAP web services. The `x-Validate-Only` header and the Get Import Process Messages operation of the Integrations web service are unavailable in versions before v27.0.

The response message returns validation errors in the request, but doesn't validate custom validations. Correct the errors in the request and resend it. After you receive a response with no validation errors, send the request. Set the HTTP header to zero to perform the SOAP action or send it without the header.

```
X-Validate-Only: 0
```

The action completes and data is now persisted in the tenant.

#### Validate Only Mode for Import Web Services

Validate only mode is available for Import web service operations. For these operations, we only test the validations listed in the WWS API Documentation of that operation. We don't test custom validations and validations that occur post-processing or at the operation level after the api persists lines.

For Import web service operations, the response message only contains the WID of the process performing the import actions. To retrieve the operation status, use the Get Import Processes operation of the Integrations web service.

The response message contains this response header if the request includes the `X-Validate-Only` header.

```
<wd:Validate_Only>1</wd:Validate_Only>
```

To retrieve the validation messages, use the Get Import Process Messages operation of the Integrations web service. The response contains any validation errors detected by this mode.

EIB and Studio tools support validate only mode, while iLoad operations don't support validate only mode.

#### Request Timeout Header

You can use the `wd-request-timeout` header in your SOAP web services to specify a timeout limit for your request calls.

You can specify values in the `wd-request-timeout` header using milliseconds.

Example: `wd-request-timeout = 21600000` corresponds to a 6 hour timeout limit.

[Workday API Headers](#)

## Steps: Authenticate RaaS with OAuth 2.0

### Context

You supply authentication credentials to access web service enabled custom reports (Reports as a Service; RaaS). OAuth 2.0 is a supported authentication method to access RaaS.

### Steps

1. Create a web service enabled REST-based custom report.

See [Concept: Accessing RaaS Output](#). Follow the instructions to copy the Workday XML URL, and save it to use later.

## 2. Register API Clients.

Register your API client with these options:

- Client Grant Type: Authorization Code Grant
- Support Proof Key for Code Exchange (PKCE): select the check box.
- Access Token Type: Bearer
- Redirection URI: enter a valid HTTPS URI.
- Grant Administrative Consent: select the check box.
- Scope (Functional Areas): select all the areas that apply to your report. There might be report data sources or report fields secured to core Workday domains that aren't in any functional areas. If so, select the Include Workday Owned Scope check box.

Copy the Authorization Endpoint, Token Endpoint, and the Client ID value.

## 3. To request an authorization code, send an HTTPS GET request to the authorization endpoint.

Send this request in your browser and sign in if requested:

```
https://{{myAuthorizationEndpoint}}?
response_type=code&client_id={{myClientID}}&code_challenge={{myCodeChallenge}}&code_cha
```

The code challenge is a SHA-256 hashed and then Base 64 encoded code verifier that you supply. Example: A code verifier *test* produces the code challenge *n4bQgYhMfWWaL-qgxVrQFaO\_TxsrC4Is0VIIsFbDwCgg*. Save your code verifier.

## 4. Copy the authorization code value from the response.

The response contains the Redirection URI entered in the Register API Client task, and the authorization code:

```
https://{{redirection URI}}/?code={{myAuthorizationCode}}
```

## 5. To request an access token, send a POST request to the token endpoint:

```
curl --location --request POST "{{myTokenEndpoint}}" ^
--header "Origin: {{Redirection URI}}" ^
--header "Content-Type: application/x-www-form-urlencoded" ^
-d "grant_type=authorization_code" ^
-d "code={{myAuthorizationCode}}" ^
-d "client_id={{myClientID}}" ^
-d "code_verifier={{myCodeVerifier}}" ^
-d "redirect_uri={{Redirection URI}}"
```

## 6. Copy the access token from the response.

The response contains the access token and token type:

```
{ "access_token": "{{myAccessToken}}", "token_type": "Bearer" }
```

## 7. Set the HTTP Authorization header to Bearer {{myAccessToken}} for your request to the report URL.

Example: Send the access token in the Authorization header to the report REST URL that you saved earlier:

```
curl -H "Authorization: Bearer {{myAccessToken}}" {{myReportURL}}
```

Note: If your RaaS report includes more than 1 prompt, encode the RaaS URL in double quotes so that the curl command executes the RaaS URL correctly.

## Result

The response contains the custom report in XML.

## View Web Service Version Changes Using the API Change Log

### Prerequisites

Security: *Integration Build* domain in the Integration functional area.

### Context

You can use the API Change Log report in Workday to view a summary of the changes to a web service for new and previous versions.

### Steps

1. Access the API Change Log report.
2. On the report, consider:

Option	Description
Web Service Operation	Select a web service.
Changes After Version	Select the starting version that you want to view changes from. Example: <i>v40.0</i> .
Changes Up To Version	Select the version that you want to view changes up to. Example: <i>v41.2</i> .
Include Reference ID related Changes	Select if you want to include changes related to reference IDs in your results.

### Result

The report displays a summary of the changes to the web service for the version range that you selected.

### Next Steps

Adjust the version range to view additional changes.

## Custom Objects in Workday Web Services

### Concept: Custom Objects in Workday Web Services

Some operations in Workday Web Services support Custom Objects. Custom Objects are tenant-specific, so a tenant-specific WSDL that contains the schema for your Custom Objects is available from your tenant.

To use these operations, retrieve the WSDL from your tenant to use with the third-party tools you use for SOAP development. The WSDL contains the information you need to access the Custom Objects.

After you have retrieved the custom WSDL, use Custom Object operations as you do for other web service operations.

### Custom Lists

If your Custom Object uses a Custom List, specify the type as `ExtendedAlias`. For example, a Custom Object for company phones is created, and uses a Custom List to specify the phone model. In the `ID` element, you specify the type as `ExtendedAlias`, and supply one of the Custom List values:

```
<cus:companyPhones>
  ...
</cus:companyPhones>
```

```

<cus:model>
  <cus:ID cus:type="ExtendedAlias">iphone</cus:ID>
</cus:model>
...
</cus:companyPhones>

```

## Operations that Support Custom Objects

Since Custom Objects are often displayed in the UI as Additional Data, web service operations that support Custom Objects typically contain Additional Data in their names. For example, the first released web service operations that support Custom Objects are named:

- Get Job Application Additional Data
- Put Job Application Additional Data
- Edit Worker Additional Data
- Edit Job Requisition Additional Data
- Edit Position Restrictions Additional Data

## Effective-Dated Custom Objects

Web service operations on effective-dated Custom Objects are processed by the associated business process. You must add a step to that business process for each Custom Object to process. When you add that step, supply entries for these columns:

- Type: Edit Additional Data
- Specify: select a Custom Object
- Group: select the security domains to apply to this Custom Object

When an effective-dated Custom Object is edited, a new instance is created. Therefore, you cannot use a WID to refer to effective-dated Custom Objects, since the WID changes whenever the object is updated. Use the reference ID, if one was specified, to reference an effective-dated Custom Object.

For multi-instance effective-dated Custom Objects, you must update all the data for all the instances in your request. Any instances not in the request are removed.

[Custom Objects \(Non-Effective Dated\) EIB - Inbound](#)

## Retrieve Custom Object WSDL

### Prerequisites

Security: *Custom Object Management* domain in the System functional area. You must have Get Integration permissions to this domain to retrieve the WSDL.

Security: *Integration Build* domain in the Integrations functional area to access the Public Web Services report.

### Context

To use Custom Objects in the web service operations that support them, retrieve the tenant-specific WSDL for those operations. Use these steps to retrieve the WSDL when logged into Workday.

### Steps

1. Access the Public Web Services report.
2. Select the related action menu from any of the web services listed in the report.

### 3. Select Web Service > View Custom WSDL

#### Result

This request returns the WSDL for your specific tenant, and includes custom objects in the operations that support them.

#### Next Steps

Use this WSDL with your toolset to access Custom Objects in operations that support them.

## Retrieve Custom Object WSDL Remotely

#### Prerequisites

You must know the service endpoint for your tenant, and you must have a username and password for an account with the required security.

**Security:** *Custom Object Management* domain in the System functional area. You must have Get Integration permissions to this domain to retrieve the WSDL.

#### Context

To use Custom Objects in the web service operations that support them, retrieve the tenant-specific WSDL for those operations. Use these steps to retrieve the WSDL without logging into Workday.

You can get a list of WWS endpoints from the Workday Data Centers page on Community. Access the page for your data center, download the data center information spreadsheet, and search for the entry, URL for Workday Web Service (WWS) requests.

#### Steps

1. Find the service endpoint URL for the web service of the custom object operation to use.

Example: An operation in the Human Resources web service will use a URL similar to this:

```
https://{{Workday Service}}/ccx/service/{{tenant}}/Human_Resources/{{version}}
```

2. Modify the service endpoint URL. Insert `Custom/Data` between the tenant and the web service portions of the URL, and append `?wsdl` to the end.

Example: Modify this URL:

```
https://{{Workday Service}}/ccx/service/{{tenant}}/Human_Resources/v24.0
```

To this:

```
https://{{Workday Service}}/ccx/service/{{tenant}}/Custom/Data/
Human_Resources/v24.0?wsdl
```

3. Use the URL to request the schema from your tenant using basic access authentication. You must supply your username and password. In contrast to web service calls, do not append your tenant name to your username for this request.

Enter the URL in your browser and supply your username and password when requested. Supply only your `<username>`, not `<username>@<tenant>`, for this request.

#### Result

This request returns the WSDL for your specific tenant, and includes custom objects in the operations that support them.

## Next Steps

Use this WSDL with your toolset to access Custom Objects in operations that support them.

## Concept: XPath Queries for Custom Objects in WWS

Some WWS operations support Custom Objects. In the web service schema (WSDL), this tenanted custom object data is associated with a namespace derived from the tenant name. This namespace will differ from tenant to tenant.

The standard Workday namespace is:

```
xmlns:wd="urn:com.workday/bsvc"
```

The custom namespace is:

```
xmlns:custom="urn:com.workday/tenants/{tenant}/data/custom"
```

where {tenant} is replaced by the tenant name.

In your XPath queries, use the custom: namespace prefix for the custom object data elements, and the wd: namespace prefix for the other elements.

Example: Using a predicate to specify a particular worker (Employee\_ID 21008), retrieve the custom object data, Parking Space Number. Notice that the namespace changes to the custom URN within the context of the Business\_Object\_Additional\_Data element:

```
/wd:Test_Get_Additional_Data_Response/
wd:Business_Object[wd:Business_Object_Reference/
wd:ID[@wd:type='Employee_ID']=21008]/wd:Business_Object_Additional_Data/
custom:parkingSpaces/custom:parkingSpaceNumber
```

## Example: Edit Worker Additional Data using WWS

This example shows how to edit effective-dated Custom Objects on a Worker using the Edit Worker Additional Data operation from the Staffing web service. Before you use this example, be sure that you can successfully follow the Getting Started example. Use the account credentials that you used for that example, and retrieve an Employee ID for a worker to use in this scenario.

### Context

For this scenario we first create Custom Objects on Worker. We'll create a single-instance Custom Object, Company Car, and a multi-instance Custom Object, Company Phones, that uses a Custom List. We'll create that Custom List before we create the Company Phones Custom Object. When you specify a Custom List value in WWS, the type of that entry is ExtendedAlias

Next we'll edit the business process associated with this web service operation, Edit Worker Additional Data Event. We will add a new step to the business process, Edit Additional Data, for each Custom Object that we will edit.

Next we'll retrieve the Custom WSDL for this web service. We retrieve the WSDL after creating the Custom Objects so they are included in the schema.

Finally, we'll make several requests to this operation to edit the Custom Objects on one of our workers.

## Steps

1. Access the Create Custom Object task.

Create a single-instance Custom Object on effective-dated Worker objects with these values:

- Workday Object: Effective Dated > ~Worker~ (Effective Dated)
- Custom Object Name: Company Car

General Settings:

- Web Service Alias: companyCar
- Allow Multiple Instances per Object?: No

Field Definitions (the Web Service Alias field will be filled in automatically. Select the Details control to display the value and confirm it, or edit it):

Field Label	Field Type	Web Service Alias
Make and Model	Text	makeAndModel
Date Purchased	Date	datePurchased
Cost	Currency	cost
Car Number	Integer	carNumber

Permissions:

- Self-Service: Personal Information
- Person Data: Personal Information

Summary:

- Review the information
- Display Value: not needed for single-instance Custom Object (leave blank)
- Reference ID: not needed for single-instance Custom Object (leave blank)

Activate the Custom Object.

2. Access the Create Custom List task.

Create a Custom List with these values:

- Custom Field Type Name: Phone Models
- Web Service Alias: phoneModels

Use these as the List Values:

List Value Name	Web Service Alias
iPhone 6	iphone6
DROID Maxx	droidMaxx
Galaxy S6	galaxyS6

3. Access the Create Custom Object task.

Create a multi-instance Custom Object on effective-dated Worker objects with these values:

- Workday Object: Effective Dated > ~Worker~ (Effective Dated)
- Custom Object Name: Company Phone

General Settings:

- Web Service Alias: companyPhone
- Allow Multiple Instances per Object?: Yes

Field Definitions (the Web Service Alias field will be filled in automatically. Select the Details control to display the value and confirm it, or edit it):

Field Label	Field Type	Web Service Alias
Phone Model	Custom List > Phone Models	phoneModel
Serial Number	Integer	serialNumber
Description	Text	description

Permissions:

- Self-Service: Personal Information
- Person Data: Personal Information

Summary:

- Review the information
- Display Value: Description
- Reference ID: Serial Number

Activate the Custom Object.

4. Edit the *business process definition*, Edit Worker Additional Data Event.

Enter `bp: edit worker additional data` into the search box to find the definition, then select Business Process > Edit Definition from the related action menu.

Accept today's date as the Effective Date, then add two business process steps, with these values:

Order	Type	Specify	Optional	Group
a1	Edit Additional Data	Company Car	checked	(Select all available options.)
a2	Edit Additional Data	Company Phone	checked	(Select all available options.)

5. [Retrieve Custom Object WSDL](#) on page 2294 or [Retrieve Custom Object WSDL Remotely](#) on page 2295

Retrieve the custom WSDL for the Staffing web service, and use it with your SOAP development tools.

6. Send an edit request to your tenant.

Set the Business Process Parameters so the process will complete automatically:

- Auto Complete: true
- Run Now: true

Set these values for the initial request:

- Effective Date: 2015-08-21 (or today's date)
- Worker Reference/ID: type="Employee\_ID" and 21001 (use the value for the worker from your tenant)

Use these values for the Custom Objects (notice that the elements names are the web service aliases). For Company Car:

- Car Number: 54
- Cost: 32000 (currency\_ID="USD")
- Date Purchased: 2014-10-08
- Make and Model: Ford Fusion

For Company Phone:

- Description: Initial issue
- Serial Number: 1000
- Phone Model: iPhone 6 (specify ID type="ExtendedAlias", and use the web alias iphone6)

Here is an example request that uses the suggested data:

```

<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/
envelope/" xmlns:bsvc="urn:com.workday/bsvc" xmlns:cus="urn:com.workday/
tenants/super/data/custom">
  <soapenv:Header/>
  <soapenv:Body>
    <bsvc:Edit_Worker_Additional_Data_Request bsvc:version="v25.0">
      <bsvc:Business_Process_Parameters>
        <bsvc:Auto_Complete>true</bsvc:Auto_Complete>
        <bsvc:Run_Now>true</bsvc:Run_Now>
      </bsvc:Business_Process_Parameters>
      <bsvc:Worker_Custom_Object_Data>
        <bsvc:Effective_Date>2015-08-21</bsvc:Effective_Date>
        <bsvc:Worker_Reference bsvc:Descriptor="?">
          <bsvc:ID bsvc:type="Employee_ID">21001</bsvc:ID>
        </bsvc:Worker_Reference>
        <bsvc:Business_Object_Additional_Data>
          <cus:companyCar>
            <cus:carNumber>54</cus:carNumber>
            <cus:cost cus:currency_ID="USD">32000</cus:cost>
            <cus:datePurchased>2014-10-08</cus:datePurchased>
            <cus:makeAndModel>Ford Fusion</cus:makeAndModel>
          </cus:companyCar>
          <cus:companyPhone>
            <cus:description>Initial issue</cus:description>
            <cus:serialNumber>1000</cus:serialNumber>
            <cus:phoneModel>
              <cus:ID cus:type="ExtendedAlias">iphone6</cus:ID>
            </cus:phoneModel>
          </cus:companyPhone>
        </bsvc:Business_Object_Additional_Data>
      </bsvc:Worker_Custom_Object_Data>
    </bsvc:Edit_Worker_Additional_Data_Request>
  </soapenv:Body>
</soapenv:Envelope>

```

## Result

The tenant should return a response similar to this example. In your tenant, if it is configured to display additional data on a worker's profile, you will be able to see these values on the Additional Data tab on the profile.

```

<env:Envelope xmlns:env="http://schemas.xmlsoap.org/soap/envelope/">
  <env:Body>
    <wd>Edit_Worker_Additional_Data_Response wd:version="v25.0"

                  </custom:companyCarReference>
                </custom:companyCarReference>
              </custom:companyCarReference>
            </custom:companyCarReference>
          </custom:companyCarReference>
        </custom:companyCarReference>
      </custom:companyCarReference>
    </wd>Edit_Worker_Additional_Data_Response>
  </env:Body>
</env:Envelope>
```

## Second Example Request

For the second request, send in a request to add a new Company Phone with these values:

- Description: Second issue
- Serial Number: 1001
- Phone Model: DROID Maxx (web alias droidMaxx)

Notice that we do not have an entry for Company Car, but we do repeat the entry for the initial issue of Company Phone. Company Phone is a multi-instance Custom Object. Anytime you modify a multi-instance

Custom Object, you must include all the instances in your request. Omitted instances of multi-instance Custom Objects will be omitted as of the effective date.

```

<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/">
  <soapenv:Header/>
  <soapenv:Body>
    <bsvc:Edit_Worker_Additional_Data_Request bsvc:version="v25.0">
      <bsvc:Business_Process_Parameters>
        <bsvc:Auto_Complete>true</bsvc:Auto_Complete>
        <bsvc:Run_Now>true</bsvc:Run_Now>
      </bsvc:Business_Process_Parameters>
      <bsvc:Worker_Custom_Object_Data>
        <bsvc:Effective_Date>2015-08-22</bsvc:Effective_Date>
        <bsvc:Worker_Reference bsvc:Descriptor="?">
          <bsvc:ID bsvc:type="Employee_ID">21001</bsvc:ID>
        </bsvc:Worker_Reference>
        <bsvc:Business_Object_Additional_Data>
          <cus:companyPhone>
            <cus:description>Initial issue</cus:description>
            <cus:serialNumber>1000</cus:serialNumber>
            <cus:phoneModel>
              <cus:ID cus:type="ExtendedAlias">iphone6</cus:ID>
            </cus:phoneModel>
          </cus:companyPhone>
          <cus:companyPhone>
            <cus:description>Second issue</cus:description>
            <cus:serialNumber>1001</cus:serialNumber>
            <cus:phoneModel>
              <cus:ID cus:type="ExtendedAlias">droidMaxx</cus:ID>
            </cus:phoneModel>
          </cus:companyPhone>
        </bsvc:Business_Object_Additional_Data>
      </bsvc:Worker_Custom_Object_Data>
    </bsvc:Edit_Worker_Additional_Data_Request>
  </soapenv:Body>
</soapenv:Envelope>

```

Compare the second response to the first response. For this web service operation, all the Custom Objects are returned, even if not specifically included in the request. So this second response contains values for Company Car, even though there is no value for Company Car in the request.

Also, compare the Custom Object WIDs that were returned in the two responses. Company Car:

- 9358fdb7118a300017a33264aa160027 (First response WID)
- 9358fdb7118a30001b7f8c2a5df40036 (Second response WID)

Company Phone:

- 9358fdb7118a300017a332134fd20026 (First response WID)
- 9358fdb7118a30001b7f8c6475510038 (Second response WID)

These WIDs are different because modifying an effective-dated Custom Object creates a new instance in the tenant. Do not use WIDs to refer to effective-dated Custom Objects, since a new WID is generated for each new instance.

    </wd:Additional_Data>
</wd>Edit_Worker_Additional_Data_Response>
</env:Body>
</env:Envelope>
```

### Third Example Request

For the third request, a new value is used for Company Car, and a new value is used for Company Phone. However, the first two Company Phone instances are not included in this request.

```

<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/" 
  xmlns:bsvc="urn:com.workday/bsvc" xmlns:cus="urn:com.workday/tenants/super/
  data/custom">
  <soapenv:Header/>
  <soapenv:Body>
    <bsvc:Edit_Worker_Additional_Data_Request bsvc:version="v25.0">
      <bsvc:Business_Process_Parameters>
        <bsvc:Auto_Complete>true</bsvc:Auto_Complete>
        <bsvc:Run_Now>true</bsvc:Run_Now>
      </bsvc:Business_Process_Parameters>
      <bsvc:Worker_Custom_Object_Data>
        <bsvc:Effective_Date>2015-08-23</bsvc:Effective_Date>
        <bsvc:Worker_Reference bsvc:Descriptor="?">
          <bsvc:ID bsvc:type="Employee_ID">21001</bsvc:ID>
        </bsvc:Worker_Reference>
        <bsvc:Business_Object_Additional_Data>
          <cus:companyCar>
            <cus:carNumber>372</cus:carNumber>
            <cus:cost cus:currency_ID="USD">45000</cus:cost>
            <cus:datePurchased>2015-02-15</cus:datePurchased>
            <cus:makeAndModel>Acura TL</cus:makeAndModel>
          </cus:companyCar>
        <!-- removed first two companyPhone elements -->
        <cus:companyPhone>
          <cus:description>Third issue</cus:description>
          <cus:serialNumber>1002</cus:serialNumber>
          <cus:phoneModel>
            <cus:ID cus:type="ExtendedAlias">galaxyS6</cus:ID>
          </cus:phoneModel>
        </cus:companyPhone>
      </bsvc:Business_Object_Additional_Data>
    </bsvc:Worker_Custom_Object_Data>
  </bsvc:Edit_Worker_Additional_Data_Request>
  </soapenv:Body>
</soapenv:Envelope>

```

For this third example response, notice that there is now only one instance of the Company Phone object. To reiterate, you must include all instances of an effective-dated multi-instance Custom Object in any web service operation edit requests, or those instances will be omitted.

```

## Integration IDs

### Concept: Integration IDs

Integration IDs identify an instance of a *business object* in Workday. Workday uses 3 different integration IDs for data loads, web services, and reports enabled as web services.

Integration ID Types	Description	Example
External ID	<p>A two-part unique identifier consisting of a:</p> <ul style="list-style-type: none"> <li>• System ID: Identifies an integration system in Workday.</li> <li>• Value: Identifies the particular business object instance.</li> </ul> <p>Reserved System IDs are a type of external ID consisting of internal <i>system ID</i> values that enable backward compatibility between:</p>	<p>Example: SFDC-W-001</p> <p>SFDC is a <i>system ID</i> for an integration between Workday and Salesforce.com.</p> <p>W-001 is the external ID value for the Western region instance of the sales organization.</p>

Integration ID Types	Description	Example
	<ul style="list-style-type: none"> <li>Original v1 and v2 operations in the Workday API</li> <li>Newer operations that use reference IDs and WIDs.</li> </ul> <p>There are 3 types of reserved System IDs:</p> <ul style="list-style-type: none"> <li>WD-WID: Enables you to use Workday IDs in a v1 or v2 operation.</li> <li>WD-EMPLID: Custom ID values that Workday uses to store employee IDs for v1 or v2 web services. Newer web services use Employee_ID reference ID.</li> </ul> <p>Use the WD-EMPLID value in the System ID EIB column or web service element. Use the employee ID in the ID column or element.</p> <ul style="list-style-type: none"> <li>The internal instance IDs Workday previously used to identify business objects.</li> </ul> <p>Note: Workday replaced WD-I with Workday IDs. Don't use WD-I.</p>	
Reference ID	<p>Reference IDs enable an integration or a data load to set a unique identifier for a Workday object. Unlike WIDs, reference IDs are constant across all Workday environments.</p> <p>Reference IDs enable you to configure unique identifiers. Business objects can have 1 or more reference IDs. Reference IDs consist of a:</p> <ul style="list-style-type: none"> <li>Type: Identifies the business object.</li> <li>Value: Identifies the instance of a business object.</li> </ul>	<p>Example: Organization-01</p> <p>Some reference IDs have parent reference IDs.</p> <p>Example: Custom report definitions whose reference ID values are unique by parent reference IDs that identify the report owner. Example: Both Logan McNeil and Betty Liu could have custom reports with a reference ID value of <i>All Employees</i>. These reference IDs become unique when combined with the parent reference ID values of <i>lmcniel</i> and <i>bliu</i>. This combination creates these reference IDs:</p> <ul style="list-style-type: none"> <li><i>lmcniel - All Employees</i></li> <li><i>bliu - All Employees</i></li> </ul>

Integration ID Types	Description	Example
Workday ID (WID)	<p>WIDs enable you to keep track of differences between objects in your tenants. WIDs can prevent integrations from running against the wrong environment.</p> <p>WIDs consist of a 32-character, nonchanging string that Workday automatically generates on customer data.</p> <p>Workday objects have different WIDs across your tenants. Testing and migration of these integrations with WIDs is more complex.</p>	Example: PEN-01 is the reference ID and c1829f532c8249eba1f592a7e6fe953e is the Workday ID for a ball point pen.

#### Related Information

##### Concepts

[Concept: Reports as a Service \(RaaS\)](#)

## Concept: Integration IDs Best Practices

### General Recommendations

- Specify easily identifiable reference IDs for your organization.
- Workday recommends that you avoid including sensitive information in the value of a reference ID because:
  - The Integration IDs report displays all reference ID values.
  - Workday Reports as a Service appends reference IDs to the URL.
  - Workday doesn't secure IDs over the internet.

### Connectors and Studio Integrations

- Avoid hard-coding values for reference IDs and WIDs in your integrations, instead use integration system attributes, maps, and launch parameters. Use these options to provide the required values for reference IDs and WIDs. Report fields provide a prompt of valid Workday values to users who configure the integration.
- Use environment restriction on attributes and maps. This option provides your integrations with the appropriate values for each environment.

### Enterprise Interface Builder (EIB) Integrations

- Use reference IDs on inbound EIBs.
- To provide greater stability, use calculated fields on outbound EIBs instead of hard-coding maps into custom XSLT transformations.

## Concept: Reference ID Maintenance

The *Put Reference* web service operation and Maintain Reference IDs task:

- Enable you to populate and maintain Reference IDs.
- Can't update Position IDs, hierarchical Reference IDs, or other complex Reference ID types.

To see the complete list of Reference ID types that you can maintain with the *Put Reference* web service operation and Maintain Reference IDs task:

1. Go to the Workday Web Services Directory.
2. Select the *Integrations* web service, and click the *Put Reference* operation.
3. Find the Reference\_IndexObjectID section.

The @type parameter value contains the list of all valid Reference ID types.

You can also use the Integration IDs report on the tenant to see a list of Reference IDs for the selected business objects.

### Reference

[Workday Web Services Directory](#)

## Set Up Reference IDs

### Prerequisites

Security:

- *Integration Build* domain in the Integration functional area.
- *Set Up: System* domain in the System functional area.

### Context

You can manually add reference IDs to *business objects* in bulk. Although Workday automatically generates IDs, Workday recommends using a custom reference ID strategy to maintain a smooth transition for integrations.

When using Object Transporter to migrate object instances from 1 tenant to another, give your objects Reference IDs unique across all tenants you control before their first migration.

Note: Use caution when editing reference ID values. After you've set the ID values, changes to those values can break integrations that use the current ID values.

### Steps

1. Access the Maintain Reference IDs task.
2. As you complete the task, consider:

Option	Description
Include Empty Values Only	Includes values for instances of business objects with manually deleted reference IDs.
Include Defaulted Values Only	Includes values for automatically generated Workday IDs.
None of the above	Includes reference IDs for all business objects

3. Click OK without entering data to have Workday auto-generate ID values for the empty values.

### Result

Populate spreadsheet lookup columns with the required reference IDs.

### Concepts

[Concept: EIB Spreadsheet Data Entry Guidelines](#) on page 56

[Concept: Reference ID Maintenance](#) on page 2306

## FAQ: Integration IDs

How do I populate empty Reference IDs?

You can add values for empty reference IDs on the Maintain Reference IDs task. You can enter your own values or have Workday automatically generate values.

You can maintain reference IDs that aren't Positional IDs or hierarchical Reference IDs.

Use the *Put Reference* web service operation:

- To set reference IDs with the Workday Web Services API.
- Create an EIB to set reference IDs.

How do I find the System\_ID value for a web service operation?

Workday doesn't display system IDs but we support backward compatibility for original Workday web service. To configure the System\_ID in the web service message, set either:

- The System\_ID to WD-EMPLID and specify values based on your Employee\_ID and Contingent\_Worker\_ID reference IDs. Example: <bsvc : ID bsvc : System\_ID = "WD-EMPLID" >22915</bsvc : ID>
- The System\_ID to WD-WID and specify the Workday ID values. Example: <bsvc : ID bsvc : System\_ID = "WD-WID" >d24b8d57b17554c5d44c12afcbd87e95</bsvc : ID>

Where can I find the WD-EMPLID for employees and contingent workers?

The WD-EMPLID value matches the reference ID value for an employee (Employee\_ID) or a contingent worker (Contingent\_Worker\_ID). To view the reference ID values, you can:

- Access the Integration IDs report
- On the related action on a worker, select Integration IDs > View IDs.

## Workday SOAP API Guidelines and Troubleshooting

### Concept: SOAP API Web Service Guidelines and Troubleshooting

This section provides topics for widely used Workday SOAP API web services. Each information page includes:

- A description of the web service operation.
- The equivalent Workday task for the SOAP API.
- The business process used by the SOAP API, when applicable.
- Guidance and best practices for the web service.
- Common issues and errors for the web service.
- Details about add/update/delete capabilities, as well as how to recover from a bad upload.
- A link to a sample XML file for the web service.

These topics supplement the information provided in [Workday SOAP Web Service Directory](#).

## Concept: Add Vaccination SOAP Web Service Guidelines and Troubleshooting

The web service loads a worker's vaccine events, including their vaccine status, type, and manufacturer.

To load a worker's workplace health and safety tests, use the *Add Workplace Testing* web service instead. Alternatively, you can also use the EIB for both the web services.

For API documentation, see [SOAP Operation Directory](#).

### Equivalent Workday User Interface (UI) Task

Add Vaccination

### Business Process Used by this Web Service

Add Vaccination Business Process

### Common Issues and Errors

Issue	Cause	Solution
The API fails with this message: Processing error occurred. The task submitted is not authorized.	Security configuration.	Verify that you have GET access to the <i>Integration Build</i> domain security policy.

### Web Service Processing

This web service only enables you to add vaccinations. You can't update or delete existing vaccination entries.

### Guidelines for Recovering from a Bad Load

When you upload incorrect entries, access 1 of these tasks:

- The Mass Cancel Business Processes task when the business process event is still in progress.
- The Mass Rescind Business Processes task when the business process event is complete.
- Security: *Business Process Administrator* domain in the System functional area.

After you cancel or rescind the events, rerun the web service requests.

- Listed below are additional vaccine-related resources:
  - [Next Level Presentation for Vaccination Tracking](#)
  - [What's New: Vaccination and Workplace Test Tracking](#)

### Sample Example File

[Add Vaccination PDF](#)

## Concept: Add Workplace Test SOAP Web Service Guidelines and Troubleshooting

- This web service is for loading a worker's workplace health and safety tests, including the test type and results.
- For more details, refer to the [Vaccination and Workplace Test Tracking What's New](#) post.
- Use web service Add Vaccination instead if you wish to load a worker's vaccine events, including their vaccine status, type, and manufacturer

For API documentation, see [SOAP Operation Directory](#).

## Equivalent User Interface (UI) Task

Add Workplace Test

## Business Process Used by This Web Service

Add Workplace Test

## Tips for Populating Your Request

- Populate these fields as follows:
  - Business\_Process\_Attachment\_Data
    - File\_Name: Enter name of file
    - File: This is the contents of the file. It must be base-64 encoded.
    - Content\_Type: If populating this field, you can find values by running the Integration IDs report and selecting business object Mime Type.
  - Auto\_Complete: Set to 1 to bypass approval/review/to do steps in the associated business process and to disable notifications.
  - Workplace\_Test\_Type: Example: COVID-19. To find the reference ID value, run View Reference IDs report and search business object Workplace Test Type.
  - Workplace\_Test\_Result: Examples: Negative, Positive. To find the reference ID value, run View Reference IDs report and search business object Workplace Test Result.
  - Workplace\_Test\_Result\_Date: Enter format YYYY-MM-DD.
- To view workers' existing workplace testing information or to confirm that the API successfully loaded the workplace testing information, consider creating a custom report from the Workplace Tests report data source.

## Common Issues and Errors

Issue	Cause	Cause and Solution
API fails with this message: <i>Processing error occurred. The task submitted is not authorized</i>	Security configuration.	<p>The <i>View Security for Securable Item</i> report displays that Add Workplace Test (Web Service) requires access to the Add Workplace Test business process security policy. Check your security configuration as follows:</p> <ul style="list-style-type: none"> <li>• View the business process security policy for Add Workplace Test: if you can't find this business process, use task Create Business Process Definition to create it.</li> <li>• Verify that you have access to Initiating Action Add Workplace Test (Web Service). Ideally, you should have unconstrained access. If you have constrained access, confirm that</li> </ul>

Issue	Cause	Cause and Solution
		<p>you have access to the necessary organizations.</p> <ul style="list-style-type: none"> <li>Also, verify you have access to the Workplace Test Tracking Functional Area.</li> </ul> <p>If you make any changes, activate them.</p>
Unable to view or open the attachment loaded by the API.	File format.	Verify that you loaded the attachment in base-64 encoded format.

### Guidelines for Recovering from a Bad Load

- This web service only enables you to add workplace tests. You can't update or delete existing test entries.
- When you upload incorrect entries, access 1 of these tasks:
  - The Mass Cancel Business Processes task when the business process event is still in progress.
  - The Mass Rescind Business Processes task when the business process event is complete.
- Select *Add Workplace Test* in the Business Process Types prompt and enter a date range for when you ran the API.
- Security: *Business Process Administrator* domain in the System functional area.

### Sample Example File

Refer to these attached files for examples:

- [Add Workplace Test WITH ATTACHMENT v38 PDF](#): This request loads a test result with an attachment.
- [Add Workplace Test NO Attachment v38 PDF](#): This request loads a test result. There's no attachment.

### Concept: Change Benefits SOAP Web Service Guidelines

The Change Benefits web service provides the ability to initiate and complete the *Change Benefits for Life Event* business process, which changes the benefit elections for an employee as part of a mass update of benefits enrollment from an external system of records.

This web service doesn't support incremental updates. The web service replaces those worker benefit elections that match a specific benefit event type and replaces them with the benefit elections that are specified on the web service call. Ensure that a 3rd party or an integration is not using the web service as it can inadvertently waive unrelated worker benefit elections.

We recommended that you use a separate benefit event type, that only contains the benefits that you want to update. For example, avoid using the Admin Correction benefit event type as it would first attempt to remove all of the benefits associated with that event type, such as FSA or HSA, before adding the requested plans.

To waive a benefit election, don't specify any replacement elections in the request.

The *Change Benefits* web service supports these benefit types:

- Health Care
- Heath Savings Account

- Spending Account
- Insurance
- Retirement Savings
- Additional Benefits elections

Each election type has its own section and each is mutually exclusive. You can submit only 1 election record for a plan. To make incremental updates for retirement savings plans, use this [Enroll in Retirement Savings Plans](#) web service.

For all web service API documentation including Get Candidates, see SOAP API Reference [Operation Directory](#).

### The Business Process

There are 2 business processes that impact the processing of this web service. When the *Change Benefits for Life Event* business process initiates:

1. Workday creates the Benefit Change event that display in the Benefit Election History page.
2. Workday creates the Election Package and Benefit Elections for the plans available to the employee.
3. Employees complete the enrollment pages and data is collected
4. The elections are finalized and attached to the employee.

The *Change Benefits* business process represents the request to make a benefit change in the Workday UI. The Change Benefits web service executes this step in the process. It is initiated through the Change Benefits related action. Once the page is submitted and reviewed, the system passes control back to *Change Benefits for Life Event* business process. For more details, learn about the difference between [Change Benefits](#) and [Change Benefits for Life Events](#).

### Event Date and Coverage Begin Date

Workday ignores the Coverage\_Begin\_Date and Deduction\_Begin\_Date fields in the web service request, and calculates these dates based on the setup in Enrollment Event Rules.

Some of the dates in the UI display the Original Coverage\_Begin\_Date and Original Coverage\_Begin\_Date. Ensure to discuss the benefit event date rules with a certified Benefits consultant to understand the functional implications of changes to these dates.

Errors are caused by violations to the defined rule set in the relevant configuration.

### Crafting the Request and the Response

Prior to creating your request, ensure you have all the reference IDs for the benefits you want to modify: Benefit Event Type ID, Frequency ID, Health Care Coverage Plan ID, Health Care Coverage Target ID, and so on.

If a plan requires a dependent, for example if you extend coverage from employee to employee + child, you will need to have the dependent in Workday with its Dependent ID otherwise your request will fail. If your request is successful, the response will provide you with a WID to view in the UI.

See the attached XML files for example of the request and the response.

### Incremental Updates Not Supported

The Change Benefits web service is not designed to be used for incremental updates

The most common use cases for updating benefit elections incrementally are updates to retirement savings plans or additional benefit plans. Updates to retirement savings plans should use the existing [Enroll\\_in\\_Retirement\\_Savings\\_Plan](#) web service. For additional benefit plans, it is recommended to have a separate event type created that has access only to that additional plan.

Note: We do not recommend that you bring in benefits deductions information into Workday Benefits via web service.

If Workday is not your system of record for benefits, as benefits administration is happening with a third-party provider, then you should load payroll input vs. benefit elections into Workday.

See the linked Q&A question "Outsourced Benefits Loading to Workday" in the Resources section.

This web service is not a substitute for the Import Payroll Input web service. Even though deductions from Workday Benefits flow through Workday Payroll after a Change Benefits web service request completes, any integration using the web service would have to leverage a RAAS call to pull existing benefits into the integrations, which may not be performant in the long run. In addition, each time the Change Benefits web service updates a worker's benefit elections, it needs to terminate existing elections and create a new Begin Date for that same plan with the new change.

Keep in mind that all historical Benefit Events are stored in Workday and displayed in the UI, so each event created by an integration using the Change Benefits web service will display in an affected worker's Benefits tab. The list of events could grow quite large if this web service is called frequently in an attempt to use it to perform incremental updates.

Changes made to benefits in the UI will perform automatic calculations that changes made via the web service will not. For example, when updating HSA/FSA elections, the UI will calculate the per period amount if only the goal based amount is known, whereas the web service will not. If only the goal-based amount is supplied in the web service request, the pay period amount will come back as zero.

## Details

- The *Change Benefits* web service covers Health Care, Heath Savings Account, Spending Account, Insurance, Retirement Savings and Additional Benefits elections. Each election type has its own section in the web service call and they are mutually exclusive.
- There are a number of date fields in the web service request. While only the Event Date and the Coverage Begin Date are required, populating other dates might affect the dates that are displayed in the Benefits tab in the UI. The Coverage Begin Date will show the earliest date of the Coverage Begin Date and the Original Coverage Begin Date loaded or defaulted. The Deduction Begin Date will show the earliest date of the Deduction Begin Date and the Original Deduction Begin Date loaded or defaulted.
- Workday allows only 1 Event Date per employee per event type. They can be in separate files or the same file. This date is typically defined as the later of the benefit plan year start date, hire date or the most current life event change date. Since this date is essentially the effective date of the plan election for an employee, benefit eligibility is also based on that date as well. For example, if a prior year hire had a job change during the current year which resulted in a benefit eligibility change and the conversion involves transactional job change history, the Event Date would have to be that particular job change date or the election will error.
- Coverage Begin Date – This date does not drive anything functionally, it is required and has to pass the validation rule for the load, that is, it cannot be prior to the Event Date. The easiest way is to make it the same as the Event Date so you won't have any loading issue. The real coverage begin date is driven by the coverage begin date configured in the enrollment event rule.
- Original Coverage Begin Date – This date is optional and can be used to capture the date that coverage really began. This is relevant when producing HIPAA statements.
- Deduction Begin Date – This date is optional and it is similar to the Coverage Begin Date that it is driven by deduction begin date configured in the enrollment event rule.
- Original Deduction Begin Date – This date is optional.

While other coverage plan types do not require Benefit Deduction Periods Remaining and Remaining Period Frequency, FSA does require both. The loaded remaining period overrides whatever the system derived remaining period based on the period schedule of the employee. The loaded frequency is the basis of the employee cost included in the load.

For example, if an employee is in a semi-monthly benefit group and his election has monthly and \$10.00 in the load, the load will convert the \$10 to \$5 for semi-monthly UI display. It is best to ask the client to provide the frequency basis that is consistent with the benefit group and pay group pay so it would be less confusing and avoid losing the decimal precision. Although the current benefit election tab would display the benefit group frequency, the Benefit Coverage History page will show the overriding frequency provided in the load. That can be confusing for the end user.

## Final Considerations

As a best practice, either Workday should be the system of record for eligibility via rules in the system, or a third party should have that ownership. If benefits eligibility is owned by a third party, this web service should only be used to bring in relevant deductions.

When using the *Change Benefits* web service:

- Configure all Benefit Plans ahead of time.
- Ensure that any dependents referenced already exists.
- You can't drop enrollments. When an employee drops their enrollment, you will only be able to update the deduction amount to zero. Run a custom report to manually drop enrollments where the amount is \$0.
- You can't perform incremental updates. Any issues arising from attempting to use the web service to perform incremental updates will not be considered bugs.

## Sample Example File

[Change Benefits Request PDF](#)

[Change Benefits Response PDF](#)

## Concept: Change Job SOAP Web Service Guidelines and Troubleshooting

### Context

The Change Job web service performs a job change on an employee or contingent worker, including organization assignments, compensation changes, pay groups and location changes. For loading large volumes of job changes, use the Import Change Job web service instead. First test both the Change Job and Import Change Job web service in your Sandbox tenant to determine which one performs better.

Due to overlapping functionality between Change Job and other web services, based on the change type, you can use 1 of these web services instead:

- Assign Pay Group
- Assign Roles
- Change Business Title
- Change Organization Assignments
- Change Work Space
- Edit Position
- Move Workers by Organization
- Request Compensation Change

### Equivalent Workday User Interface (UI) Task

From the related actions menu of worker profile, select Job Change -> Transfer, Promote, or Change Job.

### Business Process Used by This Web Service

Change Job

## Recommendations for Populating Your Request

- The Reason field in the web service request is required. Specify the reference ID type Change\_Job\_Subcategory\_ID in the request. To find a list of the reference ID type values, run the Integration IDs report and search for Change Job Subcategory business object.
- Manually change a job similar to the changes that you want to load via the web service. This helps you identify the required fields. You can also view the reference ID values from the related actions of the change job event that you manually created. This information helps you populate the reference ID values in the request.
- Ensure that the steps in the Change Job business process definition match with the web service request. When the business process definition and the web service request aren't aligned, the information might not load into Workday or the Change Job event business process might continue to stay in progress even after the web service request completes.
  - For example, if the Change Job business process has an Assign Pay Group step, then populate the pay group information in the web service request so as to update the pay group field.
  - If you don't want to update the pay group field, add a condition rule in the Change Job business process definition to skip the Assign Pay Group step. For example, add condition rule External Load = N.
  - Alternatively, you can set the Assign Pay Group step as optional in the Change Job business process definition. Also to align both, set Skip = 1 in the Business\_Sub\_Process\_Parameters section of the web service request.
  - When you populate a subprocess within the web service request, ensure that the Change Job business process definition has that step as well. For example, if you're populating role assignments in the web service request, then add an Assign Roles step in the Change Job business process definition.

For API documentation, see [SOAP Operation Directory](#).

## Common Issues and Errors

Issue	Cause	Solution
API fails with this message:  Processing error occurred. The task submitted isn't authorized.	Security configuration	<p>Access the View Security for Securable Item report to determine the security for <i>Change Job (Web Service)</i>.</p> <p>It requires access to the Change Job business process security policy. Check your security configuration as follows:</p> <ul style="list-style-type: none"> <li>View the business process security policy for Change Job</li> <li>Verify that you have unconstrained access to the Initiating Action Change Job (Web Service).</li> <li>If you have constrained access, ensure that you have access to the necessary organizations.</li> </ul>

Issue	Cause	Solution
		<ul style="list-style-type: none"> <li>If you make any changes, ensure to activate them.</li> </ul>
API completes successfully but you don't find the change job event you loaded.	The Change Job event business process is still in progress.	<p>When the web service request and the business process definition are out of alignment, it can prevent a business process step from completing.</p> <p>Refer to the <a href="#">Guidelines for Recovering from a Bad Load</a> section on how to cancel the events.</p> <p>After correcting the issue, rerun the web service request.</p>
The web service request completes successfully and some changes are made but others are missing.	The Change Job event business process definition has condition rules that skips certain steps, or it's missing a required step.	<p>Access the processing record of the business process event and check for steps that are marked as not required. Change the condition rules for those steps as necessary.</p> <p>After making corrections, run a mass cancel or mass rescind depending on whether or not the events are completed. Then, resubmit the web service requests.</p>
Web Service response issues this error: Validation error occurred. Either the Proposed Position Restriction is required or Create Position needs to be true.	The position doesn't align with the organization.	<p>If you're moving an employee to a new supervisory organization, you either need to specify a new position or else move the position restriction from the old organization to the new organization.</p> <p>To move the headcount from the old organization to the new organization, enter MOVE in the Headcount Option field.</p> <p>If you don't want to move the position, create a new position within change job. You can do this by setting the Create Position field in the web service request to 1.</p>
Role assignments are missing after the Change job event completes.	Role assignments are associated with the position and not the employee.	For example, if the employee is promoted to a new position, they'll lose their existing role assignments on the effective date of the promotion. The employee will automatically pick up role assignments that are

Issue	Cause	Solution
		<p>assigned to the position they're moving into.</p> <p>When the new position doesn't yet have any role assignments associated with it, you can place the role assignments in the Change Job request.</p> <p>Alternatively, you can run the <i>Assign Roles</i> web service to assign all relevant roles to the new positions.</p>
Unexpected changes to the worker's organization assignments.	Organization assignments populate from your predefined tenant configurations.	When a worker moves to a new position or supervisory organization, the organization assignments might change based on your tenant configuration for the new assignments. It can be from a current job or from the proposed supervisory organization. See this <a href="#">Community page</a> for details.

## Web Service Processing

This web service enables you to add new change job events. You can't delete or correct the change job event using the Change Job web service.

To opt-in or opt-out of the capability to insert out of order change job events, use the Put Functionality for Staffing Transactions web service. To determine the opt-in or opt-out status, use the Get Functionality for Staffing Transactions web service. After you opt-in using the Put Functionality for Staffing Transactions web service, you can use the Change Job web service to insert change job events before other completed staffing events in a worker's history.

## Guidelines for Recovering from a Bad Load

When you upload incorrect entries, access 1 of these tasks:

- The Mass Cancel Business Processes task when the business process event is still in progress.
- The Mass Rescind Business Processes task when the business process event is complete.
- Security: *Business Process Administrator* domain in the System functional area.

After you cancel or rescind the events, rerun the web service requests.

## Sample Example Files

Refer to the attached files for examples.

- [Change Job Include Org and Role Assignments v38 PDF](#): This request includes organization assignments (3 custom org's) and role assignments.
- [Change Job New Position and Comp Change and Pay Group Assignment PDF](#): This request moves worker to a new position and changes compensation and assigns a pay group.

## Concept: Change Other IDs SOAP Web Service Guidelines and Troubleshooting

### Context

You can use this web service to create or delete Custom IDs, also known as Other ID for a single worker. For Government IDs, use the [Change Government IDs](#) web service instead.

Note: The primary use case for this web service is the creation of static Custom ID values that you don't expect to change frequently. For identifiers, such as Badge ID of workers that require frequent update, consider using a *Custom Object* web service instead.

For API documentation for all web services, including Change Other IDs, see [SOAP Operation Directory](#).

### Equivalent Workday User Interface (UI) Task

Edit Other IDs

### Business Process Used by This Web Service

Edit Other IDs

When a user calls the web service to import the journals, ensure that they have the permission to call this web service in the Business Process Security Policy for Edit Other IDs.

### Tips for Populating your Request

#### Data at the Worker / Business Process Level

`<wd:Auto_Complete>` : Set this to true to bypass approval steps in the associated Edit Other IDs BP for the Custom ID.

`<wd:Run_Now>`: Indicates the transaction should process to completion before the response is generated. This value should be set to true.

`<wd:Person_Reference>`: Specify a value for a worker, student, etc with the appropriate ID type

Note that with large volumes of IDs in a call, setting Auto Complete and Run Now to true will result in better performance.

#### Data at the Custom Identifier Data Level

You will have one `<wd:Custom_Identification_Data>` element.

`<wd:Custom_Identification_Data>`: contains an optional `@Replace_All` attribute, which, when populated, will replace the full set of Custom IDs for the worker with the Custom IDs within this SOAP request. This element contains the entire set of Custom IDs for the web service request.

#### Data at the individual Custom ID Level

`<wd:Custom_ID>`: element that will contain the data for a single Custom ID within the SOAP request. Contains an optional `@delete` attribute, which, when populated, will remove the Custom ID denoted by the `<wd:Custom_ID_Reference>`

`<wd:Custom_ID_Shared_Reference>` Note that you need to get the `Custom_ID_Shared_Reference`

## Duplicate Checking for Custom Identifiers (Custom IDs)

value from the Get\_Workers request for the user you want to update the ID.

Custom Identifiers (Custom IDs) handle duplicate checking differently than many other object types and the system is comparing the following fields when determining if it is updating an existing record or adding a new one:

- Identifier ID
- Custom ID Type
- Issued Date
- Expiration Date
- Issued By Org
- Custom Description

If for the worker in question, there exist any Custom IDs with a 100% match for the fields above, then no new Custom ID is created.

Note: if a user only updates Issued Date, or a single field in the above list as shown in this example, the web service will create a duplicate record. When repeated over a large set of workers in a regular batch process, the number of Custom IDs in the tenant can increase greatly.

The Reference ID is not considered when updating a Custom ID.

### **Sample Example File**

[Change Other IDs 6 PDF](#)

## **Concept: Get Candidate SOAP Web Service Guidelines and Troubleshooting**

This service operation will get Candidates and their related information for the specified criteria. The request criteria can be for a single candidate based on its Reference ID, or all candidates for a specified criteria.

For all web service API documentation including Get\_Candidates, see SOAP API Reference [SOAP Operation Directory](#).

### **Data Sections**

#### Request Criteria

Workday grouped Request Criteria into 14 types of Criteria: First\_Name, Last\_Name, Candidate\_Email\_Address, Pre-hire\_Reference, Worker\_Reference, Job\_Requisition\_Reference, Recruiting\_Stage\_Reference, Applicant\_Source\_Reference, Candidate\_Tag\_Reference, Applied\_From, Applied\_Through, Internal\_Workers\_Only, Created\_From, and Created\_Through

Here's an example using a Reference ID:

```
<bsvc:Request_Criteria>
```

```
<bsvc:Reference_ID_Type>Job_Requisition_Reference
<bsvc:Reference_ID_Type>
</bsvc:Request_Criteria>
```

## Response Group

The Response Group provides these options for including or excluding specific information:

- Include\_Reference
- Include\_All\_Attachments

Example of Response Group using true/false values. You can also use 0 for false and 1 for true:

```
<bsvc:Response_Group>
<!-- Optional: -->
<bsvc:Include_Reference>true</
bsvc:Include_Reference>
<!-- Optional: -->
<bsvc:Exclude_All_Attachments>true</
bsvc:Exclude_All_Attachments>
</bsvc:Response_Group>
```

Only include what you need in your request as each option set to true can potentially add to the time to complete the request.

## Response Filter and Paging Optimization

This section allows you to filter and page the results that are returned.

If returning a large volume of ID's, populate the As\_Of\_Entry\_DateTime value in this section in order to make use of Paging Optimization. Example:

```
<bsvc:Response_Filter
  <bsvc:As_Of_Entry_DateTime>2021-05-01T00:00:00Z
  bsvc:As_Of_Entry_DateTime>
    <bsvc:Page>1</bsvc:Page>
    <bsvc:Count>500</bsvc:Count>
</bsvc:Response_Filter>
```

## Get Candidates Contextual Security

Contextual Security is available with version 36 and later.

Security:

- Prospects - get permissions
- Candidate Data: Job Application - get permissions

## Common Issues and Errors

Issue	Cause and Solution
API fails with this message:	This is security-related. Verify that you have get access to Integration Build domain security policy.

Issue	Cause and Solution
Processing error occurred. The task submitted is not authorized.	
Get Candidates request performance is poor.	This can be due to not using Paging Optimization or not using it properly, and also to request criteria being too broad.  Try limiting the result size by adjusting the criteria
Error "processing error occurred. page 1 must be requested first."	This can occur after you've hit the timeout limits for the optimization cache. The timeout limit is a maximum of two hours between 2 paged requests, such as between page1 and page2, or thirty minutes after you've requested the last page.

### Sample Example File

[Get Candidates Request Super PDF](#)

## Concept: Get Learning Course Offerings SOAP Web Service Guidelines and Troubleshooting

This web service is used to retrieve blended course offerings.

For API documentation for all web services including Get Learning Course Offerings, see [SOAP Operation Directory](#).

### Manual Equivalents to Get Learning Course Offerings

These are some of UI options for the *Get Learning Course Offerings* web service operation:

- In the Learning Worklet, you can select Learn > Browse to see course offerings.
- You can access the Learning Course Offering Report Data Sources (RDS) that contains data such as: Course Offerings and Course Offerings for Trainer.

### Data Sections

#### Request References

You can specify a WID or a Learning\_Course\_Offering\_id

#### Request Criteria

This operation does not support Request Criteria

#### Response Filter

You can add filters and pagination to the retrieved data. For large volume of IDs, populate the *As\_Of\_Entry\_DateTime* value in this section in order to make use of [Paging Optimization](#). Example:

```
<bsvc:Response_Filter>
  <bsvc:As_Of_Entry_DateTime>2021-05-01T00:00:00Z</bsvc:As_Of_Entry_DateTime>
  <bsvc:Page>1</bsvc:Page>
  <bsvc:Count>500</bsvc:Count>
</bsvc:Response_Filter>
```

## Common Issues and Errors

Issue	Cause and Solution
API fails with this message: Processing error occurred. The task submitted is not authorized.	This is security related. Verify that you have get access to Integration Build domain security policy. Additionally you need get permissions on the following domains: Manage: Learning Content Set Up: Learning Catalog
Error "processing error occurred. page 1 must be requested first."	This can occur after you've hit the timeout limits for the optimization cache. The timeout limit is a maximum of two hours between 2 paged requests, such as between page1 and page2, or thirty minutes after you've requested the last page.

## Get Learning Course Offerings Contextual Security

This web service doesn't support contextual security.

### Sample Example File

[Get Learning Course Offerings v36 PDF](#)

## Concept: Get Organizations SOAP Web Service Guidelines and Troubleshooting

Use the Get Organizations web service to retrieve multiple organizations for these organization types.

- Company
- Cost Center
- Custom
- Matrix
- Pay Group
- Region, Retiree
- Supervisory
- Company Hierarchy
- Cost Center Hierarchy
- Location Hierarchy
- Region Hierarchy

The request criteria enables you to specify organization types or organizations.

Note: [Business unit](#) organizations are not returned by the `get_organizations` web service.

When you don't specify request criteria, Workday returns all active organizations. To include inactive organizations, set `Include_Inactive` to `True`. Alternatively, when you don't specify request criteria, you can still return a specific active organization by providing the organization reference ID or the Workday ID.

### Data Sections

The `Get_Organizations` request includes several fields for specifying organization types or organizations. When you don't specify request criteria, Workday returns all active organizations.

In this example, Workday returns all active organizations:

```
<bsvc:Get_Organizations_Request
```

```
xmlns:bsvc="urn:com.workday/bsvc">
</bsvc:Get_Organizations_Request>
```

When you set `Include_Inactive` to True, Workday also returns inactive organizations.

In this example, inactive organizations are returned because the option is set to 1 or True:

```
<bsvc:Include_Inactive>1</bsvc:Include_Inactive>
```

As a best practice, only request the data sections that contain the fields that you need and select the minimum population of transactions and organizations necessary for your use case.

## Transaction Types

In the `<wd:Transaction_Log_Criteria_Data>` section, you can specify all the transactions that an organization requires to be returned in the web service response. When an organization has a single transaction in the list and that transaction meets the transaction log logic in the next section, it is returned. Workday supports these ID types for transactions:

- Workday ID
- Event\_Life\_Type\_ID
- Business\_Process\_Type
- Reorganization\_Activity\_Type

To limit organizations returned to only those with specific types of organization data changes with the date ranges specified in the transaction log criteria (for effective date and updated date), you can specify 1 or more of these Reference Id values in the Transaction Type Reference field:

Relevant Transaction Type References for  
`Get_Organizations`

Transaction Type Reference ID	Organizations Returned (as an Event Target)	Entries Available as of Date	Latency Potential (uses Observer Framework)
Assign Included Organizations	Container organization that had included organizations (content) added or removed through UI  Content organizations with a container organization change like Company Hierarchy, Cost Center Hierarchy, Location Hierarchy and Region Hierarchy	22R2	
Assign Location Hierarchies	Location Hierarchies that are assigned to Location	22R2	
Assign Locations	Location that are assigned to location hierarchy	22R2	
Assign Roles	Assign Roles BPT captures role	existing(old)	

Transaction Type Reference ID	Organizations Returned (as an Event Target)	Entries Available as of Date	Latency Potential (uses Observer Framework)
	assignment for an organization		
Assign Superior	1 org - Only the subordinate org that is assigned a new superior or its superior is changed	existing(old)	
Assign Superior With Superior	2 orgs - Subordinate org that is assigned a new superior or its superior is changed AND the superior org with a new subordinate	22R1	
Change Superior Organization		DEPRECATED	
Change Visibility	Visibility will be taken from top level.	existing	
Change Owner	Role assignment changes within an organization ( <i>but what exactly does this do?</i> )	existing	
Create Organization	Newly created organization	22R1	
Create Subordinate Organization	Newly created subordinate organization and it's superior Organization	22R1	
Create Subordinate	The new subordinate will be picked up in <i>Create Organization TLL</i>	22R1	
Edit Organization Change	Organization changes which include Reference ID, Organization subtype and external URL reference	22R1	
Edit Hiring Restrictions	Staffing changes for hiring captured through BPT	existing(hrcore)	
Inactivate Organization	Organization that was inactivated via UI or web service	existing	
Mass Assign Self-Assign Roles	Role assignment changes captured	existing	

Transaction Type Reference ID	Organizations Returned (as an Event Target)	Entries Available as of Date	Latency Potential (uses Observer Framework)
	in Mass Assign Self Assign Roles BPT		
Organization Assignment Restriction Change	Organization that has its assignment restriction updated for staffing.	<i>new (but did HRCORe implement this)</i>	
Organization Freeze/ Unfreeze		<i>Manage Organization Hiring Freeze is not tracking TLLs</i>	
Organization Name Code Change	Organization with a name change. Name changes that are captured include:  - Org name, phonetic name, org code, reference Id, manager/ leader name	22R1	
Organization Name Translation Change		Not available yet	
Organization_Type_ Change	Might be able to remove	org type can't be changed once created (it's currently under payroll)?	
Role Assignment Event	Role assignment changes captured in Role assignment event BPT	existing	
Role-Based Group Change	Role assignment changes in an organization with role and position restrictions assigned	existing	
Set Hiring Restrictions	Hiring restrictions created through BPT	existing	?
Update Included Content	Container organization that had included organizations (content) added or removed through webservice  Content organizations with a container organization change like Company Hierarchy, Cost Center Hierarchy, Location	22R2	

Transaction Type Reference ID	Organizations Returned (as an Event Target)	Entries Available as of Date	Latency Potential (uses Observer Framework)
	Hierarchy and Region Hierarchy		

### Transaction Log Logic

You can use the transaction log service within Get\_Organizations web service to identify organizations with certain transactions within a time range by using the 4 date-time fields that are analogous to the date launch parameters that are available in tools like Core Connector. You can use only the Updated parameters, the Effective parameters, or both sets of parameters.

When you choose to use both sets of Updated and Effective parameters in a single Get\_Organizations call, they're treated with an AND relationship, which means that the web service returns the transaction when it's both effective in your Effective\_From and Effective\_Through window, and when it's updated (entered) in your Updated\_From and Updated\_Through window.

When you use both the Updated and the Effective parameters in a single call, the response picks up changes that were entered between the Updated\_From and Update\_Through times and became effective on July 22, 2019. Example:

```
<wd:Transaction_Date_Range_Data>
  <wd:Updated_From>
    2019-09-22T09:44:07.134-07:00
  </wd:Updated_From>
  <wd:Updated_Through>
    2019-10-22T10:48:19.129-07:00
  </wd:Updated_Through>
  <wd:Effective_From>
    2019-07-22T00:00:00.000-07:00
  </wd:Effective_From>
  <wd:Effective_Through>
    2019-07-22T00:00:00.000-07:00
  </wd:Effective_Through>
</wd:Transaction_Date_Range_Data>
```

However, when you use only the Effective parameters, the response contains all the changes that became effective on that date, regardless of when they were entered into the system. Example:

```
<wd:Transaction_Date_Range_Data>
  <wd:Effective_From>
    2019-07-22T00:00:00.000-07:00
  </wd:Effective_From>
  <wd:Effective_Through>
    2019-07-22T00:00:00.000-07:00
  </wd:Effective_Through>
</wd:Transaction_Date_Range_Data>
```

Finally, when you use only the Updated parameters, the response contains all the changes that were entered into the system between those 2 dates and times, regardless of when they were effective in the system. Example:

```
<wd:Transaction_Date_Range_Data>
  <wd:Updated_From>
    2019-09-22T09:44:07.134-07:00
  </wd:Updated_From>
  <wd:Updated_Through>
    2019-10-22T10:48:19.129-07:00
  </wd:Updated_Through>
```

```
</wd:Transaction_Date_Range_Data>
```

Then the response contains all the changes that were entered into the system between those 2 date-times, regardless of when they were effective in the system.

However, please use extreme caution if you decide to enable the transaction log service because dates are not indexed in the data source so it is a common cause of performance issues in this web service. Furthermore, when the transaction log service is enabled, not all organizations with relevant changes to organization data such as organization name and code are guaranteed to be captured. To disable the transaction log service, leave the Transaction\_Log\_Criteria subelement empty within Request\_Criteria in the Get Organization request.

### **Transaction Log Lite**

With 2023R1, Get Organizations web service was enhanced by adding a new Enable Transaction Log Lite boolean parameter, which changes the way the web service detects organization changes and the performance is considerably improved leading to shorter processing time.

We strongly recommend that you enable this parameter when using the transaction log service because:

- It supports detection of additional organization changes, for example, Organization Name Code Change, Edit Organization Change etc. which are otherwise not captured when only transaction log service is enabled.
- Processing time is significantly reduced.

### **Get Organizations Contextual Security**

The *Get\_Organizations* web service is contextually secured, so follow security best practices when you authorize users to call the web service.

To call *Get\_Organizations*, you must have permission to:

1. Invoke the *Get\_Organizations* web service.
2. Retrieve the organizations (contextual security).
3. Retrieve those fields from the organizations (field level security).

## **Concept: Get Payments SOAP Web Service Guidelines and Troubleshooting**

This service operation will get payments and the related information for the specified criteria. The request criteria can be for a single payment based on its Reference ID, or all payments for a specified company.

For all web service API documentation including *Get\_Payments*, see the SOAP API Reference Operation Directory.

### **Data Sections**

You can use Request References to specify a WID, Payment ID, or a list of Payment IDs, among other types of references. For a full list of these references, see [Get\\_Payments Reporting\\_TransactionObjectID](#) in the SOAP API Operation Reference.

#### **Request Criteria**

Workday groups Request Criteria into 5 types of Criteria: General Payment, Check Payments to Print, Payments Message, Remittance File, and Field and Payment.

Here's an example using a WID:

```
<bsvc:Request_References>
<!-- 1 or more repetitions: -->
<bsvc:Payment_WWS_Reference
  bsvc:Descriptor="June Payments">
```

```
<!-- Zero or more repetitions: -->
<bsvc:ID
  bsvc:type="WID">2b67c9e38ede9182f5cf99sla2c15
<bsvc:ID>
</bsvc:Payment_WWS_Reference>
</bsvc:Request_References>
```

## Response Group

The Response Group gives options on whether or not to include specific information. Get Payments has these options:

- Include\_Reference
- Include-Originating\_Bank\_Date
- Include\_Payroll\_Remittance\_Date
- Include\_Payment\_Group\_Data
- Include\_Payroll\_Result\_Country\_Data

Here's the default example of Response Group using true or false values, though you can also use zero for false and 1 for true:

```
<bsvc:Response_Group>
<!-- Optional: -->
<bsvc:Include_Reference>true</
bsvc:Include_Reference>
<!-- Optional: -->
<bsvc:Include-Originating_Bank_Data>true</
bsvc:Include-Originating_Bank_Data>
<!-- Optional: -->
<bsvc:Include_Payroll_Remittance_Data>false</
bsvc:Include_Payroll_Remittance_Data>
<!-- Optional: -->
<bsvc:Include_Payment_Group_Data>true</
bsvc:Include_Payment_Group_Data>
<!-- Optional: -->
<bsvc:Include_Payroll_Result_Country_Data>true</
bsvc:Include_Payroll_Result_Country_Data>
</bsvc:Response_Group>
```

Only include what you need in your request. Each option set to true can add to the time to complete the request.

## Response Filter and Paging Optimization

There are 2 As\_Of elements used in the Response\_Filter element:

- As\_Of\_Effective\_Date is the effective date for the changed data. Some examples for Get Payments are a payment date, a settlement date, or a change in a payment status.
- As\_Of\_Entry\_DateTime is the date and time that the data was entered into Workday. If not set, the web service will use the current date and time. However, we recommend that you always set this explicitly for consistent paging results, and for optimized paging, as described below.

The 2 filter elements above enable you to return all entries, up to and including the specified filter date or date and time. Elements that have an effective date, or an entry date and time, after what is specified in the filter aren't returned.

Using Paging Optimization will give you the best performance results when you do these:

- Specify an As\_Of\_Entry\_DateTime value on your first page. This first page will take the longest of all your pages because it builds an index that is available for your subsequent pages.
- Retrieve page 1 first. Subsequent pages can be in any order, though the most common use is to call them sequentially.
- Specify that same value for As\_Of\_Entry\_DateTime on each subsequent page. You can only take advantage of the index built by the first page if you use the same DateTime value on subsequent pages. To do so, change only the page number in your subsequent requests. This also ensures that you have consistent and accurate paging results.
- Make paged requests within a reasonable frequency so that your request doesn't expire. If your request expires, you need to request page 1 again, which creates a new index of optimized paging data for the subsequent pages.
- Break your total number of records to retrieve out into multiple pages. Optimized paging is used if there's only 1 page of data.

### Get Payments WWS Best Practices

- Make certain absence balances are persisted to 91 days back. For more detailed information, see [Augmenting Absence for Optimal Performance](#)
- Review your tenant settings for Persisting Absence Balances. There's a setting called Persist Absence Data for Payslips the in Edit Tenant Setup - Payroll Complete task that you can select. If you select that option, you'd need to run pay complete again for this test. You'd want to select the Persist Absence Data for Payslips Following Pay Complete check box on the Edit Tenant Setup - Payroll task to improve payslip generation performance. Also, select Enable Persisted Accruals on the Edit Tenant Setup - HCM task to improve performance in balance generation by referencing the persisted balance for calculations. See [Setup Considerations: Absence Balances](#).

### Get Payments Contextual Security

Workday added support for Contextual Security in v 34.1.

## Common Issues and Errors

Issue	Cause and Solution
Get Payments request performance is poor.	The cause could be Paging Optimization or not using it properly, and also to absence balances persistence settings. See topics in this article on these subjects.
Error "processing error occurred. page 1 must be requested first."	This can occur after you've hit the timeout limits for the optimization cache. The timeout limit is a maximum of 2 hours between 2 paged requests, such as between page1 and page2, or 30 minutes after you've requested the last page.
ERROR: " Processing error occurred. Empty Required Parm Companies_Secured--IS " using General_Payment_Criteria section of Get_Payments_Request.	User Account is lacking proper security to successfully make this API call. Get Payments is secured to Domain: Process Settlement, which is in the Functional Areas of Banking and Settlement.
Processing error occurred. Reduce the number of instances returned by using request criteria, response filters, or date ranges. Your request returns 3787088 instances, which is more than the limit of 1000000.	<p>This happens when you have a huge number of payments and you aren't setting any filtering or As_Of DateTime values in your request. To resolve, you can set filtering to reduce the size of your return dataset, such as these 2 Examples:</p> <pre data-bbox="878 967 1628 1220">&lt;bsvc:Request_Criteria&gt; &lt;bsvc:General_Payment_Criteria&gt; &lt;bsvc:Payment_Date_on_Date_Or_After&gt;2019-01-01+&lt;/bsvc:Payment_Date_on_Date_Or_After&gt;  &lt;bsvc:Payment_Date_on_Date_Or_Before&gt;2019-01-01&lt;/bsvc:Payment_Date_on_Date_Or_Before&gt;&lt;bsvc:General_Payment_Criteria&gt; &lt;/bsvc:Request_Criteria&gt;</pre> <p>Or you could also specify an As_Of_Effective_Date or an As_Of_Entry_DateTime in the Response_Filter like 1 of the 2 in this example:</p> <pre data-bbox="878 1410 1628 1579">&lt;bsvc:Response_Filter&gt; &lt;bsvc:As_Of_Effective_Date&gt;2019-01-01+00:00&lt;/bsvc:As_Of_Effective_Date&gt; &lt;bsvc:As_Of_Entry_DateTime&gt;2019-01-01+00:00&lt;/bsvc:As_Of_Entry_DateTime&gt; &lt;/bsvc:Response_Filter&gt;</pre>

### Sample Example File

[Get Payments request Example Returned Payments PDF](#)

## Concept: Get Purchase Orders SOAP Web Service Guidelines and Troubleshooting

This web service enables you to get purchase orders (POs). There are also other web services that you can use to retrieve PO data including:

- [Get Purchase Order Acknowledgment](#)
- [Get Purchase Order Change Orders](#)

- *Get Purchase Order Lines Additional Data*
- *Get Purchase Order Schedules*

For all web service API documentation including Get Purchase Orders, see [SOAP Operation Directory](#).

If you wish to use REST API instead of SOAP API, refer to the Procurement section of the [Workday REST Services Directory](#).

## Manual Equivalents to Get Purchase Orders

To retrieve POs, you can also use:

- Find Purchase Orders report.
- Purchase Orders for Date Range by Company standard report.
- Report Data Sources (RDS) that include PO information, including Purchase Orders, Purchase Order Lines, Purchase Order Change History.

## Data Sections

### Request References

This section allows you to select specific POs. You have the choice of populating this section or the next section (Request Criteria). Below is an example of how to populate this section to return a PO. The example below uses Document\_Number for the reference ID type. You could also use Purchase\_Order\_Reference\_ID or WID.

```
<bsvc:Request_References>
  <bsvc:Purchase_Order_Reference>
    <bsvc:ID
      bsvc:type="Document_Number">PO-3355</
      bsvc:ID>
    </bsvc:Purchase_Order_Reference>
  </bsvc:Request_References>
```

### Request Criteria

This section contains filtering logic to limit the data that is returned in the response. Populate this section with the reference ID types that you want to view. For example, to return supplier S-0005 with POs in 2021:

```
<bsvc:Request_Criteria>
  <bsvc:Supplier_Reference>
    <bsvc:ID
      bsvc:type="Supplier_ID">S-0005</
      bsvc:ID>
    </bsvc:Supplier_Reference>
    <bsvc:Purchase_Order_Date_On_or_After>2021-01-01</
      bsvc:Purchase_Order_Date_On_or_After>
    <bsvc:Purchase_Order_Date_On_or_Before>2021-12-31</
      bsvc:Purchase_Order_Date_On_or_Before>
  </bsvc:Request_Criteria>
```

### Response Filter

This section allows you to filter and page the results that are returned. If returning a large volume of IDs, populate the As\_Of\_Entry\_DateTime value

in this section in order to make use of [Paging Optimization](#). Example:

```
<bsvc:Response_Filter>
  <bsvc:As_Of_Entry_DateTime>2022-05-01T00:00:00Z</bsvc:As_Of_Entry_DateTime>
  <bsvc:Page>1</bsvc:Page>
  <bsvc:Count>500</bsvc:Count>
</bsvc:Response_Filter>
```

## Response Group

Choose the data to return for each PO. Note that attachments are returned in base-64 format. Expect large payloads if including attachments. Example:

```
<bsvc:Response_Group>
  <bsvc:Include_Reference>true</bsvc:Include_Reference>
  <bsvc:Include_Attachment_Data>false</bsvc:Include_Attachment_Data>
</bsvc:Response_Group>
```

## Common Issues and Errors

Issue	Cause and Solution
API fails with this message: Processing error occurred. The task submitted isn't authorized.	This is security-related. Verify that you have Get access to domain security policy Process: Purchase Order - View.
API fails with this message: Validation error occurred. Multiple Element Contents, including Get Purchase Orders Request/b/Purchase Order Request Criteria [EL], contain data where only one is allowed by mutex Get Purchase Orders Request.	This occurs if you populate both the Request_Reference section and the Request_Criteria section. You can populate only 1 of these sections.
When not specifying any search criteria, Get Purchase Orders web service doesn't return data for v34.0 and older versions, but works for v34.1 and newer versions.	For v34.0 and prior versions, if no search criteria is provided, the web service won't return any result.  For v34.1 and subsequent versions - there's a behavior change: If no search criteria is provided, the web service will identify all companies that the user has PO access for, and query the POs in those companies.  Also, note that we don't encourage submission of this web service (or any web services) with no search criteria for performance reasons.
Get Purchase Orders isn't returning all the fields I need.	Verify you're using the latest web service version.  If you still don't have access to the fields you need, consider these: <ol style="list-style-type: none"> <li>1. Check for other web services that might have the fields you need.</li> </ol>

Issue	Cause and Solution
	2. Create a custom report that includes the information you want, then expose it as a web service (Reporting as a Service: RaaS).

## Get Purchase Orders Contextual Security

This web service supports contextual security.

### Sample Example Files

- Refer to these attached files for examples.
  - [Return POs Updated in Specified Period PDF](#): This request returns all Purchase Orders that were updated in a specified period of time. Paging is used and As of Entry Date is specified to use optimized paging for improving performance.
  - [Return Two POs PDF](#): This request returns 2 specific POs. The response group is configured to return attachments, so although there are only 2 POs returned, the payload might be large due to attachments.
  - [Return POs for One Company and in PO Date Range PDF](#): This request returns POs for one specific company and in a specified date range.
  - [Return All POs PDF](#): This request doesn't specify any request references or request criteria. Paging is used and As of Entry Date is specified to use optimized paging for improving performance. This type of request isn't recommended due to the large volume of data it might return.

## Concept: Get Reference SOAP Web Service Guidelines and Troubleshooting

This web service operation provides a list of values for a business object in Workday given its Reference ID Type. The Reference ID Type for each referenced business object can be retrieved within our API Documentation. For example, the Reference ID Type for a Location reference is Location\_ID. When you call the *Get References* web service with Location\_ID, it retrieves the list of all locations, their Workday ID, and Reference IDs.

For all web service API documentation including *Get\_References* see [SOAP Operation Directory](#)

### Manual Equivalents to Get References

These are some UI options for the *Get References* web service operation:

- View Integration IDs and View Reference IDs reports.
- You can access a Report Data Sources (RDS) that contains the Reference\_ID\_Value report field. For example, to retrieve reference IDs for job profiles, build a custom report that uses report data source All Active Job Profiles and includes the field Reference\_ID\_Value.

### Data Sections

Request References: This option is not supported for the *Get References* web service operation.

Request Criteria: This section contains the filtering logic to limit the data that is returned in the response. Populate this section with the reference ID type that you want to view. For example, to return job profiles:

```
<bsvc:Request_Criteria>
  <bsvc:Reference_ID_Type>Job_Profile_ID</bsvc:Reference_ID_Type>
</bsvc:Request_Criteria>
```

You can also opt to return only the reference ID values that were automatically populated by Workday. For example, this sample retrieves only the company reference IDs assigned by Workday:

```
<bsvc:Request_Criteria>
  <bsvc:Reference_ID_Type>Company_Reference_ID</bsvc:Reference_ID_Type>
  <bsvc:Include_Defaulted_Values_Only>1</bsvc:Include_Defaulted_Values_Only>
</bsvc:Request_Criteria>
```

**Response Filter:** This section allows you to filter and page the results that are returned.

For large volume of IDs, populate the *As\_Of\_Entry\_DateTime* value in this section in order to make use of **Paging Optimization**. Example:

```
<bsvc:Response_Filter>
  <bsvc:As_Of_Entry_DateTime>2021-05-01T00:00:00Z</
  bsvc:As_Of_Entry_DateTime>
  <bsvc:Page>1</bsvc:Page>
  <bsvc:Count>500</bsvc:Count>
</bsvc:Response_Filter>
```

**Reference ID Reference:** You can populate this section by entering either a WID or a supported reference ID type. You can find a list of supported reference ID types on the SOAP API directory page for this operation. The list is outlined under the *Reference\_IndexObjectID* section of directory page for this operation.

## Common Issues and Errors

Issue	Cause and Solution
API fails with this message:  Processing error occurred. The task submitted is not authorized.	This is security related. Verify that you have get access to Integration Build domain security policy.
Receiving an error like this:  Validation error occurred. Request References not currently supported for Get References. Element 6\$46586 Restricted by 103\$18039	The Request References section isn't supported at this time. Use the Request Criteria section instead.

## Get References Contextual Security

This web service doesn't support contextual security.

## Sample Example Files

Refer to these attached file for examples.

- [Return All values For Country Phone Code Reference PDF](#): This request returns all country phone codes.
- [Return Values for Employee ID Ref PDF](#): This request returns the first 500 employee ID values. It's tailored for optimized paging as it also includes a value for *As\_Of\_Entry\_DateTime*.
- [Return Default Values for Organization Ref PDF](#): This request returns only the organization reference IDs that were populated automatically.
- [Return Values for Supplier ID Reference PDF](#): This request returns the first 500 supplier IDs.
- [Return Values for Location\\_ID Reference ID Type PDF](#)

## Concept: Get Workers SOAP Web Service Guidelines and Troubleshooting

The Get\_Works web service is used to retrieve worker details from Workday, and supports granular transaction detection through the use of the <wd:Transaction\_Log\_Criteria\_Data> section.

Note: Get\_Works is a performant tool for identifying what populations in Workday have undergone a change, but it's important to recognize that due to the large volume of fields and data sections that can be returned by the web service, performance of this web service can vary dramatically depending on how many data sections are returned and depending on how many workers are returned.

### Data Sections

The Get\_Works request includes several boolean fields for whether various data sections should be included in the response. For example, by setting

```
<wd:Include_Personal_Information>true</wd:Include_Personal_Information>
```

you can toggle whether the <wd:Personal\_Data> section is returned.

Keep in mind that by enabling a section, the web service will retrieve all the fields in that section for you for each worker in the response. Depending on the volume of workers in your tenant that match your selection criteria, this can take some time.

As a best practice, only request the data sections that contain the fields you need, and select the minimum population of transactions and workers necessary for your use case.

### Transaction Types

Within the <wd:Transaction\_Log\_Criteria\_Data> section, you can specify all of the transactions that a worker should have had to be returned in the web service response. If a worker has a single transaction in the list and they meet the transaction log logic in the next section, they will be returned. The following ID types for the transactions are supported:

- WID
- Event\_Lite\_Type\_ID
- Business\_Process\_Type
- Reorganization\_Activity\_Type

### Transaction Log Logic

Get\_Works lets you identify workers with transactions in a time range through the use of four date/time fields analogous to the Date Launch Parameters available in tools like CCW.

Two parameters are related to the entry moment of transactions and two are related to the effective moment of transactions. Unlike in CCW, where change detection is performed by taking two snapshots of data through two Get\_Works calls, Get\_Works is ultimately a single snapshot of worker data as of the Entry and Effective moments specified in the Response\_Filter fields.

Get\_Works takes this snapshot using Updated From / Through parameters, and using Effective From / Through parameters. You can call Get\_Works using only the Updated parameters, using only the Effective parameters, or using both sets of parameters.

If you choose to use both sets of Updated and Effective parameters in a single Get\_Works call, they are treated with an AND relationship: The web service will pick up the transaction if it is both Effective in your Effective From / Through window, AND if it is Updated (entered) in your Updated From / Through window.

For instance, if you use both the Updated and the Effective parameters in a single call:

```
<wd:Transaction_Date_Range_Data>
<wd:Updated_From>
2019-09-22T09:44:07.134-07:00
```

```

</wd:Updated_From>
<wd:Updated_Through>
  2019-07-22T10:48:19.129-07:00
</wd:Updated_Through>
<wd:Effective_From>
  2019-07-22T00:00:00.000-07:00
</wd:Effective_From>
<wd:Effective_Through>
  2019-07-22T00:00:00.000-07:00
</wd:Effective_Through>
</wd:Transaction_Date_Range_Data>

```

Then the response will pick up changes that were entered between the Updated\_From and Update\_Through times AND became effective on July 22, 2019.

On the other hand, if you use only the Effective parameters:

```

<wd:Transaction_Date_Range_Data>
<wd:Effective_From>
  2019-07-22T00:00:00.000-07:00
</wd:Effective_From>
<wd:Effective_Through>
  2019-07-22T00:00:00.000-07:00
</wd:Effective_Through>
</wd:Transaction_Date_Range_Data>

```

then the response will contain all the changes that became effective on that date, regardless of when they were entered into the system.

Finally, if you use only the Updated parameters:

```

<wd:Transaction_Date_Range_Data>
<wd:Updated_From>
  2019-09-22T09:44:07.134-07:00
</wd:Updated_From>
<wd:Updated_Through>
  2019-07-22T10:48:19.129-07:00
</wd:Updated_Through>
</wd:Transaction_Date_Range_Data>

```

then the response will contain all the changes that were entered into the system between those two dateTimes, regardless of when they were effective in the system.

As stated, this is similar to but *different* from the change detection logic used by CCW, which makes two calls to Get\_Workers to get two separate snapshots of worker data and compare them. There are no change detection rules about Effective and Entry windows in a single Get\_Workers call.

The transaction must be fully in the Updated window if only Updated parameters are provided, fully in the Effective window if only Effective parameters are provided, or fully in *both* windows if both Updated and Effective parameters are included.

For an additional thorough review of the Transaction Log in Get\_Workers, see [Use Transaction Log Criteria to Find Employee Data Changes](#).

### **Get\_Workers vs. CCW and Other Change Detection Tools**

Additionally, although on the face of it Get\_Workers and CCW use similar transaction logs and date/time parameters, it's important to remember that CCW can return both a field's current value and prior value when a worker has undergone a change, whereas Get\_Workers returns you the current data for the extracted worker as of an effective and entry moment specified in the <wd:Response\_Filter> section of your request.

Get\_Workers natively returns many more fields and targeted instances than CCW does.

Rescinds and Corrections are handled differently by Get\_Workers and CCW: Both rescinds and corrections are returned by Get\_Workers if they are transactions that fit your <wd:Transaction\_Types> criteria and <wd:Transaction\_Log\_Criteria\_Data> time ranges, whereas CCW has limited correction and rescind support.

## Get\_Workers Studio Best Practices

### Using the Response\_Filter Element

When calling Get\_Workers in a Studio integration, it is best practice to leverage the paging functionality of the web service by calling the web service using the Paged Get component, effectively batching the web service response.

Note: For maximum performance when using Paged Get, it is critical to specify the *As\_Of\_Effective\_Date* and *As\_Of\_Entry\_DateTime* in the *Response\_Filter* section of the web service. This gives Workday the opportunity to cache the query results for use on later page requests.

For more details on how to use the *Response\_Filter* element in your web service calls, see [Use the Response\\_Filter Element in WWS](#).

## Get\_Workers Contextual Security

Because Get\_Workers can expose many fields for large groups of workers, it's important to follow security best practices when authorizing users to call the web service. Please take the following into consideration when securing access to Get\_Workers:

In order to call Get\_Workers and extract a particular set of field data for a given set of workers, you need:

1. Permission to invoke the Get\_Workers web service.
2. Permission to retrieve that group of workers (contextual security).
3. Permission to retrieve those fields off of that group of workers (field level security).

### Permission to invoke the Get\_Workers web service

The Security Domain Worker Data: Public Worker Reports secures access to the Get\_Workers web service. So the ISU or user launching the Get\_Workers request should have unconstrained access to this domain.

### Permission to retrieve that group of workers (contextual security)

The Security Domain Worker Data: Workers secures access to workers extracted by the Get\_Workers web service in a way that obeys your contextual security configuration. To ensure that you are able to leverage contextual security with Get\_Workers, so that users calling the web service will only ever be able retrieve workers that they are constrained to access, the user should be added to a group with Worker Data: Workers Integration GET permissions and the All Users group should be removed from the Worker Data: Workers policy.

### Permission to retrieve those fields off of that group of workers (field-level security)

Once you have permission to launch the Get\_Workers web service and have access only to

## Performance when configuring Get\_Workers Contextual Security

the appropriate subset of workers your account is constrained to, ensure that the user calling the web service has permission to extract any fields needed for your interface or integration process and is not granted permissions not needed for the interface.

When configuring security to constrain access to web services, there can be a substantial increase in processing time. When possible, use the web service operation's request parameters to limit access, instead of using security to filter access.

### **Sample XML File**

[Get Workers Transaction Log PDF](#)

## **Concept: Hire Employee SOAP Web Service Guidelines and Troubleshooting**

The Hire Employee web service is used to hire a pre-hire (new or existing) into an employee position.

Import Hire Employee is a similar web service operation. However, use Import Hire Employee only if you're loading large volumes of new hires, such as thousands. If this is the case for you, test in your Sandbox tenant to determine whether the Hire Employee or Import Hire Employee web service performs better in your tenant.

For a list of the API documentation for all web services including Hire Employee, see [SOAP Operation Directory](#).

### **Equivalent User Interface (UI) Task**

[Hire Employee](#)

### **Tips for Populating Your Request**

- Applicant: This field equates to specifying an existing pre-hire when hiring in Workday. Don't populate this field if you want to create the pre-hire within the Hire web service request.
- Manually enter and make note of all the information when you hire an employee. You'll then know what information you need to populate in the web service request
- Ensure that the steps in the Hire business process are aligned with what you populate in the request.
  - For example, if the Hire business process has an Assign Pay Group step, then you either need to populate the pay group information in the request or add a condition rule to skip the step in the Hire business process.
    - Example: Add condition rule External Load = N.

### **Common Issues and Errors**

Issue	Cause and Solution
The web service successfully completes but you can't find the hires you loaded.	The business process events are still in progress due to the misalignment of the web service request and the business process definition. Run a Mass Cancel task to cancel the in progress hire events, and start over.

Issue	Cause and Solution
<p>When you include an existing applicant ID (that is, pre-hire) or former worker ID in the request, it fails with one of these errors:</p> <ul style="list-style-type: none"> <li>Validation error occurred. Multiple Element Contents, including Hire Employee Business Process Data/a1/Applicant/CL] contain data where only one is allowed by mutex Hire Employee Business Process Data.</li> <li>Validation error occurred. Multiple Element Contents, including Hire Employee Business Process Data/a2/Former Worker [CL], contain data where only one is allowed by mutex Hire Employee Business Process Data</li> </ul>	<p>If you populate an applicant ID (that is, pre-hire ID) or a former worker ID in the request, then you can't populate any other data associated with the applicant or former worker, such as name, country, email, phone, or addresses. This information is redundant, and the web service issues an error so that you don't overwrite existing applicant information. To resolve this error, remove all applicant information from the request including any sections that reference applicant data and specify only the applicant ID or former worker ID.</p> <p>If there's information that needs to be updated for the applicant or former worker you're hiring, the options are: 1) Update it within a subprocess of the hire web service request (that is, Change Personal Information) 2) Or run another web service after the hire to update applicant information (that is, Change Home Contact Information, Put Applicant, and so on).</p>
<p>Web Service response displays this error:</p> <p>Validation error occurred. Enter a unique Employee ID. The ID is already in use by xxx</p>	<p>This occurs if the request contains an employee ID that you already used. This could occur if you hire employees but then rescind the events. To resolve the issue, you could:</p> <ul style="list-style-type: none"> <li>Change the reference IDs for the hires you previously loaded using the Put Reference request.</li> <li>Use different employee IDs.</li> <li>Reload the hire and specify the pre-hire ID (the applicant ID) in the request. If you do this, you also need to remove all pre-hire's information from the request, including their name.</li> </ul>
<p>Web Service response returns errors that localized information is missing. Example: Gender isn't tracked or Marital status doesn't exist.</p>	<p>These are localized fields and the web service can't find the country to check against. To fix this:</p> <ol style="list-style-type: none"> <li>Bring up the location associated with the worker's position.</li> <li>Go to the Contact Information tab and click Edit.</li> <li>Change the effective date to an earlier date such as 01/01/1900.</li> </ol>
<p>Web Service response returns this error:</p> <p>Validation error occurred. Multiple Element Contents, including Hire Employee Business Process Data/d1/Job Requisition for Fill WWS Events Secured by Transactions [WS]*ST, contain data where only one is allowed by mutex Hire Employee Business Process Data.</p>	<p>This occurs when you populate both the position and job requisition.</p>

Issue	Cause and Solution
Even though the Create Workday Account section is populated in the request, the information is ignored.	<p>There are two different Create Workday Account steps that can be configured in the Hire business process. One has a type of Service and the other has a type of Action:</p> <ul style="list-style-type: none"> <li>• If using Service step: The Hire event will automatically kick off the step and create the Workday account based on the naming conventions configured on the Maintain User Name Rules and Maintain Password Rules tasks. The web service would ignore any Workday account information populated in the request.</li> <li>• If using Action step: The event uses the information supplied in the request to create the Workday account.</li> </ul> <p>To address this issue, check the Hire business process definition and verify that the Workday Account step is type Action.</p>
Compensation grade profile not defaulting consistently using Hire web service	<p>If you only provide partial compensation guideline information in this web service, that information will take precedence and negate any other compensation guideline default settings.</p> <p>Example: If you only add a package or grade and not a grade profile in the web service, we interpret this as you specifying that you don't want a grade profile for that hire.</p> <p>If you don't add any guideline information and remove the Compensation_Guidelines_Data section from the web service entirely, we apply all default settings, including package, grade, and grade profile.</p> <p>Provide all compensation guideline information, including grade profile, in the web service to avoid this issue.</p>

### Business Process Used by this Web Service

Hire

### Details About Add/Update/Delete Capabilities and How to Recover from a Bad Load

- This web service enables you to add only. You can't change, correct, or delete the hire through the web service.
- If you have inadvertently uploaded incorrect entries, run the mass rescind or mass cancel, depending on whether the business process event is completed or in progress.

### Sample File

[Hire Employee Request v38 PDF](#)

## Concept: Import Accounting Journal SOAP Web Service Guidelines and Troubleshooting

This web service is used to create or update accounting journals. While in an EIB you can populate a sheet with many header keys (and thus many journals on a single sheet that are each called in separate Import Accounting Journal requests), this web service imports one journal per web service call. Consideration should be given to scalability so that an optimal number of Journal Lines is included in each Accounting Journal.

Note: The Import web service runs asynchronous returning immediately a runtime ID of a process that runs in the background breaking up a journal into chunks and process them in parallel.

Use the [Get\\_Import\\_Processes](#) web service to poll and check the status of the journal process. Use the [Get\\_Import\\_Process\\_Messages](#) web service to return any error messages.

Note that there are 3 different options for loading accounting journals via web services:

- Import Accounting Journal (described here) loads accounting journals by EIB or API.
- Submit Accounting Journal can be used to load journals (by EIB or API) with a smaller quantity of line items (1,000 or fewer).
- There is also the Accounting Journal Connector that can be used. Refer to the [Accounting Journal Connector](#) documentation for more details.

Also, there are some related web services that you can use for journals, including:

- Cancel Accounting Journal
- Put Beginning Balance Journal
- Put Beginning Balance Translation Amounts
- Unpost-Reverse Accounting Journal

For API documentation for all web services, including Import Accounting Journal, see [Operation Directory](#).

### Equivalent User Interface (UI) Task

Create Journal

### Tips for Populating your Request

Data at the Header or Journal Level

`<wd:Import_Accounting_Journal_Data>`

`<wd:Accounting_Journal_ID>`: Use a unique value for each journal. If you upload a journal with an identical `Accounting_Journal_ID` to a journal that is already posted, canceled, reversed, or intercompany, you may receive the following error:

*The Accounting Journal is posted or canceled or ...*

`<wd:Accounting_Journal_Reference>`: Specify a value if updating an existing journal. You can update the journal only if it is not yet posted.

`<wd:Accounting_Date>`: The Accounting Date that will be used for *all* journal lines within the journal. The date at the header level trickles down to each of its lines. Because all lines in a journal share the same Company and Accounting Date, make sure that your journal lines are batched into journals in a way that makes sense logically by Company and by Date.

	<p><b>&lt;wd:Auto_Complete&gt;</b>: Set this to true to bypass approval steps in the associated Accounting Journal Event BP for the journal.</p> <p><b>&lt;wd:Submit&gt;</b>: Set to false if you want to create the journal but not post it.</p> <p><b>&lt;wd:Locked_in_Workday&gt;</b>: If you set this to true, you can't unpost the journal.</p> <p><b>&lt;wd:Balancing_Worktag_Reference&gt;</b>: If using worktag balancing in your tenant, populate this field with the anchor worktag for Workday to base the automatic worktag balancing entries off of.</p> <p><b>&lt;wd&gt;Create_Reversal&gt;</b>: when set to true, Workday creates a reversal journal for this journal on a specified reversal date.</p> <p><b>&lt;wd:Reversal_Date&gt;</b> : when using the <b>&lt;wd&gt;Create_Reversal&gt;</b> option, this is the date that the reversal journal is created.</p>
Data at the Journal Line Level	<p>The web service request contains various fields that map to the individual Journal Line fields you see when reporting off of Journals in the tenant.</p> <p>Note again that Accounting Date is driven at the header level of the journal, not the journal line level.</p> <p>If you need to store descriptions or external references about specific journal lines, you can use the <b>&lt;wd:Memo&gt;</b> and <b>&lt;wd:External_Reference_ID&gt;</b> fields to store free text data with whatever you need to make it clear what those journal lines represent.</p> <p>After loading the journals, you can use the <b>Find Journals</b> report to review the uploaded journals.</p>
Worktag Data	<p>For each journal line entry, use the <b>&lt;wd:Worktags_Reference&gt;</b> element to specify all worktags that are necessary for the journal to post successfully and to meet the your organization's financial requirements.</p> <p><i>Note: All Custom Organizations are Custom Worktags, so Custom Orgs can be tagged on the journal line using this element as well, as long as the ID and the ID type are accurate.</i></p> <p>You will populate one <b>&lt;wd:Worktags_Reference&gt;</b> element for each worktag on the journal line. Take care to ensure that both the worktag's Reference ID and Reference ID type are populated accurately. The ID types are case sensitive.</p> <p>For example, to add a worktag for a Custom Worktag called Line of Business, either through Workday Report Writer or the Integration IDs report, note down which Custom Worktag Type ID that worktag has (this may vary from tenant to tenant, so ensure that your request exactly matches the type</p>

that's defined in Workday) as well as the Reference ID for the exact Custom Worktag value your are linking to.

If you see that Line of Business is Custom Worktag 3 and has a Custom\_Worktag\_Type\_ID of Custom\_Worktag\_3 and the specific Line of Business Sales you want to include has a Reference ID of Sales, populate the <wd:Worktags\_Reference> element as follows.

```
<wd:Worktags_Reference>
  <wd:ID
    wd:type="Custom_Worktag_3">Sales</
    wd:ID>
  </wd:Worktags_Reference>
```

Then populate as many instances of <wd:Worktags\_Reference> as are necessary for you to have the worktags you need on that journal line, and repeat across all journal lines in the journal.

Note: Any worktags you populate must have a matching and valid Custom Worktag Type ID.

## Web Service Performance Considerations

**Note:** We recommend splitting the journals into smaller groups when the line volume approaches 100,000 lines per journal. Based on performance testing benchmarks, where possible, target to load your journals with approximately 10,000 lines per journal.

## Journal Balancing

As with any journals in Workday, journals created using the Import\_Accounting\_Journal web service must have their Debits and Credits balance by Company at the header of the Journal, and if worktag balancing is enabled for your tenant (for example, fund balancing), the journals must additionally balance by the balancing worktag.

Workday allows the use of an Anchor Balancing Worktag in the web service request so that balancing worktag entries are automatically generated for you where possible. To leverage this, populate the <wd:Balancing\_Worktag\_Reference> field with the anchor worktag to base this balancing off of.

## Common Issues and Errors

Issue	Cause and Solution
The request is running slowly	<p>There are various reasons that the request may run slowly. Review the following:</p> <ul style="list-style-type: none"> <li>Custom Validations can slow down performance, especially if you have a large amount of custom validations or the validations are complex. Check the validation rules for accounting journals using task Maintain Custom Validations. There is a Test validations button that will help you determine if a validation rule has a slow execution time.</li> </ul>

Issue	Cause and Solution
	<ul style="list-style-type: none"> <li>Note that each SOAP web service request equates to one background job. If you run one large journal, make sure you are not running more than 100k lines in that journal and that you are batching your lines so that each journal has about 10,000 lines if possible.</li> <li>Intercompany Accounting: Note that intercompany accounting requires additional journals to be created thus increasing processing time.</li> <li>Worktag Balancing: You have the option to specify the balancing worktag in the transaction header. Workday automatically creates due to or due from entries for the other balancing worktag values in the journal. As a result, journal line volumes increases when the feature is enabled, thus increasing processing time.</li> </ul>
After loading a large journal, you are unable to edit it. You may receive a notify me later message if editing during the review step. You may see that the step has a Withdrawn status.	There are some restrictions within the User Interface (UI) in regard to editing large transactions (even within the business process event). We expect to see this behavior when editing a transaction that is too large for the user interface to process and display. For this reason, you need to rely on the web service to supply all information for the journal, so you don't have to make any updates in the UI. We do offer the ability to add an attachment to the journal without actually getting into edit mode. If you merely need to add an attachment, you can do this from the related actions (Journal > Add/Change Attachment) on the journal. This feature was specifically added due to the above mentioned limitations when editing large journals in the UI.
The web service completes successfully but the journal cannot be found in the UI.	Try running the report Find Journals to search for the journal. It may have been loaded to the wrong period, loaded with Submit set to false, or have some other issue causing it to not fully load.
Web service issues errors such as: Invalid ID value. '5000' is not a valid ID value for type = 'Ledger_Account_ID'	Make certain you are populating the Account Set field in the Journal Entry Line Replacement section of the web service request

### Business Process Used by this Web Service

Accounting Journal Event: be sure that the user that will be calling the web service to import the journals has the permission to call this web service in the Business Process Security Policy for *Accounting Journal Event*.

## Details About Add, Update, and Delete Capabilities for This Web Service and How to Recover From Bad Load

- This web service allows you to create new journals or update existing journals (that are not yet posted). You can't delete journals, and there is no Cancel or Rescind option available in the Account Journal Event.
- If you have inadvertently uploaded incorrect entries, below are options to consider:
  - If the journals are not yet posted, you can do the following:
    - Get the reference IDs of the accounting journals you loaded and populate an EIB input file with these values. To get the reference ID values, make a copy of the standard report Find Journals and then add Reference ID to the report.
    - Make any other necessary data corrections to the source input file or data source.
    - Re-run the integration process to update the previously loaded journals, with corrections.
  - If journals are posted:
    - You may want to look into using EIB Cancel Accounting Journal to back out the entries.
    - There is also an EIB Unpost Reverse Accounting Journal that you can use, if the journal is not locked, to unpost the journal, which would then allow you to correct it.

## Sample Example Files

### [Import Accounting Journal Super PDF](#)

Note that this is an XML file built from GMS data that will run successfully using SOAP UI or the Workday Studio Web Service Tester if the appropriate values for your specific FDM are included in the request. Review this sample and copy the information from this sample file if you want to use it to help get you started with populating your request.

## Concept: Import Budget SOAP Web Service Guidelines and Troubleshooting

The Import Budget web service is used to add or update budget details, and replaces other web services (including Import Budget Details, Put Budget Incremental, and Put Business Plan Details). If you're using any of those web services, you will need to switch to Import Budget.

There are other web services related to the budget functionality. Review the following web services to figure out what works best for you:

- Import Budget Amendment: Used strictly for amending budgets. If you have an approved amendable budget you want to update, use this web service.
- Import Position Budget: Used to add or update Position Budgets.
- Import Headcount Plans: Used to add Headcount Plans (HCM).
- Put Budget Template: Used to add Plan Templates.

To view API documentation for all web services (including Import Budget), see [Operation Directory](#).

**Note:** *The Import web service runs asynchronous returning immediately a runtime ID of a process that runs in the background breaking up a budget into chunks and process them in parallel.*

## Equivalent Workday Task

Maintain Budget

## Tips for Populating your Request

**Note:** *Before calling the web service for the first time, you may want to test populating a budget entry via the user interface using **Maintain Budgets** task. This helps ensure that everything is properly configured and you are able to successfully add a budget line.*

## Data at the Header or Budget Level

<wd:Import\_Budget\_High\_Volume\_Request>

<wd:Budget\_Reference>: Use a unique value for each budget. If you upload a budget with an identical Budget\_Reference to a budget that has already been created, and intend on updating or overwriting that budget with your SOAP request, ensure that the Budget\_Reference matches the original.

<wd:Import\_Mode\_Reference>: Report View Plan Import Modes will show you the allowable values, descriptions, and their associated reference ID value. The most commonly used values are:

- REPLACE\_ALL: Replaces the budget with the info in the SOAP request.
- INCREMENTAL\_ADD\_ONLY: Add new or update existing entries.
- INCREMENTAL\_ADD\_WITH\_DELETE: Delete existing plan lines by specifying an amount of 0.00
- REPLACE\_ALL\_BY\_PERIOD: Replace all plan lines in a single budget period.

**Note:** *If your budget contains over 25,000 entries, we suggest you load 25,000 per web service request. For the first load, use import mode REPLACE\_ALL. For each additional load, use import mode INCREMENTAL\_ADD\_ONLY.*

<wd:Budget\_Structure\_Reference>: One way to identify this value is to:

1. Locate your budget using Find Plan Templates. You'll see the company, plan structure, plan name, and more for your budget.
2. Next, from the related actions of your Plan Structure value, choose Integration IDs->View IDs. This will display the value for the reference ID type Budget\_Structure\_ID.

<wd:Budget\_Name\_Reference>: Based on the Plan Type you're importing, you'll need to update the format for the Budget Name. This field defaults to Award\_Proposal\_ID. For Project Budgets, specify the reference ID type Project\_Budget\_ID. For Financial Budgets, specify the reference ID type Custom\_Budget\_ID. To find the reference ID value:

1. Locate your budget using Find Plan Templates. You'll see the company, plan structure, plan name, and more for your budget.
2. Next, from the related actions of your Plan Name value, choose Integration IDs->View

IDs. This will display the value for the reference ID type and ID.

## Business Process Data

<wd:Auto\_Complete>: Set this to true for the business process event to automatically process, then skip approval and to do steps. <wd:Auto\_Complete> won't auto complete a required action step where the value for the action is not provided in the call.

## Budget Line Data

<wd:Year>: The year associated with the budget; take caution to ensure that the Fiscal Year Number and Fiscal Year Name are both created with logical and clear values when these are first created in the tenant. To determine what value to include:

1. Use report View Fiscal Year and choose the fiscal schedule used by your plan structure.
2. Next, find the value for the fiscal year and fiscal time interval from the related actions of the fiscal year and fiscal posting interval.

<wd:Fiscal\_Time\_Interval\_Reference>: To determine the value for this field:

1. For Budgets by Duration, the fiscal year should be the fiscal year corresponding to the start of the project. The Fiscal Time Interval must be set to Fiscal\_Posting\_Interval\_ID and the Fiscal Time Interval must be the first period of the plan. If the plan starts on March 3, 2019 and your calendar year is the same as your fiscal year, then the fiscal year would be 2019 and the Fiscal Posting Interval for all plan lines would be March.
2. For Project Budgets by Period, use the Fiscal Year and Fiscal Posting Interval corresponding with the budget period.

## Sample Example File

[Import Budget PDF](#)

## Concept: Import Charges for Students SOAP Web Service Guidelines and Troubleshooting

- You can use this web service to apply a charge to a student or adjust a given charge to a new amount and due date.
- Don't use these web services because they were replaced by [Import Charges for Students](#):
  - Import Student Charges (DNU)
  - Submit Student Charge (DNU)

## Equivalent User Interface (UI) Task

- There are 2 different tasks depending on whether you're adding or adjusting student charge:
  - To create a new charge: Apply Student Charge
  - To adjust an existing charge: From Student's Profile, go to Account Transactions in the Student Financials section. From related action of the transaction, choose Student Charge > Adjust.

## Tips for Populating Your Request

What to Populate If Adding New Student Charge

- If creating a new Student charge, populate section <wd:Apply\_Student\_Charge\_Data>.

Below are the more commonly used text boxes in this section:

- <wd:Student\_Reference>: Reference ID value of the Student. Specify the reference ID type you wish to use such as Academic\_Person\_ID or Student\_ID.
- <wd:Institution\_Academic\_Unit\_Reference>: To find reference ID values, run the View Reference IDs report and search business object Academic Unit
- <wd:Transaction\_Date>: Student Charge Transaction Date. Enter date using format YYYY-MM-DD
- <wd:Due\_Date>: Student Charge Due Date. Enter date using format YYYY-MM-DD
- <wd:Academic\_Period\_Reference>: To find reference ID values, run the View Reference IDs report and search business object Academic Period
- <wd:Student\_Charge\_Item\_Reference>: To find reference ID values, run the View Reference IDs report and search business object Student Charge Item
- <wd:Amount>: Amount
- <wd:Currency\_Reference>: Reference ID value for Currency
- <wd:Worktags\_Reference>: Reference ID of any worktags associated with the student charge

#### What to Populate If Adjusting Existing Student Charge

If adjusting an existing Student Charge, populate the ID along with section <wd:Apply\_Student\_Charge\_Data>

- <wd:ID>: If adjusting an existing charge, enter the reference ID value of the original charge. You can create a custom report, with data source Student Charges to find reference ID value. Refer to sample custom report definition below
- <wd:Amount>: Adjust the new amount that the charge Enter \$zero to back out charge.
- <wd:Due\_Date>: Student Charge Due Date. Enter date using format YYYY-MM-DD
- <wd:Student\_Charge\_Adjustment\_Reason>: To find reference ID values, run the Integration IDs report and search business object Student Charge Adjustment Reason

## Web Service Performance Considerations

Always launch only 1 request for ALL the student charges, instead of submitting a separate request for each individual student charge. This is important because each web service request triggers a background job that processes the student charges along with another job that processes accounting information for the student charges submitted by the request. So if you submit multiple web service requests, you trigger multiple jobs, which can severely degrade tenant performance.

The import web service limit is 2gb, which equates to around 750,000 charges. If you believe that you'll exceed this limit, then you can break up the charges into another one or 2 requests. But submit just 1 request at a time and allow it to finish loading and processing accounting documents before initiating the next request.

## Common Issues and Errors

Issue	Cause and Solution
One or both of these occurs: <ul style="list-style-type: none"> <li>Although the web service request completes successfully, some of the student charges have no accounting attached to them</li> <li>Performance is slow</li> </ul>	Both of these behaviors occur if submitting 1 charge per web service request. Refer to <a href="#">Web Service Performance Considerations</a> section for more details.
Web service response returns error: The task submitted it not authorized.	This error is most likely security-related. The View Security for Securable Item report will show you that Import Charges for Students (WS Background Process) requires access to the Student Charge Event business process security policy. Check your security configuration as follows: <ul style="list-style-type: none"> <li>Bring up the business process security policy for Student Charge Event.</li> <li>Verify that you have access to Initiating Action Import Charges for Students (WS Background Process). Ideally, you should have unconstrained access (If you have constrained access, make certain that you don't need to load any student charges where you don't have access to the organizations that the student belongs to.).</li> <li>If you make any security changes, activate the changes.</li> </ul>

## Business Process Used by this Web Service

Student Charge Event

## Details About Add, Update, and Delete Capabilities and How to Recover from a Bad Load

- This web service enables you to add new student charges or update existing student charges. You can't delete or cancel charges.
- If you have inadvertently uploaded incorrect entries, below are options to correct the entries:
  - If the business process is still in progress, use task Mass Cancel Business Processes to cancel the student charge events.
  - The business process doesn't have a rescind option. So if the business processes successfully completed loading the student charge events, 1 option is to rerun the EIB and

update the student charges with correct amount/due date. Another option is to cancel the entries using web service Import Mass Cancel Student Charges

### Sample Example Files

- [Import Charge for Student REQUEST to ADD New Charges PDF](#): This request is creating 3 new student charges. The 2nd and 3rd entries demonstrate how to add worktags.
- [Import Charges for Students REQUEST to ADJUST Existing Charges](#): This request is adjusting 2 existing student charges
- [Import Charges for Students RESPONSE SAMPLE](#) : This sample displays a sample response.

## Concept: Import Payroll Input SOAP Web Service Guidelines and Troubleshooting

The Import Payroll Input web service is used to create or update payroll input.

- You might also consider managing bulk payroll input using Worksheets. Refer to this [What's New Post](#) for use and availability of this feature
- There is also a payroll input connector called Worker Payroll Input Async. Review [Steps: Set Up Integration for Worker Payroll Data Import](#) for more details.
- You may want to review other integrations related to the payroll input functionality to determine what works best for your requirement. Use the:
  - Put\_Payroll\_Off-Cycle\_Payment and Import\_Payroll\_Off-Cycle\_Payment web services to add or update off-cycle on-demand or manual payments.
  - Put\_Payroll\_History web service to add or update historical payments.
- For a list of the API documentation for all web services including Import Payroll Input, see [Operation Directory](#).

### Equivalent Workday Task

Add Payroll Input by Worker

### Tips for Populating the Web Service

**Note:** *This Import web service batches the payroll input entries into jobs and processes them asynchronously. We recommend you batch at least 1,000 payroll inputs per Import request. Test in a non-production tenant first to find out what works best for you.*

#### Data at the Header Level

`<wd:Default_Batch_ID>`: The web service uses this when you don't specify any Batch IDs in the Payroll Input SOAP request.

**Note:** *You typically use the same Batch ID for all entries. The batch ID is useful when you need to validate or delete the entries you loaded. Use the task **Payroll Input by Batch ID** to monitor and validate Payroll Input organized by its Batch ID, and use the task **Delete Payroll Input by Batch ID** to recover from a bad load and delete the entire batch.*

**Note:** *You can only delete Payroll Input in the **Delete Payroll Input by Batch ID** task if no input in the batch is part of a completed payroll. Put another way, if a single entry in even a large batch of payroll inputs is part of a completed payroll, the entire batch will not be able to be deleted. If you need to rerun a SOAP process to import an update to that*

**Note:** *You can only delete Payroll Input in the **Delete Payroll Input by Batch ID** task if no input in the batch*

*is part of a completed payroll. Put another way, if a single entry in even a large batch of payroll inputs is part of a completed payroll, the entire batch will not be able to be deleted. If you need to rerun a SOAP process to import an update to that batch, first run Cancel Pay Complete on any payrolls associated with your batch that were already completed, then run the Delete Payroll Input by Batch ID task on that batch, and then rerun the SOAP request.*

## Data at the Payroll Input Level

**<wd:Batch\_ID>**: The Batch ID associated with this input. Typically use the same value across all inputs. This drives what inputs will be grouped together and able to be viewed or deleted together using the Payroll Input by Batch ID and Delete Payroll Input by Batch ID tasks.

**<wd:Payroll\_Input\_ID>**: When you update an existing payroll input, you must specify the input ID for that payroll input. For new entries, the web service will populate this value. If you choose to enter a value, make certain you specify a new ID that will be unique to that transaction. This ID is your best safeguard against duplicate entries.

**<wd:Ongoing\_Input>**: when this is set to true, the Payroll Input on this line will continue on into subsequent pay periods. The default when not populated is false.

*Note: When dealing with ongoing inputs, once the original ongoing Payroll Input is included in a completed payroll, you can neither update nor delete it. You can only end date it. To alter the amount or rate of an ongoing input, or to end it entirely, you will need to end date the existing payroll input and create a new one with the new amount (if the input needs to continue at the updated amount or rate). If you are updating Payroll Inputs as part of an integration or custom process, your technical solution will need to house logic for looking up the appropriate End Date in these situations, end dating existing Payroll Inputs as of that end date, and creating a new, updated Payroll Input when necessary at the appropriate Start Date.*

**<wd:Start\_Date>**: the date this input should begin. This field is required for ongoing entries. Required for one-time entries (entries where wd:Ongoing\_Input is set to false).

**<wd:End\_Date>**: the date this input should end. This field is not required for ongoing entries, but is necessary when end-dating existing ongoing entries (populate this field with a given date to have an input end as of this date). Required for one-time entries (entries where wd:Ongoing\_Input is set to false).

**<wd:Worker\_Reference>**: the worker this Payroll Input should be assigned to. For two inputs with the same ID to be processed, they must both reference the same worker.

**<wd:Position\_Reference>**: when required for your pay component, populate this with the appropriate position for the worker.

**<wd:Earning\_Reference>**: The Reference ID of the earning associated with this line. Depending on the earning included, and depending on functional configuration that's already been completed by a Payroll consultant, you may have to populate specific worktags, rate, hours, or amount for this Payroll Input to be entered into Workday successfully. This element is mutually exclusive with the **<wd:Deduction\_Reference>** element for a given Payroll Input.

**<wd:Deduction\_Reference>**: The Reference ID of the earning associated with this line. Depending on the Deduction included, and depending on functional configuration that's already been completed by a Payroll consultant, you may have to populate specific worktags, rate, hours, or amount for this Payroll Input to be entered into Workday successfully. This element is mutually exclusive with the **<wd:Earning\_Reference>** element for a given Payroll Input.

**<wd:Amount>**: Flat amount for this Payroll Input; may be required depending on the pay component

**<wd:Hours>**: Hours worked represented on this Payroll Input; may be required depending on the pay component

**Note:** *this element can be critical for a customer's Payroll GL processing and labor reporting. For hours from the Payroll Input to not only flow through to Payroll, but to flow through to the Operational Journals generated when the payroll for this input is completed (and to the customer's GL integrations), work with your Payroll consultant to ensure that any pay components used in a Payroll Input integration that will require Hours for GL purposes have had the General Ledger: Hours group added to them before running Run Pay Calculation.*

**<wd:Rate>**: Rate value for this Payroll Input; may be required depending on the pay component

**<wd:Adjustment>**: set to true if you want this Payroll Input to show as an additional entry that increases or decreases a pay component on the Payroll Result. The default is false, which overrides any matching input, including its amount and related calculations.

## Worktag Data

For each input entry use the element appropriate for the Custom Worktag type to tag the input with the values needed for the customer's payroll and GL requirements. Unlike other web services that deal with worktags such as Import\_Accounting\_Journal and Import\_Budget that have generic worktag reference elements that you can populate IDs and their associated ID types into, the Import Payroll Input web service has dedicated elements in the <wd:Worktag\_Data> section for given worktags.

Take care to ensure that both the worktag's Reference ID and Reference ID type are populated accurately and match the correct element. The ID types are case sensitive.

### When Adding Delivered Worktags

When adding worktags like Cost Center, Location, Job Profile, Project, and others, you must leverage the pre-defined element for that worktag, and populate a wd:type appropriate for the field, or use a type of WID and populate the WID. For example, if adding in a Cost Center, Location, and Job Profile (shown here with arbitrary values), you would populate your request as follows with your own valid references:

```
<wd:Cost_Center_Reference>
  <wd:ID
    wd:type="Cost_Center_Reference_ID">Office
    of the CEO</wd:ID>
  </wd:Cost_Center_Reference>
  <wd:Location_Reference>
    <wd:ID
      wd:type="Location_ID">PLEASANTON_HQ</
      wd:ID>
    </wd:Location_Reference>
    <wd:Job_Profile_Reference>
      <wd:ID
        wd:type="Job_Profile_ID">JOB_ID2345</
        wd:ID>
    </wd:Job_Profile_Reference>
```

### When Adding Custom Orgs

When adding other Custom Orgs besides the orgs that may have been included above, the format is as follows; include as many <wd:Custom\_Organization\_Reference> tags as there are Custom Organizations you need to tag:

```
<wd:Custom_Organization_Reference>
  <wd:ID
    wd:type="Custom_Organization_Reference_ID">WEST
    wd:ID>
  </wd:Custom_Organization_Reference>
```

### When Adding Custom Worktags

For example, to add a worktag for a Custom Worktag called Line of Business, either through

Workday Report Writer or the Integration IDs report, note down which Custom Worktag Type ID that worktag has (this may vary from tenant to tenant, so ensure that your request *exactly* matches the type that's defined in Workday) as well as the Reference ID for the exact Custom Worktag value you are linking to.

If you see that Line of Business is Custom Worktag 3 and has a Custom\_Worktag\_Type\_ID of Custom\_Worktag\_3 and the specific Line of Business *Sales* you want to include has a Reference ID of *Sales*, you would populate the `<wd:Custom_Worktag_03_Reference>` element as follows.

```
<wd:Custom_Worktag_03_Reference>
  <wd:ID
    wd:type="Custom_Worktag_3">Sales</
  wd:ID>
</wd:Custom_Worktag_03_Reference>
```

You would then populate any other Custom Worktag references as are necessary for you to have the worktags you need on that payroll input, being careful to use only Custom Worktags with a given Worktag number in the corresponding Custom Worktag Reference element in the SOAP request (e.g., Custom Worktags with ID types of *Custom Worktag 7* will only ever be accepted in the `<wd:Custom_Worktag_03_Reference>` element).

**Note:** Any Custom Worktags you populate must have a matching and valid Custom Worktag Type ID, and the number of the Custom Worktag must align with the reference element you've populated it in.

#### Additional Input Data

`<wd:Additional_Input_Details_Data>`

`<wd:Related_Calculation_Reference>`: Note that some Related Calculation codes are Workday-owned, so be sure you specify the correct reference ID. For example, `Related_Calculation_ID` vs. `Workday_Related_Calculation_ID`.

A reminder that after loading the payroll input, you can use the Payroll Input by Batch ID report to view the entries.

#### Common Issues and Errors

Issue	Cause and Solution
The request successfully finishes, but some payroll inputs are missing.	<p>A few possible causes:</p> <ul style="list-style-type: none"> <li>Since this is an Import web service, Workday processes the data asynchronously. Though the SOAP request has finished, the background job</li> </ul>

Issue	Cause and Solution
	<p>may still be running. Use the Payroll Input by Batch ID report to periodically monitor progress and verify that payroll inputs continue loading.</p> <ul style="list-style-type: none"> <li>If you accidentally use the Payroll Input ID value for all entries, each entry will wipe out the previous entry. Make certain that the line key is unique for each payroll input entry.</li> <li>The performance will be very slow if you call the Import web service once for every line of input. Example: You call Import_Payroll_Input 1,000 times to process 1,000 payroll inputs with one input per line. Workday creates 1,000 background jobs that queue up and take a long time to process. There is no easy way to recover from this scenario other than to wait for all the jobs to complete their processing. It is important to batch up the pay input lines together into consolidated requests.</li> </ul>
You receive the message: Changing the worker associated with a Payroll Input is not allowed when updating an existing Payroll Input.	This error message indicates that you already used some of the Payroll Input IDs in the SOAP request. The web service is trying to update the entries, but is unable as they are either completed or are assigned to a different worker. When you add new payroll input and want to specify the Payroll Input ID, you may want to preface the Payroll input ID with a date (for example, 2018-06-12) to ensure that it is unique.
When populating a related calculation in the input file, you receive an error message such as: Validation error occurred. Invalid ID value. 'W_NETGU is not a valid ID value for type = 'Related_Calculation_ID'	<p>You are specifying the incorrect Reference ID type in the input file for the related calculation: Note that for related calculations, there is one reference ID type called Related_Calculation_ID and another called Workday_Related_Calculation_ID.</p> <p>If you are not sure which ID to specify, run Integration IDs report to search the values. For example, for related calculations, search Related Calc in the business object prompt. Then choose Related Calculation and Related Calculation (Workday Owned). This will show you a list of all related calculations and the reference ID type they are using. Then populate the web service request accordingly.</p>

### Business Process Used by This Web Service

This web service does not use a business process.

## Details About Add, Update, and Delete Capabilities for This Web Service and How to Recover From Bad Load

- This web service allows you to add new entries or update existing entries. You cannot delete entries through the web service.
- If you inadvertently upload incorrect entries, access the Delete by Batch ID task to remove the entries by specifying the batch ID you used in the input file. See above notes for considerations on deleting existing batches and end-dating previously-entered ongoing inputs.

This web service does not use a business process.

**Note:** *Reminder: You cannot delete payroll inputs used in completed payroll results.*

### Sample Example File

#### Import Payroll Input Super PDF

We update an existing payroll input and add a couple of new payroll inputs, though you typically use the Import Payroll Input to process large volumes of payroll input. For the purposes of this example, we show only 3 entries.

## Concept: Import Payroll Off-Cycle Payment SOAP Web Service Guidelines and Troubleshooting

You can use this web service to add or update manual or on-demand off-cycle payments. These are some of the other web services related to payroll input functionality that you might want to review based on your business need:

- *Import Payroll Input* : This web service is used to add or update payroll input data.
- *Put Payroll History*: This web service is used to add or update historical payments.

**Note:** *This Import web service batches the off-cycle payments into multiple jobs and processes them asynchronously. We recommend you batch at least 1,000 off-cycle payments per Import request (test in a non-production tenant first to find out what works best for you).*

For API documentation of all web services including *Import Payroll Off-Cycle Payment* , see [Operations Directory](#).

### Equivalent Workday User Interface (UI) Task

From related actions on Worker profile, access Payroll > Manual Payment or access Payroll > On-Demand Payment.

### Business Process Used by this Web Service

This web service does not use a business process.

### Tips for Populating your Request

To validate the data you are loading, use the Pay Calculation Off-cycle Inputs for Group of Workers report. This report can be run for specific statuses and/or Batch IDs.

To use an inbound EIB, see [Concept: Dates in Payroll Off-Cycle Payment EIB Spreadsheets](#).

### Data at the Header Level

Repeat `<wd:Payroll_Off-cycle_Payment_Data>` elements for each separate payment in your SOAP request.

`<wd:Batch_ID>` : The Batch ID associated with this payment. You can use it to group off-cycle payments together to run pay calculation, complete, cancel and settlement. Ensure to use the same value across all payments in your request.

**<wd:Payment\_ID>**: This field is required. Enter a unique value when creating a new off-cycle payment. If you put an existing Payment ID, Workday will overwrite that payment with the data from this request unless the payment has a status of Complete.

**<wd:Employee\_Reference>**: The employee for whom you are entering the off-cycle payment.

**<wd:Payment\_Date>**: The date associated with this off-cycle payment.

**<wd:Period\_Date>**: This date determines the period or sub-period that the off-cycle payment is included in. See [Concept: Dates in Payroll Off-Cycle Payment EIB Spreadsheets](#) for further details on how dates are used by this web service.

**<wd:Payment\_Priority>**: If a worker has multiple off-cycle payments in the same period or sub-period, Workday uses this value to determine the pay calculation order when processing the payments. If there is only 1 off-cycle payment for the worker in a given period or sub-period, enter 1.

**<wd:Result\_Type\_Reference>**: Possible values are ManualPayment or OnDemandPayment. The value you specify, must align with the **<wd:On\_Demand\_Payment\_Data>** section or the **<wd:Manual\_Payment\_Data>** section of the payment, which are mutually exclusive.

### Data at the Off-Cycle Input Level

**<wd:Off-Cycle\_Input\_Data>**

**<wd:Earning\_Reference>**: The Reference ID of the earning associated with this line. Depending on the earning included, and depending on functional configuration that's already been completed by a Payroll consultant, you might need to populate specific worktags, rate, hours, or amount for submitting this operation successfully. This element is mutually exclusive with the **<wd:Deduction\_Reference>** element for a given Payroll Off-Cycle Payment.

**<wd:Deduction\_Reference>**: The Reference ID of the earning associated with this line. Depending on the Deduction included, and depending on functional configuration that's already been completed by a Payroll consultant, you might need to populate specific worktags, rate, hours, or amount for submitting this operation successfully. This element is mutually exclusive with the **<wd:Earning\_Reference>** element for a given Payroll Off-Cycle Payment.

### Common Issues and Errors

Issue	Cause and Solution
The web service completes successfully, however you do not see the off-cycle payments in the tenant.	When you load the off-cycle payments via the web service, they get loaded as unprocessed. You would then need to run pay calculations to process them. One way to validate the data that you loaded, is to use report Pay Calculation Off-Cycle Inputs for Group of Workers. This report can be run for specific statuses and/or Batch IDs.
The web service issues an error such as one of the following: <ul style="list-style-type: none"> <li>• <i>Invalid ID value. W_TTWG is not a valid ID value for type = Related_Calculation_ID</i></li> <li>• <i>Invalid ID value. W_OASER is not a valid ID value for type = Deduction_Code</i></li> </ul>	You are using the wrong Reference IDs in your request for deduction and/or related calc. Note that for deductions, there is one Reference ID called Deduction_Code and another called Workday_Deduction_Code. Also, for related calculation IDs, there is one Reference ID called Related_Calculation_ID and another called Workday_Related_Calculation_ID. If you are not sure which ID to specify, run Integration IDs report to search the values. For example, for deductions, search Deduction in the business object prompt. Then choose Deduction and Deduction (Workday

Issue	Cause and Solution
	<p>Owned). This will show you a list of all deductions and the Reference ID they are using. For related calculations, choose Related Calculation and Related Calculation (Workday Owned). Then populate the pay component or related calc value in the appropriate line of your SOAP request.</p>
<p>The web service issues error <i>Validation error occurred. No eligible processing period exists for the period date.</i></p>	<p>There are multiple causes for this issue, which are described below. Also, If you receive this error, it may be helpful to test in the user interface by entering the off-cycle payment using the same information you populated in the input file. You may find that you receive an error and/or cannot enter the information you provided in the input file, as it is not valid for the worker.</p> <ul style="list-style-type: none"> <li>• Previous Period is not complete: You cannot process payments in a given period until the previous period is complete.</li> <li>• The Period Date/Run Category/Pay Group that you provided is not allowing the web service to find a period for processing: Note that the web service uses the Period Date to identify the target period for the off-cycle payment. If you populate Run Category, the web service will check for the period date within the run category you specified. If Run category is left blank, the web service will look for the period date in the regular run category. If you populate the pay group, this is also used to assist in identifying the correct period. If the pay group is left blank, then the web service looks for the pay group that the worker is in as of the period date.</li> </ul>
<p>Slow Performance</p>	<p>A few possible causes:</p> <ul style="list-style-type: none"> <li>• Since this is an Import web service, Workday processes the data asynchronously. Though the SOAP request has finished, the background job may still be running. Use the Pay Calculation Off-cycle Inputs for Group of Workers report to periodically monitor progress and verify that Off-Cycle Payments continue loading.</li> <li>• The performance will be very slow if you call the Import web service once for every Off-Cycle Payment. Example: You call Import_Payroll_Off-Cycle_Payments 1,000 times to process 1,000 Off-Cycle Payments with one input per line. Workday creates 1,000 background jobs that queue up and take a long time to process. There is no easy way to recover from this</li> </ul>

Issue	Cause and Solution
	scenario other than to wait for all the jobs to complete their processing. It is important to batch up the Off-Cycle Payment lines together into consolidated requests.

## Web Service Processing

This web service enables you to add new entries or update existing entries. You cannot delete entries nor can you rescind since this web service doesn't use a business process.

### Guidelines for Recovering from a Bad Load

When you inadvertently upload incorrect entries, you can use the Delete by Batch ID task and then remove the entries by specifying the Batch ID you used in the input file.

**Security:** *Process: Delete Payroll Input by Batch ID – batch / Initialize Reference IDs* domain in the Core Payroll functional area.

**Note:** *You cannot delete entries that are used in completed payroll results.*

### Sample Example File

Refer to the attached sample file for reference. Some of the entries in the input file might not make business sense, but demonstrate different examples of how to add multiple earnings, deductions, and multiple related calculations for a single off-cycle payment.

[Import Payroll Off Cycle Payment Sample File](#)

## Concept: Import Reported Time Blocks SOAP Web Service Guidelines and Troubleshooting

### Purpose

This web service is intended for bulk loads such as holiday time blocks, or bulk loads from a third-party system. Workday Time Tracking will process these time blocks into reported and calculated time blocks.

### Use Case

For API documentation for all web services, including Import Reported Time Blocks, see [Operation Directory](#).

### Equivalent User Interface (UI) Task

Enter Time for Worker

### Tips for Populating the Web Service Request

**Note:** *This Import web service batches the time block entries into jobs and processes them asynchronously. We recommend you batch at least 1,000 time block entries per Import request (test in a non-Production tenant first to find out what works best for you).*

**<wd:Worker\_Reference>**: Worker is required. Most likely you'll need to change the reference ID in row 4 from Contingent\_Worker\_ID to Employee\_ID

**<wd:Worker\_Time Block\_Reference>**: Enter a value here only if you're updating an existing time block. Currently this field doesn't support setting the *initial* value of the time block's Reference ID. To identify the Reference ID value of a time block to update later, you may find it helpful to make a copy of standard

report Time Block Audit, then add field Reference ID (the field you need to populate in the Worker Time Block field). You may also want to add field Is Deleted to the report.

<wd:Delete\_Time\_Block>: Enter true if you need to delete an existing time block. Note that you'll also need to specify a <wd:Worker\_Time\_Block\_Reference> value for the time block you wish to delete.

<wd:In\_Date\_Time> and <wd:Out\_Date\_Time>: Keep in mind that when populating In Date Time and Out Date Time, Workday is assuming the times are in US Pacific Time. For this reason, you may find it preferable to populate the input file using a UTC offset to correctly load the time zone for each time block. Below are examples showing the UTC format:

- Oct 25 at 8:00am CET is 2018-10-25T08:00:00+02:00
- Oct 25 at 8:15am EST is: 2018-10-25T08:15:00-05:00
- Oct 25 at 8:15am EDT is 2018-10-25T08:15:00-04:00

#### Worktag Data

For each input entry, use the element appropriate for the Custom Worktag type to tag the input with the values needed for the customer's payroll and GL requirements. Unlike other web services that deal with worktags such as Import\_Accounting\_Journal and Import\_Budget that have generic worktag reference elements that you can populate IDs and their associated ID types into, the Import Reported Time Blocks web service has dedicated elements in the SOAP request body for given worktags.

Take care to ensure that both the worktag's Reference ID and Reference ID type are populated accurately and match the correct element. The ID types are case-sensitive.

#### When Adding Delivered Worktags

When adding worktags like Cost Center, Location, Job Profile, Project, and others, you must leverage the predefined element for that worktag, and populate a wd:type appropriate for the field, or use a type of WID and populate the WID. For example, if adding in a Cost Center, Location, and Job Profile (shown here with arbitrary values), you would populate your request as follows with your own valid references:

```

<wd:Cost_Center_Reference>
  <wd:ID
    wd:type="Cost_Center_Reference_ID">Office
    of the CEO</wd:ID>
  </wd:Cost_Center_Reference>
<wd:Location_Reference>
  <wd:ID
    wd:type="Location_ID">PLEASANTON_HQ</
  wd:ID>
  </wd:Location_Reference>
<wd:Job_Profile_Reference>
  <wd:ID
    wd:type="Job_Profile_ID">JOB_ID2345</
  wd:ID>
  </wd:Job_Profile_Reference>
```

## When Adding Custom Worktags or Custom Orgs

For example, to add a worktag for a Custom Worktag called Line of Business, either through Workday Report Writer or the Integration IDs report, note down which Custom Worktag Type ID that worktag has (this may vary from tenant to tenant, so ensure that your request *exactly* matches the type that's defined in Workday) and the Reference ID for the exact Custom Worktag value you are linking to.

If you see that Line of Business is Custom Worktag 3 and has a Custom\_Worktag\_Type\_ID of Custom\_Worktag\_3 and the specific Line of Business Sales you want to include has a Reference ID of Sales, you would populate the <wd:Custom\_Worktag\_03\_Reference> element as follows.

```
<wd:Custom_Worktag_03_Reference>
  <wd:ID
    wd:type="Custom_Worktag_3">Sales</
  wd:ID>
</wd:Custom_Worktag_03_Reference>
```

You would then populate any other Custom Worktag references as are necessary for you to have the worktags you need on that payroll input, being careful to use only Custom Worktags with a given Worktag number in the corresponding Custom Worktag Reference element in the SOAP request (such as Custom Worktags with ID types of Custom Worktag 7 will only ever be accepted in the <wd:Custom\_Worktag\_03\_Reference> element).

Unlike in other web services, the same structure applies to the Custom Org elements as well:

```
<wd:Custom_Organization_01_Reference>
  <wd:ID
    wd:type="Custom_Organization_Reference_ID">WEST
  wd:ID>
</
wd:Custom_Organization_01_Reference>
```

**Note:** Any Custom Worktags you populate must have a matching and valid Custom Worktag Type ID, and the number of the Custom Worktag must align with the reference element you've populated it in.

## Common Issues and Errors

Issue	Cause and Solution
Even though the web service successfully finishes, some time block entries are missing.	Since this is an import web service, the data is processed asynchronously. Though the SOAP

Issue	Cause and Solution
	request has completed, the background job may still be running.
The Time Block Entries are taking hours to show up in the tenant.	<p>This will occur if you load each entry in a separate web service call (not recommended).</p> <p>For example, you upload 1,000 time blocks in 1,000 separate SOAP requests rather than calling a single SOAP request with 1,000 time blocks in it. If you do this, the result is that 1,000 background jobs are created, thus they queue up and take a long time to process. There's no easy way to recover from this scenario, other than wait for all the jobs to complete their processing.</p>
The web service issues error Invalid ID value. 'xxxxx' isn't a valid ID value for type = 'Contingent_Worker_ID'.	<p>This usually occurs because the Reference ID type for the worker in the SOAP request is set to Contingent Worker instead of Employee ID. If you're attempting to add time blocks for employees, check the value in &lt;wd:Worker_Reference&gt; and make certain it's Employee_ID.</p>

## Design Notes

### Business Process Used by This Web Service

Details about Add/Update/Delete Capabilities for this Web Service and How to Recover from Bad Load

### Reported Time Batch Event

This web service allows you to Add, Update, and Delete time blocks.

If you have inadvertently uploaded incorrect entries, one option would be to use the Mass Rescind task. You'll find the entries you uploaded by searching for business type Reported Time Batch Event for the period of time the entries were loaded. To view the batch event associated with a worker, make a copy of report Time Block Audit, then add field Batch Events.

## Sample Example File

[Import Reported Time Blocks Sample PDF](#)

## Concept: Import Statistic SOAP Web Service Guidelines and Troubleshooting

The Import Statistic web service is used to add or update statistic lines for a given period's statistic in mass. Note that any update to a statistic definition for a given period using this web service will perform a complete overwrite of the existing statistic lines with the lines in your request.

There is a corresponding Put Statistic operation if you need to add a single statistic with relatively few lines; but if you're adding or overwriting many statistic lines at a time, you will need to switch to Import Statistic.

There are other web services related to the statistic functionality. Review the following web services to figure out what works best for you:

- Put Statistic: Used to add or update a single statistic for a given period.
- Import Position Budget: Used to add or update Position Budgets.

- Import Statistic Plans: Used to update Statistic Plan Lines asynchronously.
- Put Statistic Definition: Used to add Statistic Definitions.

To view API documentation for all web services (including Import Statistic), see [Operation Directory](#).

Note: The Import web service runs asynchronous returning immediately a runtime ID of a process that runs in the background breaking up a budget into chunks and process them in parallel.

At this time, loading a statistic to a statistic definition will overwrite all existing statistic line values in that definition's statistic for the period, regardless of whether the lines you are adding have unique worktag values. This web service should be thought of as providing a Replace All overwrite of statistic lines within a statistic definition for a given period.

## **Equivalent Workday Task**

Create Statistic / Edit Statistic

### **Tips for Populating your Request**

Before calling the web service for the first time, you may want to test populating a statistic entry via the user interface using Create Statistic task. This helps ensure that everything is properly configured and you are able to successfully add a statistic line.

#### Data at the Header or Statistic Definition Level

<wd:Import\_Statistic\_Request>

<wd:Add\_Only>: Boolean value. If set to true, the web service will not load statistic lines to a statistic definition that already has statistic lines populated for the given fiscal period. If set to false, overwrites to the statistic definition will be possible, and the existing lines for the period will be replaced by the lines in the web service request.

<wd:Statistic\_Reference>: Use a unique value for each statistic. If you upload statistic data with an identical Statistic\_Reference to a statistic that has already been created, and intend on updating or overwriting that statistic with your SOAP request, ensure that the Statistic\_Reference matches the original.

#### Data at the Header / Statistic Definition Level

<wd:Statistic\_ID>: A unique reference ID for the statistic being loaded.

<wd:Statistic\_Definition\_Reference>: One way to identify this value is to:

1. Locate your statistic definition using View Statistic Definition.
2. You'll then see the company, statistic type, statistic definition name, Ledger/Plan Structure, and required dimensions for your statistic.
3. Next, from the related actions of your Statistic Definition value, choose Integration IDs->View IDs.
4. This will display the value for the reference ID type Statistic\_Definition\_ID.

<wd:Ledger\_Budget\_Structure\_Statistic\_Reference>:  
 Every Statistic Definition is tied to at least one Ledger / Plan Structure; in order to import the statistic lines to the Statistic Definition identified above, populate the ID of the Ledger Type(s) or Plan Structure(s) associated with the Statistic Definition. If there are both Ledger Types and Plan Structures on the statistic definition, you can enter values for either a Ledger (actuals) or Plan. To find the reference ID value(s):

1. Locate your statistic definition using View Statistic Definition.
2. You'll then see the company, statistic type, statistic definition name, Ledger/Plan Structure, and required dimensions for your statistic.
3. Next, from the related actions of each of your Ledger / Plan Structure values, choose Integration IDs->View IDs.
4. This will display the value for the reference ID type and ID.

**Note:** *Only enter Plan Structures with matching worktag dimensions to your Statistic Definition.*

<wd:Fiscal\_Period\_Reference\_Data>

<wd:Fiscal\_Year\_Reference>: ID of the Fiscal Year (you must populate the reference ID, the ID Type, the Parent ID, and the Parent ID Type). To find the reference ID and ID Type value(s):

1. Locate your Fiscal Year using View Fiscal Year.
2. You'll then see the details related to that Fiscal Year
3. Next, from the related actions of the Fiscal Year itself, choose Integration IDs->View IDs.
4. This will display the value for the reference ID type (Fiscal\_Year\_ID or WID), the ID, the Parent Type (Fiscal\_Schedule\_ID), and the Parent ID.

<wd:Fiscal\_Posting\_Interval\_Reference>: ID of the Fiscal Posting Interval (you must populate the reference ID and the ID Type). To find the reference ID and ID Type value(s):

1. Locate your Fiscal Year using View Fiscal Year.
2. You'll then see the details related to that Fiscal Year
3. Next, from the related actions of the individual Fiscal Posting Interval itself, choose Integration IDs->View IDs.

4. This will display the value for the reference ID type (Fiscal\_Posting\_Interval\_ID or WID) and the ID.

You can also find this value using the Integration IDs report, by navigating through the results of the View Fiscal Schedule report and drilling into a Fiscal Year, or by using the Maintain Fiscal Schedule Posting Intervals task.

**Note:** *If available, use <wd:Fiscal\_Summary\_Year\_Reference> and <wd:Fiscal\_Summary\_Interval\_Reference> elements to specify the Fiscal Summary Year and Fiscal Summary Interval. You can find the appropriate IDs to populate using the View Fiscal Summary Schedule task.*

**<wd:Statistic\_Memo>**: A description of the overall statistic entry.

#### Statistic Line Replacement Data

**<wd:Company\_Reference>**: The company associated with the statistic entry. If a company was included on the Statistic Definition, this field is required and must match the company on the Statistic Definition. Correspondingly, Company cannot be entered if the Statistic Definition does not include Company.

**<wd:Budget\_Name\_Reference>**: The Budget associated with the statistic entry; this must match the Budget on the header if a Budget is included there.

**<wd:Statistic\_Line\_Value>**: The numeric value of the statistic line.

#### Worktag Data

For each statistic line, entry use the **<wd:Worktag\_Reference>** element to specify all worktags that are necessary for the statistic to post successfully to the statistic definition and to meet the customer's financial requirements.

**Note:** *All Custom Organizations are Custom Worktags, so Custom Orgs can be tagged on the statistic line using this element as well, as long as the ID and the ID type are accurate.*

You will populate one **<wd:Worktag\_Reference>** element for each worktag on the statistic line. Take care to ensure that both the worktag's Reference ID and Reference ID type are populated accurately. The ID types are case sensitive.

For example, to add a worktag for a Custom Worktag called Line of Business, either through Workday Report Writer or the Integration IDs report, note down which Custom Worktag Type ID that worktag has (this may vary from tenant to tenant, so ensure that your request *exactly* matches the type

that's defined in Workday) as well as the Reference ID for the exact Custom Worktag value your are linking to.

If you see that Line of Business is Custom Worktag 3 and has a Custom\_Worktag\_Type\_ID of Custom\_Worktag\_3 and the specific Line of Business *Sales* you want to include has a Reference ID of *Sales*, you would populate the <wd:Worktag\_Reference> element as follows.

```
<wd:Worktag_Reference>
  <wd:ID
    wd:type="Custom_Worktag_3">Sales</
  wd:ID>
</wd:Worktag_Reference>
```

You would then populate as many instances of <wd:Worktag\_Reference> as are necessary for you to have the worktags you need on that statistic line, and repeat across all statistic lines in the statistic.

## Common Issues and Errors

Issue	Cause and Solution
<i>The web service fails with error Use Worktags for required or optional dimensions or Enter Worktags for each Required Dimension.</i>	This indicates you haven't specified the correct Year or Fiscal Time Interval. Check the instructions in <a href="#">Tips for Populating the Input File</a> above for advice on how to populate the year and fiscal time interval.
<i>The web service fails with error Use Worktags for required or optional dimensions or Enter Worktags for each Required Dimension.</i>	This indicates your Statistic Definition had required dimensions (worktags) you did not specify in your Statistic Lines.
<i>The web service fails with error The following worktags are not allowed</i>	This indicates your Statistic Lines included dimensions (worktags) that were neither required nor optional in the Statistic Definition.
<i>The web service fails with error Worktag is not valid</i>	<p>Below are causes of this issue. If you encounter this error, you may want to test whether you can enter the information via the user interface using Create Statistic or Edit Statistic to determine if this is a configuration issue or an issue with how you're populating the SOAP request. This can occur if:</p> <ol style="list-style-type: none"> <li>1. You specify an inactive worktag.</li> <li>2. You specify a worktag that references a related worktag that is inactive.</li> <li>3. The worktag is not configured in the structure dimension or if the worktag is configured in the structure dimension but doesn't include all members.</li> </ol>

Issue	Cause and Solution
<p>The web service fails with error <i>Fiscal Period is required if Statistic has Ledger Type or Budget Structures without Summary Schedule or A Fiscal Period does not exist for the year and posting interval provided</i></p>	<p>This indicates you haven't specified the correct Year or Fiscal Time Interval. Check the instructions in <a href="#">Tips for Populating the Input File</a> above for advice on how to populate the year and fiscal time interval.</p>
<p>The web service fails with message <i>The task submitted is not authorized.</i></p>	<p>This happens if you don't have the proper access to the Process Statistics domain security policy. To fix this, you can:</p> <ol style="list-style-type: none"><li>1. Check the Process Statistics domain security policy to make certain you have Put access,</li><li>2. Activate the change.</li></ol>

### Business Process Used by this Web Service

None.

### Details About Add/Update/Delete Capabilities for This Web Service and How to Recover From Bad Load

There is no option to mass rescind or mass cancel the load of the statistics. However, if you inadvertently loaded incorrect entries, one option would be to reload the correct entries with Add\_Only set to false.

### Sample Example File

[Import Statistic PDF](#)

## Concept: Import Time Clock Events SOAP Web Service Guidelines and Troubleshooting

The Import Time Clock Events web service is intended to load large batches of Time Clock Events on an infrequent basis. There is a similar web service called Put Time Clock Events. Consider the following when determining which web service should be used:

- Put Time Clock Events is intended for use with real-time integrations with 3rd-party time clock devices. Typically, this would be frequent, small batches.
- Import Time Clock Events is intended to be used for loading larger volumes of time clock events (1,000 or more).
- Refer to the [Import Time Clock Events](#) Community page for more details.
- For API documentation for all web services including *Import Time Clock Events*, see [Operation Directory](#).

### Equivalent User Interface (UI) Task

From related actions in Worker Profile, navigate to Time and Leave -> Add Time Clock Event.

### Tips for Populating the Web Service Request

Note: This Import web service batches the Time Clock Events into jobs and processes them asynchronously. We recommend you batch at least 1,000 Time Clock Events per Import request (test in a non-production tenant first to find out what works best for you).

`<wd:Time_Clock_Event_ID>`: This is a unique ID assigned to each Time Clock Event. When adding new Time Clock Events you can leave this blank (or assign a value that hasn't yet been used). If updating or

deleting an existing Time Clock Event, be sure to populate the Time Clock Event ID for the existing time clock.

There is a report definition below that you can use to identify the Time Clock Event IDs.

`<wd:Time_Clock_Event_Date_Time>`: Refer to the [FAQ Time Entry](#) for details on how time zones are handled.

`<wd:Time_Entry_Code>`: Note that the out punch doesn't have a time entry code associated with it. When you load the out punch, the value does not need populated.

`<wd:Clock_Event_Type_Reference>`: Used to determine whether the event is an In, Break, Meal, or Out time punch.

## Worktag Data

For each input entry, use the element appropriate for the Custom Worktag type to tag the input with the values needed for the customer's payroll and GL requirements. Unlike other web services that deal with worktags such as Import\_Accounting\_Journal and Import\_Budget that have generic worktag reference elements that you can populate IDs and their associated ID types into, the Import Time Clock Events web service has dedicated elements in the SOAP request body for given worktags and orgs.

Take care to ensure that both the worktag's Reference ID is populated accurately and matches the correct element. The IDs are passed in as a simple string.

## Common Issues and Errors

The most common issue is time clocks not visible in the tenant after the web service successfully completes. If you see this behavior, keep in mind that the time clocks are initially loaded and saved with a status Unprocessed.

Although the request completed, all the entries may not be processed. There is a background job called TCE Sweeper that runs every 15 minutes to look for unprocessed entries. This sweeper processes just one "batch" of Time Clock Events at a time (the events associated with a single SOAP call to this web service). If you have a process that calls this web service multiple times, the entries from the first request would be immediately processed. The entries from your next request would then be processed 15 minutes later when the TCE Sweeper job runs, and entries from a subsequent call would be processed in another 15 minutes when the TCE Sweeper runs again, and so on.

This is why it is important to load at least 1,000 time clocks per SOAP call. If you unnecessarily spread your time clock events across multiple SOAP calls, then it will take a very long time for the processing to complete. Below are some tools you can use to monitor the loading of the time clock events:

- Report Unprocessed Time Clock Events: If you see the entries here, then your events were loaded but haven't been processed yet.
- Task Maintain Invalid Time Clock Events: This will show you if there are any errors for the time clock events you loaded.
- You could also create a custom report, from data source All Time Clock Events that checks the TCE Status and use this to monitor the load.

## Business Process Used by this Web Service

No business process is used by this Web Service.

## Details About Add/Update/Delete Capabilities for This Web Service and How to Recover from Bad Load

- This web service allows you to add, update and delete time clocks.

- If you have inadvertently uploaded incorrect entries, you can either:
  - Rerun the process that created the entries and set <wd:Delete\_Time\_Clock\_Event> to true. (You will need to be sure to populate the Time Clock Event ID values for the entries to be deleted.)
  - Or you can rerun the request and update the existing entries to correct them. (You will need to be sure to populate the Time Clock Event ID values for the entries to be updated.)
  - Below is an example of a custom report that could be used to identify the Reference ID (populated in the Time Clock Event ID field) for the entries that you wish to update or delete.

### Sample Example File

[Import Time Clock Events Sample File PDF](#)

## Concept: Put Applicant SOAP Web Service Guidelines and Troubleshooting

This web service should be used to upload pre-hires into Workday. Note that an Applicant is a pre-hire in Workday.

For API documentation for all web services including Put Applicant, see [SOAP Operation Directory](#).

### Equivalent User Interface (UI) Task

The equivalent UI task for this web service operation is Create pre-hire.

### Common Issues and Errors

Issue	Solution
Validation error occurred. The ethnicity doesn't exist in the specified Location Context. The Location Context is derived from the Country of the Location of the Position.	<p>Check these:</p> <ul style="list-style-type: none"> <li>• Run the Maintain Localization Settings task and validate Additional Nationalities (Pre-Hire) is Active.</li> <li>• Check the Allow for Countries and Region text box.</li> </ul>
Message: ERROR: Processing error occurred. Attempt to delete instance with 1 references as target of 1 way Indexed Student Decorator.indexes Contact Interface relationship	<p>If the worker has existing Primary Home Contact information in Workday, submitting another request(Put_applicant) with the Home contact information included, will trying to delete the information that is existing in the tenant and update with the current data in the soap request.</p> <p>To resolve this issue, please add "wd:Do_Not_Replace_All="true" " for each of the contact data section (email, phone, and address) to add/update the primary home contact info.</p>

### Business Process Used by This Web Service

None

### Details About Add/Update/Delete Capabilities and How to Recover from a Bad Load

- This web service allows you to add new entries or update existing entries. You can't delete entries via the web service.

- This web service doesn't use a business process, therefore there's no Rescind option. However, if you have inadvertently uploaded incorrect entries, use can use task Delete Pre-Hires.

### **Sample Example File**

[Put Applicant v36 Add PDF](#)

[Put Applicant v36 Update PDF](#)

## **Concept: Put Time Clock Events SOAP Web Service Guidelines and Troubleshooting**

This web service is intended to add time clock events from a third party vendor.

Note that there is also another similar web service called Put Time Clock Events to load time clocks. Consider the following when determining which web service should be used:

- Put Time Clock Event is intended for use with real-time integrations with 3rd-party time clock devices. Typically, this would be frequent, small batches.
- Import Time Clock Events is intended to be used for loading larger volumes of time clock events (1,000 or more).

For API documentation for all web services including Put Time Clock Events see [SOAP Operation Directory](#).

### **Equivalent User Interface (UI) Task**

This would be similar to choosing Time and Leave -> Add Time Clock Event from related actions in Worker Profile.

**<wd:Time\_Clock\_Event\_ID>**: This is a unique ID assigned to each Time Clock Event. When adding new Time Clock Events you can leave this blank (or assign a value that hasn't yet been used). If updating or deleting an existing Time Clock Event, be sure to populate the Time Clock Event ID for the existing time clock.

There is a report definition below that you can use to identify the Time Clock Event IDs.

**<wd:Time\_Clock\_Event\_Date\_Time>**: Refer to the [FAQ Time Entry](#) for details on how time zones are handled.

**<wd:Time\_Entry\_Code>**: Note that the out punch doesn't have a time entry code associated with it. When you load the out punch, the value does not need populated.

**<wd:Clock\_Event\_Type\_Reference>**: Used to determine whether the event is an In, Break, Meal, or Out time punch.

### **Worktag Data**

For each input entry use the element appropriate for the Custom Worktag type to tag the input with the values needed for the customer's payroll and GL requirements. Unlike other web services that deal with worktags such as Import\_Accounting\_Journal and Import\_Budget that have generic worktag reference elements that you can populate IDs and their associated ID types into, the Put Time Clock Events web service has dedicated elements in the SOAP request body for given worktags and orgs.

Take care to ensure that both the worktag's Reference ID is populated accurately and matches the correct element. The IDs are passed in as a simple string.

### **Common Issues and Errors**

The most common issue is time clocks not visible in the tenant after the web service successfully completes. If you see this behavior, keep in mind that the time clocks are initially loaded and saved with a status Unprocessed.

Although the request completed, all the entries may not be processed. There is a background job called TCE Sweeper that runs every 15 minutes to look for unprocessed entries. This sweeper processes just one "batch" of Time Clock Events at a time (the events associated with a single SOAP call to this web service). If you have a process that calls this web service multiple times, the entries from the first request would be immediately processed. The entries from your next request would then be processed 15 minutes later when the TCE Sweeper job runs, and entries from a subsequent call would be processed in another 15 minutes when the TCE Sweeper runs again, and so on.

Even though this web service is for frequent, small batches, it remains important to batch events together in your SOAP requests where possible. If you unnecessarily spread your time clock events across many, many SOAP calls, then it will take a very long time for the processing to complete. Below are some tools you can use to monitor the loading of the time clock events:

- Report Unprocessed Time Clock Events: If you see the entries here, then your events were loaded but haven't been processed yet.
- Task Maintain Invalid Time Clock Events: This will show you if there are any errors for the time clock events you loaded.
- You could also create a custom report, from data source All Time Clock Events that checks the TCE Status and use this to monitor the load.

### **Business Process Used by this Web Service**

No business process is used by this Web Service.

### **Guidelines for Recovering from a Bad Load**

- This web service allows you to add, update and delete Time Clock Events.
- If you have inadvertently uploaded incorrect entries, you can either:
  - Rerun the process that created the entries and set <wd>Delete\_Time\_Clock\_Event> to true. (You will need to be sure to populate the Time Clock Event ID values for the entries to be deleted).
  - Or you can rerun the request and update the existing entries to correct them (You will need to be sure to populate the Time Clock Event ID values for the entries to be updated).
  - Below is an example of a custom report that could be used to identify the Reference ID (Populated in the Time Clock Event ID field) for the entries that you wish to update or delete.

### **Sample Example Files**

Refer to the attached files for examples:

- [Create TCE GMS PDF](#): This sample will create a time clock event (TCE).
- [Delete TCE GMS PDF](#): This sample will delete the the TCE that was created in the previous sample.

## **Concept: Request Leave of Absence SOAP Web Service Guidelines and Troubleshooting**

This web service enables you to add new leave of absence events or correct existing leave of absence events.

To load large volumes of Leave of Absence events, use the Import Request Leave of Absence Events. If you're loading more than 1,000 events, you might want to test both web services in a non-production tenant to evaluate which web service provides the best performance.

Use web service operation Request Return from Leave of Absence to add new return from leave of absence requests.

For API documentation for all web services including Request Leave of Absence, see [SOAP Operation Directory](#).

## Equivalent User Interface (UI) Task

Place Worker on Leave

### Tips for Populating Your Request

**Note:** *Regarding Canadian Workers:* If you're loading Leave of Absence Events for Canadian workers, you must first edit the leave type and configure the Last Date for Which Paid field to be required. If you don't do this, the date won't be loaded (even if you populate the date in the request). Refer to the first entry in the Guidelines for Recovering from a Bad Load section on how to configure the leave type so that the data is properly loaded.

**NOTE:** Regarding Notifications for Corrections: The Correction functionality doesn't support suppression of notifications, even if you enable Auto\_Complete. If you have a business requirement to not send notifications for corrections, we recommend you complete these steps:

1. Add a condition to the business process notifications, such as External Load is Blank to prevent them from firing when making corrections through the web service.
2. Also note that any changes to the notifications, will be honored only for newly initiated Request Leave of Absence events. If you need to correct leaves that were already initiated (before making the change in item#1 above), then you might want to temporarily disable all notifications in the tenant, using task Edit Tenant Setup - Notifications, while you run the requests.

Below are details on how to populate some of the more commonly used fields in the request:

- Business Process section:
  - Auto\_Complete: Set to 1 if you want all approvals, review steps, to do steps and notifications to be bypassed. Set to zero if you want the approval/review/to do steps to be manually processed (and the notifications sent).
  - Comment: You'll need to enter a comment if you're correcting any Leave of Absence Entries.
- Request Leave of Absence section:
  - Request\_Leave\_of\_Absence\_ID: This field is required only if you're correcting an existing Leave of Absence Request. Refer to the sample report in the Guidelines for Recovering from a Bad Load section to identify the values for Request Leave of Absence ID. Note that if correcting a Leave of Absence request, you also need to set the Correction field to true.
  - Correction: Set this to true to correct an existing Leave of Absence Request (you'll also need to populate the Request\_Leave\_of\_Absence\_ID field).
  - Leave\_of\_Absence\_Type: (required): To determine the reference ID type value needed to populate this field, run the View Reference IDs report and search business object Event Classification Subcategory. You can then filter the Business Object Instance column (for example, search Leave or Disability) to find the reference ID value for the leave types you wish to use.
  - First\_Day\_of\_Leave: (Required) Date for first day of leave. Enter using format YYYY-MM-DD.
  - Last\_Day\_of\_Work: Date for last day of work. Enter using format YYYY-MM-DD.
  - Estimated\_Last\_Day\_of\_Leave: (Required) Date value for estimated last day of leave. Enter using format YYYY-MM-DD.
  - Last\_Date\_for\_Which\_Paid: This field is required for Canada. In addition, verify that the leave type is configured in your tenant, to be required. Refer to the first entry in the Common Issues and Errors section for details.

### Common Issues and Errors

Issue	Cause and Solution
The web service doesn't load the Last Day for which Paid (LDFWP) field even though it's populated in the web service request. This is needed to submit ROE for Canada.	When using this web service, you must configure the Leave Type so that Last Date for Which Paid (LDFWP) is required. Do this as follows:

Issue	Cause and Solution
	<ul style="list-style-type: none"> <li>Access the Edit Leave Type task.</li> <li>Select the Leave Type that you're referencing in the request.</li> <li>Go to the Additional Field tab.</li> <li>Go to the bottom of the page and select the + in the Additional Fields section.</li> <li>In the Additional Field, select Last Date for Which Paid</li> <li>Select the Required box.</li> <li>You might see a warning that there are Pending requests that need corrected or canceled. Go ahead and click Ok.</li> </ul> <p>If you've already loaded Leave of Absence events where the LDFWP is missing, then you'll need to complete one of these steps:</p> <ul style="list-style-type: none"> <li>Option 1: Mass Rescind the Events and reload them</li> <li>Option 2: Correct the existing events by rerunning the web service requests and populating the Request Leave of Absence ID and Correction fields.</li> </ul>
<p>Web service response returns errors like this: <i>Processing error occurred. The task submitted isn't authorized.</i></p>	<p>This is most likely security-related. When running report View Security for Securable Item for securable item Request Leave of Absence (Web Service), you'll see that you need access to business process Request Leave of Absence. To change the security:</p> <ol style="list-style-type: none"> <li>Edit the business process security policy for <i>Request Leave of Absence</i>.</li> <li>Access the section for Initiating Action <i>Request Leave of Absence (Web Service)</i>.</li> <li>Confirm that you have access (Ideally, you should have access through an unconstrained security group so that you can load Leaves for any worker.).</li> <li>Activate the change.</li> </ol>
<p>Web service response returns errors like this:</p> <ul style="list-style-type: none"> <li>Invalid format for date text=3/1/2020 on attr Event Effective Date</li> <li>Invalid format for date text=02/29/2020 on attr Last Day of Work</li> <li>Invalid format for date text=02/29/2020 on attr Estimated Last Day of Leave</li> <li>Invalid format for date text=02/29/2020 on attr Last Day for which Paid</li> </ul>	Enter the dates in your request with format YYYY-MM-DD.
<p>Web service response returns an error like this:</p>	If you're making any corrections, you must populate the Comment field.

Issue	Cause and Solution
Each correction must have a comment. Add comments for each correction that you're processing.	
When submitting corrections, notifications are sent even though I enabled Auto_Complete.	The Correction functionality doesn't support suppression of notifications. Refer to instructions in the Tips for Populating the Input File section, to work around this restriction.

## Business Process Used by this Web Service

Request Leave of Absence

## Guidelines for Recovering from a Bad Load

This web service enables you to add new entries or correct existing entries. You can't delete entries but you can rescind or cancel the Business Process event.

When you upload incorrect entries, access 1 of these tasks:

- The Mass Cancel Business Processes task when the business process event is still in progress.
- The Mass Rescind Business Processes task when the business process event is complete.
- Select *Request Leave of Absence* in the Business Process Types prompt and enter a date range for when you ran the API.
- Security: *Business Process Administrator* domain in the System functional area.

After you cancel or rescind the events, rerun the web service requests with correct values. To correct data, complete these steps:

- Set the Correction field to Y for entries that need corrected
- Populate the Request Leave of Absence ID field with the Leave of Absence event that needs corrected. You can create a custom report, such as the one below, to identify the values to populate in the Request Leave of Absence ID field.
- Change any fields that have incorrect values before reloading.

## Sample Example Files

Refer to these attached files for examples:

- [Request Leave of Absence Request Add New Canada PDF](#): This request adds a new Leave of Absence request for a Canadian worker.
- [Request Leave of Absence Request Correction v38 PDF](#): This request corrects an existing Leave of Absence request.
- [Request Leave of Absence Request Add New Leave US PDF](#): This request adds a new Leave of Absence request for a U.S. worker.

## Workday Web Services Attributes, Filters, and Patterns

### Suppress or Display Descriptor Attribute

#### Context

For WWS versions v27.0 and earlier, the reference descriptor attribute displays automatically in web service responses. For WWS versions v27.1 and later, the reference suppresses the descriptor attribute automatically. Suppressing the descriptor attribute increases the performance of many operations.

A Workday SOAP header controls the display of the descriptor attribute for all references returned in a response. You can override this behavior for any WWS version.

## Steps

Set the `Include_Reference_Descriptors_In_Response` element in the `Workday_Common_Header` section of your request to include or exclude the descriptor attribute from the response.

## Example

These SOAP requests will suppress the descriptor attribute in the response, even though the default for WWS version v25.0 is to display the descriptor:

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"  
    xmlns:bsvc="urn:com.workday/bsvc">  
    <soapenv:Header>  
        <bsvc:Workday_Common_Header>  
            <bsvc:Include_Reference_Descriptors_In_Response>false</bsvc:Include_Reference_Descriptors_In_Response>  
        </bsvc:Workday_Common_Header>  
    </soapenv:Header>  
    <soapenv:Body>  
        <bsvc:Get_Workers_Request bsvc:version="v25.0">  
        ...
```

The response is similar to this code:

```
...  
    <wd:Response_Data>  
        <wd:Worker>  
            <wd:Worker_Reference>  
                <wd:ID wd:type="WID">3aa5550b7fe348b98d7b5741afc65534</wd:ID>  
                <wd:ID wd:type="Employee_ID">21001</wd:ID>  
            </wd:Worker_Reference>  
        ...
```

For version v25.0, if you set the `Include_Reference_Descriptors_In_Response` element to `true`, or don't include the element, the response is similar to this code:

```
...  
    <wd:Response_Data>  
        <wd:Worker>  
            <wd:Worker_Reference wd:Descriptor="Logan McNeil (CHRO)">  
                <wd:ID wd:type="WID">3aa5550b7fe348b98d7b5741afc65534</wd:ID>  
                <wd:ID wd:type="Employee_ID">21001</wd:ID>  
            </wd:Worker_Reference>  
        ...
```

## Concept: Disable Integration Subscriptions

To disable integration subscriptions for a web service request, you set the `x-disable-subscriptions` header value to 1 in the HTTP request. In Workday Studio, you can use the `set-headers` component to set the header value before performing a web service request.

You can also use various languages to set the property. Example (Java):

```
// Create a new URL object and set the Workday Web Services endpoint
```

```

URL url = new URL("https://[Workday Web Services endpoint]");

// Create an HTTP URL connection object and open the connection to the URL
HttpURLConnection httpCon = (HttpURLConnection) url.openConnection();

// Disable the integration subscriptions by setting the x-disable-
// subscriptions
// property to 1 in the HTTP URL connection object
httpCon.setRequestProperty("x-disable-subscriptions", "1");

```

When *x-disable-subscriptions* is set to 1, all integration subscriptions are disabled for that request. You can't disable individual integration subscriptions. The default for *x-disable-subscriptions* is zero, which means integration subscriptions are enabled.

## Concept: Import Web Service Pattern

The Import web service pattern enables you to load large documents (data sets) from external systems into Workday. Import web services automatically split up a large document to improve processing performance. You can use a single import call to import large amounts of data to Workday. The web service returns a reference to a Workday background process that imports the data.

An Import web service request from an integration creates a sub business process step. When that happens, later steps in the parent integration business process don't fire until the Import web service request has finished processing. For this reason, a synonymous term for an Import Web Service is a Web Service Background Process.

### Using an Import Web Service

An Import web service sends a response that contains a Workday ID (WID) that identifies the background process importing the data.

This example response from the *Import Accounting Journal* web service includes the WID of the process importing the data:

```

<env:Envelope xmlns:env="http://schemas.xmlsoap.org/soap/envelope/">
  <env:Body>
    <wd:Put_Import_Process_Response wd:version="v21.0"
      xmlns:wd="urn:com.workday/bsvc">
      <wd:Import_Process_Reference wd:Descriptor="Import Accounting Journal">
        <wd:ID wd:type="WID">1e1e4b0388fa1080ce4fdb18d8531e43</wd:ID>
        </wd:Import_Process_Reference>
      </wd:Put_Import_Process_Response>
    </env:Body>
  </env:Envelope>

```

Note: The *Import Accounting Journal* web service performs the same function as the *Submit Accounting Journal* web service.

You can monitor the activity in the Process Monitor in your Workday tenant, or using Workday Web Services.

The Process Monitor displays a link to detailed information if any errors or warnings generate during processing.

If you monitor the activity using Workday Web Services, the:

- Get Import Processes operation monitors the status.
- Get Import Process Messages operation retrieves the processing messages.

You resolve errors for Import web services in the same way as for non-Import web services.

If you upload information using an Import operation with an EIB, specify an Errors & Warnings Spreadsheet during setup. Workday creates the spreadsheet during upload. You can use this spreadsheet to resolve issues. The topic *Launch EIB Spreadsheet Upload* explains how to set this up.

## Bulk Import Web Services

You can use Bulk Import web services to load many individual documents asynchronously.

Bulk import web services support these processing modes, which you can specify in the header:

- High concurrency – which enables you to process a high amount of requests simultaneously, maximizing throughput and performance. High concurrency helps your bulk import web service run faster, but also increases the risk of data conflicts.
- Low concurrency - which enables you to process a lower amount of requests simultaneously, reducing the risk of data conflicts.
- Serial mode - which enables you to process requests sequentially, further reducing the risk of data conflict issues.

You can specify a processing mode in the header by entering *x-bulk-processing-mode-override = mode*, where mode is either *high-concurrency*, *low-concurrency*, or *serial*.

## Concept: Replace\_All and Delete Attributes

The *Replace\_All* and *Delete* attributes enable you to add, edit, and remove data without resending element entries. You use these attributes with multiple instance sets that have reference IDs.

Example:

```
<bsvc:Multi_Instance_Data bsvc:Replace_All="?">
  <bsvc:Instance_Data bsvc:Delete="?">
    <bsvc:Instance_Data_Reference>
      <bsvc:ID bsvc:type="?">?</bsvc:ID>
    </bsvc:Instance_Data_Reference>
    <bsvc:Data_1></bsvc:Data_1>
    <bsvc:Data_2></bsvc:Data_2>
    [...]
    <bsvc:Data_n></bsvc:Data_n>
  </bsvc:Instance_Data>
</bsvc:Multi_Instance_Data>
```

In this example, the *Instance\_Data* element represents 1 instance of a multiple instance set. *Instance\_Data* contains:

- *Reference* element.
- *Instance\_Data\_Reference* element.
- Multiple data elements, *Data\_1* through *Data\_n*.

Example: This SOAP message, from the *Change Personal Information* web service for disability information, creates a new *Disability\_Status\_Information\_Data* entry. The SOAP message doesn't affect existing entries (*Disability\_Status\_Data* contains the added data, but no reference element because a new entry is specified).

```
<bsvc:Disability_Information_Data bsvc:Replace_All="0">
  <bsvc:Disability_Status_Information_Data bsvc:Delete="0">
    <bsvc:Disability_Status_Data>
      [...]
    </bsvc:Disability_Status_Data>
  </bsvc:Disability_Status_Information_Data>
</bsvc:Disability_Information_Data>
```

If you set *Replace\_All* to:

- False: Workday preserves existing data for the worker.

- True: Workday replaces all existing data for the worker. Workday also performs this action if you omit *Replace\_All*.

If you set *Replace\_All* to false and *Delete* to:

- True: Workday removes the existing data entry. Specify the instance data reference if *Delete* is set to true. The instance reference identifies the data instance to remove.
- False: Workday adds or modifies the data entry to conform with the supplied information.

If you set *Replace\_All* to true, there's no use case for the *Delete* flag, so you omit it. If you're deleting all the entries, you use an empty data element instead.

This table summarizes the use cases and the settings:

Use Case	Replace_All	Delete
Create a new data entry, or modify an existing one, and preserve existing data entries.	False	False
Delete an existing data entry, and preserve existing data entries.	False	True
Create a new data entry, or modify an existing one, and remove existing data entries.	True	(Omit)
Remove existing data entries (use an empty data entry in the request message).	True	(Omit)

### Create a New Entry and Preserve Existing Data

This SOAP message creates a new *Disability Status* entry, but preserves existing *Disability\_Status\_Information\_Data* entries for the worker:

- *Replace\_All*: Set to false.
- *Delete*: Set to false.
- *Reference* element: Omit.

```

</soapenv:Body>
</soapenv:Envelope>
```

## Create a New Entry and Remove Existing Data

This SOAP message creates a new *Disability Status* entry and removes any existing entries:

- *Replace\_All*: Set to true.
- *Delete*: Omit.
- *Reference element*: Omit.

```
<bsvc:Disability_Information_Data bsvc:Replace_All="1">
    <bsvc:Disability_Status_Information_Data bsvc:Descriptor="Learning
Disability starting on 2012-11-10">
        <bsvc:Disability_Status_Data>
            [...]
        </bsvc:Disability_Status_Data>
    </bsvc:Disability_Status_Information_Data>
</bsvc:Disability_Information_Data>
```

## Remove an Entry and Preserve Other Entries

This SOAP message removes a specific *Disability Status* entry, but doesn't create or modify other entries:

- *Replace\_All*: Set to false.
- *Delete*: Set to true.
- *Reference element*: Required; identifies the instance to delete.

```
<bsvc:Disability_Information_Data bsvc:Replace_All="0">
    <!-- 0 or more -->
    <bsvc:Disability_Status_Information_Data bsvc:Descriptor="Learning
Disability starting on 2012-11-10" bsvc:Delete="1">
        <!-- Optional -->
        <bsvc:Disability_Reference>
            <bsvc:ID
bsvc:type="Disability_Status_ID">DISABILITY_STATUS_123456</bsvc:ID>
        </bsvc:Disability_Reference>
        <bsvc:Disability_Status_Data>
            [...]
        </bsvc:Disability_Status_Data>
    </bsvc:Disability_Status_Information_Data>
</bsvc:Disability_Information_Data>
```

## Disability Status and Disability Elements

The *Change Personal Information* web service includes these elements:

Element Name	Description
Disability Status	<p>Disability status for an individual, including:</p> <ul style="list-style-type: none"> <li>• Type of disability.</li> <li>• Begin and end dates.</li> <li>• Severity.</li> <li>• Issuing authorities.</li> </ul> <p>This field is represented by the XML element <i>Disability_Status_Reference</i>.</p>
Disability	<p>A type of disability that individuals can have. Example: Blindness (United States of America). This field is represented by the XML element <i>Disability_Reference</i>.</p>

## Concept: Workday Web Service API Date, Time, and Time Zone Handling

Workday SOAP Web Services support both datetimes and dates.

For datetimes:

- Send Datetimes requests in ISO 8601 format. The datetime can specify any time zone offset from Coordinated Universal Time (UTC). Provide both minutes and seconds in the time component of a datetime in a request. Seconds can have an optional fraction.
- Workday returns Datetimes in ISO 8601 format. Times are in Pacific Time, either as UTC-07:00 or UTC-08:00, depending on the season.

Dates have:

- No time component or time zone offset.
- The same format as a datetime but without a time component or time zone offset.

Examples:

Datetime or Date Format	Example	Description
<i>YYYY-MM-DDThh:mm:ss,fffZ</i>	2013-02-26T19:06:57.493Z	Datetime with zero offset from UTC. <ul style="list-style-type: none"> <li>Fff represents a fractional second.</li> <li>T indicates a time.</li> <li>Z indicates zero offset.</li> </ul>
<i>YYYY-MM-DDThh:mm:ss,fff-hh:mm</i>	2014-04-15T19:06:57.493-08:00	Datetime with a time zone offset of -08:00 hours from UTC.
<i>YYYY-MM-DDThh:mm:ss,fff+hh:mm</i>	2014-04-15T19:06:57.493+03:30	Datetime with a time zone offset of +03:30 hours from UTC.
<i>YYYY-MM-DD</i>	2014-02-26	Date.

When you access Workday from your external system using Workday Web Service API, we recommend that you provide offset values for dates and datetimes. Adjust for the difference between the time zone of your business site and Pacific Time. These options vary according to which web service API version you use.

Note: Your external system adjusts time offsets. Coordinated Universal Time (UTC) doesn't change with Daylight Savings Time.

Web Service API Version	Time Zone Offset Support
Version v10	Date and datetime values don't support time zone offsets: <ul style="list-style-type: none"> <li>For web service PUT operations, Workday assumes that all inbound date and datetime values are for Pacific Time regardless of offset.</li> <li>For web service GET operations, Workday sets outbound date and datetime values to Pacific Time.</li> </ul>
Version v9 and earlier	Date and datetime values support time zone offsets: <ul style="list-style-type: none"> <li>For web service PUT operations, Workday converts inbound date and datetime values</li> </ul>

Web Service API Version	Time Zone Offset Support
	<p>based on offset values to Pacific Time before processing.</p> <ul style="list-style-type: none"> <li>For web service GET operations, Workday sets outbound date and datetime values to Pacific Time.</li> </ul>
Version v11 and later	<p>Datetime values support time zone offsets, but not date values:</p> <ul style="list-style-type: none"> <li>For web service PUT operations, Workday converts inbound datetime values based on offset values to Pacific Time before processing.</li> <li>For web service PUT operations, Workday assumes that all inbound date values are for Pacific Time regardless of offset.</li> <li>For web service GET operations, Workday sets outbound date and datetime values to Pacific Time.</li> <li>If you've opted in to the Workday 32 - Time Zones feature and don't use an ISU, then Workday uses the user's local time zone.</li> </ul>

## Concept: Web Services Percentage Behavior

### Overview

Workday multiples decimals for percentage fields by 100.

Example: you can send a decimal to Workday when adding a:

- Percentage-based allowance plan using the *Request\_Compensation\_Change\_Request* operation.
- Goal Payout Band using the *Put\_Goal\_Payout\_Band* operation.
- Percentage-based package while submitting an Offer using the *Offer\_Request* operation.

### Example

Example: Workday multiples this field by 100.

```
<bsvc:Percent>.08</bsvc:Percent>
```

An administrator submits a change for a percentage-based allowance plan and adds a worker using the *Request\_Compensation\_Change\_Request* operation.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/">
  <ns1:Body xmlns:ns1="urn:com.workday/bsvc">
    <wd:Request_Compensation_Change_Request wd:version="v32.0">
      <wd:Business_Process_Parameters>
        <wd:Auto_Complete>1</wd:Auto_Complete>

</wd:Check_Position_Budget_Sub_Process>
</wd:Request_Compensation_Change_Data>
</wd:Request_Compensation_Change_Request>
<bsvc:Request_Default_Compensation_Request/></soapenv:Body>
<bsvc:Workday_Common_Header/></soapenv:Envelope>

```

## Result

Workday displays an 8% change for employee number 21002 in the UI.

## Concept: Workday Web Services Response Filter Element

Many Workday Web Services get request operations contain a *Response\_Filter* element. Workday recommends that you use this element in any web service where it's available.

This element filters request results, and also affects:

- Paging consistency.
- Paging optimization
- Performance.

The request element often contains:

Element Name	Description
<i>Request_References</i>	References for the specific entries to retrieve.
<i>Request_Criteria</i>	Categories of entries to retrieve.
<i>Response_Filter</i>	Filters and pages the returned results. Each element is optional.
<i>Response_Date_Range_Filter</i>	Filters by date range. The date range is used in combination with the dates set in <i>Response_Filter</i> .
<i>Response_Group</i>	Fields for each entry to return.

Example: *Response\_Filter* element where each element is optional

```

<bsvc:Response_Filter>
  <bsvc:As_Of_Effective_Date>2013-07-16</bsvc:As_Of_Effective_Date>
  <bsvc:As_Of_Entry_DateTime>2013-07-16T22:04:00Z</bsvc:As_Of_Entry_DateTime>
  <bsvc:Page>5</bsvc:Page>
  <bsvc:Count>50</bsvc:Count>
</bsvc:Response_Filter>

```

## As\_Of Filter Elements

The *Response\_Filter* element uses these *As\_Of* elements:

Element Name	Element Description
<i>As_Of_Effective_Date</i>	<p>Effective date for the changed data.</p> <p>Example a:</p> <ul style="list-style-type: none"> <li>• Business title change</li> <li>• Change in compensation</li> <li>• New worker employment date</li> <li>• Promotion</li> <li>• New benefits election</li> </ul>
<i>As_Of_Entry_DateTime</i>	<p>Set the date and time that you enter data into Workday. This value ensures consistent paging results and performance even for web services that don't support historic dates and times. Otherwise, the web service automatically populates this field with the current date and time.</p>

The *Response\_Filter* element only returns elements up to and including the specified filter date or date and time. Workday doesn't return elements that have an effective date or an entry date and time after what filter specifies.

Some web services contain this message in the web service documentation: The operation doesn't support criteria-based requests with an *As\_Of\_Entry\_DateTime* in the past, unless for paging consistency the *As\_Of\_Entry\_DateTime* matches the page 1 request.

Even though these operations don't support request criteria for times in the past, Workday recommends that you use the *As\_Of\_Entry\_DateTime* element for optimized paging and consistent results.

## Paging

When you make a web service request that returns a large amount of data, Workday pages search results. The response only returns a subset of data.

These elements control paging:

Element Name	Description
<i>Page</i>	Page of data to return. Paging starts at 1 and the default is 1.
<i>Count</i>	Workday automatically returns 100 data elements per page. The maximum is 999.

## Paging Consistency

Always specify the same value of the *As\_Of\_Entry\_DateTime* element as you page through the entries. Specifying the same value for this element will avoid inconsistent paging results. Inconsistent results include missing some entries and retrieving some entries multiple times.

If you don't specify a value for *As\_Of\_Entry\_DateTime*, Workday uses the current time. Therefore, each page uses a different value and doesn't enforce paging consistency.

### Paging Optimization

If you specify an *As\_Of\_Entry\_DateTime* value and a *Page* value of 1 in a request, Workday optimizes the retrieval of subsequent pages of data. For any large set of data, optimized paging gives you better performance.

Use the paging optimization pattern for all web services that have the *Response\_Filter* element. There's no disadvantage to following this pattern with those web services. You'll still have the advantage of consistent paging, even if the web service doesn't support optimized paging.

To take advantage of optimized paging:

- Specify an *As\_Of\_Entry\_DateTime* value.
- Retrieve page 1 first. Subsequent calls can be in any order (typically, you'll retrieve them in order).
- Perform paged results frequently to avoid error messages, otherwise the optimization will expire and you'll receive an error message.
- Change only the page number in subsequent requests.

If the optimization expires, request page 1 again and continue your requests for other pages. The subsequent requests will use the newly optimized paging data when returning the other pages.

The response won't use optimized paging if:

- There's no *As\_Of\_Entry\_DateTime* element in the request.
- There's only 1 page of data.

## Concept: Best Practices for Submit Workday Project Web Service

This section describes best practices when using the *Submit Workday Project* web service.

### Setting Reference Identifiers

Set the reference IDs of the objects to the strings shown:

Reference ID	Recommended String for Reference ID	Example Reference ID Strings
Project ID	Project ID	• PRJ-123
Project Plan Phase ID	Project ID + "_" + Project Plan Phase ID	• PRJ-123_Phase-1 • PRJ-123_Design
Project Plan Task ID	Project ID + "_" + Project Plan Phase ID + "_" + Project Plan Task ID	• PRJ-123_Phase-1_Task-2 • PRJ-123_Design_FitGapAnalysis

Note: The + operator in the recommended reference ID means concatenate the string parts.

The *Submit Workday Project* web service uses data for these objects:

- Project
- Project Plan
- Resource Plan

When updating Project Plan and Resource Plan objects, Workday first removes the existing data and then inserts the new data. If no new data is supplied, Workday just removes data from the objects.

During an update, if the reference IDs of the Project Plan Phase and Project Plan Task objects are not supplied or do not match the corresponding Project object, it might cause the Project Plan Phase and Project Plan Task objects to be disconnected from their Project object. (Disconnection means the objects no longer reference each other through reference IDs.)

To prevent disconnection, you set the reference IDs as shown in the previous table.

### Updating Project Data

You can update Project data without providing Project Plan or Resource Plan data by setting the Boolean parameters:

- Do Not Update Project Plan
- Do Not Update Resource Plan

If you set either Boolean parameter to true, the respective object is not updated and you can omit data for that object. Example: If you want to only update a Project end date, set both Boolean parameters to true; you can omit Project Plan and Resource Plan data.

## Reference: Workday Web Service Version Reports

Depending on which reports you use, you can identify changes of versions of an entire Workday Web Service (WWS) or individual Web Service operations.

Report	Description
Web Service Change Log	<p>Identifies the changes of an entire web service from 1 version to another.</p> <p>Use this report when you're:</p> <ul style="list-style-type: none"> <li>• Considering creating a new custom integration.</li> <li>• Looking for new operations in a web service.</li> <li>• Looking for the complete history of changes to a web service.</li> </ul> <p>Example: You want to see if there are new operations on the <i>Human Resources</i> web service so you can take advantage of any new functionality.</p>
API Change Log	<p>Identifies the changes in a WWS operation from 1 version to another.</p> <p>Use this report when you're:</p> <ul style="list-style-type: none"> <li>• Considering updating your custom integration to use a newer version of an operation.</li> <li>• Identifying the date of change to an operation.</li> <li>• Looking for a list of additions or removal of features to a single operation.</li> <li>• Looking for changes related to reference IDs.</li> </ul> <p>Example: You want to see if Workday has added an effective-dated attribute to an operation you commonly use.</p>

## Reference: Common Workday Web Service Operation Types

Note:

For information on any web service operation type not listed here, consult the description of the web service operation in the [public web services operations directory](#).

Web Service Operation Type	Description
Get	Retrieves data from Workday.
Put	Creates or updates data in Workday.
Import	Loads large documents with many lines into Workday.
Bulk Import	Processes many small documents into Workday asynchronously.
Submit	Creates or updates data using a relevant business process in Workday.

## Reference: Rich Text Fields in WWS

The WWS API documentation indicates Rich Text Format (RTF) fields as *RichText*. The text must be valid HTML markup and you must escape characters with special meaning in XML. If you submit invalid HTML markup using a web service, Workday validated the HTML markup in your tenant to avoid formatting issues. Workday also supports CDATA.

### Example 1

Input Text	Display
<p>HTML:</p> <pre>&lt;p&gt;Expenses &amp;lt; \$40,000&lt;/p&gt;</pre> <p>XML request:</p> <pre>... &lt;bsvc:Description&gt;   &amp;lt;p&gt;Expenses &amp;lt; \$40,000&amp;lt;/p&gt; &lt;/bsvc:Description&gt; ...</pre> <p>CDATA:</p> <pre>&lt;! [ CDATA[ Expenses &lt; \$40,000 ] ]&gt;</pre>	Expenses < \$40,000

## Example 2

Input Text	Display
<p>HTML:</p> <pre>Expenses &amp;lt; \$40,000 &amp;amp;lt;br&gt; &lt;p&gt;only &lt;b&gt;ONE&lt;/b&gt; open headcount at quarter end&lt;/p&gt;</pre> <p>XML request:</p> <pre>... &lt;bsvc:Description&gt; Expenses &amp;lt; \$40,000 &amp;amp;lt;br&gt; &amp;lt;p&gt;only &amp;lt;b&gt;ONE&lt;/b&gt; open headcount at quarter end&amp;lt;/p&gt; &lt;/bsvc:Description&gt; ...</pre> <p>CDATA:</p> <pre>&lt;![CDATA[ Expenses &lt; \$40,000 ]&amp; Only &lt;b&gt;ONE&lt;/b&gt; open headcount at quarter end]]&gt;</pre>	<p>Expenses &lt; \$40,000 &amp;</p> <p>Only ONE open headcount at quarter end</p>

## HTML Markup for RichText Fields in WWS

Function	Markup	Markup Properties
Bold	<b>b</b>	
Italic	<i>i</i>	
Underline	<u>u</u>	
List item	li	style
Unordered list	ul	
Ordered list	ol	
Anchor	a	href target
Font	font	color face size
Paragraphs	p	align
Span	span	id style
Division	div	style
Break	br	

Note: Unlike all other markups, break (br) doesn't require a closing tag.

## Related Information

[Workday Community: Workday APIs](#)

## Reference: Workday Web Services Error Messages

Workday Web Services (WWS) use the SOAP protocol to exchange information with external systems. If the service encounters an error, Workday returns an HTTP status code of 500, Internal Server Error.

In the response message, errors are in the `<SOAP-ENV:Fault>` element, and consist of at least a `<faultcode>` and a `<faultstring>` element.

Example:

```
<SOAP-ENV:Envelope xmlns:SOAP-ENV="http://schemas.xmlsoap.org/soap/envelope/">
  <SOAP-ENV:Body>
    <SOAP-ENV:Fault xmlns:wd="urn:com.workday/bsvc">
      <faultcode>SOAP-ENV:Client.validationError</faultcode>
      <faultstring>Invalid request</faultstring>
    </SOAP-ENV:Fault>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```

These tables list some common faultstrings for different faultcodes.

### ns0:Server faultcode

faultstring	Description/Solution
No service at endpoint=http://{Workday Service}/ccx/service/{tenant}/Human_Resources/v22.0, Target application service does not exist.	Verify the endpoint URL. In this example, the user truncated service to <i>servic</i> , causing the error.

### SOAP-ENV:Server.error faultcode

faultstring	Description/Solution
java.lang.IllegalArgumentException: Customer id was not specified	Append the tenant name to your account name when you specify the username in the request. Example: If your account is <i>ISU_benefits</i> , and your tenant is <i>my_tenant</i> , use <i>ISU_benefits@my_tenant</i> as the username.

### SOAP-ENV:Client.authenticationError faultcode

faultstring	Description/Solution
invalid username or password	Either the password or username is incorrect. Be sure that you've appended the tenant name to the account to create the username.

## SOAP-ENV:Client.validationError faultcode

This table is a small list of errors that you might encounter. For other faultstrings, consult the WWS API Documentation for the web service operation you're calling. Validations listed in that document might display in the faultstring element in WWS error messages.

faultstring	Description/Solution
Request service version has reached its end of life	The Workday Web Service that you're calling has reached its end of life. Change to a currently supported version.
Invalid request service version	The version string you specified isn't a supported WWS version. A common error is to omit the leading letter v from the version string. Example: 22.1 is invalid, but v22.1 is valid.
Invalid request	Verify that you specified the tenant name correctly in the endpoint URL, and that you've specified a valid operation.
Validation error occurred. Invalid ID value. '2001' isn't a valid ID value for type = 'Employee_ID'	Supply a valid value for this ID.

### A

Academic Date Range

The period of time associated with a student recruiting cycle.

Academic Level

The level of an educational objective that a student can pursue at an institution, such as:

- Undergraduate, Graduate, or Professional at a university.
- Associates or Baccalaureate at a community college.

Academic Unit

A Workday organization type that represents a school, college, university, or other unit of your institution. These units can recruit prospective students, admit students, offer programs of study or courses, or administer financial aid. Academic

Academic Unit Hierarchy	units are also used with academic appointments in Workday.
Accounting Cash	A hierarchical grouping of academic units primarily used for roll-up reporting.
Accounting Cash Pool	A group of cash ledger accounts that you can use to check cash balances against during settlement.
Active Candidate	One or more primary balancing worktag hierarchies that you can use to pool cash ledger balances for cash balance checks during settlement.
All Ledgers Journal	A person with an application for a specific job requisition. Candidates must be linked to a job requisition for Workday to initiate a job application event.
Applicant Pool	An accounting journal that's not configured as a single ledger for the given company and is posted to both primary and alternate ledgers.
Application Grouping	A subset of applications in an application grouping. Applicant pools enable you to control and adjust workload for application reviewers.
Auto-fill	A grouping of applications for the same admitting level of an academic unit and the same anticipated start date. Groupings can have 1 or more application pools, with an admissions counselor assigned to each pool.
Award	A time entry option that copies time blocks from a worker's schedule or from a previous week when entering time.
Award Costs Processing (ACP)	A contract agreement with your sponsor in the form of funding to perform an activity for a public purpose. It defines how to capture direct and facilities and administration costs, recognize revenue, and bill your sponsor.
Award Credits	Processing facilities and administration costs and revenue recognition related to spend transactions on awards.
Award Line	Percentage of award or award lines you allocate to specific worktags for reporting purposes.
Award Tasks	A line of authorized amount associated with a grant on an award. It includes information on the line's effective date, spend restrictions, basis limit, salary cap, and facilities and administration cost rates for expenditures charged to the grant.
Aggregation Security Group	Administrative tasks that you do or track for a sponsor to support the terms of your award contract. Example: Quarterly progress report, financial report.
	A security group that grants access rights to members of an included set of security groups.

Approve	Revokes access of members of any excluded security groups.
Assignable Roles	An action in a business process that designated participants select to progress the event to the next step.
<a href="#">Back to Top</a>	Positions you can assign to organization roles.
<b>B</b>	
Basis Limit	The maximum amount of direct costs you can use to calculate facilities and administration costs.
Base Pay Element	The compensation components that are included in the calculation of base pay for the purposes of determining the compa-ratio and target penetration.  Example: Include both base pay and bonuses in the base pay calculation for compa-ratio.
Benefit Credit Bundle	A defined group of benefit credits that you can award together.
Benefit Defaulting Rule	A rule that identifies the benefit plans, coverage targets, and coverage amounts that employees receive by default when they do not complete an enrollment event.
Benefit Event Rules	These rules specify coverage increase limits, EOI requirements, waiting periods, and other rules and conditions of enrollment for benefits enrollment events.
Benefit Event Type	Identifies the events that trigger benefit enrollment, such as open enrollment, new hires, or the birth of a child. It also identifies the coverage types to make available to employees for when an event of this type occurs.
Benefit Group	A group of employees who qualify for benefits based on eligibility rules. Employees must be included in a benefit group to enroll in a benefit plan.
Business Object	Objects used to store data in Workday (such as organizations or workers). A business object has <i>fields</i> and <i>instances</i> , which are analogous to rows and columns in a spreadsheet. Workday links related business objects: a worker is associated with a position, the position to a job profile, and so on.
Business Process Definition	The tasks that compose a business process, the order in which they must be done, and who can do them.

**Business Process Instance** A business process that the initiator has started. The *Hire Employee for Organization X* business process definition becomes an instance when the initiator uses it to hire an employee.

**Business Process Security Policy** A business process security policy secures the steps and process-wide actions including view, rescind, cancel and correct. It specifies which security groups have access to each action.

[Back to Top](#)

## C

**Calculated Time** Result of applying time calculations to a worker's reported time. Automates application of company or regulatory rules.

**Calendar-Based Time Entry** A time entry method that uses the time entry calendar as the focal point for entering, editing, and submitting time.

**Cancel (business process)** Canceling a business process stops the workflow in progress and reverses changes made to data. You can't cancel a completed business process; you must rescind it. A securable action in a business process security policy.

**Candidate** Candidates include both prospects and active candidates.

**Candidate Pipeline** All active candidates.

**Candidate Pool** Candidates grouped together based on specific criteria.

**Cascading Leave** A sequence of related leave types that are linked together. When an employee meets the conditions defined for ending a leave, Workday generates a return from leave request and a separate request for the next leave.

**Company** Companies are organizations within Workday that represent the internal business entities within your enterprise. In Workday Financial Management, companies are the primary organization for all business processes. A Company is considered the level at which one holds a balanced set of books and should reflect Legal Entities where possible.

**Company Hierarchy** Defines a parent-child or reporting relationship between Companies in your organizations. The way that you structure your hierarchies influences many important Workday functions, especially role assignments, planning, and reporting.

**Compensation Basis** A grouping of compensation components, such as salary, commission, and allowance plans, that define estimated earnings for an employee population.

Compensation Component	The umbrella term for compensation packages, grades, grade profiles, and plans that can be associated with compensation eligibility rules.
Compensation Defaulting Rule	A rule that establishes the criteria for how compensation components default to worker compensation during staffing transactions (such as hire or job change).
Compensation Element	Compensation elements link Compensation to Payroll. When a compensation element is attached to a plan that is assigned to an employee, Workday can determine which earnings to use to pay the employee.
Compensation Package	A grouping of compensation guidelines (grades, grade profiles, and their associated steps) and plans that you can assign to workers as a set. Packages provide a quick view of the eligible plans for a particular job or group of employees.
Compensation Rule	Guidelines for determining which workers are eligible for which components of compensation.
Compensation Step	A specific monetary amount within a grade or grade profile.
Compensation Target Rule	A rule used to segment your employee population for assignment of compensation plans.
Conditional Calculation	Time calculation that tags time blocks that meet certain conditions.
Conditions	Conditions are one or more logical matches that are resolved to True or False and used to decide if some action should be taken. You can add conditions to steps in a business process to determine if the step should run.
Connection Map	A tool on a customer profile that enables you to establish and manage the relationships between business entities and ship-to addresses.
Connector	A set of 1 or more integration templates that provide a framework for building integrations in a particular functional area. The integration can support a specific type of data, or can support a specific endpoint (example: Salesforce.com or Okta).
Consolidated Billing Schedule	A billing schedule type that allows you to combine all charges for multiple projects or services within a specific billing period into one invoice.
Contextual Custom Report	A custom report created from the related actions menu of a Workday object by selecting Reporting > Create Custom Report from Here. Simplifies choices of data and fields to those related to the context of the object.
Contract Rate Sheet	A document that outlines the contract billing hourly rates for roles such as the engineer, manager, or

Conversation Tag	consultant, with the option to add billing rules for specific contract considerations.
Conversation Topic	A descriptor, such as Dietary Restrictions or Special Needs that you can assign to an engagement conversation to identify its topic. You can search for conversations by conversation tag.
Correct (business process)	A conversation tag or recruiting event name that you can associate with an engagement conversation to make conversations easier to find.
Cost Reimbursable Spend	Correcting a business process changes a specification or data in the workflow while in progress. A securable action in a business process security policy.
Coverage Target	A billing item that Workday creates to help you bill your sponsor for award-related spending. The cost reimbursable spend amount includes both the original spend amount and any overhead costs Workday calculates based on your award costs configurations.
Cross Plan Dependency	Defines whether a specific health care plan or insurance plan applies only to the employee or also to the dependents, spouse, family, and so on.
Custom Report	Limits the coverage options available to workers during an enrollment event based on their choice of other benefit plans and coverage amounts.
Customer Payment Matching	Example: You can limit coverage in a specific plan to a percentage of the total coverage in 1 or more other benefit plans.
Customer Refund Payments in Settlement Runs	Reports not delivered by Workday and built using the Workday Report Writer. Can be created new or by copying another standard or custom report.
Back to Top	A feature that uses historical payment applications to suggest customer invoices and adjustments that match customer payments with insufficient remittance advice.
D	A refund payment generated by the settlement run with a payment date that reflects the date you settle the refund.

## Dashboard (landing pages)

Dashboard (landing pages)	A specialized landing page containing a set of pre-configured worklets for a functional area that you can copy or modify. You can add additional custom worklets to dashboards using the report writer.
Data Source	A data source defines a set of business object instances for reporting purposes. Allows reporting

Day Breaker	access to all business objects related to those in the data source.
Deny (business process)	The time of day on which a worker's work day and work week begins. Defines the 24-hour period over which daily time calculations execute and the 168-hour period over which weekly time calculations execute. Unless otherwise specified, the default day breaker is 12am.
Depreciation Profile	When you deny a business process, the business process is terminated and all Workday data is restored to its state before the business process started. To restart the business process, you need to submit the process again, and redo all previously completed steps.
Designation	A configuration that determines how Workday depreciates assets by defining a depreciation method, convention, and useful life.
Discrete Composite Asset	An attribute, such as Community Learning Partner, Honors, or STEM, that you can associate with educational institutions and external associations to make them easy to find and report on.
Disposition	A combination of related but distinct assets for which you can individually track cost, depreciation, and lifecycle events.
Domain	Status of candidates that have been rejected for hire or declined a job during the job application event.
Domain Security Policy	A collection of related securable items such as actions, reports, report data, report data sources, or custom report fields. Each domain is secured by a domain security policy.
Dynamic Period	A collection of related securable elements of different types and user-specified security groups that have access to elements of each type.

[Back to Top](#)

## E

Educational Taxonomy	A taxonomy scheme and set of codes you can assign to programs of study and their concentrations to meet state, local, or other classification requirements.
Effort Grant	The sponsor funded grant associated with the worker's certified effort.
Effort Recertification	The process you use to recertify an employee's effort in response to payroll accounting changes that occur after you last certified the effort.

Eligible Investigator	A type of role that you can use to assign individuals to awards, grants, and grant hierarchies, so that the role assignments remain intact even when the person's position or organization changes.
Engagement Action Item	Defines a requirement that must be met for an application for admission to be considered complete. Example: Submit transcripts.
Engagement Item	An engagement email or printed engagement item. You can include engagement items in engagement plans and use them to support student recruiting events.
Enrollment Event Rule	A rule that defines coverage start and end dates, waiting periods, coverage increase limits, Evidence of Insurability requirements, and other coverage rules and conditions. Rules ensure that the benefits process presents only the options that each employee is eligible for based on the event type.
Enterprise Interface Builder (EIB)	An integration tool that enables you to create simple, secure, and customizable integrations with Workday. Alternately, an EIB is a simple integration created by the integration tool. An EIB consists of an integration system, an integration data source, an integration transformation, and an integration transport protocol.
Estimate at Completion (EAC)	Includes all the hours logged and approved for the project, as well as the future hours the worker expects to complete.
Estimate to Completion (ETC)	Includes the future hours the worker expects to complete.
Event	A business process transaction that occurs within your organization, such as hiring or terminating an employee.
External Association	A nonprofit, community-based, or other noneducational organization that you can associate with student prospects or identify as a location for recruiting events.
External Engagement Item	Used to send and track third-party engagement items for recruiting events, communication plans, or ad hoc communications.

[Back to Top](#)

## F

Fast Path	A streamlined approach to moving applications for admission from submission to matriculation as quickly as possible.
Field Overrides	A tool that lets you customize integration systems that are based on a connector template. Field overrides are managed through an integration service. They use calculated fields or report fields

Financial Aid Period Record	to supply values to an integration system. Example: member IDs in benefit provider integrations.
Functional Area	A record containing data such as academic unit, academic level, and program of study for a student that Workday uses to process financial aid for an academic period.
Back to Top	A collection of domain or business process security policies that are related to the same set of product features, for example, Benefits or Compensation.

**G**

Grade Profile	A breakdown of a compensation grade by functional task, geographical region, or other categorization your business requires. A profile enables you to assign more granular compensation ranges to workers.
Grant	A worktag you use to charge award-related expenditures to an award line.

[Back to Top](#)**H**

Headcount Plan	Provides visibility into the number of workers necessary to achieve your business goals within a specified period of time.
----------------	--

[Back to Top](#)**I**

Individual Target	An individual bonus or merit target for a worker during a compensation review process that overrides the target defined on the compensation plan.
Integration Attribute	An integration component that specifies the tenanted value of a data element in Workday. Example: Plan Sponsor Name is a type of attribute in benefit provider integrations.
Integration Data Source	Indicates the type of data that Workday receives from or exports to an external system and its location.
Integration Event	The record of an integration process. Every integration—current or past, involving the import or export of data, successful or not—gets recorded as an integration event. The integration event contains all the information about the integration process, including its status.
Integration Map	An integration component that specifies how values in Workday map to values in an external system.

	Example: Pay Rate Frequency is a type of map in third-party payroll integrations.
Integration Service	A group of related integration attributes, maps, and XSLT that provides a framework to transform Workday data into the format required by an external system.
Integration System	A tenanted definition of an integration between Workday and an external system based on a template that provides the methodology for communicating data.
Integration Template	A collection of integration services that enables communication between Workday and an external system. Workday provides integration templates in categories such as Benefits, Financials, HCM, Payroll, Payroll Interface, Procurement, Recruiting, Security, and Settlement. Many of the delivered templates contain default values for attributes, as well as prompt values for attributes and maps, to define the integration further.
Integration Transformation	Converts data into a format that Workday or a receiving external system can understand. Workday provides some delivered transformations, and you can also create custom transformations.
Integration Transport Protocol	Controls how Workday exports data to an external endpoint or service or imports the data from an external endpoint or service. Workday supports several types of transport protocols, including email, FTP and SFTP, HTTP/SSL, Workday attachments, and Workday Web Services.
Intersection Security Group	A security group whose members are other security groups. Members associated with all included security groups are granted access through an intersection security group.
Initiation Step	The first step of a business process.
<a href="#">Back to Top</a>	
<b>J</b>	
Job-Based Security Group	A security group that includes one or more job-related attributes or objects including job profile, job family, job category, management level, or exempt/non-exempt status.
Job Management Staffing Model	A structure that defines 1 set of hiring restrictions for all jobs in a supervisory organization, with no specific limits on the number of jobs that can be filled.
Job Profile	The generic features and characteristics of a job or position, such as management level, pay rate type, compensation, skills, and other qualifications.
<a href="#">Back to Top</a>	

**K****Knowledge Article**

An article that is accessible to workers in your organization based on the assigned article audience. You can use these articles to document, share, and manage HR information specific to your organization.

**Knowledge Article Audience**

A group of employees that can view designated Knowledge articles. Their access to articles is determined by condition rules assigned to the audience.

[Back to Top](#)

**L****Landing Page**

Landing pages display a collection of worklets. Landing pages may have different display formats (grid or bubble) and support different functions. The Home landing page is intended for common worklets, such as self-service worklets.

**Leave Family**

A set of similar leave of absence types. Example: A company-specific family includes disability leave and bereavement leave, while a separate regulatory family includes jury duty and family medical leave.

**Leave of Absence Rule**

A rule that defines worker eligibility for leaves of absence.

**Line Tax Rate Application (LTRA)**

A collection of tax amounts that apply to a given transaction line or supplier invoice line split on a taxable document.

**Linked Customer Contracts**

Child customer contracts that you associate with a parent customer contract for revenue allocation purposes.

**Linked Leave**

A leave type that shares an entitlement with other leave types or time offs. Eligibility rules, validation rules, and supporting data reference the combined balance of the associated leave types and time offs. Also known as coordinated leaves and time off.

**Location Membership Security Group**

A security group whose members are any workers assigned to that location.

[Back to Top](#)

**M****Match and Merge**

A process that helps eliminate duplicate student prospect information in Workday.

**Micro-edit**

The ability to edit existing time blocks or add time blocks directly to a day by clicking the time entry calendar.

**Multiplier-Based Coverage**

Insurance coverage based on multiples of salary, such as 1x, 2x, or 3x salary.

[Back to Top](#)**N****Nonbillable**

A nonbillable project is an internal project that you don't invoice customers for.

[Back to Top](#)**O****Object Class**

The spend categories that award sponsors agree to reimburse award recipients for maintaining their projects.

**On-Account Document**

A document that's generated when you place a payment amount on an existing customer account. You can apply on-account documents to future payments.

**Organization Security Group**

A security group whose members are any workers assigned to that organization.

[Back to Top](#)**P****Parent Customer Contract**

A customer contract that you associate with a child customer contract so you can add contract lines across contracts to the same schedule. When you view the parent customer contract, Workday displays the child customer contracts as linked contracts.

**Passive Event**

Events that result from the passage of time rather than from a specific change to employee data.

**Payment Group**

The payments that result from a settlement run.

**Payment Tax Rate Application (PTR)**

A collection of tax amounts that apply to a given payment on a taxable document.

**Position Management Staffing Model**

A structure that defines different staffing rules and restrictions for each position in an organization.

**Position Restrictions**

The attributes and conditions that apply to an unfilled position in a supervisory organization that uses the position management staffing model. Example: Job profile, location, qualifications, and worker type.

**Pre-Hire**

In Staffing, an individual you're tracking before employment. In Recruiting, a candidate who is in the *Offer*, *Employment Agreement*, *Background Check*, or *Ready for Hire* stage.

**Procurement Contract**

Contracts enable your organization to define preferred suppliers, analyze spend for better control, and standardization. They also allow your organization to implement contractual spend to

Procurement Contract Type	better negotiate and enforce discounts and other supplier terms.
Pro Forma Effort Certification	A procurement contract in Workday is always associated with a Contract Type that dictates how the contract can be used across the procure-to-pay chain. Example: when a Contract Type has the Scheduled Purchase Orders option set, Workday can use the contract to automatically create purchase orders based on a predefined schedule.
Project Advanced Labor Costing	A report you can run before you run effort certification to review estimated effort based on salaries and wages that payroll accounting attributes to grants. It allows you to take corrective action, such as payroll accounting adjustments, prior to certifying employee effort, to ensure a more seamless certification process.
Project Asset	Prorating project labor costs using standard or fully burdened costing.
Project Billing Rate Sheet	A container that captures separate, ongoing costs of a capital project in progress. You can associate multiple projects assets with a project to track costs over the life of a project.
Project Plan Phase	A document that outlines the hourly or daily rates charged per project role, with the option to be more specific based on defined categories such as Region, Skill Level, and Project Size.
Project Plan Task	A phase in the project plan that represents a stage in the project work. Example: Plan and Strategize. A project plan organizes projects into sequenced phases and tasks. A project phase is generally project agnostic, but when you add that phase into a project plan, it becomes a project plan phase.
Project Transaction Source	The work details in a project plan phase. Example: Define Project Objectives.
Prospect	The source of project billing transactions. Example: Supplier Invoice, Expense, or Time.

[Back to Top](#)

## Q

Quick Add

A time entry option that enables you to create a time block and copy it to multiple days in a week.

[Back to Top](#)

**R**

Recipient Threshold	The maximum number of prospects to whom you can send an engagement item at the same time without requiring approval.
Recruiting Cycle	A recruiting period for 1 or more academic levels of an academic unit. You associate recruiting cycles with campaigns to measure the effectiveness of each campaign per recruiting cycle.
Reference ID	A unique identifier used to look up data for integration purposes.
Reference Pay Range	A range of pay established for a compensation grade or grade profile.
Related Customer Contract	A customer contract that you associate with another customer contract for reporting purposes. When you create a customer contract, you can associate 1 related customer contract with it. The related customer contract must share the same company and sold-to customer.
Reported Time	A worker's time that has been entered, but has not had any time calculations applied.
Revenue Category	An attribute in customer contracts and billing used to search for and report on goods and services you sell. Also a dimension in account posting rule types for customer contracts, billing, and accounts receivable that drives accounting behavior.
Risk Insight	Provides the reason why Workday identifies an expense report with a High or Medium risk level. Reasons may include 1 or more of these: Amount Anomaly, Duplicate Expense, and Incorrect Expense Item.
Risk Level	The value (Low, Medium, and High) that Workday provides from risk evaluation. Workday provides default risk levels, which can also be configured based on Risk Score.
Risk Score	The numerical value (0 to 100) that Workday provides from risk evaluation. The score helps identify anomalous expense reports.

[Back to Top](#)

**S**

Salary Over the Cap Basis	A worktag type representing the effort grant on over-the-cap salaries when you have salary over the cap enabled on your tenant. For the portion of salary that's over the cap, the Salary Over the Cap Basis worktag identifies the effort grant, while the Grant worktag, if applied, identifies the grant on the salary over the cap suballocation.
---------------------------	---

Salary Over the Cap Suballocation	Worktags and their distribution percentages that you want to allocate on the portion of salary that's over the salary cap.
Single Ledger Journal	An accounting journal that's a single primary or alternate ledger currency for the given company.
Source	The duplicate record that you want to merge in the Duplicate Management Framework.
Spend Category	A logical grouping to search and report on acquired items and services. Also a dimension in account posting rules for procurement and spend that drives accounting behavior.
Staffing Model	A structure that defines how jobs and positions are created and filled in a supervisory organization. Workday supports 2 kinds of staffing models: <ul style="list-style-type: none"> <li>• Job management.</li> <li>• Position Management.</li> </ul>
Staffing Organization	An organization category that includes supervisory organizations, matrix organizations, or retiree organizations.
Stage	A value, such as Lead, Inquirer, or Applicant, that identifies where a student prospect is in the recruitment or admissions process.
Student Financials Period Record	A record containing data such as academic unit, academic level, and program of study for a student that Workday uses to process student financials transactions for an academic period.
Student Prospect Profile	A worklet that displays information for a prospective student, including contact information and recruitment details.
Student Prospect Type	A value, such as First Year or Adult Returning, that you can assign to prospective students and use to match student prospects to admissions counselors automatically.
Student Recruiting Region	Workday term for recruiting territory. A recruiting region can represent a geographical area, 1 or more schools, or schools in selected school districts.
Student Tags	An attribute, such as Veteran, Athlete, or Scholarship Recipient, that you can assign to student prospects. You can use tags to match student prospects to recruiters automatically, find prospects, and use as criteria for associating engagement plans with prospects.
Supplier Contract	Contracts enable your organization to define preferred suppliers, analyze spend for better control, and standardization. They also allow your organization to implement contractual spend to better negotiate and enforce discounts and other supplier terms.

Supplier Contract Type	A supplier contract in Workday is always associated with a Contract Type that dictates how the contract can be used across the procure-to-pay chain. Example: when a Contract Type has the Scheduled Purchase Orders option set, Workday can use the contract to automatically create purchase orders based on a predefined schedule.
System User	An account associated with and required to launch a Connector or Studio integration. Workday delivered integrations and custom integrations require a system user account for authentication and web service calls. A system user account is not associated with a person in Workday.
Staffing Organization	An organization category that includes supervisory organizations, matrix organizations, or retiree organizations.

[Back to Top](#)

## T

Target	The record into which you want to merge the source in the Duplicate Management Framework.
Tax Code	A combination of tax rates that you select on transaction lines.
Tax Rate Application (TRA)	A collection of tax amounts across all lines on a taxable document with the same tax applicability, tax code, tax option, tax point date, tax rate, and tax recoverability.
Tax Recovery Pro Rata Factor Percentage	A company-specific percentage that modifies the tax recoverabilities that you configure for the tenant.
Termination Adjustment	A time off adjustment that automatically sets the remaining balance of a worker's time off plan to zero upon the worker's termination.
Time Block	A time block carries information about a portion of time, such as the number of hours worked or in/out times. Time blocks can be reported or calculated, but only calculated time blocks are pulled into Workday Payroll.
Time Calculation	A set of rules to apply time calculation tags to calculated time blocks for Payroll or other purposes. Example: You could create a time calculation to convert regular hours into overtime hours automatically if a worker works more than 40 hours in a week.
Time Calculation Tag	Workday applies calculation tags to time blocks during time calculations. The tags map to payroll earnings to drive how time blocks are paid and can be included in time off and accrual calculations. You can also use them to display time and time off totals on the time entry calendar.

Time Clock Event	A time clock event describes a worker's actions, such as a check-in or check-out, on the web time clock or an external time clock. Workday matches time clock events to form time blocks, which workers can edit and submit.
Time Code Group	The primary use of a time code group is to determine which time entry codes a worker is eligible for. Time code groups are assigned to a worker or to a position through eligibility rules.
Time Entry Calendar	A set of self-service pages that workers use to enter, edit, and submit time, when using calendar-based time entry. When using high volume time entry, workers can view and submit time from the time entry calendar.
Time Entry Code	A time entry code describes the type of time a worker enters, such as worked time or meal allowance. To use time entry codes, you must attach them to time code groups, except for the default time entry code assigned to a time entry template.
Time Entry Template	A template defines how a worker's time entry calendar is configured. Workers are matched to time entry templates through eligibility rules.
Time Entry Validation	Errors or warnings that prevent users from entering invalid time. Critical validations prevent a user from submitting time. Warnings display when entering time but don't prevent the worker from submitting time.
Time Off	The rules that apply to a specific type of time off, including eligibility rules, whether adjustments are allowed, and limits that differ from the time off plan.
Time Off Plan	The rules for entering and tracking 1 or more related time offs. Identifies the unit of time, eligibility requirements, whether to track balances, and if time offs are position-based or worker-based.
Time Period Schedule	A time period schedule defines which dates are available for entry at a given time and defines which dates are paid in which pay periods. They can line up with pay periods, or, in more complex scenarios, they can be paid on a lag.
Time Proration Rule	A rule that prorates employees' target compensation in a bonus or merit increase compensation event according to time-based criteria, such as leave of absence or time since hire.
Time Shift	A grouping of consecutive time blocks that you can use in standard overtime calculations, time block conditional calculations, and validations.

**U**

[Unbillable](#)

An unbillable transaction is a billing transaction that has an issue preventing it from being billed. You can't take action on the transaction until you resolve the issue.

[Unnamed Resources](#)

Placeholders for project resources that you can use to assign tasks and perform resource forecasting without specific resource assignments.

[Back to Top](#)

**V**

[Value-Based Project](#)

A customer contract line type that you use when your project billing installment values are not known at the time of contract creation.

[Back to Top](#)

**W**

[Wave Picking](#)

Enables you to group picking lists together in groups to better organize and prioritize your inventory picking process

[Week Breaker](#)

The day of the week on which a worker's work week begins. Defines the 7-day period over which weekly time calculations execute. Unless otherwise specified, the default week breaker is Sunday at 12am.

[Work Schedule Calendar](#)

A calendar that defines the days and hours that a worker is scheduled to work. In Time Tracking, work schedule calendars affect time entry options, calendar displays, and time calculations.

[Workday Studio](#)

An Eclipse-based development environment that enables you to build more complex integrations with Workday.

[Workday Web Services](#)

Workday's public API. Based on open standards, Workday Web Services (WWS) provide the core method for integration with Workday.

[Worker](#)

An employee or a contingent worker.

[Worklets](#)

Mini applications represented by clickable icons in Workday, providing quick and easy access to tasks and data that you access regularly. Example: the Inventory or Time Off worklets, or a worklet based on a report.

**Z**

Zone Picking

A method of picking for orders from different zones at an inventory site. In Workday, you can split a stock request into multiple zone picking lists for more efficient picking and shipping. You can then ship the zone picking lists separately or merge them before shipment.
